

DLP780TE 0.78 4K UHD Digital Micromirror Device

1 Features

- 0.78-inch diagonal micromirror array
 - 4K UHD (3840 × 2160) display resolution
 - 9.0- μ m micromirror pitch
 - $\pm 14.5^\circ$ micromirror tilt
 - Corner illumination
- 2xLVDS input data bus
- Supports 4K UHD up to 60Hz
- LED, laser-phosphor, and RGB laser supported by DLPC4420 display controller, DLPA100 power management and motor driver IC

2 Applications

- Laser TV
- Smart projector
- Enterprise projector
- Digital signage

3 Description

The DLP780TE digital micromirror device (DMD) is a digitally controlled micro-electromechanical system (MEMS) spatial light modulator (SLM) that enables bright 4K UHD solid-state illuminated display systems. The TI DLP® 0.78-inch 4K UHD chipset comprises the DMD, two DLPC4420 display controllers, DLPA300 micromirror driver, and DLPA100 power and motor driver. The compact physical size of the chipset provides a complete system that enables small form factor 4K UHD displays with solid-state illumination.

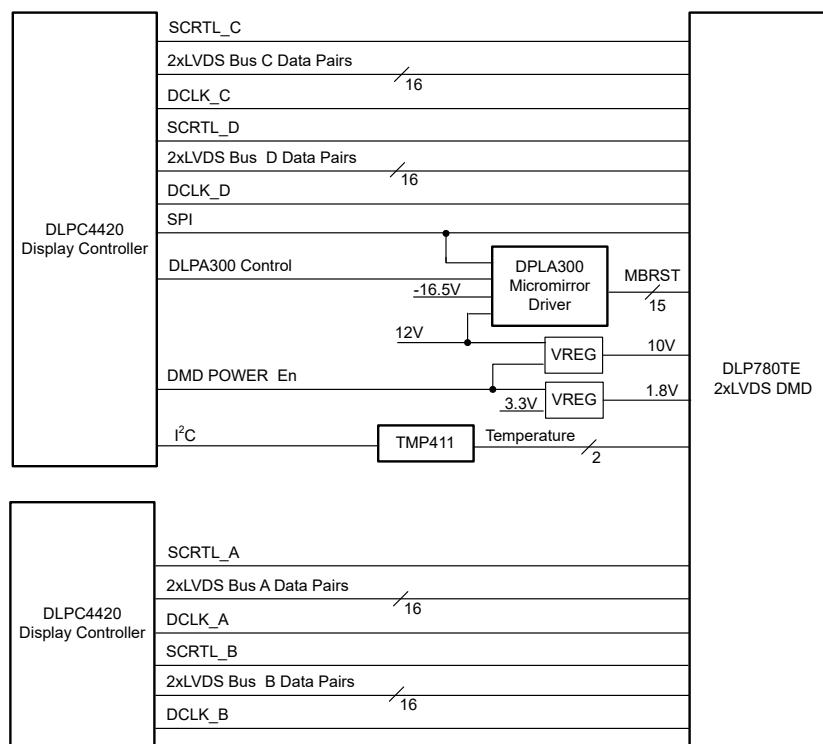

To help accelerate the design cycle, the DMD ecosystem includes established resources, which include [production ready optical modules](#), [optical module manufacturers](#), and [design houses](#).

To learn more about how to start designing with the DMD, visit the [Getting Started with TI DLP display technology](#) page.

Device Information

PART NUMBER ⁽¹⁾	PACKAGE	BODY SIZE (NOM)
DLP780TE	FYU (350)	35.0mm × 32.2mm

(1) For more information, see the *Mechanical, Packaging, and Orderable* addendum.

Simplified Application

An **IMPORTANT NOTICE** at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. **PRODUCTION DATA**.

5 Specifications

5.1 Absolute Maximum Ratings

Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

		MIN	MAX	UNIT
SUPPLY VOLTAGES				
V _{DD}	Supply voltage for LVC MOS core logic ⁽¹⁾	-0.5	2.3	V
V _{DDI}	Supply voltage for LVDS Interface ⁽¹⁾	-0.5	2.3	V
V _{CC2}	Micromirror Electrode and HVC MOS voltage ^{(1) (2)}	-0.5	11	V
V _{MBRST}	Input voltage for MBRST pins ⁽¹⁾	-17.5	22.5	V
V _{DDI} – V _{DD}	Supply voltage delta (absolute value) ⁽³⁾		0.3	V
INPUT VOLTAGES				
V _{ID}	Input differential voltage for LVDS pins (absolute value)		500	mV
V _{LVC MOS}	Input voltage for all other input pins ⁽¹⁾	-0.3	V _{DDI} + 0.3	V
ENVIRONMENTAL				
T _{ARRAY}	Temperature, operating ⁽⁴⁾	0	90	°C
	Temperature, nonoperating ⁽⁴⁾	-40	90	°C
T _{DP}	Dew point temperature, operating and non-operating (noncondensing)		81	°C

(1) All voltages are referenced to common ground V_{SS}. V_{DD}, V_{DDI}, and V_{CC2} power supplies are all required for all DMD operating modes.

(2) V_{CC2} supply transients must fall within specified voltages.

(3) Exceeding the recommended allowable voltage difference between V_{DD} and V_{DDI} may result in excessive current draw.

(4) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1), shown in [Figure 6-1](#) using the [Micromirror Array Temperature Calculation](#).

5.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system

		MIN	MAX	UNIT
T _{DMD}	DMD storage temperature	-40	80	°C
T _{DP-AVG}	Average dew point temperature (noncondensing) ⁽¹⁾		28	°C
T _{DP-ELR}	Elevated dew point temperature range (noncondensing) ⁽²⁾	28	36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range		24	months

(1) This is the average over time (including storage and operating) that the device is not in the elevated dew point temperature range.

(2) Exposure to dew point temperatures in the elevated range during storage and operation must be limited to less than a total cumulative time of CT_{ELR}.

5.3 ESD Ratings

SYMBOL	PARAMETER	DESCRIPTION	VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	V
V _(ESD)	Electrostatic discharge (MBRST PINS)	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001	±150	V

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
VOLTAGE SUPPLY					
V _{DD}	Supply voltage for LVCMOS core logic ⁽¹⁾	1.65	1.8	1.95	V
V _{DDI}	Supply voltage for LVDS Interface ⁽¹⁾	1.65	1.8	1.95	V
V _{CC2}	Micromirror Electrode and HVCMOS voltage ^{(1) (2)}	9.5	10	10.5	V
V _{MBRST}	Micromirror Bias / Reset Voltage ⁽¹⁾	-17		21.5	V
V _{DD} – V _{DDI}	Supply voltage delta (absolute value) ⁽³⁾	0	0.3		V
LVCMOS					
V _{IH(DC)}	Input High Voltage	0.7 × VDD		V _{DD} + 0.3	V
V _{IL(DC)}	Input Low Voltage	-0.3		0.3 × VDD	V
V _{IH(AC)}	Input High Voltage	0.8 × VDD		V _{DD} + 0.3	V
V _{IL(AC)}	Input Low Voltage	-0.3		0.2 × VDD	V
I _{OH}	High-level Output Current			2	mA
I _{OL}	Low-level Output Current	-2			mA
t _{PWRDNZ}	PWRDNZ pulse width ⁽⁴⁾	10			ns
SCP INTERFACE					
F _{SCPCLK}	SCP clock frequency	50	500		kHz
SCPCLK _{DCDIN}	SCP Clk Input duty cycle	40%	60%		
LVDS INTERFACE					
F _{CLOCK}	Clock frequency for LVDS interface (all channels), DCLK ⁽⁵⁾			400	MHz
DCD _{IN}	Input CLK Duty Cycle Distortion tolerance	44%	56%		
V _{ID}	Input differential voltage (absolute value) ⁽⁶⁾	150	300	440	mV
V _{CM}	Common mode voltage ⁽⁶⁾	1100	1200	1300	mV
V _{LVDS}	LVDS voltage ⁽⁶⁾	880	1520		mV
t _{LVDS_RSTZ}	Time required for LVDS receivers to recover from PWRDNZ	2			μs
Z _{IN}	Internal differential termination resistance	80	100	120	Ω
Z _{LINE}	Line differential impedance (PWB/trace)	90	100	110	Ω
ENVIRONMENTAL					
T _{ARRAY}	Array temperature, long-term operational ^{(7) (8) (9)}	10	40 to 70 ⁽¹⁰⁾		°C
	Array temperature, short-term operational, 500 hour max ^{(8) (11)}	0	10		°C
T _{DP-AVG}	Average dew point average temperature (non-condensing) ⁽¹²⁾			28	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) ⁽¹³⁾	28	36		°C
CT _{ELR}	Cumulative time in elevated dew point temperature range			24	Months
Q _{AP-ILL}	Window aperture illumination overfill ^{(14) (15) (16)}			17	W/cm ²
SOLID STATE ILLUMINATION					
ILL _{UV}	Illumination power at wavelengths < 410nm ^{(7) (18)}			10	mW/cm ²
ILL _{VIS}	Illumination power at wavelengths ≥ 410nm and ≤ 800nm ^{(17) (18)}			22	W/cm ²
ILL _{IR}	Illumination power at wavelengths > 800nm ⁽¹⁸⁾			10	mW/cm ²
ILL _{BLU}	Illumination power at wavelengths ≥ 410nm and ≤ 475nm ^{(17) (18)}			7.5	W/cm ²
ILL _{BLU1}	Illumination power at wavelengths ≥ 410nm and ≤ 440nm ^{(17) (18)}			1.1	W/cm ²

(1) All voltages are referenced to common ground V_{SS}. V_{DD}, V_{DDI}, and V_{CC2} power supplies are all required for proper DMD operation. V_{SS} must also be connected.

(2) V_{CC2} supply transients must fall within specified max voltages.

- (3) To prevent excess current, the supply voltage delta $|V_{DDI} - V_{DD}|$ must be less than the specified limit. See the [DMD Power Supply Requirements](#).
- (4) PWRDNZ input pin resets the SCP and disables the LVDS receivers. The PWRDNZ input pin overrides the SCPENZ input pin and tristates the SCPDO output pin.
- (5) See LVDS clock timing requirements in [Timing Requirements](#).
- (6) See [Figure 5-5](#) for the LVDS waveform requirements.
- (7) Simultaneous exposure of the DMD to the maximum [Recommend Operating Conditions](#) for temperature and UV illumination reduces device lifetime.
- (8) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1), shown in [Figure 6-1](#) using the [Micromirror Array Temperature Calculation](#).
- (9) Long-term is defined as the usable life of the device.
- (10) Per [Figure 5-1](#), the maximum operational array temperature is derated based on the micromirror landed duty cycle that the DMD experiences in the end application. See [Micromirror Landed-on/Landed-off Duty Cycle](#) for a definition of micromirror landed duty cycle.
- (11) Short-term is the total cumulative time over the useful life of the device.
- (12) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.
- (13) Exposure to dew point temperatures in the elevated range during storage and operation is limited to less than a total cumulative time of CT_{ELR} .
- (14) Applies to region defined in [Figure 5-2](#)
- (15) The active area of the DMD is surrounded by an aperture on the inside of the DMD window surface that masks structures of the DMD device assembly from normal view. The aperture is sized to anticipate several optical conditions. Overfill light illuminating the area outside the active array can scatter and create adverse effects to the performance of an end application using the DMD. Minimizing the light flux incident outside the active array is a design requirement of the illumination optical system. Depending on the particular optical architecture and assembly tolerances of the optical system, the amount of overfill light on the outside of the active array may cause system performance degradation.
- (16) To calculate see [Window Aperture Illumination Overfill Calculation](#).
- (17) The maximum allowable optical power incident on the DMD is limited by the maximum optical power density for each wavelength range specified and the micromirror array temperature (T_{ARRAY}).
- (18) To calculate see [Micromirror Power Density Calculation](#).

5.5 Thermal Information

THERMAL METRIC	DLP780TE	UNIT
	FYU	
	350 PINS	
Thermal resistance, active area to test point 1 (TP1) ⁽¹⁾	0.55	°C/W

(1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the DMD within the temperature range specified in the [Recommended Operating Conditions](#). The total heat load on the DMD is largely driven by the incident light absorbed by the active area, although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array. Minimizing the light energy falling outside the window clear aperture is a design requirement of the optical system because any additional thermal load in this area can significantly degrade the reliability of the device.

5.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted)

	Unstable pixel(s) in active area ⁽¹⁵⁾	Any screen		0		

- (1) Measured relative to the plane formed by the overall micromirror array.
- (2) Additional variation exists between the micromirror array and the package datums.
- (3) Represents the variation that can occur between any two individual micromirrors, located on the same device or located on different devices.
- (4) For some applications, it is critical to account for the micromirror tilt angle variation in the overall system optical design. With some system optical designs, the micromirror tilt angle variation within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some system optical designs, the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations or system contrast variations.
- (5) Refer to [Figure 5-11](#).
- (6) The time required for a micromirror to nominally transition from one landed state to the opposite landed state.
- (7) The minimum time between successive transitions of a micromirror.
- (8) Conditions of Acceptance: all DMD image performance returns are evaluated using the following projected image test conditions:
 - Test set degamma shall be linear.
 - Test set brightness and contrast shall be set to nominal.
 - The diagonal size of the projected image shall be a minimum of 60 inches.
 - The projections screen shall be 1× gain.
 - The projected image shall be inspected from an 8-foot minimum viewing distance.
 - The image shall be in focus during all image performance tests.
- (9) Bright pixel definition: a single pixel or mirror that is stuck in the ON position and is visibly brighter than the surrounding pixels
- (10) Dark pixel definition: a single pixel or mirror that is stuck in the OFF position and is visibly darker than the surrounding pixels
- (11) POM definition: rectangular border of off-state mirrors surrounding the active area
- (12) Gray 10 screen definition: a full screen with RGB values set to R = 10/255, G = 10/255, B = 10/255
- (13) White screen definition: a full screen with RGB values set to R=255/255, G = 255/255, B = 255/255
- (14) Adjacent pixel definition: Two or more stuck pixels sharing a common border or common point, also referred to as a cluster.
- (15) Unstable pixel definition: A single pixel or mirror that does not operate in sequence with parameters loaded into memory. The unstable pixel appears to be flickering asynchronously with the image.

5.11 Window Characteristics

PARAMETER DESCRIPTION	Test Conditions	MIN	NOM	MAX	UNIT
Window Material			Corning EagleXG		
Window Refractive Index	546.1nm		1.5119		

5.12 Chipset Component Usage Specification

Reliable function and operation of the DLP780TE DMD requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD

control technology. TI DMD control technology consists of the TI technology and devices used for operating or controlling a DLP DMD.

Note

TI assumes no responsibility for image quality artifacts or DMD failures caused by optical system operating conditions exceeding limits described previously.

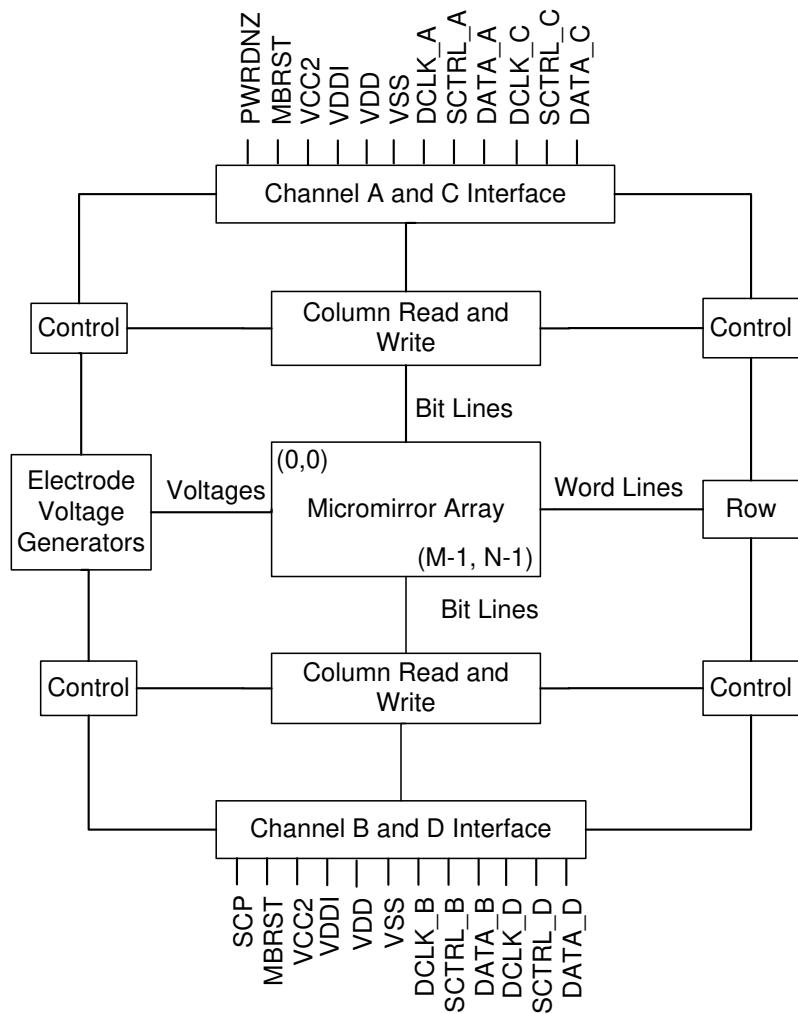

6 Detailed Description

6.1 Overview

The DMD is a 0.78-inch diagonal spatial light modulator which consists of an array of highly reflective aluminum micromirrors. The DMD is an electrical input, optical output micro-optical-electrical-mechanical system (MOEMS). The fast switching speed of the DMD micromirrors combined with advanced DLP image processing algorithms enables the micromirror array to display a full 3840×2160 pixel image at a 60Hz frame rate. The electrical interface is a low voltage differential signaling (LVDS) interface. The DMD consists of a two-dimensional array of 1-bit CMOS memory cells. The array is organized in a grid of M memory cell columns by N memory cell rows. Refer to the [Section 6.2](#). The positive or negative deflection angle of the micromirrors can be individually controlled by changing the address voltage of underlying CMOS addressing circuitry and micromirror reset signals (MBRST).

The DLP 0.78-inch 4K UHD chipset is comprised of the DLP780TE DMD, two DLPC4420 display controllers, the DLPA300 micromirror driver and the [DLPA100](#) power management and motor driver. For reliable operation, the DLP780TE DMD must always be used with the DLP display controller and the power and motor driver specified in the chipset.

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Power Interface

The DMD requires two DC voltages: 1.8-V source for VDD and VDDI, and a 10-V supply for VCC2. In a typical configuration, 3.3V is created by the [DLPA100](#) power management and motor driver and is used on the DMD board to create the 1.8V. The [DLPA300](#) micromirror driver takes in 12V and creates the micromirror reset voltages.

6.3.2 Timing

The data sheet specifies timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be considered. Timing reference loads are not intended to be precise representations of any particular system environment or depiction of the actual load presented by a production test. TI recommends that system designers use IBIS or other simulation tools to correlate the timing reference load to a system environment. Use the specified load capacitance value for characterization and measurement of AC timing signals only. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.4 Device Functional Modes

DMD functional modes are controlled by the DLPC4420 display controller. See the DLPC4420 display controller data sheet or contact a TI applications engineer.

6.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. Optimizing system optical performance and image quality strongly relate to optical system design parameter trades. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

6.5.1 Numerical Aperture and Stray Light Control

TI recommends that the light cone angle defined by the numerical aperture of the illumination optics is the same as the light cone angle defined by the numerical aperture of the projection optics. This angle must not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and projection pupils to block out flat-state and stray light from the projection lens. The DLP780TE has a 14.5° tilt angle which corresponds to the f/2.0 numerical aperture. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than 2° larger than the illumination numerical aperture angle (and vice versa), contrast degradation and objectionable artifacts in the display border or active area are possible.

6.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display border and active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

6.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view, and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. Design the illumination optical system to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the

average flux level in the active area. Depending on the particular system optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

6.6 Micromirror Array Temperature Calculation

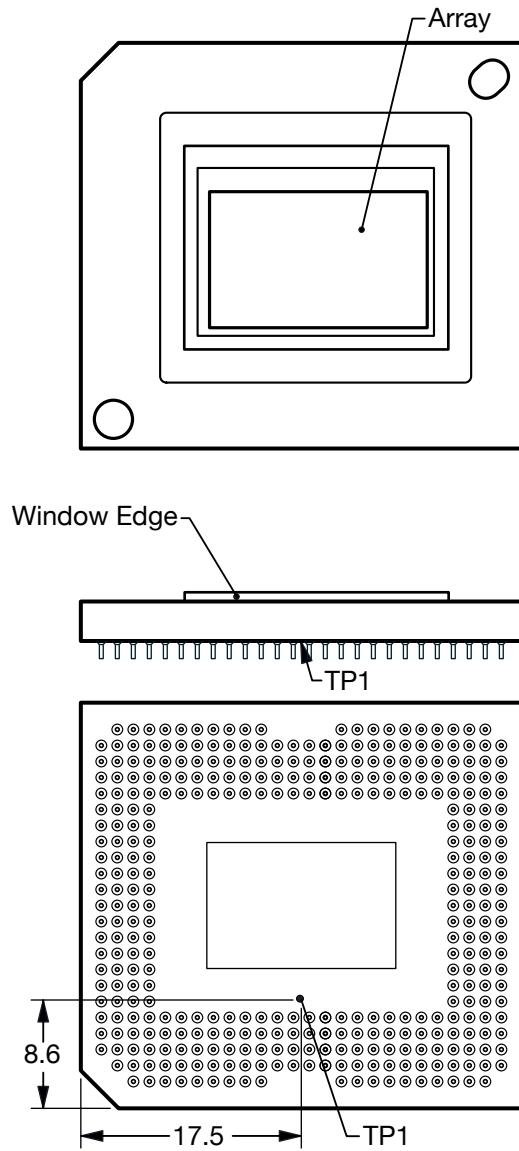

Figure 6-1. DMD Thermal Test Point

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from a measurement point on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The following equations show the relationship between array temperature and the reference ceramic temperature, thermal test point TP1, shown above:

$$T_{ARRAY} = T_{CERAMIC} + (Q_{ARRAY} \times R_{ARRAY-TO-CERAMIC}) \quad (1)$$

$$Q_{ARRAY} = Q_{ELECTRICAL} + Q_{ILLUMINATION} \quad (2)$$

where

- T_{ARRAY} = Computed array temperature (°C)
- $T_{CERAMIC}$ = Measured ceramic temperature (°C) (TP1 location)
- $R_{ARRAY-TO-CERAMIC}$ = Thermal resistance of package specified in [Section 5.5](#) from array to ceramic TP1 (°C/Watt)
- Q_{ARRAY} = Total DMD power on the array (W) (electrical + absorbed)
- $Q_{ELECTRICAL}$ = Nominal electrical power (W)
- $Q_{INCIDENT}$ = Incident illumination optical power (W)
- $Q_{ILLUMINATION}$ = (DMD average thermal absorptivity $\times Q_{INCIDENT}$) (W)
- DMD average thermal absorptivity = 0.55

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 1.4W. The absorbed power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a single chip or multichip DMD system. It assumes an illumination distribution of 83.7% on the active array, and 16.3% on the array border.

The sample calculation for a typical projection application is as follows:

$$Q_{INCIDENT} = 40\text{W} \text{ (measured)} \quad (3)$$

$$T_{CERAMIC} = 55.0^\circ\text{C} \text{ (measured)} \quad (4)$$

$$Q_{ELECTRICAL} = 1.4\text{W} \quad (5)$$

$$Q_{ARRAY} = 1.4\text{W} + (0.55 \times 40\text{W}) = 23.4\text{W} \quad (6)$$

$$T_{ARRAY} = 55.0^\circ\text{C} + (23.40\text{W} \times 0.55^\circ\text{C/W}) = 67.9^\circ\text{C} \quad (7)$$

6.7 Micromirror Power Density Calculation

The calculation of the optical power density of the illumination on the DMD in the different wavelength bands uses the total measured optical power on the DMD, percent illumination overfill, area of the active array, and ratio of the spectrum in the wavelength band of interest to the total spectral optical power.

- $ILL_{UV} = [OP_{UV-RATIO} \times Q_{INCIDENT}] \times 1000 \div A_{ILL}$ (mW/cm²)
- $ILL_{VIS} = [OP_{VIS-RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm²)
- $ILL_{IR} = [OP_{IR-RATIO} \times Q_{INCIDENT}] \times 1000 \div A_{ILL}$ (mW/cm²)
- $ILL_{BLU} = [OP_{BLU-RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm²)
- $ILL_{BLU1} = [OP_{BLU1-RATIO} \times Q_{INCIDENT}] \div A_{ILL}$ (W/cm²)
- $A_{ILL} = A_{ARRAY} \div (1 - OV_{ILL})$ (cm²)

where:

- ILL_{UV} = UV illumination power density on the DMD (mW/cm²)
- ILL_{VIS} = VIS illumination power density on the DMD (W/cm²)
- ILL_{IR} = IR illumination power density on the DMD (mW/cm²)
- ILL_{BLU} = BLU illumination power density on the DMD (W/cm²)
- ILL_{BLU1} = BLU1 illumination power density on the DMD (W/cm²)
- A_{ILL} = illumination area on the DMD (cm²)

- Q_{INCIDENT} = total incident optical power on DMD (W) (measured)
- A_{ARRAY} = area of the array (cm^2) (data sheet)
- OV_{ILL} = percent of total illumination on the DMD outside the array (%) (optical model)
- $OP_{\text{UV-RATIO}}$ = ratio of the optical power for wavelengths $< 410\text{nm}$ to the total optical power in the illumination spectrum (spectral measurement)
- $OP_{\text{VIS-RATIO}}$ = ratio of the optical power for wavelengths ≥ 410 and $\leq 800\text{nm}$ to the total optical power in the illumination spectrum (spectral measurement)
- $OP_{\text{IR-RATIO}}$ = ratio of the optical power for wavelengths $> 800\text{nm}$ to the total optical power in the illumination spectrum (spectral measurement)
- $OP_{\text{BLU-RATIO}}$ = ratio of the optical power for wavelengths ≥ 410 and $\leq 475\text{nm}$ to the total optical power in the illumination spectrum (spectral measurement)
- $OP_{\text{BLU1-RATIO}}$ = ratio of the optical power for wavelengths ≥ 410 and $\leq 440\text{nm}$ to the total optical power in the illumination spectrum (spectral measurement)

The illumination area varies and depends on the illumination overfill. The total illumination area on the DMD is the array area and overfill area around the array. The optical model is used to determine the percent of the total illumination on the DMD that is outside the array (OV_{ILL}) and the percent of the total illumination that is on the active array. From these values the illumination area (A_{ILL}) is calculated. The illumination is assumed to be uniform across the entire array.

From the measured illumination spectrum, the ratio of the optical power in the wavelength bands of interest to the total optical power is calculated.

Sample calculation:

$$Q_{\text{INCIDENT}} = 40\text{W} \text{ (measured)} \quad (8)$$

$$A_{\text{ARRAY}} = (17.280\text{mm} \times 9.72\text{mm}) \div 100 = 1.6796\text{cm}^2 \text{ (data sheet)} \quad (9)$$

$$OV_{\text{ILL}} = 16.3\% \text{ (optical model)} \quad (10)$$

$$OP_{\text{UV-RATIO}} = 0.00017 \text{ (spectral measurement)} \quad (11)$$

$$OP_{\text{VIS-RATIO}} = 0.99977 \text{ (spectral measurement)} \quad (12)$$

$$OP_{\text{IR-RATIO}} = 0.00006 \text{ (spectral measurement)} \quad (13)$$

$$OP_{\text{BLU-RATIO}} = 0.28100 \text{ (spectral measurement)} \quad (14)$$

$$OP_{\text{BLU1-RATIO}} = 0.03200 \text{ (spectral measurement)} \quad (15)$$

$$A_{\text{ILL}} = 1.6796\text{cm}^2 \div (1 - 0.163) = 2.0067\text{cm}^2 \quad (16)$$

$$ILL_{\text{UV}} = [0.00017 \times 40\text{W}] \times 1000 \div 2.0067\text{cm}^2 = 3.39\text{mW/cm}^2 \quad (17)$$

$$ILL_{\text{VIS}} = [0.99977 \times 40\text{W}] \div 2.0067\text{cm}^2 = 19.93\text{W/cm}^2 \quad (18)$$

$$ILL_{\text{IR}} = [0.00006 \times 40\text{W}] \times 1000 \div 2.0067\text{cm}^2 = 1.20\text{mW/cm}^2 \quad (19)$$

$$ILL_{\text{BLU}} = [0.28100 \times 40\text{W}] \div 2.0067\text{cm}^2 = 5.60\text{W/cm}^2 \quad (20)$$

$$ILL_{\text{BLU1}} = [0.03200 \times 40\text{W}] \div 2.0067\text{cm}^2 = 0.64\text{W/cm}^2 \quad (21)$$

6.8 Window Aperture Illumination Overfill Calculation

The amount of optical overfill on the critical area of the window aperture cannot be measured directly. For systems with uniform illumination on the array the amount is determined using the total measured incident optical power on the DMD, and the ratio of the total optical power on the DMD that is on the defined critical area. The optical model is used to determine the percent of optical power on the window aperture critical area and estimate the size of the area.

- $Q_{AP_ILL} = [Q_{INCIDENT} \times OP_{AP_ILL_RATIO}] \div A_{AP_ILL}$ (W/cm²)

where:

- Q_{AP_ILL} = window aperture illumination overfill (W/cm²)
- $Q_{INCIDENT}$ = total incident optical power on the DMD (Watts) (measured)
- $OP_{AP_ILL_RATIO}$ = ratio of the optical power on the critical area of the window aperture to the total optical power on the DMD (optical model)
- A_{AP_ILL} = size of the window aperture critical area (cm²) (datasheet)
- OP_{CA_RATIO} = percent of the window aperture critical area with incident optical power (%) (optical model)

Sample calculation:

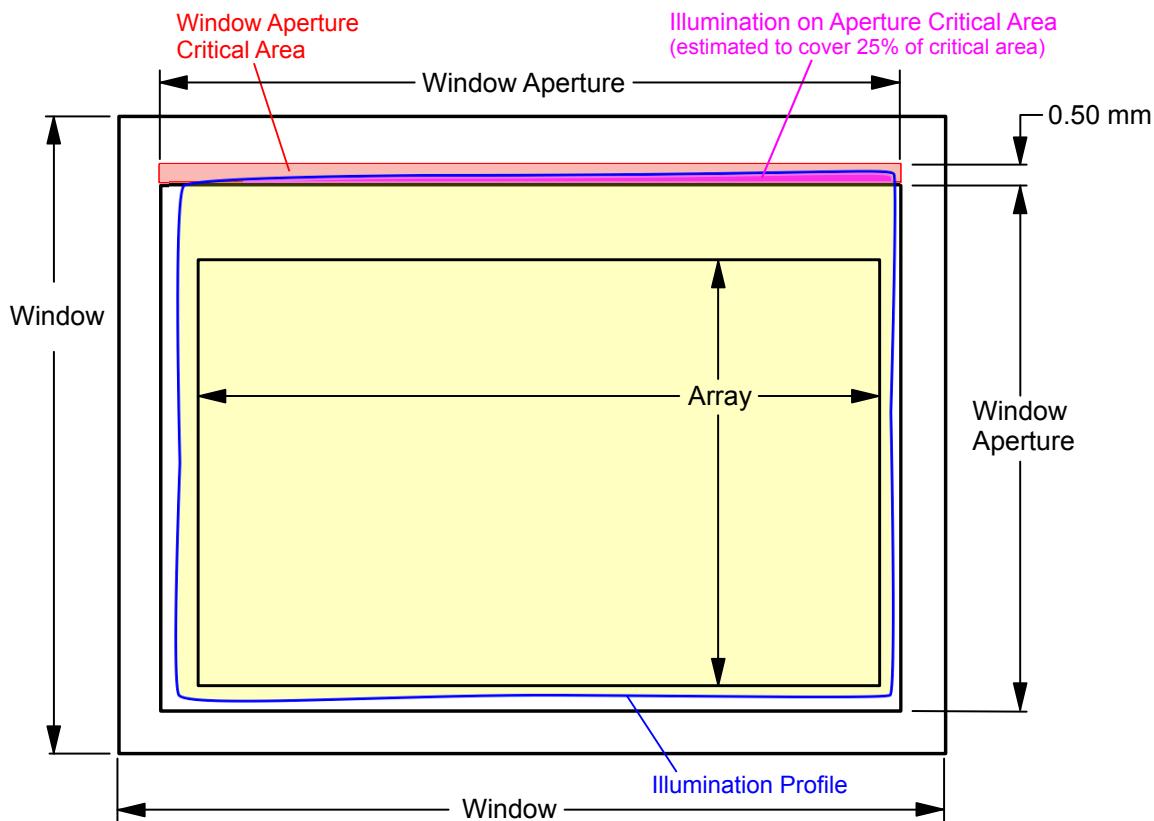

Figure 6-2. Window Aperture Overfill Example

See the figure for the length of the critical aperture.

$$Q_{INCIDENT} = 40W \text{ (measured)} \quad (22)$$

$$OP_{AP_ILL_RATIO} = 0.312\% \text{ (optical model)} \quad (23)$$

$$OV_{CA_RATIO} = 25\% \text{ (optical model)} \quad (24)$$

$$\text{Length of the window aperture for critical area} = 1.8613\text{cm} \text{ (data sheet)} \quad (25)$$

$$\text{Width of critical area} = 0.050\text{cm} \text{ (data sheet)} \quad (26)$$

$$A_{AP-ILL} = 1.8613\text{cm} \times 0.050\text{cm} = 0.093065 \text{ (cm}^2\text{)} \quad (27)$$

$$Q_{AP-ILL} = (40\text{W} \times 0.00312) \div (0.093065\text{cm}^2 \times 0.25) = 5.4 \text{ (W/cm}^2\text{)} \quad (28)$$

6.9 Micromirror Landed-On/Landed-Off Duty Cycle

6.9.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the percentage of time that an individual micromirror is landed in the ON state versus the amount of time the same micromirror is landed in the OFF state.

For example, a landed duty cycle of 100/0 indicates that the referenced pixel is in the ON state 100% of the time (and in the OFF state 0% of the time); whereas 0/100 indicates that the pixel is in the OFF state 100% of the time. Likewise, 50/50 indicates that the pixel is ON for 50% of the time (and OFF for 50% of the time).

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) always add to 100.

6.9.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD useful life.

Note that it is the symmetry/asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

6.9.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD temperature and landed duty cycle interact to affect DMD useful life, and this interaction can be exploited to reduce the impact that an asymmetrical landed duty cycle has on the DMD useful life. This is quantified in the derating curve shown in [Figure 5-1](#).

The importance of this curve is that:

- All points along this curve represent the same useful life.
- All points above this curve represent lower useful life (and the further away from the curve, the lower the useful life).
- All points below this curve represent higher useful life (and the further away from the curve, the higher the useful life).

In practice, this curve specifies the maximum operating DMD temperature for a given long-term average landed duty cycle.

6.9.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the landed duty cycle of a given pixel follows from the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel operates under a 100/0 landed duty cycle during that time period. Likewise, when displaying pure-black, the pixel operates under a 0/100 landed duty cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the landed duty cycle tracks one-to-one with the gray scale value, as shown in [Table 6-1](#).

Table 6-1. Grayscale Value and Landed Duty Cycle

GRAYSCALE VALUE	LANDED DUTY CYCLE
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and blue) for the given pixel as well as the color cycle time for each primary color, where “color cycle time” is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

Use [Equation 29](#) to calculate the landed duty cycle of a given pixel during a given time period.

$$\text{Landed Duty Cycle} = (\text{Red_Cycle_ \%} \times \text{Red_Scale_Value}) + (\text{Green_Cycle_ \%} \times \text{Green_Scale_Value}) + (\text{Blue_Cycle_ \%} \times \text{Blue_Scale_Value}) \quad (29)$$

where

- Red_Cycle_% represents the percentage of the frame time that red is displayed to achieve the desired white point.
- Green_Cycle_% represents the percentage of the frame time that green is displayed to achieve the desired white point.
- Blue_Cycle_% represents the percentage of the frame time that blue is displayed to achieve the desired white point.

For example, assume that the red, green, and blue color cycle times are 30%, 50%, and 20% respectively (to achieve the desired white point), then the landed duty cycle for various combinations of red, green, blue color intensities are shown in [Table 6-2](#) and [Table 6-3](#).

Table 6-2. Example Landed Duty Cycle for Full-Color, Color Percentage

CYCLE PERCENTAGE		
RED	GREEN	BLUE
30%	50%	20%

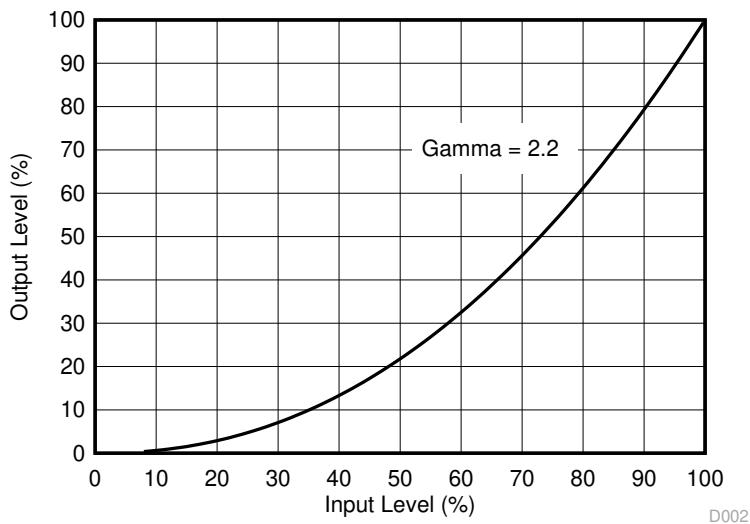

Table 6-3. Example Landed Duty Cycle for Full-Color

SCALE VALUE			LANDED DUTY CYCLE
RED	GREEN	BLUE	
0%	0%	0%	0/100
100%	0%	0%	30/70
0%	100%	0%	50/50
0%	0%	100%	20/80
0%	12%	0%	6/94
0%	0%	35%	7/93
60%	0%	0%	18/82
0%	100%	100%	70/30
100%	0%	100%	50/50
100%	100%	0%	80/20
0%	12%	35%	13/87
60%	0%	35%	25/75
60%	12%	0%	24/76
100%	100%	100%	100/0

The last factor to account for in estimating the landed duty cycle is any applied image processing. Within the DLPC4420 display controller, the gamma function affects the landed duty cycle.

Gamma is a power function of the form $\text{Output_Level} = A \times \text{Input_Level}^{\text{Gamma}}$, where A is a scaling factor that is typically set to 1.

In the DLPC4420 display controller, gamma is applied to the incoming image data on a pixel-by-pixel basis. A typical gamma factor is 2.2, which transforms the incoming data as shown in [Figure 6-3](#).

Figure 6-3. Example of Gamma = 2.2

From [Figure 6-3](#), if the gray scale value of a given input pixel is 40% (before gamma is applied), then gray scale value is 13% after gamma is applied. Therefore, it can be seen that since gamma has a direct impact displayed gray scale level of a pixel, it also has a direct impact on the landed duty cycle of a pixel.

Consideration must also be given to any image processing that occurs before the DLPC4420 display controller.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the two DLPC4420 display controllers. Typical applications using the DLP780TE DMD include laserTV, smart projectors, enterprise projectors and digital signage.

DMD power-up and power-down sequencing is strictly controlled by the DLPC4420 display controller through the DLPA300. Refer to [Section 7.4.2](#) for power-up and power-down specifications. For reliable operation, the DLP780TE DMD must always be used with two DLPC4420 display controllers, a [DLPA100](#) PMIC/Motor driver and a DLPA300 Micromirror Driver.

7.2 Typical Application

The DLP780TE DMD combined with two DLPC4420 display controllers and a power management device provides 4K UHD resolution for bright, colorful display applications. A typical display system using LED illumination combines the DLP780TE DMD, two DLPC4420 display controllers, DLPA300 micromirror driver and [DLPA100](#) PMIC and motor driver. [Figure 7-1](#) shows a system block diagram for this configuration of the DLP 0.78-inch 4K UHD chipset and additional system components needed. See [Figure 7-2](#) for a block diagram showing the system components needed along with the laser phosphor of the DLP 0.78-inch 4K UHD chipset. The components include DLP780TE DMD, two DLPC4420 display controllers and [DLPA100](#) PMIC and motor driver and a DLPA300 micromirror driver.

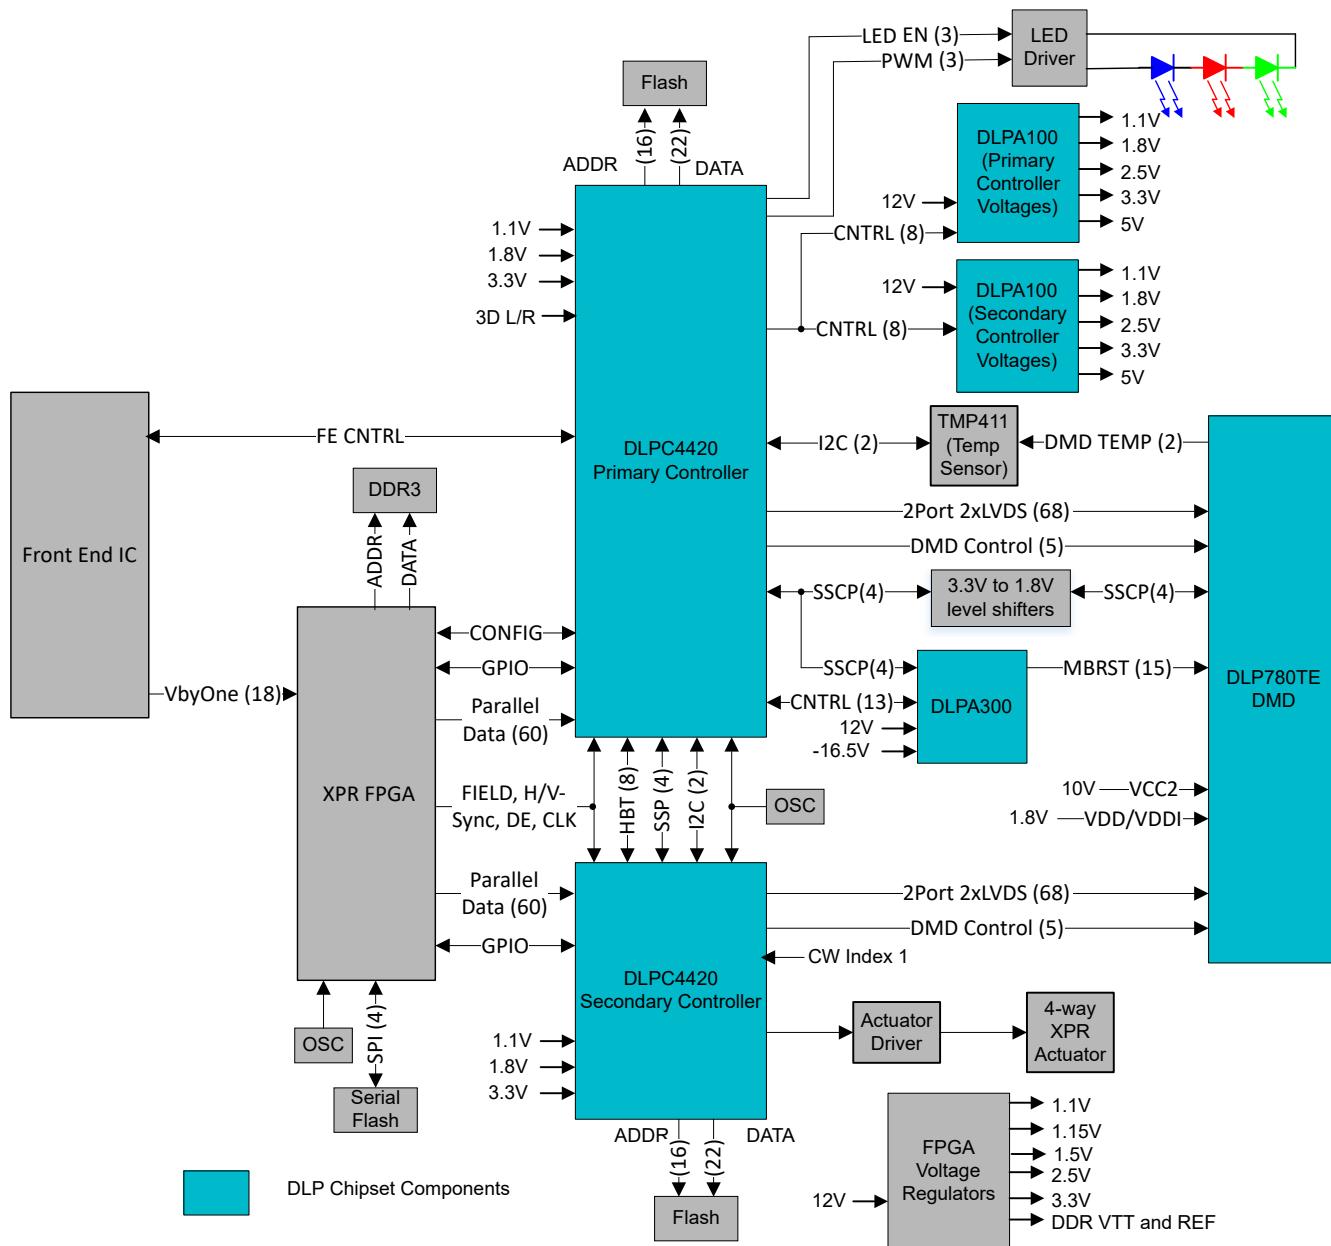

Figure 7-1. Typical 4K UHD LED Application

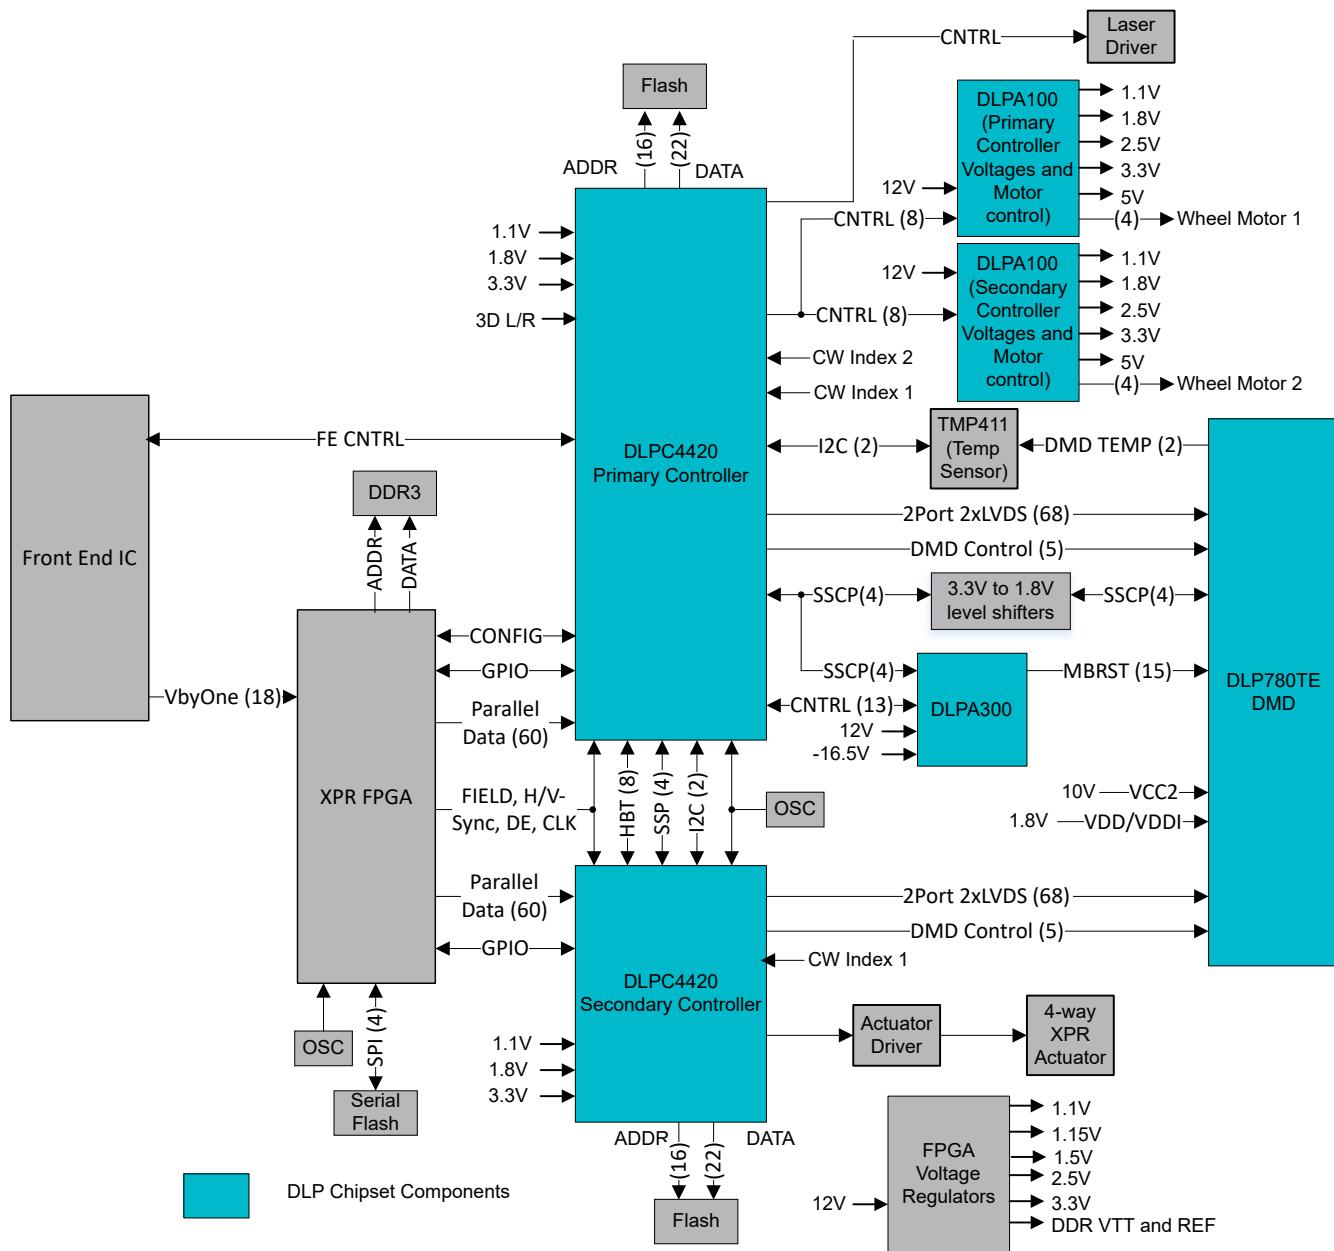

Figure 7-2. Typical 4k UHD Laser Phosphor Application

7.2.1 Design Requirements

Other core components of the display system include an illumination source, an optical engine for the illumination and projection optics, other electrical and mechanical components, and software. The type of illumination used and desired brightness has a major effect on the overall system design and size.

The display system uses the DLP780TE DMD as the core imaging device and contains a 0.78-inch array of micromirrors. The DLPC4420 display controller is the digital interface between the DMD and the rest of the system, taking digital input from front end receiver and driving the DMD over a high-speed LVDS interface. The DLPA100 PMIC serves as a voltage regulator for the controller, and color filter wheel and phosphor wheel motor control. The DLPA300 provides the DMD reset control.

7.2.2 Detailed Design Procedure

For a complete DLP system, an optical module or light engine is required that contains the DLP780TE DMD, associated illumination sources, optical elements, and necessary mechanical components.

For reliable operation, the DMD must always be used with two DLPC4420 display controllers, the DLPA300 micromirror driver and the [DLPA100](#) PMIC and motor driver.

7.2.3 Application Curves

In a typical projector application, the luminous flux on the screen from the DMD depends on the optical design of the projector. The efficiency and total power of the illumination optical system and the projection optical system determines the overall light output of the projector. The DMD is inherently a linear spatial light modulator, so its efficiency just scales the light output. [Figure 7-3](#) describes the relationship of laser input optical power to light output for a laser-phosphor illumination system, where the phosphor is not at its thermal quenching limit.

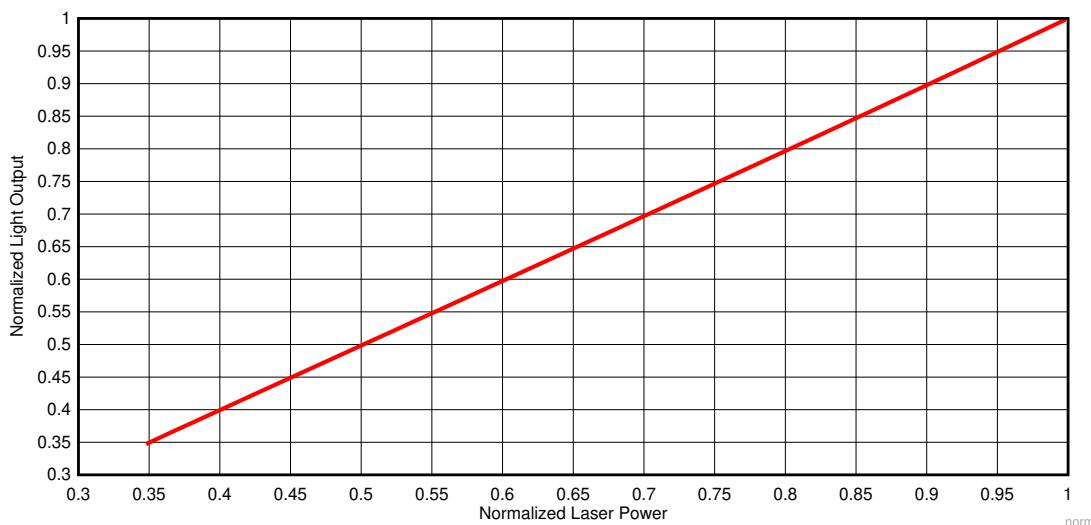

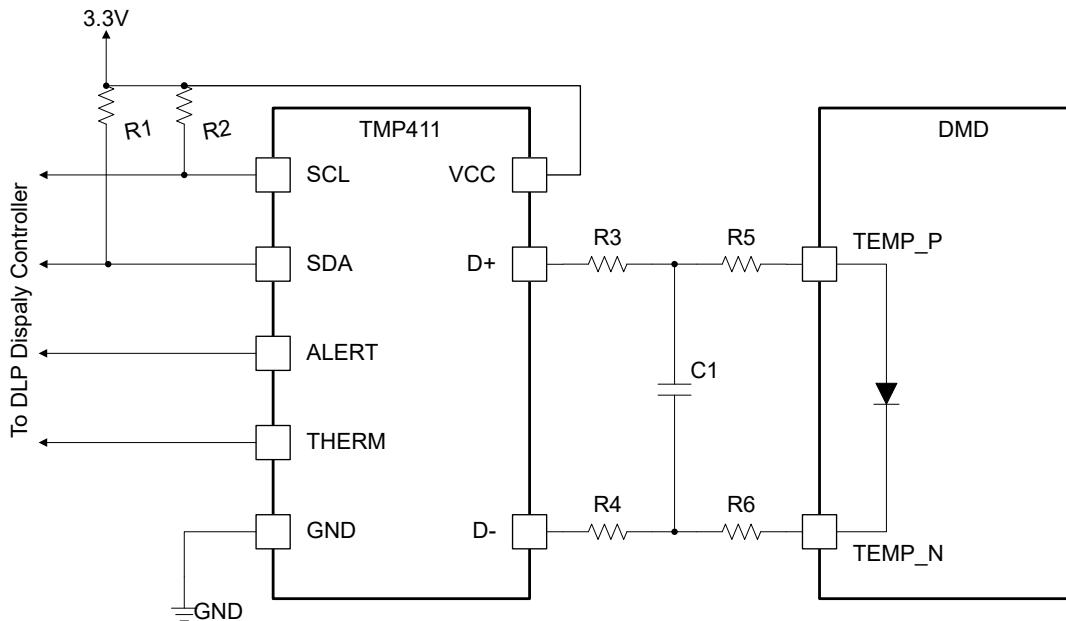

Figure 7-3. Normalized Light Output vs. Normalized Laser Power for Laser Phosphor Illumination

7.3 Temperature Sensor Diode

The DMD features a built-in thermal diode that measures the temperature at one corner of the die outside the micromirror array. The thermal diode can be interfaced with the TMP411 temperature sensor as shown in [Figure 7-4](#). The software application contains functions to configure the [TMP411](#) to read the DLP780TE DMD temperature sensor diode. This data can be leveraged by the customer to incorporate additional functionality in the overall system design such as adjusting illumination, fan speeds, etc. All communication between the [TMP411](#) and the DLPC4420 display controller happens over the I²C interface. The [TMP411](#) connects to the DMD through pins outlined in [Section 4](#).

Leave TEMP_N and TEMP_P pins unconnected (NC) if the temp sensor is not used.

- A. Details omitted for clarity.
- B. See the [TMP411](#) datasheet for system board layout recommendation.
- C. See the [TMP411](#) datasheet and the TI reference design for suggested component values for R1, R2, R3, R4, and C1.
- D. R5 = 0Ω. R6 = 0Ω. Place 0-Ω resistors close to the DMD package pins.

Figure 7-4. TMP411 Sample Schematic

7.4 Power Supply Recommendations

7.4.1 DMD Power Supply Requirements

The following power supplies are all required to operate the DMD: VDD, VDDI, and VCC2. VSS must also be connected. DMD power-up and power-down sequencing is strictly controlled by the DLPC4420 display controller.

CAUTION

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to the prescribed power-up and power-down procedures may affect device reliability. VDD, VDDI and VCC2 power supplies have to be coordinated during power-up and power-down operations. VSS must also be connected. Failure to meet any of the below requirements results in a significant reduction in the reliability and lifetime of the DMD. Refer to [Figure 7-5](#).

7.4.2 DMD Power Supply Power-Up Procedure

- During power-up, VDD and VDDI must always start and settle before VCC2 is applied to the DMD.
- Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements listed in [Section 5.1](#) and in [Section 5.4](#).
- During power-up, LVC MOS input pins must not be driven high until after VDD and VDDI have settled at operating voltages listed in [Section 5.4](#) table.

7.4.3 DMD Power Supply Power-Down Procedure

- During power-down, VDD and VDDI must be supplied until after VCC2 is discharged to within the specified limit of ground. Refer to [Section 5.4](#).
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements listed in [Section 5.1](#) and in [Section 5.4](#).

- During power-down, LVCMOS input pins must be less than specified in [Section 5.4](#).

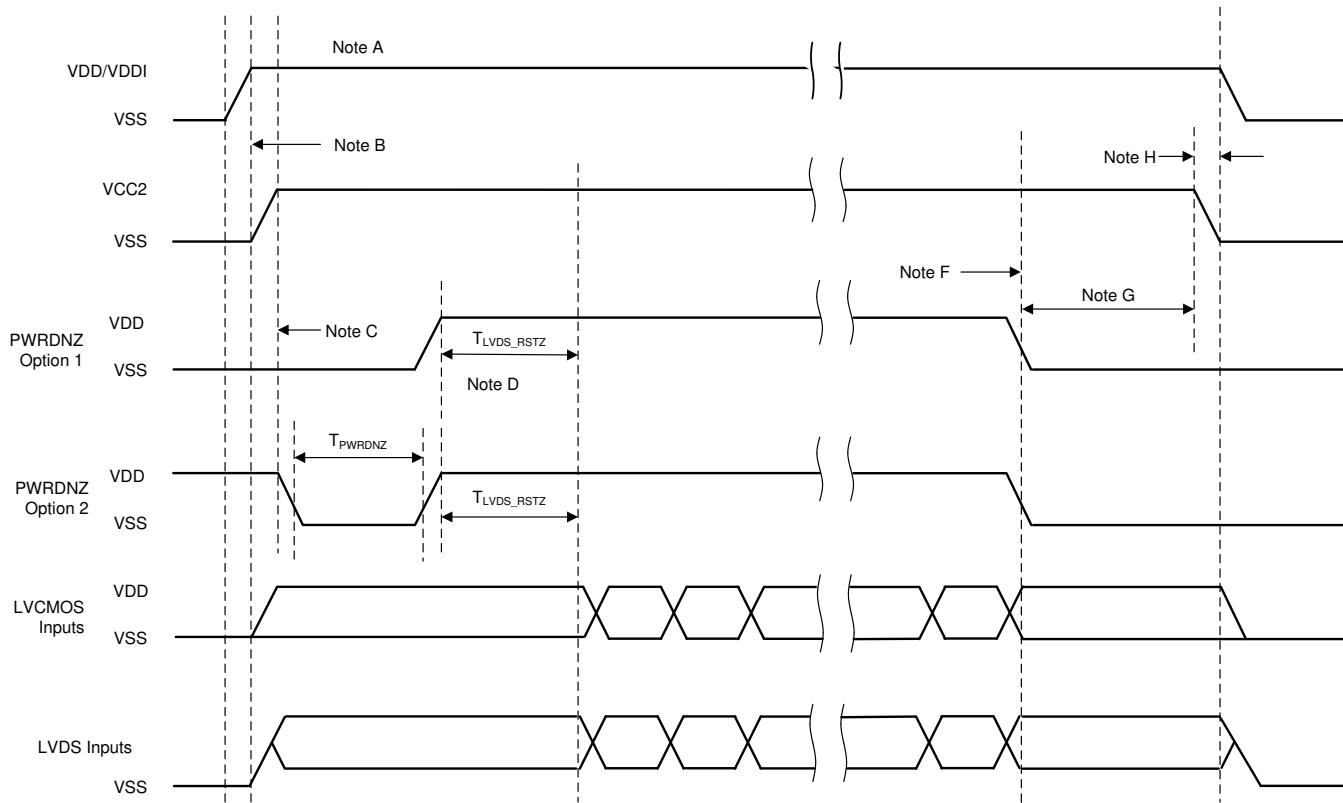

Figure 7-5. DMD Power Supply Sequencing Requirements

- See [Pin Configuration and Functions](#) for pin functions.
- VDD must be up and stable prior to VCC2 powering up.
- PWRDNZ has two turn on options. Option 1: PWRDNZ does not go high until VDD and VCC2 are up and stable, or Option 2: PWRDNZ must be pulsed low for a minimum of T_{PWRDNZ} , or 10ns after VDD and VCC2 are up and stable.
- There is a minimum of T_{LVDS_ARSTZ} , or 2 μ s, wait time from PWRDNZ going high for the LVDS receiver to recover.
- After the DMD micromirror park sequence is complete, the DLP controller software initiates a hardware power-down that activates the PWRDNZ and disables VCC2.
- Under power-loss conditions, where emergency DMD micromirror park procedures are being enacted by the DLP controller hardware, PWRDNZ goes low.
- VDD must remain high until after VCC2 goes low.
- To prevent excess current, the supply voltage delta $|VDDI - VDD|$ must be less than specified limit in [Section 5.4](#).

7.5 Layout

7.5.1 Layout Guidelines

The DLP780TE DMD is part of a chipset that is controlled by the two DLPC4420 display controllers in conjunction with the DLP300 micromirror driver and the DLPA100 power and motor driver. These guidelines are targeted at designing a PCB board with the DLP780TE DMD. The DLP780TE DMD board is a high-speed multi-layer PCB, with primarily high-speed digital logic utilizing dual edge clock rates up to 400MHz for DMD LVDS signals. The remaining traces are comprised of low speed digital LVTTL signals. Solid planes are required for DMD_P1P8V and Ground. The target impedance for the PCB is $50\Omega \pm 10\%$ with the LVDS traces being $100\Omega \pm 10\%$ differential. TI recommends using an 8-layer stack-up as described in [Table 7-1](#).

7.5.2 Layout Example

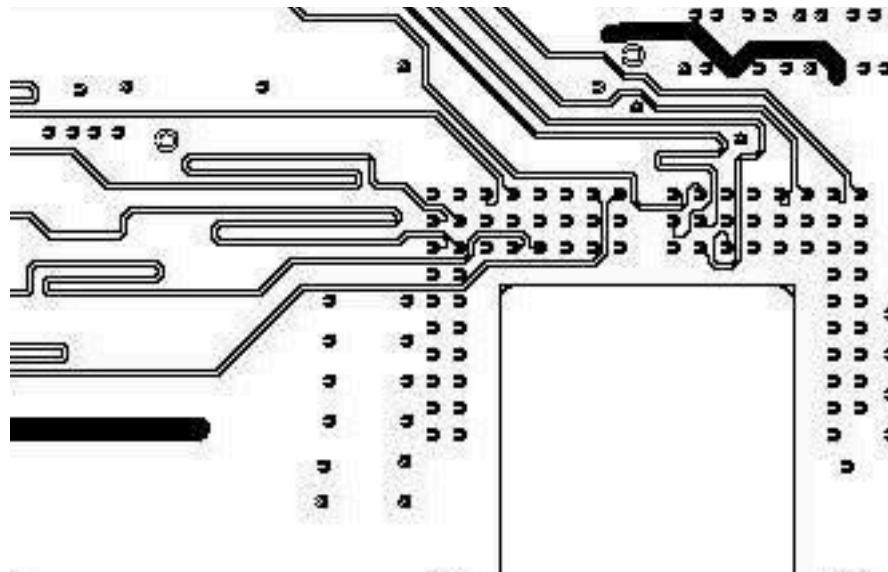

Figure 7-6. Typical example for matching LVDS signal lengths by serpentine sections

7.5.2.1 Layers

The layer stack-up and copper weight for each layer is shown in [Table 7-1](#). Small subplanes are allowed on signal routing layers to connect components to major subplanes on top and bottom layers if necessary.

Table 7-1. Layer Stack-Up

LAYER NO.	LAYER NAME	COPPER WT. (oz.)	COMMENTS
1	Side A—DMD only	1.5	DMD, escapes, low frequency signals, power subplanes
2	Ground	1	Solid ground plane (net GND)
3	Signal	0.5	50Ω and 100Ω differential signals
4	Ground	1	Solid ground plane (net GND)
5	VDD and VDDI	1	+1.8V power plane
6	Signal	0.5	50Ω and 100Ω differential signals
7	Ground	1	Solid ground plane (net GND)
8	Side B—All other Components	1.5	Discrete components, low frequency signals, power subplanes

7.5.2.2 Impedance Requirements

TI recommends that the board has matched impedance of $50\Omega \pm 10\%$ for all signals. The exceptions are listed in [Table 7-2](#).

Table 7-2. Special Impedance Requirements

SIGNAL TYPE	SIGNAL NAME	IMPEDANCE (Ω)
C channel LVDS differential pairs	DDCP(0:15), DDCN(0:15)	$100 \pm 10\%$ differential across each pair
	DCLKC_P, DCLKC_N	
	SCTRL_CP, SCTRL_CN	

Table 7-2. Special Impedance Requirements (continued)

SIGNAL TYPE	SIGNAL NAME	IMPEDANCE (Ω)
D channel LVDS differential pairs	DDDP(0:15), DDDN(0:15)	$100 \pm 10\%$ differential across each pair
	DCLKD_P, DCLKD_N	
	SCTRL_DP, SCTRL_DN	

7.5.2.3 Trace Width, Spacing

Unless otherwise specified, TI recommends that all signals follow the 0.005"/0.005" design rule. Minimum trace clearance from the ground ring around the PWB has a 0.1" minimum. An analysis of impedance and stack-up requirements determine the actual trace widths and clearances.

7.5.2.3.1 Voltage Signals

Table 7-3. Special Trace Widths, Spacing Requirements

SIGNAL NAME	MINIMUM TRACE WIDTH TO PINS (MIL)	LAYOUT REQUIREMENT
GND	15	Maximize trace width to connecting pin
3.3-V Supply Rail	15	Maximize trace width to connecting pin
VDD, VDDI	15	Maximize trace width to connecting pin
MBRST(0,14)	15	Use 10mil etch to connect all signals/voltages from DLPA300 to DLP780TE
VCC2	15	Create mini plane from Voltage regulator to DLP780TE

8 Device and Documentation Support

8.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

8.2 Device Support

8.2.1 Device Nomenclature

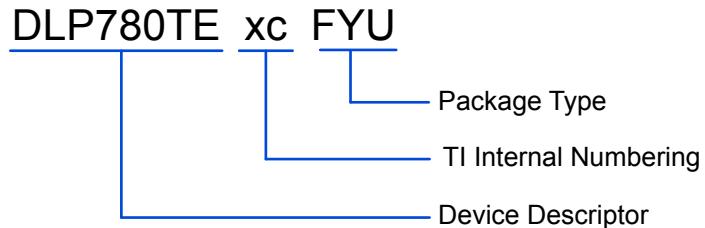

Figure 8-1. Part Number Description

8.3 Device Markings

The device marking includes both human-readable information and a 2-dimensional matrix code. The human-readable information is described in [Figure 8-2](#). The 2-dimensional matrix code is an alpha-numeric string that contains the DMD part number, Part 1 and Part 2 of the serial number.

Example:

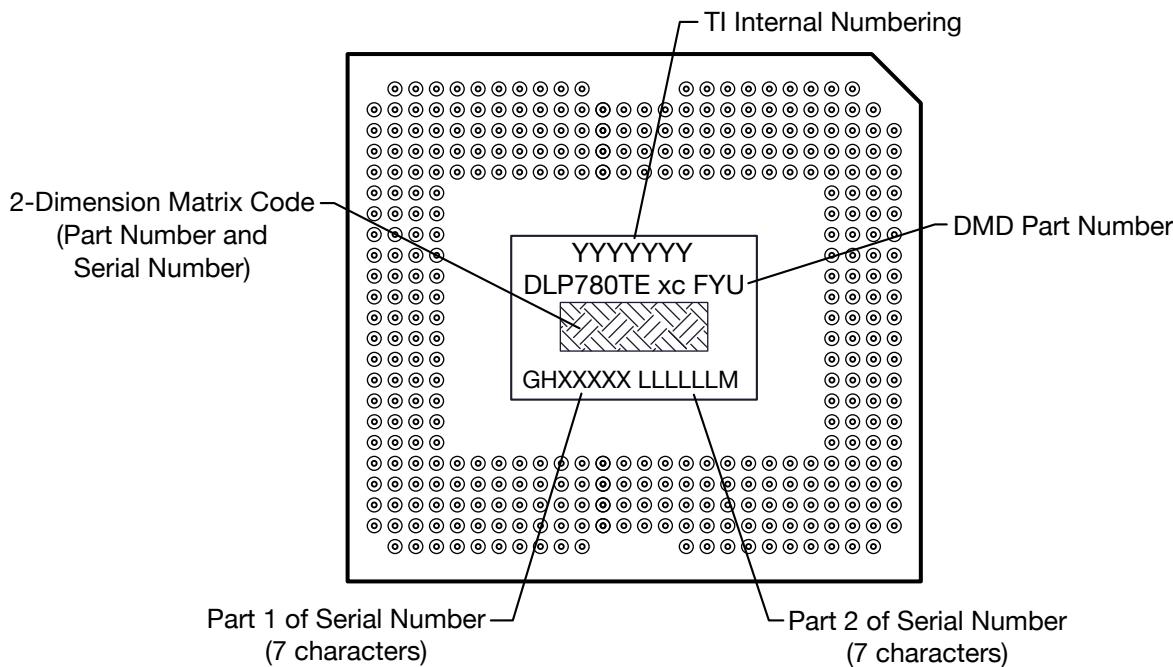

Figure 8-2. DMD Marking Locations

8.4 Documentation Support

8.4.1 Related Documentation

For related documentation, see the following:

- [DLP4420 DLP Display Controller Data Sheet](#)
- [DLPA100 Power and Motor Driver Data Sheet](#)
- [DLPA300 DMD Micromirror Driver Data Sheet](#)

8.5 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.6 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

8.7 Trademarks

TI E2E™ is a trademark of Texas Instruments.

DLP® is a registered trademark of Texas Instruments.

All trademarks are the property of their respective owners.

8.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.9 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (March 2023) to Revision C (March 2024)	Page
• Updated ILLVIS, ILL_BLU and ILL_BLU1 in Section 5.4	10
• Added Section 6.7 Micromirror Power Density Calculation	26
• Added Section 6.8 Window Aperture Illumination Overfill Calculation	28

Changes from Revision A (September 2022) to Revision B (March 2023)	Page
• Added t_{SKEW_A2B}	14
• Updated Figure 5-8	15

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DLP780TEA0FYU	Active	Production	CPGA (FYU) 350	21 JEDEC TRAY (5+1)	Yes	Call TI	N/A for Pkg Type	0 to 70	
DLP780TEA0FYU.A	Active	Production	CPGA (FYU) 350	21 JEDEC TRAY (5+1)	Yes	Call TI	N/A for Pkg Type	0 to 70	

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

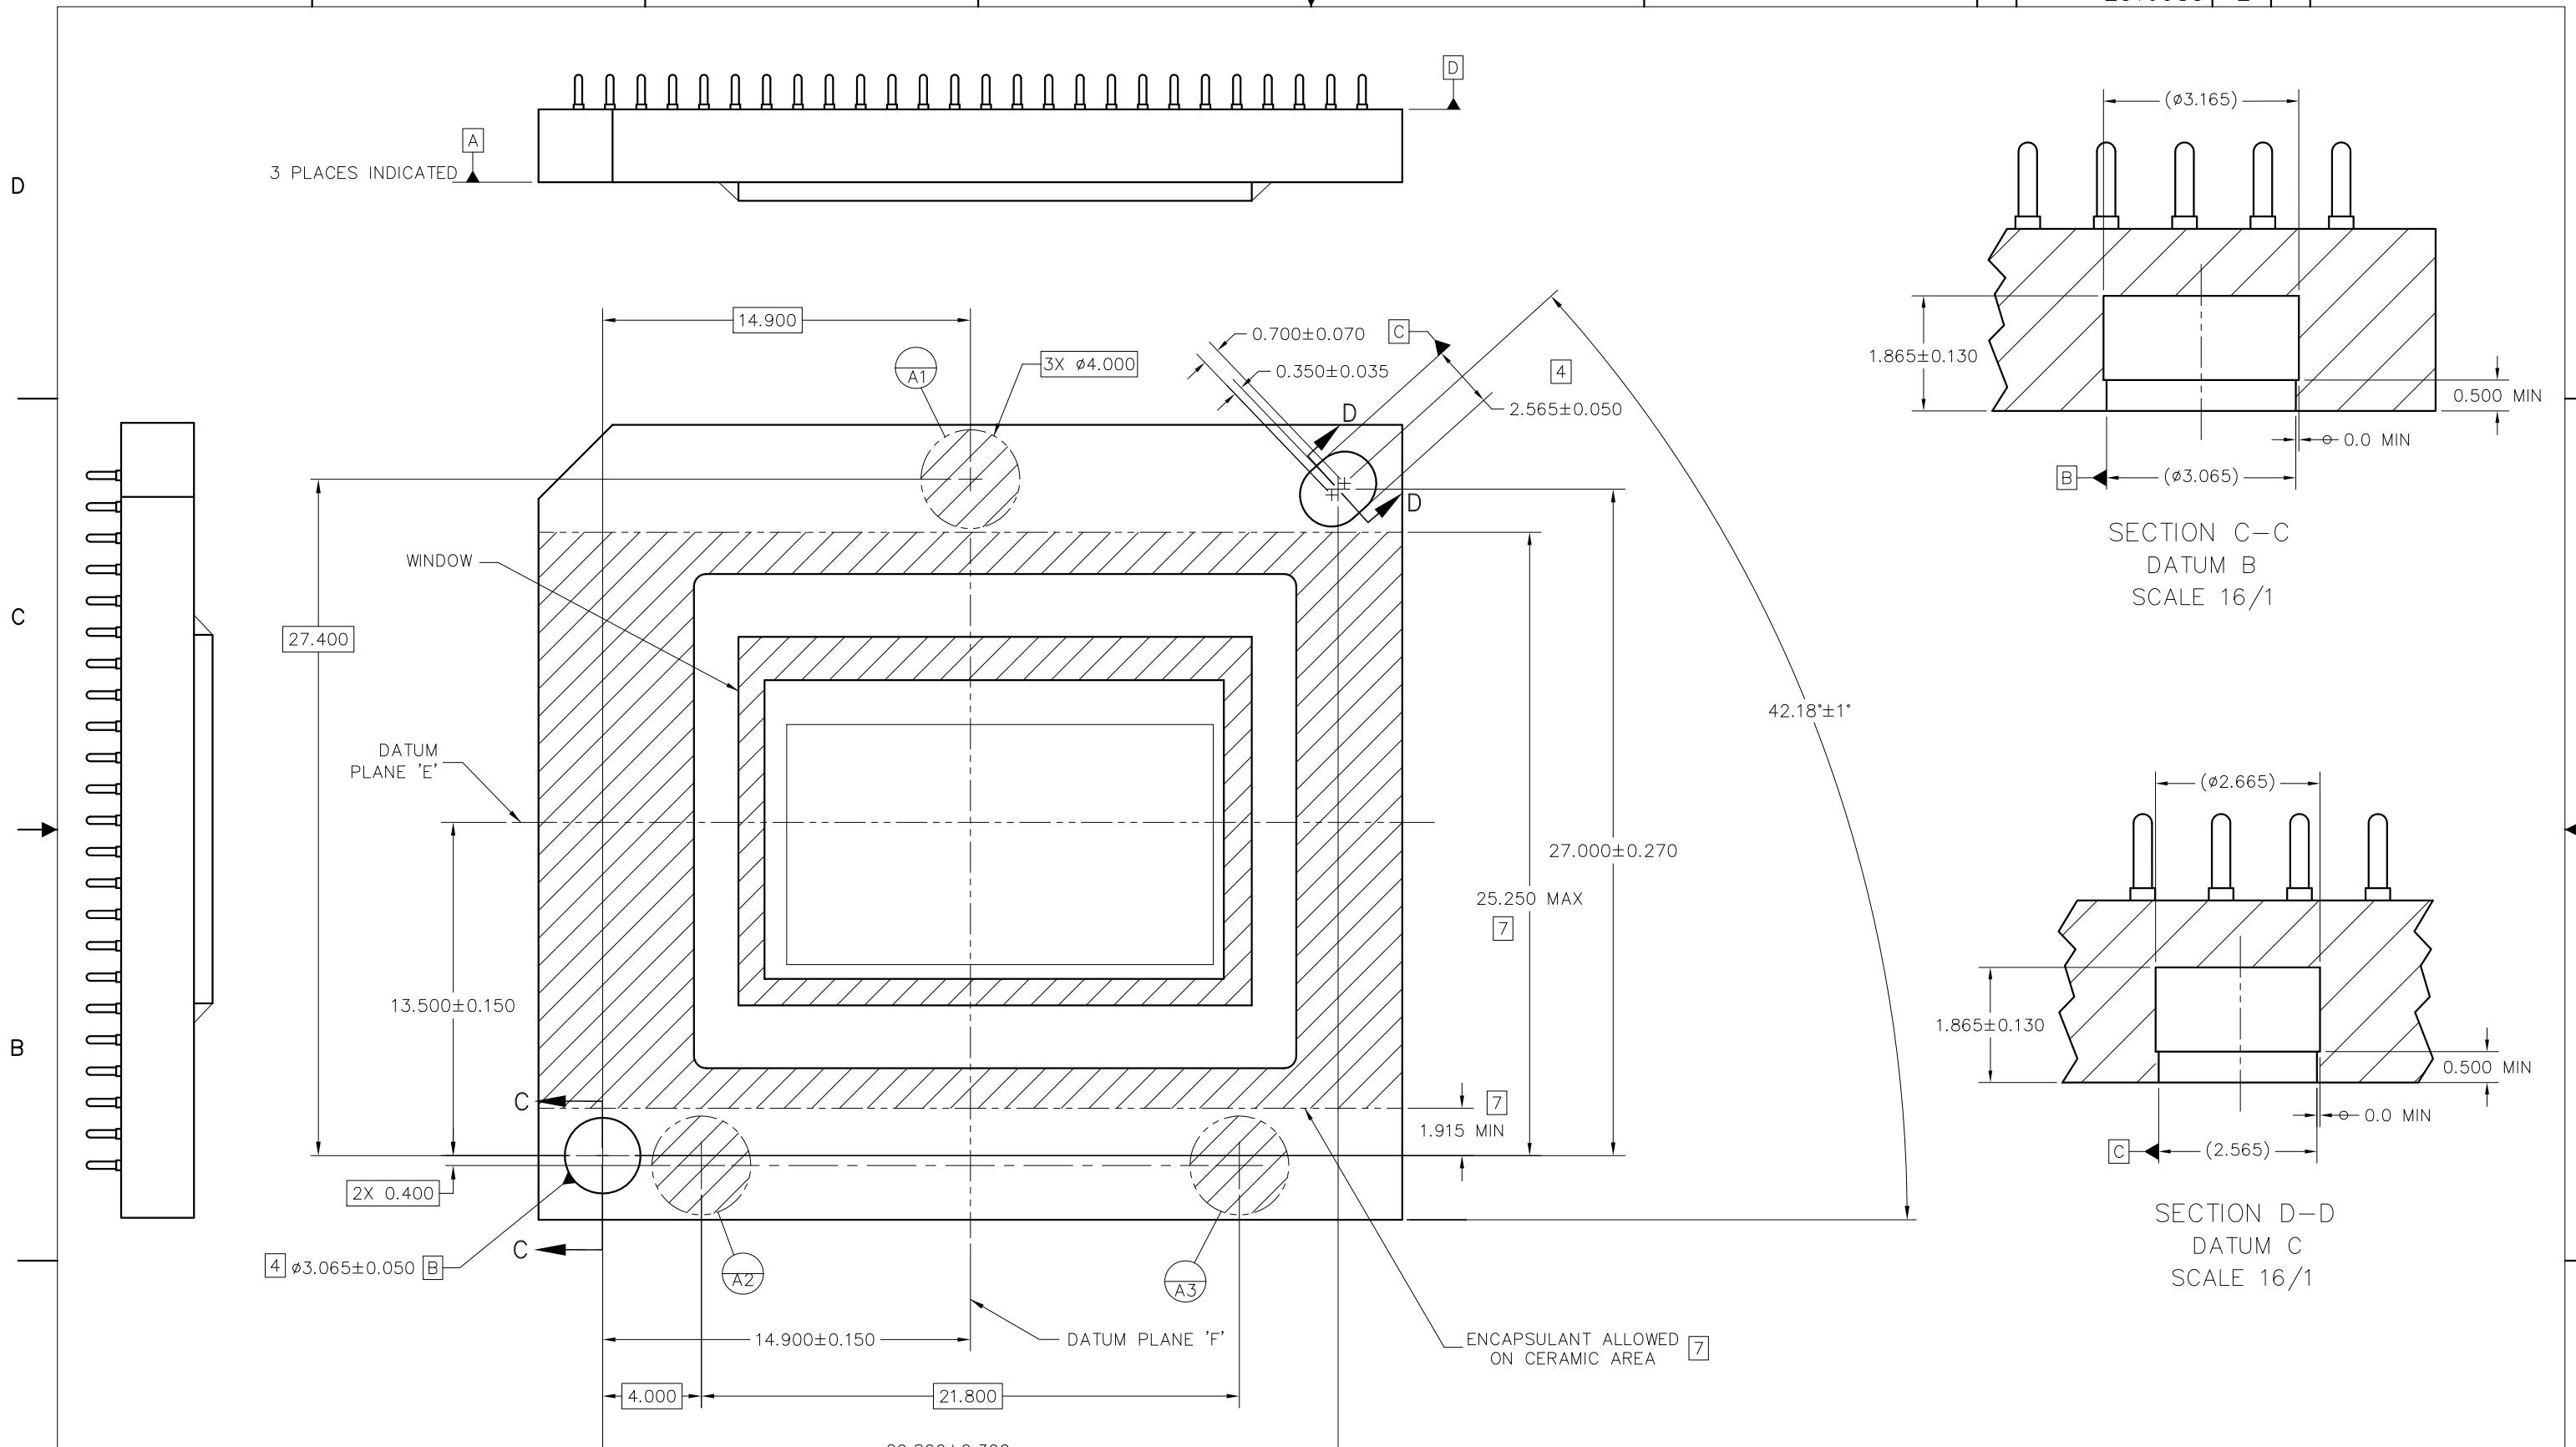

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

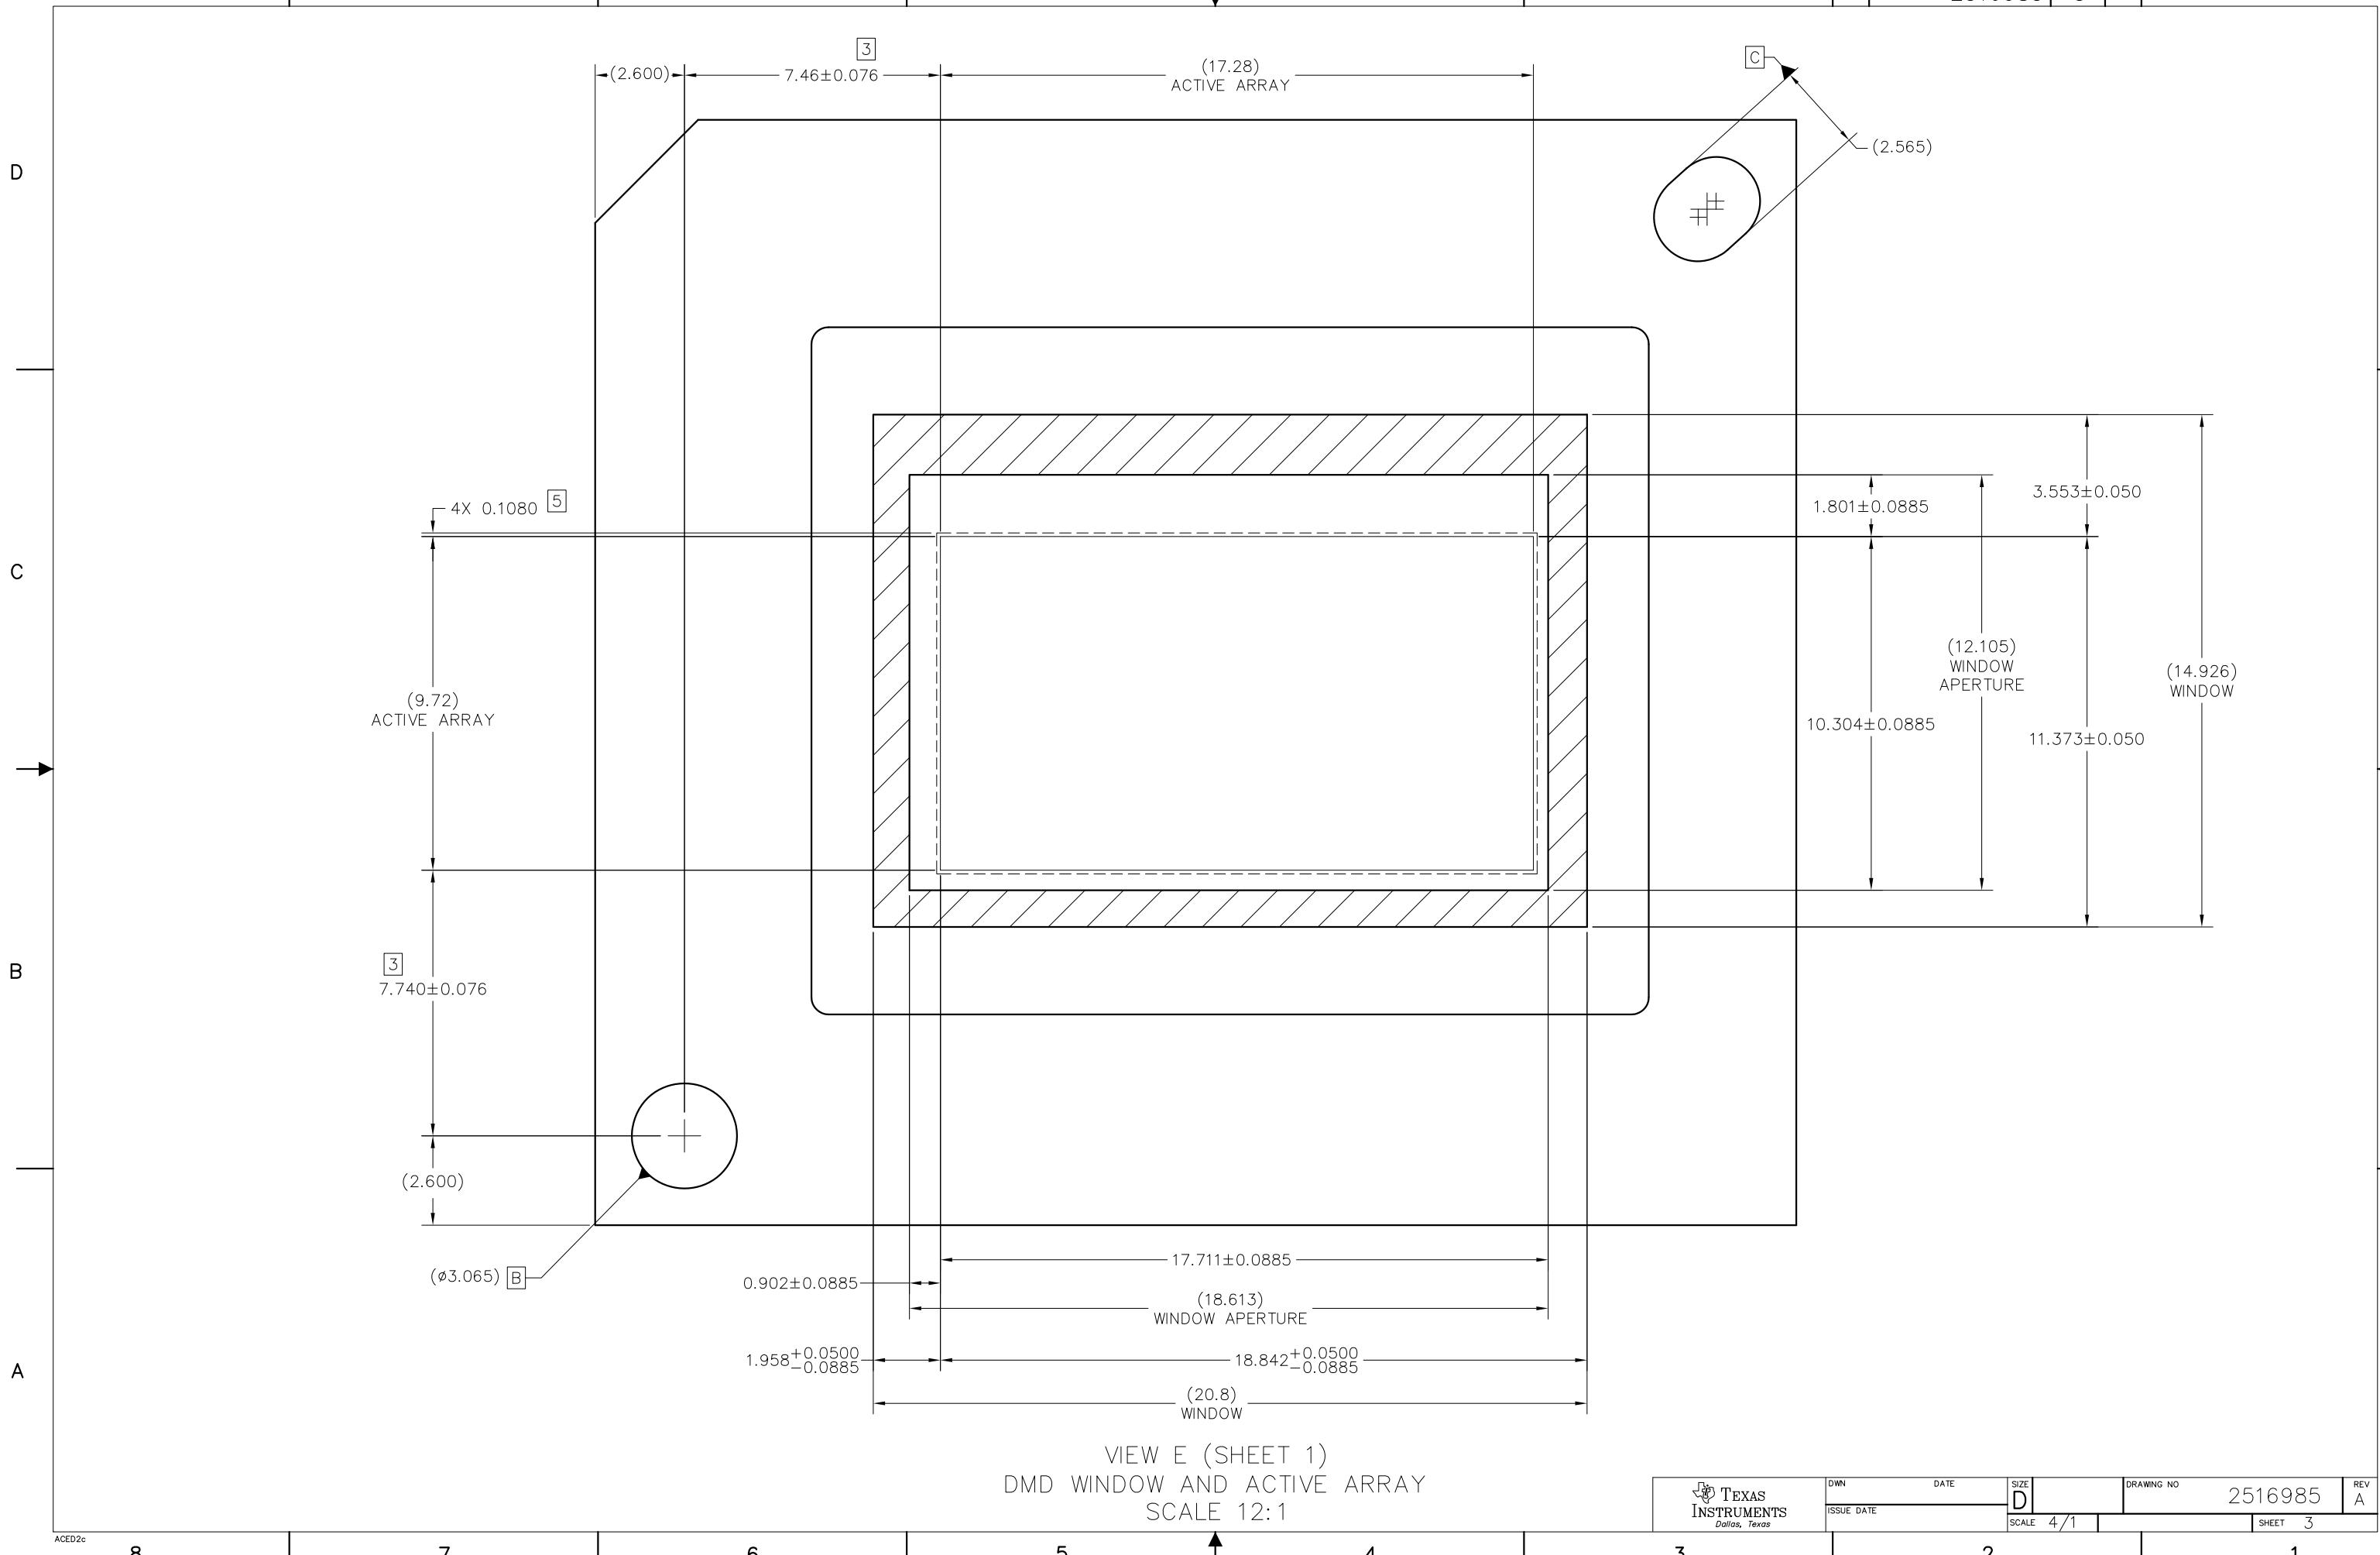

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

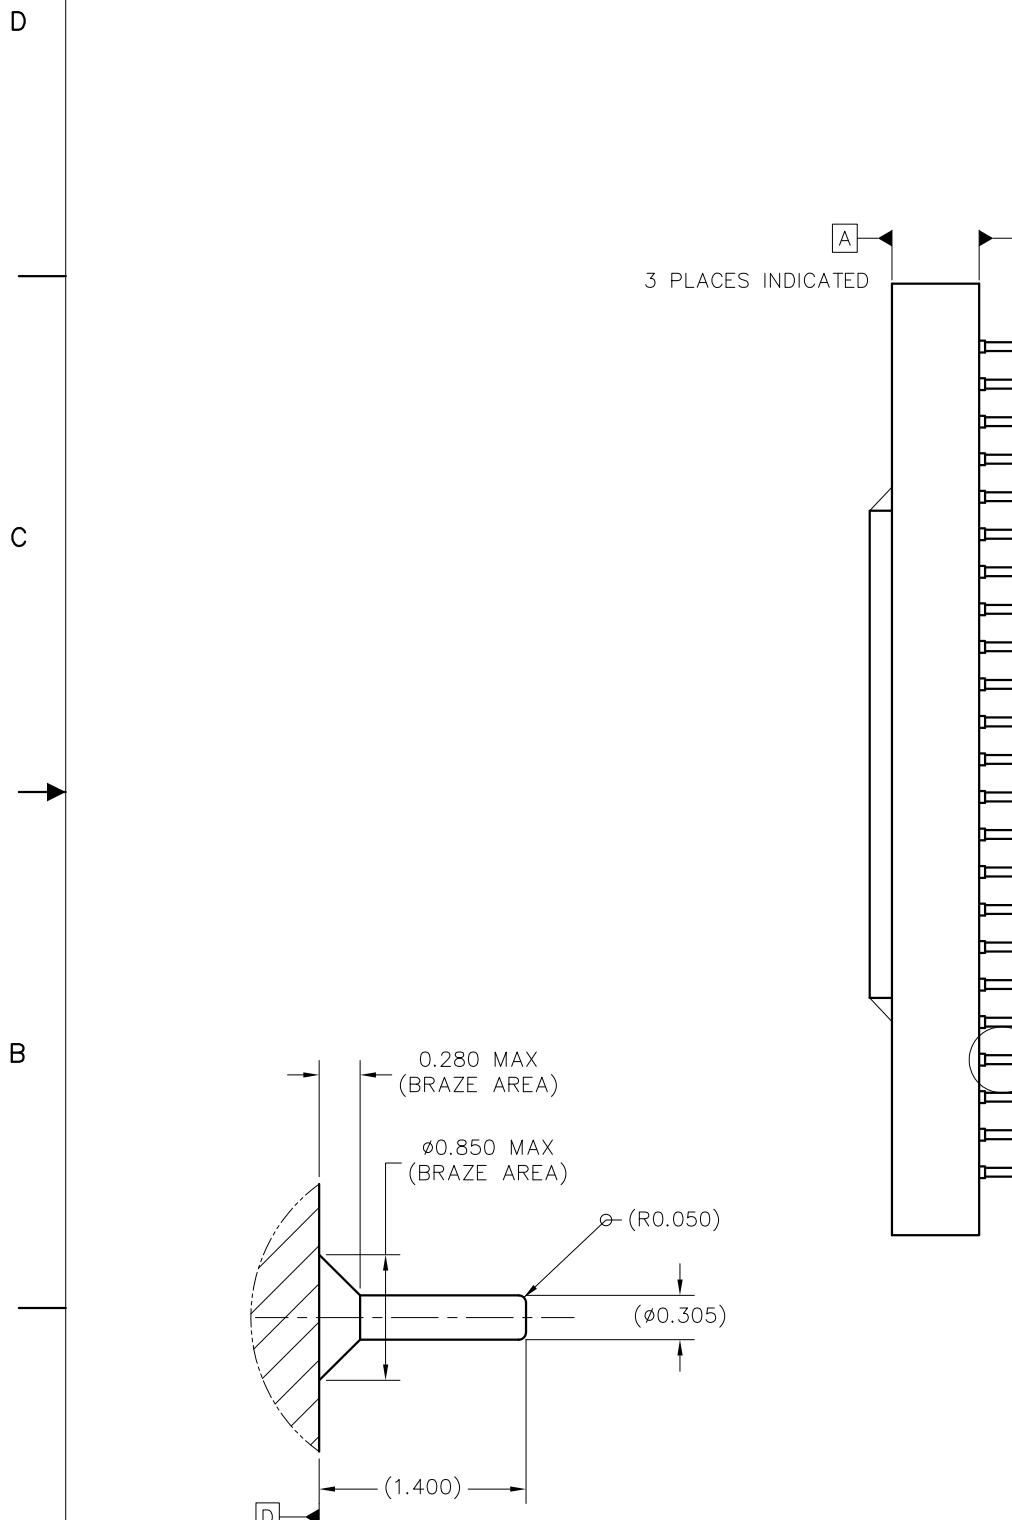

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
