

# DRV8376 Three-Phase Integrated FET Motor Driver

## 1 Features

- Three-phase BLDC motor driver
  - Supports 48V systems
  - Supports up to 100kHz PWM frequency
  - Active Demagnetization to reduce power losses
  - Cycle-by-cycle current limit to limit phase current
- 4.5V to 65V operating voltage (70V abs max)
- High output current capability: 4.5A Peak
- Low MOSFET on-state resistance
  - 400mΩ  $R_{DS(ON)}$  (HS + LS) at  $T_A = 25^\circ\text{C}$
- Reduced switching loss with 1.1V/ns slew rate and reverse recovery loss minimization technique
  - Adjustable slew rate options
- Low audible noise and ease of motor control with ultra-low dead time < 200ns, and propagation delay < 100ns
- Low-power sleep mode
  - 1.5μA typical at  $V_{VM} = 24\text{V}$ ,  $T_A = 25^\circ\text{C}$
- Multiple control interface options
  - 6x PWM control interface
  - 3x PWM control interface
- Does not require external current sense resistors, built-in current sensing
- Flexible device configuration options
  - DRV8376S: 5MHz 16-bit SPI for device configuration and fault status
  - DRV8376H: Hardware pin-based configuration
- Supports 1.8V, 3.3V, and 5V logic inputs
- Built-in 3.3V (5%), 30mA LDO regulator
- Built-in 5V (5%), 30mA LDO regulator
- Integrated protection features
  - Supply under voltage lockout (UVLO)
  - Charge pump under voltage (CPUV)
  - Overcurrent protection (OCP)
  - Thermal warning and shutdown (OTW/OTSD)
  - Fault condition indication pin (nFAULT)
  - Optional fault diagnostics over SPI

## 2 Applications

- [Brushless-DC \(BLDC\) Motor Modules](#)
- [HVAC motors](#)
- [Office automation machines](#)
- [Factory automation and robotics](#)
- [Wireless antenna motor](#)
- [Drones](#)

## 3 Description

The DRV8376 provides a gate drive and power stage for driving a 4.5V to 65V brushless-DC motors. The DRV8376 integrates three 1/2-H bridges with 70V absolute maximum capability and a very low  $R_{DS(ON)}$  of 400mΩ (high-side plus low-side) to enable high-power drive capability. Current is sensed using an integrated current sensing feature eliminating the need for external sense resistors. Power management features with integrated LDO generate the necessary voltage rails for the device and can be used to power external circuits.

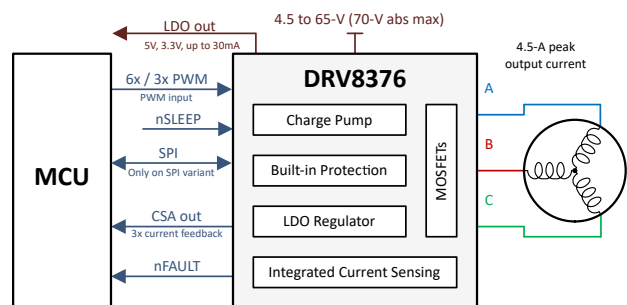

DRV8376 implements a 6x or 3x PWM control scheme which can be used to implement sensed or sensorless field-oriented control (FOC), sinusoidal control, or trapezoid control using an external microcontroller. The DRV8376 is capable of driving a PWM frequency up to 100kHz. The control scheme is highly configurable through hardware pins or register settings ranging from motor current limiting behavior to fault response.

There are a large number of protection features integrated into DRV8376, intended to protect the device, motor, and system against fault events.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>	BODY SIZE (NOM)
DRV8376H	VQFN (28)	6.00mm x 5.00mm	6.00mm x 5.00mm
DRV8376S	VQFN (28)	6.00mm x 5.00mm	6.00mm x 5.00mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

## 4 Device Comparison Table

DEVICE	PACKAGES	INTERFACE
DRV8376S	28-pin VQFN (6x5mm)	SPI
DRV8376H		Hardware

**Table 4-1. DRV8376S (SPI variant) vs. DRV8376H (Hardware variant) configuration comparison**

Parameters	DRV8376S (SPI variant)	DRV8376H (Hardware variant)
PWM mode settings	PWM_MODE (4 settings)	MODE_SR pin (4 settings)
Slew rate settings	SLEW_RATE (4 settings)	SLEW pin (4 settings)
CSA gain settings	CSA_GAIN (4 settings)	GAIN pin (4 settings)
SDO pin configuration: mode, voltage	SDO_ODEN (2 settings), SDO_VSEL (2 settings), SDO_MD (2 settings)	
Current Limit configuration: Mode, reporting on nFAULT, Blanking time, 100% duty PWM frequency	ILIMFLT_MODE (2 settings), ILIM_MODE (2 settings), ILIM_BLANK_SEL (4 settings), PWM_100_FREQ_SEL (4 settings)	Current limit reporting on nFAULT is enabled, fixed to coast mode, blanking time set to 5.5µs for slew rate of 50 and 1.8µs for all other slew rates, the 100% duty input PWM cycle is fixed to 20kHz
Over voltage protection mode	OVP_MODE (2 settings), OVP_SEL (2 settings)	Over voltage protection is disabled
OCP configuration: Mode, level, deglitch	OCP_MODE (4 settings), OCP_LVL (2 settings), OCP_DEG (4 settings) and OCP_RETRY (2 settings)	Enabled with automatic retry mode, level is fixed to 4.5A with 1.25µs deglitch time, 5ms retry time
Active demagnetization: Enable, comparator threshold, comparator mask time, behaviour during fault	EN_ASR (2 settings), EN_AAR (2 settings), AD_COMP_TH (2 settings)	MODE_SR (2 settings), active demag comparator threshold set to 100mA, comparator mask time set to 5.5µs for slew rate of 50V/µs and 1.8µs for all other slew rates. ADMAG_TMARGIN set to 1.6µs, active demag is disabled during OCP.
Over temperature warning	OTW_MODE (2 settings)	Reported on nFAULT

## 5 Pin Configuration and Functions

**Figure 5-1. DRV8376 28-Pin VQFN With Exposed Thermal Pad Top View**

**Table 5-1. DRV8376 Pin Functions**

PIN	28-pin VQFN Package		TYPE <sup>(1)</sup>	DESCRIPTION
	DRV8376H	DRV8376S		
AGND	8	8	GND	Device analog ground. Refer <a href="#">Section 9.4.1</a> for connections recommendation.
AVDD	9	9	PWR O	3.3V internal regulator output. Connect an X5R or X7R, 0.1µF, 6.3V ceramic capacitor between the AVDD and AGND pins. This regulator can source up to 30mA externally.
CP	1	1	PWR O	Charge pump output. Connect a X5R or X7R, 0.1µF, 16V ceramic capacitor between the CP and VM pins.
DRVOFF	11	11	I	When this pin is pulled high the six MOSFETs in the power stage are turned OFF making all outputs Hi-Z.
GAIN	21	-	I	Current sense amplifier gain setting. The pin is a 4 level input pin set by an external resistor.
GVDD	10	10	PWR O	5V internal regulator output. Connect an X5R or X7R, 1µF, 10V ceramic capacitor between the AVDD and AGND pins. This regulator can source up to 30 mA externally.
ILIMIT	28	28		Sets the threshold for phase current used in cycle by cycle current limit.
INHA	14	14	I	High-side driver control input for OUTA. This pin controls the output of the high-side MOSFET.
INHB	16	16	I	High-side driver control input for OUTB. This pin controls the output of the high-side MOSFET.
INHC	18	18	I	High-side driver control input for OUTC. This pin controls the output of the high-side MOSFET.
INLA	15	15	I	Low-side driver control input for OUTA. This pin controls the output of the low-side MOSFET.
INLB	17	17	I	Low-side driver control input for OUTB. This pin controls the output of the low-side MOSFET.

**Table 5-1. DRV8376 Pin Functions (continued)**

PIN NAME	28-pin VQFN Package		TYPE <sup>(1)</sup>	DESCRIPTION
	DRV8376H	DRV8376S		
INLC	19	19	I	Low-side driver control input for OUTC. This pin controls the output of the low-side MOSFET.
MODE_SR	20	-	I	PWM input mode setting. This pin is a 4-level input pin set by an external resistor.
nFAULT	12	12	O	Fault indicator. Pulled logic-low with fault condition; Open-drain output requires an external pull-up resistor to 1.8V to 5.0V. If an external supply is used to pull up nFAULT, ensure that it is pulled to >2.2V on power up.
nSCS	-	23	I	Serial chip select. A logic low on this pin enables serial interface communication.
nSLEEP	13	13	I	Driver nSLEEP. When this pin is logic-low, the device goes into a low-power sleep mode. A 20 to 40µs low pulse can be used to reset fault conditions without entering sleep mode.
OCP	23	-	I	OCP level setting. This pin is a 2 level input pin set by an external resistor (Hardware devices).
OUTA	4	4	PWR O	Half bridge output A
OUTB	5	5	PWR O	Half bridge output B
OUTC	6	6	PWR O	Half bridge output C
PGND	3, 7	3, 7	GND	Device power ground. Refer <a href="#">Section 9.4.1</a> for connections recommendation.
SCLK	-	22	I	Serial clock input. Serial data is shifted out and captured on the corresponding rising and falling edge on this pin (SPI devices).
SDI	-	21	I	Serial data input. Data is captured on the falling edge of the SCLK pin (SPI devices).
SDO	-	20	O	Serial data output. Data is shifted out on the rising edge of the SCLK pin. This pin requires an external pullup resistor (SPI devices).
SLEW	22	-	I	Slew rate control setting. This pin is a 4-level input pin set by an external resistor.
SOA	27	27	O	Current sense amplifier output. Supports capacitive load or low pass filter (resistor in series and capacitor to GND)
SOB	26	26	O	Current sense amplifier output. Supports capacitive load or low pass filter (resistor in series and capacitor to GND)
SOC	25	25	O	Current sense amplifier output. Supports capacitive load or low pass filter (resistor in series and capacitor to GND)
VM	2	2	PWR I	Power supply. Connect to motor supply voltage; bypass to PGND with a 0.1-µF capacitor plus one bulk capacitor rated for VM. TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device.
VREF	24	24	PWR/I	Current sense amplifier reference. Connect a X5R or X7R, 0.1µF, 6.3V ceramic capacitor between the VREF and AGND pins.
Thermal pad			AGND	Must be connected to analog ground.

(1) I = input, O = output, GND = ground pin, PWR = power, NC = no connect

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Power supply pin voltage (VM)	-0.3	70	V
Power supply voltage ramp (VM)		4	V/μs
Voltage difference between ground pins (PGND, AGND)	-0.6	0.6	V
Charge pump voltage (CP)	-0.3	V <sub>M</sub> + 6.2	V
Analog regulators pin voltage (GVDD)	-0.3	5.75	V
Analog regulators pin voltage (AVDD)	-0.3	5.75	V
Analog pin input voltage (VREF, ILIMIT)	-0.3	5.75	V
Analog pin output voltage (SOx)	-0.3	5.75	V
Logic pin input voltage (DRVOFF, INHx, INLx, nSCS, nSLEEP, SCLK, SDI)	-0.3	5.75	V
Logic pin output voltage (nFAULT, SDO, )	-0.3	5.75	V
Multi-level pin input voltage (GAIN, MODE_SR, OCP, SLEW)	-0.3	5.75	V
Output pin voltage (OUTA, OUTB, OUTC)	-1	V <sub>M</sub> + 1	V
Ambient temperature, T <sub>A</sub>	-40	125	°C
Junction temperature, T <sub>J</sub>	-40	150	°C
Storage temperature, T <sub>stg</sub>	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V <sub>VM</sub>	Power supply voltage	V <sub>VM</sub>	4.5	24	65	V
f <sub>PWM</sub>	Output PWM frequency	OUTA, OUTB, OUTC			100	kHz
I <sub>OUT</sub> <sup>(1)</sup>	Peak output winding current	OUTA, OUTB, OUTC			4	A
V <sub>IN</sub>	Logic input voltage	DRVOFF, INHx, INLx, nSCS, nSLEEP, SCLK, SDI, OCP	-0.1		5.5	V
V <sub>IN</sub>	Multilevel input voltage	GAIN, MODE_SR, SLEW	-0.1		GVDD	
V <sub>OD</sub>	Open drain pullup voltage	nFAULT, SDO, FG	-0.1		5.5	V
V <sub>SDO</sub>	Push-pull voltage	SDO	2.2		AVDD	V
I <sub>OD</sub>	Open drain output current	nFAULT, SDO, FG			5	mA
V <sub>VREF</sub>	Voltage reference pin voltage	VREF		2.8	5.5	V
ILIMIT	Voltage reference for current limit	ILIMIT	-0.1		5.5	V
T <sub>A</sub>	Operating ambient temperature		-40		125	°C

over operating ambient temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T <sub>J</sub>	Operating Junction temperature	-40		150	°C

(1) Power dissipation and thermal limits must be observed

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV8376H, DRV8376S		UNIT
		VQFN (NLG)		
		28 Pins		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	29.9		°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	20.8		°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	11		°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.3		°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	11		°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.9		°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 6.5 Electrical Characteristics

T<sub>J</sub> = -40°C to +150°C, V<sub>VM</sub> = 4.5 to 65 V (unless otherwise noted). Typical limits apply for T<sub>A</sub> = 25°C, V<sub>VM</sub> = 24 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLIES</b>						
I <sub>VMQ</sub>	VM sleep mode current	V <sub>VM</sub> > 6V, nSLEEP = 0, T <sub>A</sub> = 25°C		1.5	3	μA
		nSLEEP = 0		2.5	8	μA
I <sub>VMS</sub>	VM standby mode current	V <sub>VM</sub> > 6V, nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF', T <sub>A</sub> = 25°C		6.6	8.2	mA
		nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF'		6.6	8.2	mA
I <sub>VMS</sub>	VM standby mode current	V <sub>VM</sub> > 6V, nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF', T <sub>A</sub> = 25°C, ASR and AAR disabled		6.1	7.5	mA
I <sub>VMS</sub>	VM standby mode current	nSLEEP = 1, INHx = INLx = 0, SPI = 'OFF', ASR and AAR disabled		6.1	7.5	mA
I <sub>VM</sub>	VM operating mode current	V <sub>VM</sub> > 6V, nSLEEP = 1, f <sub>PWM</sub> = 20kHz		7.6	9.8	mA
		nSLEEP = 1, f <sub>PWM</sub> = 20kHz		7.6	9.8	mA
		nSLEEP = 1, f <sub>PWM</sub> = 100kHz		10.1	13.4	mA
V <sub>GVDD</sub>	Analog regulator voltage	0mA ≤ I <sub>GVDD</sub> ≤ 30mA; (External Load); VM > 6V	4.75	5	5.25	V
V <sub>GVDD</sub>	Analog regulator voltage	0mA ≤ I <sub>GVDD</sub> ≤ 30mA; (External Load); VM = 4.5V	3.7		4.5	V
V <sub>AVDD</sub>	Analog regulator voltage	0mA ≤ I <sub>AVDD</sub> ≤ 30mA; (External Load)	3.1	3.3	3.465	V
I <sub>GVDD</sub>	External analog regulator load	I <sub>AVDD</sub> = 0mA			30	mA
I <sub>AVDD</sub>	External analog regulator load	I <sub>GVDD</sub> = 0mA			30	mA
V <sub>VCP</sub>	Charge pump regulator voltage	VCP with respect to VM, (V <sub>VM</sub> > 6V)	4	5	6	V
t <sub>WAKE</sub>	Wakeup time	V <sub>VM</sub> > V <sub>UVLO</sub> , nSLEEP = 1 to outputs ready and nFAULT released			5.5	ms
t <sub>SLEEP</sub>	Sleep Pulse time	nSLEEP = 0 period to enter sleep mode	120			μs
t <sub>RST</sub>	Reset Pulse time	nSLEEP = 0 period to reset faults	20		40	μs
<b>LOGIC-LEVEL INPUTS (DRVOFF, INHx, INLx, nSLEEP, SCLK, SDI, OCP)</b>						

$T_J = -40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$ ,  $V_{VM} = 4.5$  to  $65\text{ V}$  (unless otherwise noted). Typical limits apply for  $T_A = 25^{\circ}\text{C}$ ,  $V_{VM} = 24\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{IL}$	Input logic low voltage		0		0.6	V
$V_{IH}$	Input logic high voltage	nSLEEP	1.6		5.5	V

## 7 Detailed Description

### 7.1 Overview

The DRV8376 device is an integrated 400mΩ (combined high-side and low-side MOSFET's on-state resistance) driver for 3-phase motor-drive applications. The device reduces system component count, cost, and complexity by integrating three half-bridge MOSFETs, gate drivers, charge pump, current sense amplifiers, and linear regulator for the external load. A standard serial peripheral interface (SPI) provides a simple method for configuring the various device settings and reading fault diagnostic information through an external controller. Alternatively, a hardware interface (H/W) option allows for configuring the most commonly used settings through fixed external resistors.

The architecture uses an internal state machine to protect against short-circuit events, and protect against dv/dt parasitic turnon of the internal power MOSFET.

The DRV8376 device integrates three, bidirectional current-sense amplifiers for monitoring the current through each of the low side MOSFET using a built-in current sense. The gain setting of the amplifier can be adjusted through the SPI or hardware interface.

In addition to the high level of device integration, the DRV8376 device provides a wide range of integrated protection features. These features include power-supply undervoltage lockout (UVLO), charge-pump undervoltage lockout (CPUV), overcurrent protection (OCP), AVDD and GVDD undervoltage lockout (AVDD\_UV, GVDD\_UV), and overtemperature shutdown (OTW and OTSD). Fault events are indicated by the nFAULT pin with detailed information available in the SPI registers on the SPI device version.

The DRV8376 device is in a VQFN surface-mount package. The VQFN package size is 6 mm × 5 mm.

## 7.2 Functional Block Diagram

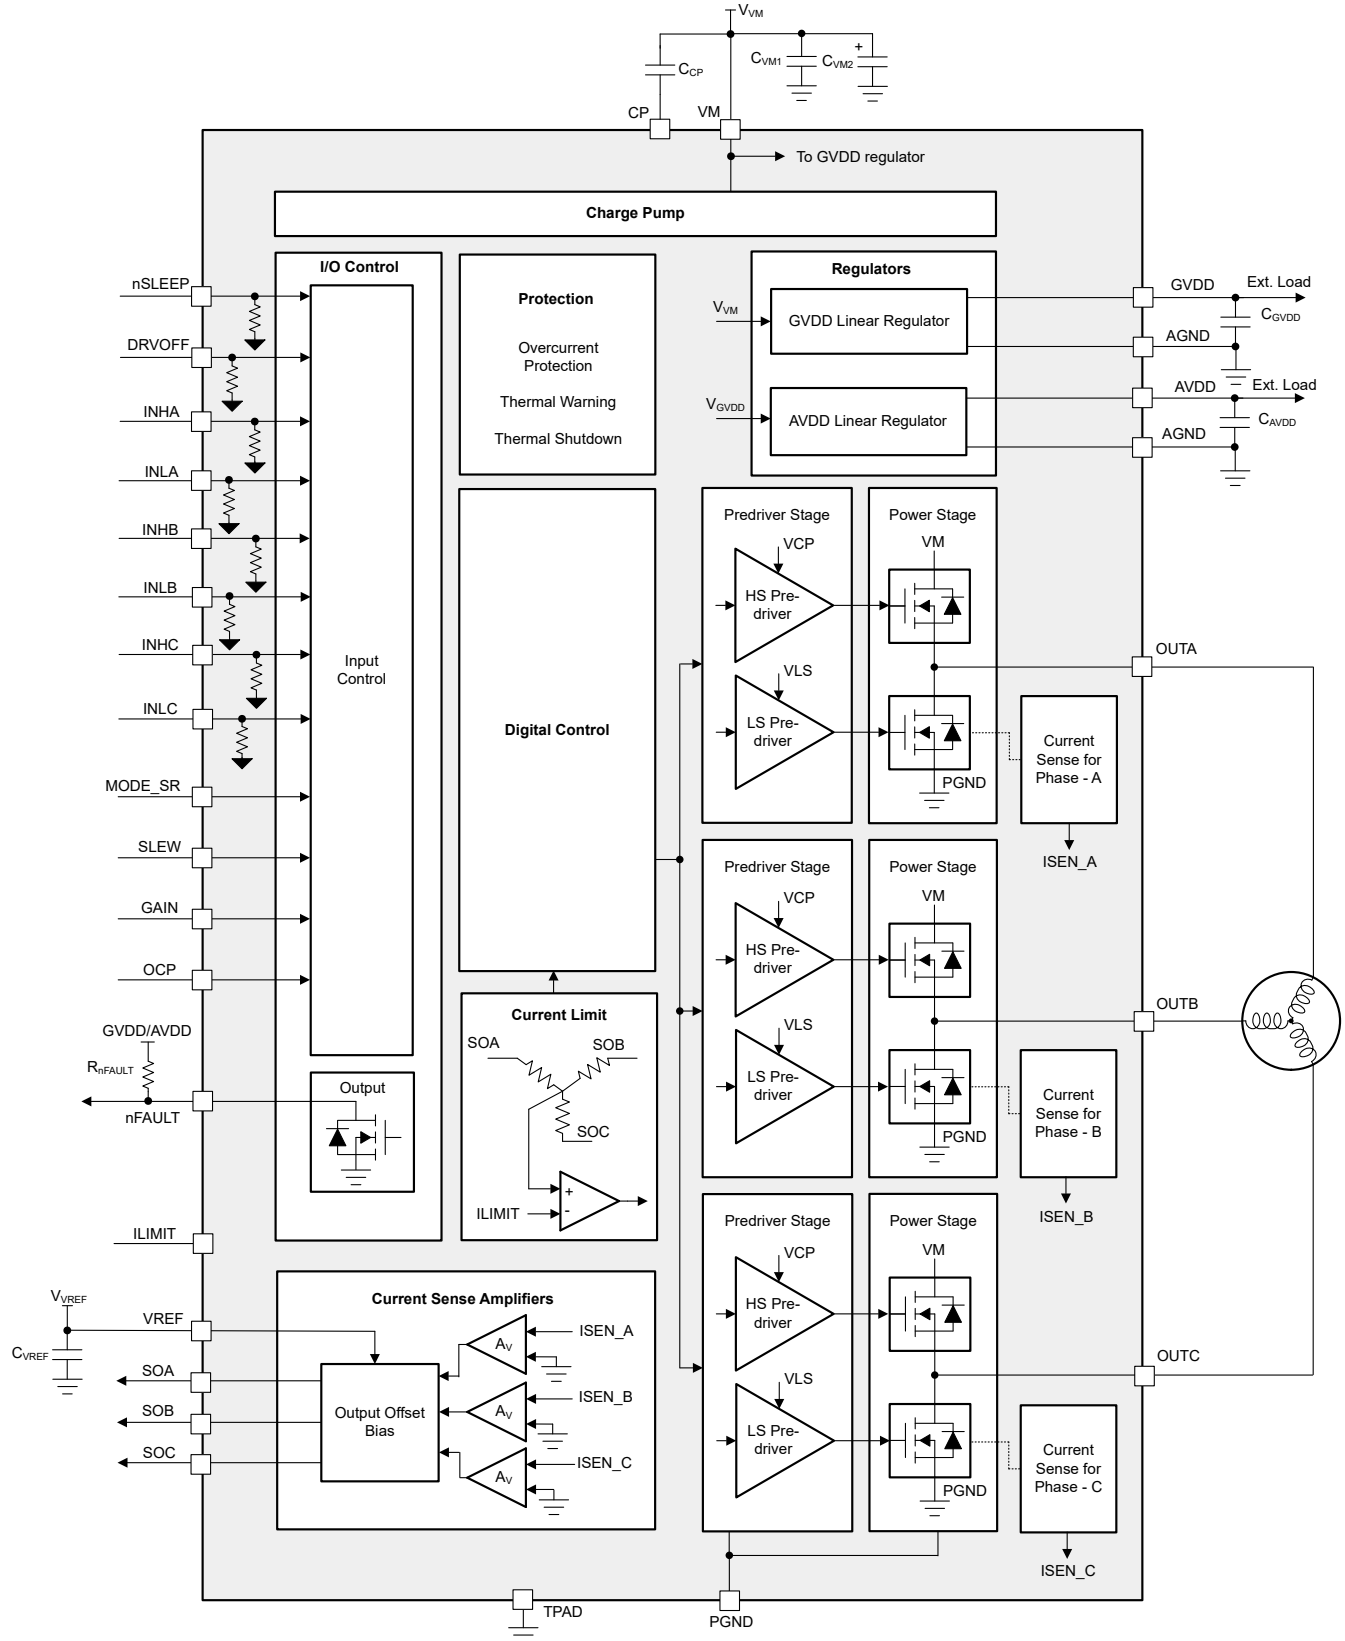

Figure 7-1. DRV8376S Block Diagram

**Figure 7-2. DRV8376H Block Diagram**

## 7.3 Feature Description

Table 7-1 lists the recommended values of the external components for the driver.

**Table 7-1. DRV8376 External Components**

COMPONENTS	PIN 1	PIN 2	RECOMMENDED
$C_{VM1}$	VM	PGND	X5R or X7R, 0.1 $\mu$ F, TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device
$C_{VM2}$	VM	PGND	$\geq 10\mu$ F, TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device
$C_{CP}$	CP	VM	X5R or X7R, 16V, 0.1 $\mu$ F capacitor
$C_{GVDD}$	GVDD	AGND	X5R or X7R, 1 $\mu$ F, $\geq 10$ V
$C_{AVDD}$	AVDD	AGND	X5R or X7R, 0.1 $\mu$ F, $\geq 6.3$ V
$R_{nFAULT}$	AVDD/GVDD	nFAULT	5.1k $\Omega$ , Pullup resistor
$R_{MODE\_SR}$	MODE_SR	AGND or GVDD	DRV8376H hardware interface
$R_{SLEW}$	SLEW	AGND or GVDD	DRV8376H hardware interface
$R_{OCP}$	OCP	AGND or GVDD	DRV8376H hardware interface
$R_{GAIN}$	GAIN	AGND or GVDD	DRV8376H hardware interface
$C_{VREF}$	VREF	AGND	X5R or X7R, 0.1 $\mu$ F, VREF-rated capacitor (Optional)

### Note

TI recommends to connect pull up on nFAULT even if nFAULT is not used to avoid undesirable entry into internal test mode. If external supply is used to pull up nFAULT, make sure that nFAULT is pulled to  $>2.2$ V on power up.

### 7.3.1 Output Stage

The DRV8376 device consists of an integrated 400m $\Omega$  (combined high-side and low-side FET's on-state resistance) NMOS FETs connected in a three-phase bridge configuration. A doubler charge pump provides the proper gate-bias voltage to the high-side NMOS FET's across a wide operating-voltage range in addition to providing 100% duty-cycle support. An internal linear regulator provides the gate-bias voltage for the low-side MOSFETs.

### 7.3.2 Control Modes

The DRV8376 family of devices provides four different control modes to support various commutation and control methods. [Table 7-2](#) shows the various modes of the DRV8376 device.

**Table 7-2. PWM Control Modes**

MODE Type	MODE_SR Pin (Hardware Variant)	PWM_MODE Bits (SPI Variant)	SR Bits (SPI Variant)	PWM MODE	ASR and AAR Mode
Mode 1	Connected to AGND	PWM_MODE = 00b	EN_ASR = 0, EN_AAR = 0	6x Mode	ASR and AAR Disabled
Mode 2	Hi-Z	PWM_MODE = 01b	EN_ASR = 1, EN_AAR = 0	6x Mode	ASR Enabled and AAR Disabled
Mode 3	Connected to GVDD with R <sub>MODE</sub>	PWM_MODE = 10b	EN_ASR = 0, EN_AAR = 0	3x Mode	ASR and AAR Disabled
Mode 4	Connected to GVDD	PWM_MODE = 11b	EN_ASR = 1, EN_AAR = 0	3x Mode	ASR Enabled and AAR Disabled

**Note**

The MODE\_SR pin is sensed or PWM\_MODE register is read only during power up and the device doesn't support MODE\_SR / PWM\_MODE change during operation.

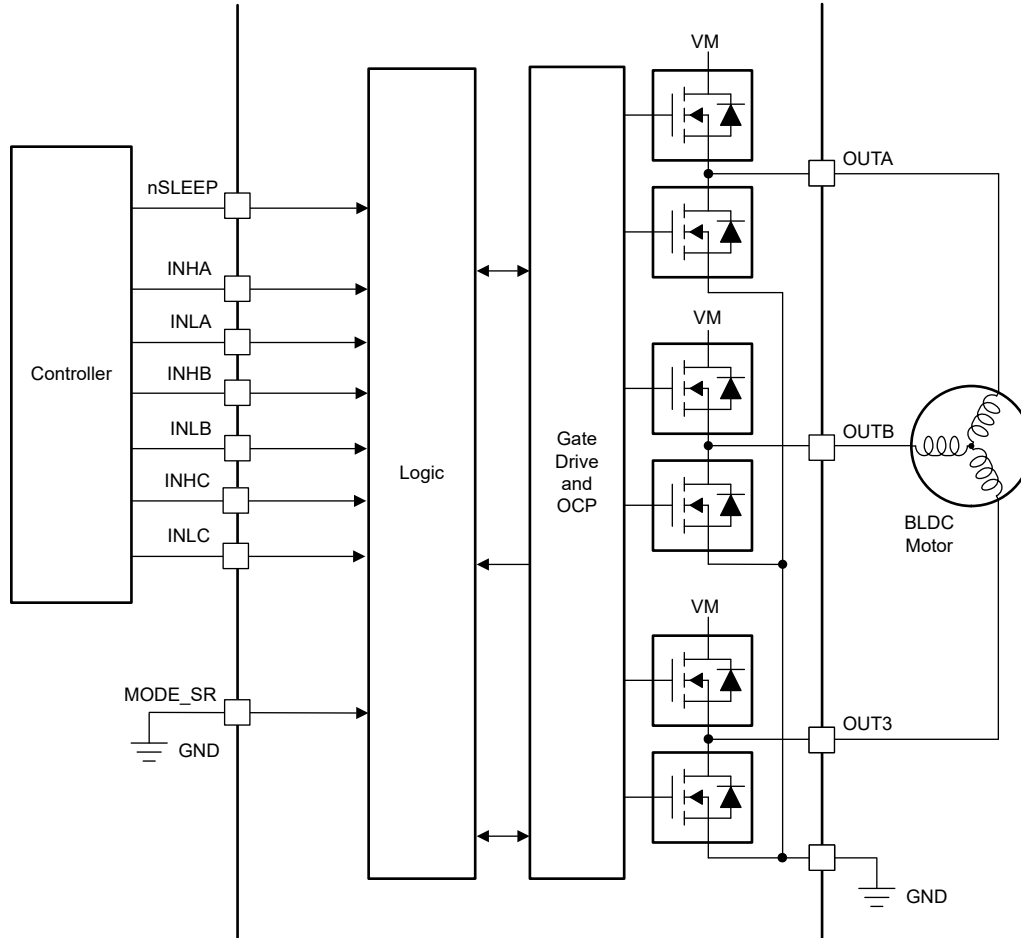

#### 7.3.2.1 6x PWM Mode (PWM\_MODE = 00b or 01b or MODE\_SR Pin Tied to AGND or in Hi-Z)

In 6x PWM mode, each half-bridge supports three output states: low, high, or high-impedance (Hi-Z). The corresponding INHx and INLx signals control the output state as listed in [Table 7-3](#).

**Table 7-3. 6x PWM Mode Truth Table**

INLx	INHx	PHASEx
0	0	Hi-Z
0	1	H
1	0	L
1	1	Hi-Z

[Figure 7-3](#) shows the application diagram of DRV8376 configured in 6x PWM mode.

**Figure 7-3. 6x PWM Mode**

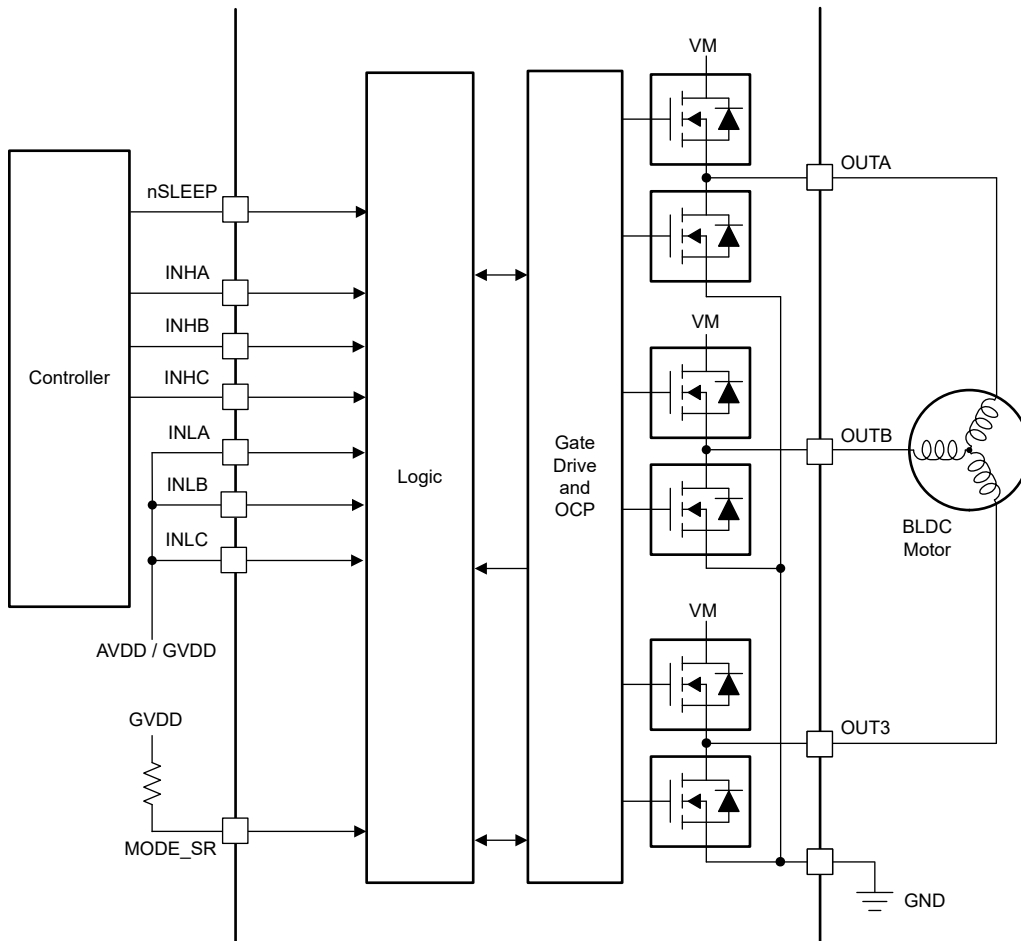

**7.3.2.2 3x PWM Mode (PWM\_MODE = 10b or 11b or MODE\_SR Pin is Connected to GVDD or to GVDD with R<sub>MODE</sub>)**

In 3x PWM mode, the INHx pin controls each half-bridge and supports two output states: low or high. The INLx pin is used to put the half bridge in the Hi-Z state. If the Hi-Z state is not required, tie all INLx pins to logic high. The corresponding INHx and INLx signals control the output state as listed in [Table 7-4](#).

**Table 7-4. 3x PWM Mode Truth Table**

INLx	INHx	PHASEx
0	X	Hi-Z
1	0	L
1	1	H

Figure 7-4 shows the application diagram of DRV8376 configured in 3x PWM mode.

**Figure 7-4. 3x PWM Mode**

### 7.3.3 Device Interface Modes

The DRV8376 family of devices supports two different interface modes (SPI and hardware) to let the end application design for either flexibility or simplicity. The two interface modes share the same four pins, allowing the different versions to be pin-to-pin compatible. This compatibility lets application designers evaluate one interface version and potentially switch to another with minimal modifications to a design.

#### 7.3.3.1 Serial Peripheral Interface (SPI)

The SPI devices support a serial communication bus that lets an external controller send and receive data with the DRV8376. This support lets the external controller configure device settings and read detailed fault information. The interface is a four wire interface using the SCLK, SDI, SDO, and nSCS pins which are described as follows:

- The SCLK pin is an input that accepts a clock signal to determine when data is captured and propagated on the SDI and SDO pins.
- The SDI pin is the data input.
- The SDO pin is the data output. The SDO pin can be configured to either open-drain or push-pull through SDO\_MODE.
- The nSCS pin is the chip select input. A logic low signal on this pin enables SPI communication.

For more information on the SPI, see the [Section 7.5](#) section.

#### 7.3.3.2 Hardware Interface

Hardware interface devices convert the four SPI pins into four resistor-configurable inputs which are GAIN, SLEW, MODE\_SR, and OCP.

The hardware interface lets the application designer to configure the most common device by tying the pin logic high or logic low, or with a simple pullup or pull-down resistor. This removes the requirement for an SPI bus from the external controller. General fault information can still be obtained through the nFAULT pin.

- The GAIN pin configures the gain of the current sense amplifier.
- The SLEW pin configures the slew rate of the output voltage.
- The MODE\_SR pin configures the PWM control mode.
- The OCP pin is used to configures the OCP level.

For more information on the hardware interface, see the [Section 7.3.9](#) section.

Figure 7-5. DRV8376S SPI

Figure 7-6. DRV8376H Hardware Interface

#### Note

VCC is external pull up voltage

### 7.3.4 AVDD and GVDD Linear Voltage Regulator

The DRV8376 family of devices integrates DRV83763.3V and 5V linear regulators, making them available for external circuitry. The AVDD and GVDD regulators power the internal digital circuitry of the device and can also supply voltage to a low-power MCU or other circuitry supporting low current (up to 30mA). Place an X5R or X7R, 0.1µF, 6.3V ceramic capacitor near the AVDD pin to bypass the AVDD regulator’s output, and route the capacitor directly back to the adjacent AGND ground pin. Place an X5R or X7R, 1µF, 10V ceramic capacitor near the GVDD pin to bypass the GVDD regulator’s output, and connect directly to the adjacent AGND ground pin.

The AVDD nominal, no-load output voltage is 3.3V.

**Figure 7-7. GVDD Linear Regulator Block Diagram**      **Figure 7-8. AVDD Linear Regulator Block Diagram**

Use [Equation 1](#) and [Equation 2](#) to calculate the power dissipated in the device by the AVDD and GVDD linear regulator with VM as supply.

$$P = (V_{VM} - V_{AVDD}) \times I_{AVDD} \tag{1}$$

$$P = (V_{VM} - V_{GVDD}) \times I_{GVDD} \tag{2}$$

For example, at a  $V_{VM}$  of 24V, drawing 20mA out of AVDD results in power dissipation as shown in [Equation 3](#).

$$P = (24 \text{ V} - 3.3 \text{ V}) \times 20 \text{ mA} = 414 \text{ mW} \tag{3}$$

**Note**

The combined external current support from both the linear regulators AVDD and GVDD is limited to 30mA. If 30mA of external load is connected to AVDD, then do not connect any external load to GVDD and vice versa.

### 7.3.5 Charge Pump

Because the output stages use N-channel FETs, the device requires a gate-drive voltage higher than the VM power supply to enhance the high-side FETs fully. The DRV8376 integrates a charge-pump circuit that generates a voltage above the VM supply for this purpose.

The charge pump requires one external capacitors for operation. See the block diagram, pin descriptions and see section (Section 7.3 ) for details on these capacitors (value, connection, and so forth).

The charge pump shuts down when nSLEEP is low or during an over temperature shutdown.

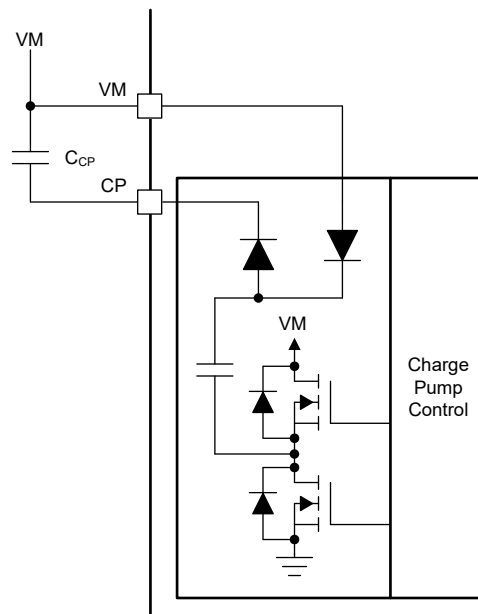

Figure 7-9. DRV8376 Charge Pump

### 7.3.6 Slew Rate Control

An adjustable gate-drive current control actively manages the MOSFETs in the half-bridges to achieve slew rate control. The MOSFET VDS slew rates critically influence the optimization of radiated emissions, the energy and duration of diode recovery spikes, and the switching voltage transients caused by parasitics. The rate of gate charge to the internal MOSFETs predominantly determines these slew rates, as shown in Figure 7-10.

Figure 7-10. Slew Rate Circuit Implementation

The slew rate of each half-bridge can be adjusted by the SLEW pin in the hardware device variant or by using the SLEW bits in the SPI device variant. Each half-bridge can be selected to either of a slew rate setting of 1.1V/ns, 0.5V/ns, 0.25V/ns, or 0.05V/ns. The slew rate is calculated by the rise time and fall time of the voltage on the OUTx pin as shown in Figure 7-11.

Figure 7-11. Slew Rate Timings

#### Note

The SLEW pin is sensed only during power up and the DRV8376H device doesn't support slew rate change during operation. Slew rate can be changed during operation through register write in DRV8376S device. TI recommends not to change the slew rate during operation.

### 7.3.7 Cross Conduction (Dead Time)

The device is fully protected for any cross conduction of MOSFETs. In half-bridge configuration, the operation of high-side and low-side MOSFETs are maintained to avoid any shoot-through currents by inserting a dead time ( $t_{dead}$ ). This is implemented by sensing the gate-source voltage (VGS) of the high-side and low-side MOSFETs and maintaining that VGS of high-side MOSFET has reached below turn-off levels before switching on the low-side MOSFET of same half-bridge as shown in Figure 7-12 and Figure 7-13.

**Figure 7-12. Cross Conduction Protection**

**Figure 7-13. Dead Time**

### 7.3.8 Propagation Delay

The propagation delay time ( $t_{pd}$ ) is measured as the time between an input logic edge to change in gate driver voltage.

#### Note

During current limit mode or active demag mode a small digital delay is added as the input command propagates through the device, and user may see upto 300ns more delay during these modes.

Figure 7-14. Propagation Delay Timing

### 7.3.9 Pin Diagrams

This section presents the I/O structure of all digital input and output pins.

#### 7.3.9.1 Logic Level Input Pin (Internal Pulldown)

Figure 7-15 shows the input structure for the logic level pins, DRVOFF, INHx, INLx, nSLEEP, SCLK and SDI. The input can be with a voltage or external resistor. It is recommended to put these pins low in device sleep mode to reduce leakage current through internal pull-down resistors.

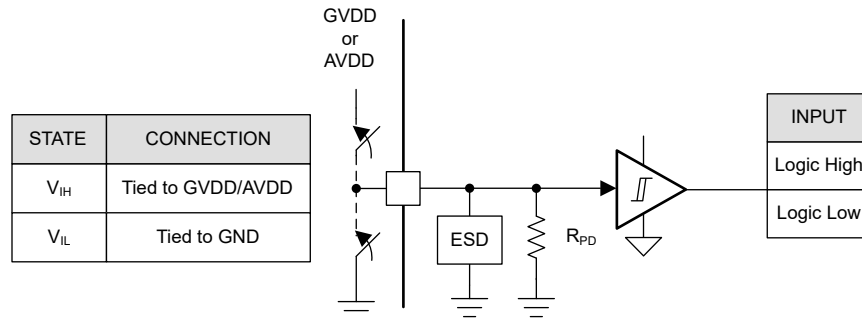

Figure 7-15. Logic-Level Input Pin Structure

#### 7.3.9.2 Logic Level Input Pin (Internal Pullup)

Figure 7-16 shows the input structure for the logic level pin, nSCS. The input can be driven with a voltage or external resistor.

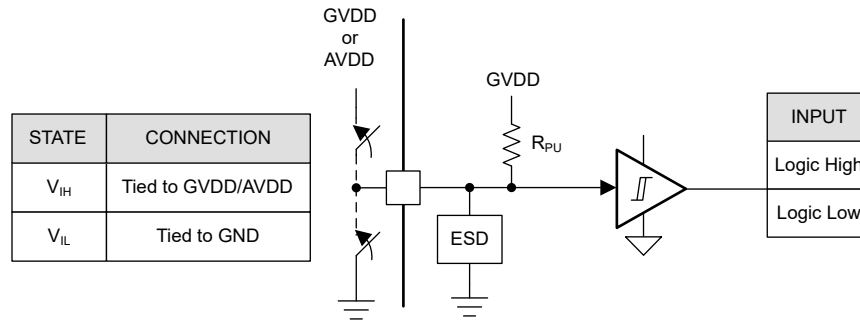

Figure 7-16. Logic nSCS

7.3.9.3 Open Drain Pin

Figure 7-17 shows the structure of the open-drain output pin, nFAULT and SDO in open drain mode. The open-drain output requires an external pullup resistor to function properly.

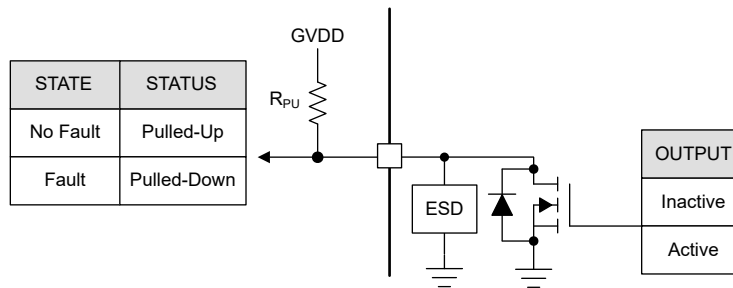

Figure 7-17. Open Drain

7.3.9.4 Push Pull Pin

Figure 7-18 shows the structure of SDO in push-pull mode. The SDO power supply in push pull mode can be selected to GVDD or AVDD by configuring SDO\_VSEL.

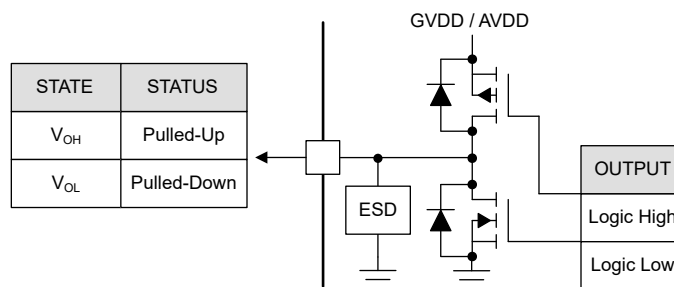

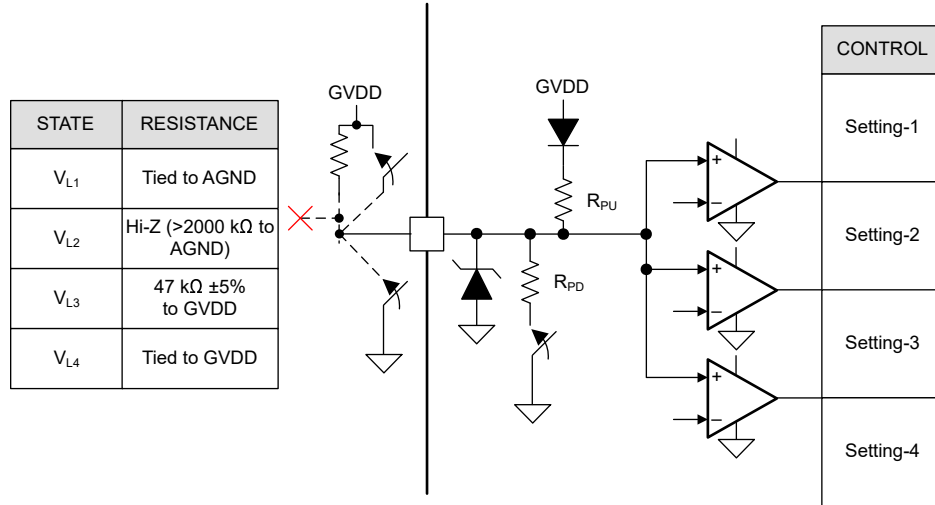

Figure 7-18. Push Pull

7.3.9.5 Four Level Input Pin

Figure 7-19 shows the structure of the four level input pins, GAIN, MODE,\_SR, SLEW, and OCP on hardware interface devices. The input can be set with an external resistor.

**Figure 7-19. Four Level Input Pin Structure**

### 7.3.10 Current Sense Amplifiers

The DRV8376 integrates three, high-performance low-side current sense amplifiers for current measurements using built-in current sensing. Low-side current measurements are commonly used to implement overcurrent protection, external torque control, or brushless-DC commutation with an external controller. All three amplifiers can be used to sense the current in each of the half-bridge legs (low-side FETs). The current sense amplifiers include features such as programmable gain and external reference is provided on a voltage reference pin (VREF).

#### 7.3.10.1 Current Sense Amplifier Operation

The SO<sub>x</sub> pin on the DRV8376 outputs an analog voltage proportional to the current flowing in the low-side FETs multiplied by the gain setting ( $G_{CSA}$ ). The gain setting is adjustable between four different levels which can be set by the GAIN pin (in the hardware device variant) or the GAIN bits (in the SPI device variant).

Figure 7-20 shows the internal architecture of the current sense amplifiers. The current sense is implemented with the sense FET on each low-side FET of the DRV8376 device. This current information is fed to the internal I/V converter, which generates the CSA output voltage on the SO<sub>X</sub> pin based on the voltage on the VREF pin and the Gain setting. The CSA output voltage can be calculated as :

$$SOX = \left( \frac{V_{REF}}{2} \right) \pm GAIN \times I_{OUTX} \quad (4)$$

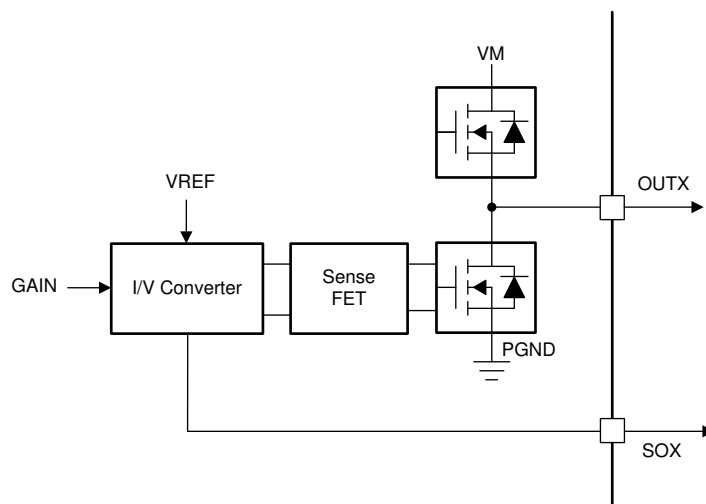

Figure 7-20. Integrated Current Sense Amplifier

Figure 7-21 and Figure 7-22 illustrates the amplifier's operational range in detail. In bi-directional operation, the amplifier sets the output to  $V_{REF}/2$  for a 0V input. Any change in the differential input produces a corresponding change in the output, multiplied by the CSA\_GAIN factor. The amplifier maintains operation within a defined linear region.

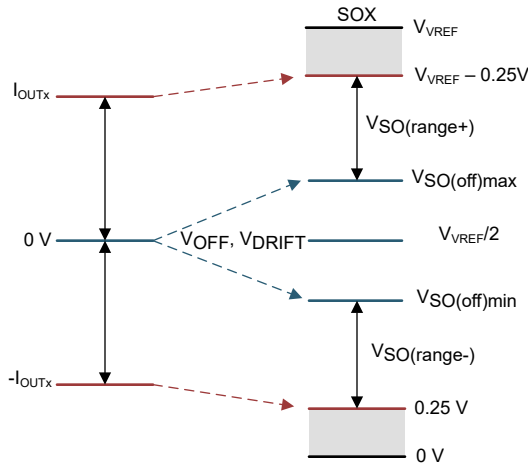

Figure 7-21. Bidirectional Current Sense Output

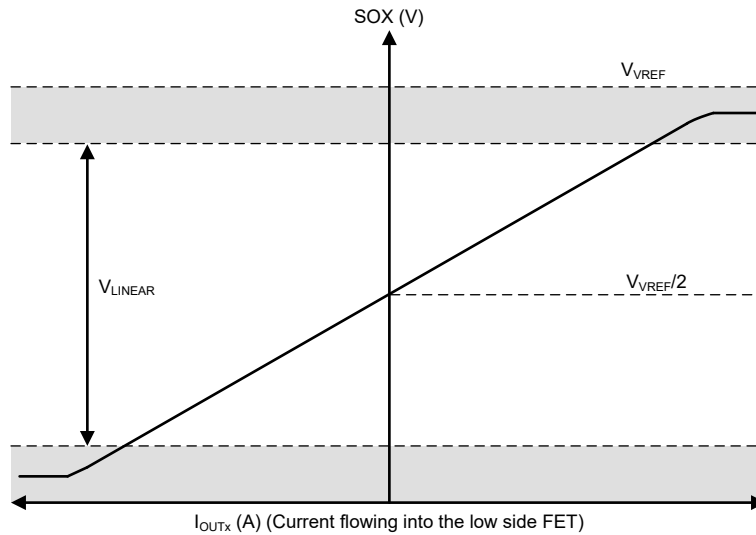

Figure 7-22. Bidirectional Current Sense Regions

**Note**

The current sense amplifier is not designed to support continuous current load at the output and supports only capacitive load at the output. TI recommends connecting the low pass filter with the resistor and capacitor on the output of the current sense amplifier.

**Note**

The current sense amplifier supports dynamic gain changes. In the HW variant, the system samples the GAIN every 1ms through pin sensing, while in the SPI variant, the system updates the GAIN via an SPI write. After receiving the GAIN change command, the system applies the new GAIN to all three current sense amplifiers on the next falling edge of any INLx signal.

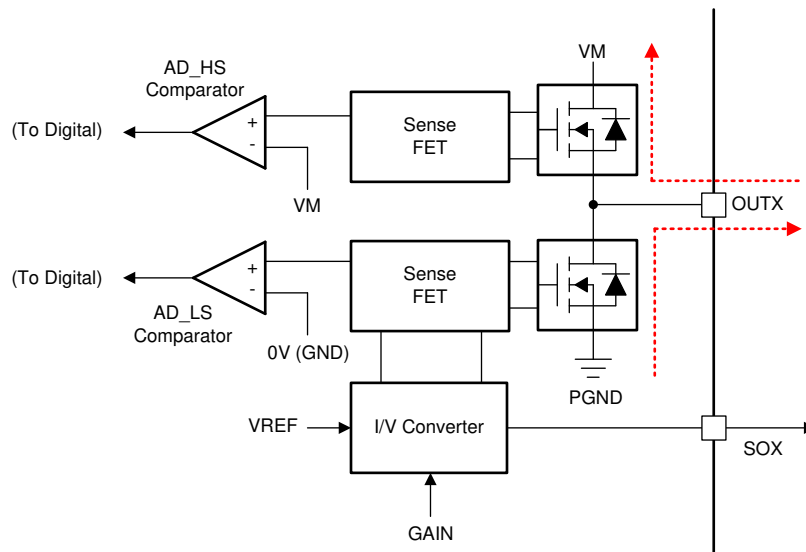

### 7.3.11 Active Demagnetization

DRV8376 family of devices has smart rectification features (active demagnetization) which decreases power losses in the device by reducing diode conduction losses. When this feature is enabled, the device automatically turns ON the corresponding MOSFET whenever the device detects diode conduction. This feature can be configured with the MODE\_SR pins in hardware variants. In SPI device variants this can be configured through EN\_ASR and EN\_AAR bits. The smart rectification is classified into two categories of automatic synchronous rectification (ASR) mode and automatic asynchronous rectification (AAR) mode which are described in the sections below.

#### Note

In SPI device variants both bits, EN\_ASR and EN\_AAR need to be set to 1 to enable active demagnetization.

The DRV8376 device includes a high-side (AD\_HS) and low-side (AD\_LS) comparator which detects the negative flow of current in the device on each half-bridge. The AD\_HS comparator compares the sense-FET output with the supply voltage (VM) threshold, whereas the AD\_LS comparator compares with the ground (0V) threshold. Depending upon the flow of current from OUTx to VM or PGND to OUTx, the AD\_HS or the AD\_LS comparator trips. This comparator provides a reference point for the operation of active demagnetization features.

**Figure 7-23. Active Demagnetization Operation**

Table 7-2 shows the configuration of ASR and AAR mode in the DRV8376 device.

#### Note

Active demagnetization disabled on an OCP event .

#### 7.3.11.1 Automatic Synchronous Rectification Mode (ASR Mode)

The automatic synchronous rectification (ASR) mode is divided into two categories of ASR during commutation and ASR during PWM mode.

##### 7.3.11.1.1 Automatic Synchronous Rectification in Commutation

Figure 7-24 shows the operation of active demagnetization during the BLDC motor commutation. As shown in Figure 7-24 (a), the current is flowing from HA to LC in one commutation state. During the commutation changeover as shown in Figure 7-24 (b), the HB switch is turned on, whereas the commutation current (due to motor inductance) in OUTA flows through the body diode of LA. This incorporates a higher diode loss depending

on the commutation current. This commutation loss is reduced by turning on the LA for the commutation time as shown in Figure 7-24 (c).

Similarly the operation of high-side FET is realized in Figure 7-24 (d), (e) and (f).

**Figure 7-24. ASR in BLDC Motor Commutation**

Figure 7-25 (a) shows the BLDC motor phase current waveforms for automatic synchronous rectification mode in BLDC motor operating with trapezoidal commutation. This figure shows the operation of various switches in a single commutation cycle.

Figure 7-25 (b) shows the zoomed waveform of commutation cycle with details on the ASR mode start with margin time ( $t_{margin}$ ) and ASR mode early stop due to active demag. comparator threshold and delays.

(a) Commutation current of Phase "A"

(b) Zoomed waveform of Active Demagnetization

**Figure 7-25. Current Waveforms for ASR in BLDC Motor Commutation**

### 7.3.11.1.2 Automatic Synchronous Rectification in PWM Mode

Figure 7-26 shows the operation of ASR in PWM mode. As shown in this figure, a PWM is applied only on the high-side FET, whereas the low-side FET is always off. During the PWM off time, current decays from the low-side FET which results in higher power losses. Therefore, this mode supports turning on the low-side FET during the low-side diode conduction.

**Figure 7-26. ASR in PWM Mode**

### 7.3.11.2 Automatic Asynchronous Rectification Mode (AAR Mode)

Figure 7-27 shows the operation of AAR in PWM mode. As shown in this figure, a PWM is applied in a synchronous rectification to the high-side and low-side FETs. During the low-side FET conduction, for lower inductance motors, the current can decay to zero and becomes negative since low side FET is in on-state. This creates a negative torque on the BLDC motor operation. When AAR mode is enabled, the current during the decay is monitored and the low-side FET is turned off as soon as the current reaches near to zero. This saves the negative current building in the BLDC motor which results in better noise performance and better thermal management.

**Figure 7-27. AAR in PWM Mode**

### 7.3.12 Cycle-by-Cycle Current Limit

The current-limit circuitry utilizes the current sense amplifier output of the three phases compared with the voltage at ILIMIT pin. Figure 7-28 shows the implementation of current limit circuitry, the output of current sense amplifiers are combined with star connected resistive network. This measured voltage  $V_{MEAS}$  is compared with the external reference voltage  $V_{LIM}$  on ILIMIT pin to realize the current limit implementation. The relation between current sensed on three phases ( $I_{OUTx}$ ) and  $V_{MEAS}$  threshold is given as:

$$V_{MEAS} = \left(\frac{V_{VREF}}{2}\right) + ((I_{OUTA} + I_{OUTB} + I_{OUTC}) \times GAIN/3) \quad (5)$$

where

- $V_{VREF}$  is the current sense amplifier supply
- $I_{OUTx}$  is current flowing into the low-side MOSFET
- $CSA\_GAIN$  is the current sense amplifier gain

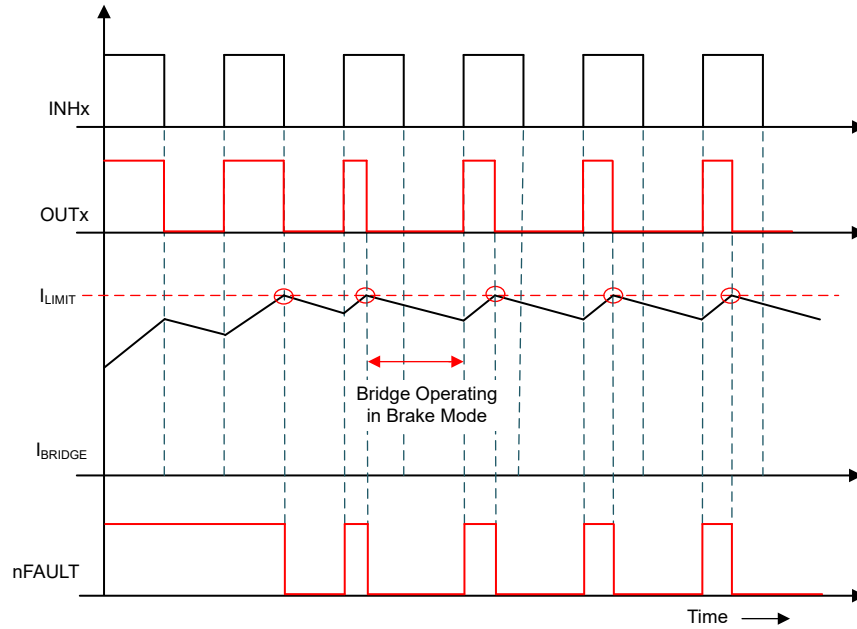

The current limit threshold can be adjusted by configuring the voltage at ILIMIT pin. Current limit varies linearly between 0A to 4A, as the voltage at ILIMIT pin varies from  $V_{REF}/2$  to  $V_{MEAS}$ . A voltage more than  $V_{VREF}$  can be applied to disable ILIMIT.

Current limit comparator output is blanked for a blanking time, on every rising edge of high side and low side switch control input (INHx and INLx) and the DRV8376 output state depends on the INHx and INLx status during blanking time. The blanking time is configured through ILIM\_BLANK\_SEL in SPI device and the blanking time is fixed to 5.5us for slew rate of 50 and 1.8us for all other slew rates in hardware variant.

**Figure 7-28. Current Limit Implementation**

When the current limit activates, the high-side FET of each half bridge is disabled until the rising edge of the high side (INHx) of that half bridge as shown in Figure 7-29. The low-side FETs can operate in brake mode or Coast (high-Z) mode by configuring the ILIM\_MODE bit in the SPI device variant. The low-side FETs operate in Coast (high-Z) mode in the hardware variant.

**Figure 7-29. Cycle-by-Cycle Current-Limit Operation**

**Figure 7-30. Cycle-by-Cycle Current-Limit Operation with Low Side Switching in Brake Mode**

**Figure 7-31. Cycle-by-Cycle Current-Limit Operation with Low Side Switching in Coast Mode**

Figure 7-32 shows the operation of driver in brake mode, where the current recirculates through low-side FETs while the high-side FETs are disabled.

Figure 7-33 shows the operation of driver in hi-Z mode, where the current recirculates through the body diodes of the low-side FETs while the high-side FETs are disabled.

**Figure 7-32. Brake State**

**Figure 7-33. Coast State**

**Note**

During the brake operation, a high current flows through the low-side FETs, which may ultimately activate the overcurrent protection circuit. In this state, the body diode of the high-side FET conducts and directs brake energy to the VM supply rail.

### 7.3.12.1 Cycle by Cycle Current Limit with 100% Duty Cycle Input

In case of 100% duty cycle applied on PWM input, there is no edge available to turn high-side FET back on. To overcome this problem, DRV8376 has built in internal PWM clock which is used to turn high-side FET back on once high-side FET is disabled after exceeding  $I_{LIMIT}$  threshold. In SPI variant DRV8376, this internal PWM clock can be configured to either 10kHz or 20kHz or 40kHz through PWM\_100\_DUTY\_SEL. In H/W variant DRV8376 PWM internal clock is set to 20kHz. Figure 7-34 shows operation with 100 % duty cycle.

**Figure 7-34. Cycle-by-Cycle Current-Limit Operation with 100% PWM Duty Cycle**

### 7.3.13 Protections

The DRV8376 family of devices is protected against VM undervoltage, charge pump undervoltage, and overcurrent events. [Table 7-5](#) summarizes various faults details.

**Table 7-5. Fault Action and Response (SPI Devices)**

FAULT	CONDITION	CONFIGURATION	REPORT	H-BRIDGE	LOGIC	RECOVERY
VM undervoltage (RESET)	$V_{VM} < V_{UVLO}$	—	—	Hi-Z	Disabled	Automatic: $V_{VM} > V_{UVLO\_R}$ CLR_FLT, nSLEEP Reset Pulse (RESET bit)
GVDD undervoltage (RESET)	$V_{GVDD} < V_{GVDD\_UV}$	—	—	Hi-Z	Disabled	Automatic: $V_{GVDD} > V_{GVDD\_UV\_R}$ CLR_FLT, nSLEEP Reset Pulse (RESET bit)
AVDD undervoltage (RESET)	$V_{AVDD} < V_{AVDD\_UV}$	—	—	Hi-Z	Disabled	Automatic: $V_{AVDD} > V_{AVDD\_UV\_R}$ CLR_FLT, nSLEEP Reset Pulse (RESET bit)
Charge pump undervoltage (VCP_UV)	$V_{CP} < V_{CPUV}$	—	nFAULT	Hi-Z	Active	Automatic: $V_{VCP} > V_{CPUV}$ CLR_FLT, nSLEEP Reset Pulse (VCP_UV bit)
OverVoltage Protection (OVP)	$V_{VM} > V_{OVP}$	OVP_MODE = 0b	None	Active	Active	No action (OVP Disabled)
		OVP_MODE = 1b	FAULT	Hi-Z	Active	Automatic: $V_{VM} < V_{OVP}$ CLR_FLT, nSLEEP Reset Pulse (OVP bit)
Overcurrent Protection (OCP)	$I_{PHASE} > I_{OCP}$	OCP_MODE = 00b	nFAULT	Hi-Z	Active	Latched: CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		OCP_MODE = 01b	nFAULT	Hi-Z	Active	Retry: $t_{RETRY}$ CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		OCP_MODE = 10b	nFAULT	Active	Active	Report only: CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		OCP_MODE = 11b	None	Active	Active	No action
ILIMIT	$V_{LIMIT} > V_{SO}$	ILIMFLT_MODE = 0b	None	ILIMIT Mode	Active	Automatic: High side on the next rising edge of INHx Low side on the next rising edge of INLx
		ILIMFLT_MODE = 1b	nFAULT	ILIMIT Mode	Active	Automatic: High side on the next rising edge of INHx Low side on the next rising edge of INLx
SPI Error (SPI_FLT)	SCLK, Parity and ADDR fault	SPIFLT_MODE = 0b	None	Active	Active	No action
		SPIFLT_MODE = 1b	nFAULT	Active	Active	Report only: CLR_FLT, nSLEEP Reset Pulse (SPI_FLT bit)
OTP Error (OTP_ERR)	OTP reading is erroneous	—	nFAULT	Hi-Z	Active	Latched: Power Cycle, CLR_FLT
Thermal warning (OTW)	$T_J > T_{OTW}$	OTW_MODE = 0b	None	Active	Active	No action
		OTW_MODE = 1b	nFAULT	Active	Active	Automatic: $T_J < T_{OTW} - T_{OTW\_HYS}$ CLR_FLT, nSLEEP Pulse (OTW bit)
Thermal shutdown (OTSD)	$T_J > T_{TSD}$	—	nFAULT	Hi-Z	Active	Automatic: $T_J < T_{TSD} - T_{TSD\_HYS}$

### 7.3.13.1 VM Supply Undervoltage Lockout (RESET)

If at any time the input supply voltage on the VM pin falls lower than the  $V_{UVLO}$  threshold (VM UVLO falling threshold), all of the integrated FETs, driver charge-pump and digital logic controller are disabled as shown in Figure 7-35. Normal operation resumes (driver operation) when the VM undervoltage condition is removed. The RESET bit is latched high in the device status (DEV\_STS) register once the device presumes VM. The RESET bit remains high until cleared through the CLR\_FLT bit or an nSLEEP pin reset pulse ( $t_{RST}$ ).

Figure 7-35. VM Supply Undervoltage Lockout

### 7.3.13.2 AVDD Undervoltage Protection (AVDD\_UV)

If at any time the voltage on AVDD pin falls lower than the  $V_{AVDD\_UV}$  threshold, all of the integrated FETs, driver charge-pump and digital logic controller are disabled. Normal operation resumes (driver operation) when the AVDD undervoltage condition is removed. The RESET bit is latched high in the device status (DEV\_STS) register once the device presumes VM. The RESET bit remains high until cleared through the CLR\_FLT bit or an nSLEEP pin reset pulse ( $t_{RST}$ ).

### 7.3.13.3 GVDD Undervoltage Lockout (GVDD\_UV)

If at any time the voltage on GVDD pin falls lower than the  $V_{GVDD\_UV}$  threshold, all of the integrated FETs, driver charge-pump and digital logic controller are disabled. Normal operation resumes (driver operation) when the GVDD undervoltage condition is removed. The RESET bit is latched high in the device status (DEV\_STS) register once the device presumes VM. The RESET bit remains high until cleared through the CLR\_FLT bit or an nSLEEP pin reset pulse ( $t_{RST}$ ).

### 7.3.13.4 VCP Charge Pump Undervoltage Lockout (CPUV)

If at any time the voltage on the VCP pin (charge pump) falls lower than the  $V_{CPUV}$  threshold voltage of the charge pump, all of the integrated FETs are disabled and the nFAULT pin is driven low. Normal operation starts again (driver operation and the nFAULT pin is released) when the VCP undervoltage condition clears. The charge pump undervoltage is reported on FAULT and CPUV bits. FAULT bit will be autocleared when charge pump undervoltage condition is removed. The CPUV bit stays set until cleared through the CLR\_FLT bit or an nSLEEP pin reset pulse ( $t_{RST}$ ). The CPUV protection is always enabled in both hardware and SPI device variants.

### 7.3.13.5 Overvoltage Protections (OV)

If at any time input supply voltage on the VM pins rises higher lower than the  $V_{OVP}$  threshold voltage, all of the integrated FETs are disabled and the nFAULT pin is driven low. Normal operation starts again (driver operation and the nFAULT pin is released) when the OVP condition clears. The undervoltage is reported on FAULT and OVP bits. FAULT bit will be autocleared when over voltage condition is removed. The OVP bit stays set until

cleared through the CLR\_FLT bit or an nSLEEP pin reset pulse ( $t_{RST}$ ). Setting the OVP\_MODE bit high on the SPI devices enables this protection feature. On hardware interface devices, the OVP protection is disabled.

The OVP threshold is also programmable on the SPI device variant. The OVP threshold can be set to 35-V or 65-V based on the OVP\_SEL bit.

**Figure 7-36. Over Voltage Protection**

**7.3.13.6 Overcurrent Protection (OCP)**

A MOSFET overcurrent event is sensed by monitoring the current flowing through FETs. If the current through a FET exceeds the  $I_{OCP}$  threshold for longer than the  $t_{OCP}$  deglitch time, an OCP event is recognized and action is done according to the OCP\_MODE bit. On hardware interface devices, the  $I_{OCP}$  threshold is set via OCP pin, the  $t_{OCP\_DEG}$  is fixed at 1.2 $\mu$ s, and the OCP\_MODE bit is configured for latched shutdown. On SPI devices, the  $I_{OCP}$  threshold is set through the OCP\_LVL bits, the  $t_{OCP\_DEG}$  is set through the OCP\_DEG bits.

Table 7-6 shows the configuration of OCP level and deglitch time in the DRV8376 device.

**Table 7-6. OCP Configuration**

OCP Setting	OCP Pin (Hardware Variant)	OCP_LVL bits (SPI variant)	Minimum OCP Level
OCP 1	Connected to AGND	OCP_LVL= 0b	4.5A
OCP 2	Connected to GVDD	OCP_LVL= 1b	2.5A

The OCP\_MODE bit can operate in four different modes: OCP latched shutdown, OCP automatic retry, OCP report only, and OCP disabled.

**7.3.13.6.1 OCP Latched Shutdown (OCP\_MODE = 00b)**

After a OCP event in this mode, all MOSFETs are disabled and the nFAULT pin is driven low. The FAULT, OCP, and corresponding FET's OCP bits are latched high in the SPI registers. Normal operation starts again (driver operation and the nFAULT pin is released) when the OCP condition clears and a clear faults command is issued either through the CLR\_FLT bit or an nSLEEP reset pulse ( $t_{RST}$ ).

**Figure 7-37. Overcurrent Protection - Latched Shutdown Mode**

**7.3.13.6.2 OCP Automatic Retry (OCP\_MODE = 01b)**

After a OCP event in this mode, all the FETs are disabled and the nFAULT pin is driven low. The FAULT, OCP, and corresponding FET's OCP bits are latched high in the SPI registers. Normal operation starts again automatically (driver operation and the nFAULT pin is released) after the  $t_{RETRY}$  time elapses. After the  $t_{RETRY}$  time elapses, the FAULT, OCP, and corresponding FET's OCP bits stay latched until a clear faults command is issued either through the CLR\_FLT bit or an nSLEEP reset pulse ( $t_{RST}$ ).

**Figure 7-38. Overcurrent Protection - Automatic Retry Mode**

**7.3.13.6.3 OCP Report Only (OCP\_MODE = 10b)**

No protective action occurs after a OCP event in this mode. The overcurrent event is reported by driving the nFAULT pin low and latching the FAULT, OCP, and corresponding FET's OCP bits high in the SPI registers. The DRV8376 continues to operate as usual. The external controller manages the overcurrent condition by acting

appropriately. The reporting clears (nFAULT pin is released) when the OCP condition clears and a clear faults command is issued either through the CLR\_FLT bit or an nSLEEP reset pulse ( $t_{RST}$ ).

#### 7.3.13.6.4 OCP Disabled (OCP\_MODE = 11b)

No action occurs after a OCP event in this mode.

#### 7.3.13.7 Thermal Warning (OTW)

If the die temperature exceeds the trip point of the thermal warning ( $T_{OTW}$ ), the OT bit in the OT status (OT\_STS) register and OTF bit in the status register (DEV\_STS) is set. The reporting of OTW on the nFAULT pin can be enabled by setting the over-temperature warning reporting (OTW\_MODE) bit in the configuration control register. The device performs no additional action and continues to function. In this case, the nFAULT pin releases when the die temperature decreases below the hysteresis point of the thermal warning ( $T_{OTW\_HYS}$ ). The OTW bit remains set until cleared through the CLR\_FLT bit or an nSLEEP reset pulse ( $t_{RST}$ ) and the die temperature is lower than thermal warning trip ( $T_{OTW}$ ). In hardware variant the over temperature warning is reported on nFAULT pin by default.

#### 7.3.13.8 Thermal Shutdown (OTS)

If the die temperature in the device exceeds the trip point of the thermal shutdown limit ( $T_{TSD}$ ), all the FETs are disabled, the charge pump is shut down, and the nFAULT pin is driven low. In addition, the FAULT and OTSD bit in the OT status (OT\_STS) register and OTF bit in the status register (DEV\_STS) is set. Normal operation starts again (driver operation and the nFAULT pin is released) when the overtemperature condition clears. The OTSD bit stays latched high indicating that a thermal event occurred until a clear fault command is issued either through the CLR\_FLT bit or an nSLEEP reset pulse ( $t_{RST}$ ). This protection feature cannot be disabled.

## 7.4 Device Functional Modes

### 7.4.1 Functional Modes

#### 7.4.1.1 Sleep Mode

The nSLEEP pin manages the state of the DRV8376 family of devices. When the nSLEEP pin is low, the device goes to a low-power sleep mode. In sleep mode, all FETs are disabled, sense amplifiers are disabled, the charge pump is disabled, the GVDD and AVDD regulators are disabled, and the SPI bus is disabled. The  $t_{\text{SLEEP}}$  time must elapse after a falling edge on the nSLEEP pin before the device goes to sleep mode. The device comes out of sleep mode automatically if the nSLEEP pin is pulled high. The  $t_{\text{WAKE}}$  time must elapse before the device is ready for inputs.

In sleep mode and when  $V_{\text{VM}} < V_{\text{UVLO}}$ , all MOSFETs are disabled.

---

#### Note

During power up and power down of the device through the nSLEEP pin, the nFAULT pin is held low as the internal regulators are enabled or disabled. After the regulators have enabled or disabled, the nFAULT pin is automatically released. The duration that the nFAULT pin is low does not exceed the  $t_{\text{SLEEP}}$  or  $t_{\text{WAKE}}$  time.

---

#### 7.4.1.2 Operating Mode

When the nSLEEP pin is high and the  $V_{\text{VM}}$  voltage is greater than the  $V_{\text{UVLO}}$  voltage, the device goes to operating mode. The  $t_{\text{WAKE}}$  time must elapse before the device is ready for inputs. In this mode the charge pump, GVDD and AVDD regulator, and SPI bus are active.

#### 7.4.1.3 Fault Reset (CLR\_FLT or nSLEEP Reset Pulse)

In the case of device latched faults, the DRV8376 family of devices goes to a partial shutdown state to help protect the power MOSFETs and system.

When the fault condition clears, the device can go to the operating state again by either setting the CLR\_FLT SPI bit on SPI devices or issuing a reset pulse to the nSLEEP pin on either interface variant. The nSLEEP reset pulse ( $t_{\text{RST}}$ ) consists of a high-to-low-to-high transition on the nSLEEP pin. The low period of the sequence falls within the  $t_{\text{RST}}$  time window or else the device starts the complete shutdown sequence. The reset pulse has no effect on any of the regulators, device settings, or other functional blocks.

### 7.4.2 DRVOFF Functionality

DRV8376 has capability to disable predriver and MOSFETs bypassing the digital through DRVOFF pin. When DRVOFF pin is pulled high, all six MOSFETs are disabled. If nSLEEP is high when the DRVOFF pin is high, the charge pump, AVDD regulator, GVDD regulator, and SPI bus are active and any driver-related faults such as OCP will be inactive. DRVOFF pin independently disables MOSFETs which stops motor commutation irrespective of status of INHx and INLx input pins.

## 7.5 SPI Communication

### 7.5.1 Programming

On DRV8376 SPI devices, an SPI bus is used to set device configurations, operating parameters, and read out diagnostic information. The SPI operates in secondary mode and connects to a controller. The SPI input data (SDI) word consists of a 24-bit word, with one read or write bit, a parity bit, 6-bit address and 15 bits of data with a parity bit. The SPI output consists of 24 bit word, with a 8 bits of status information (STS register) and 16-bit register data.

A valid frame must meet the following conditions:

- The SCLK pin should be low when the nSCS pin transitions from high to low and from low to high.
- The nSCS pin should be pulled high for at least 400 ns between words.
- When the nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is placed in the Hi-Z state.
- Data is captured on the falling edge of the SCLK pin and data is propagated on the rising edge of the SCLK pin.
- The most significant bit (MSB) is shifted in and out first.
- A full 24 SCLK cycles must occur for transaction to be valid.
- If the data word sent to the SDI pin is less than or more than 24 bits, a frame error occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin following the 8-bit status data.

The SPI registers are reset to the default settings on power up and when the device is enters sleep mode

#### 7.5.1.1 SPI Format

##### SPI Format - with Parity

The SDI input data word is 24 bits long and consists of the following format:

- 1 read or write bit, W (bit B16)
- 6 address bits, A (bits B22 through B17)
- Parity bit, P (bit B23)
- 15 data bits with 1 parity bit, D (bits B15 through B0)

The SDO output data word is 24 bits long. The most significant bits are status bits and the least significant 16 bits are the data content of the register being accessed.

**Table 7-7. SDI Input Data Word Format for SPI**

PAR ITY	ADDRESS						RW	PAR ITY	DATA															
B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0	
P	A5	A4	A3	A2	A1	A0	W0	P	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	

**Table 7-8. SDO Output Data Word Format**

STATUS								DATA															
B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
S7	S6	S5	S4	S3	S2	S1	S0	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

The details of the bits used in SPI frame format are detailed below.

**Read/Write Bit (R/W):** R/W (W0) bit set to 0b indicates a SPI write transaction. For a SPI read operation, R/W bit needs to be set to 1b.

**Address Bits (A):** A SPI secondary device takes a 6-bit register address.

**Parity Bit (P):** Both header and data fields of a SPI input data frame include a parity bit for single bit error detection - in [Table 7-7](#), B23 is parity bit for the header field, while B15 is the parity bit for the data field. The parity scheme used is even parity - the number of ones in a block of 16-bits (including the parity bit) is even. Data will be written to the internal registers only if the parity check is successful. Parity checks can be enabled or disabled by configuring the SPI\_PEN bit of SYS\_CTRL register. Parity checks are disabled by default.

**Note**

Though parity checks are disabled by default, TI recommends enabling parity checks to safeguard against single-bit errors.

## 8 Register Map

### 8.1 STATUS Registers

[Table 8-1](#) lists the memory-mapped registers for the STATUS registers. All register offset addresses not listed in [Table 8-1](#) should be considered as reserved locations and the register contents should not be modified.

**Table 8-1. STATUS Registers**

Offset	Acronym	Register Name	Section
0h	Device Status Register	Device Status Register	<a href="#">Section 8.1.1</a>
2h	Device Raw Status Register	Device Raw Status Register	<a href="#">Section 8.1.2</a>
4h	Over Temperature Status Register	Over Temperature Status Register	<a href="#">Section 8.1.3</a>
5h	Supply Status Register	Supply Status Register	<a href="#">Section 8.1.4</a>
6h	Driver Status Register	Driver Status Register	<a href="#">Section 8.1.5</a>
7h	System Interface Status Register	System Interface Status Register	<a href="#">Section 8.1.6</a>

Complex bit access types are encoded to fit into small table cells. [Table 8-2](#) shows the codes that are used for access types in this section.

**Table 8-2. STATUS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Reset or Default Value		
-n		Value after reset or the default value

### 8.1.1 Device Status Register (Offset = 0h) [Reset = 0280h]

Device Status Register is shown in [Table 8-3](#).

Return to the [Summary Table](#).

**Table 8-3. Device Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-11	RESERVED	R-0	0h	Reserved
10	RESERVED	R	0h	Reserved
9	DNRDY_STS	R	1h	Device Not Ready Status. Will be cleared automatically after completion of Power Up. 0h = Device is Ready 1h = Device is NOT Ready
8	SYSFLT	R	0h	OTP Read fault occurred. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No OTP read fault is detected 1h = OTP read fault detected
7	RESET	R	1h	Device Reset status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = Cleared Value 1h = Device has undergone power on reset
6	SPIFLT	R	0h	SPI Fault status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No SPI fault is detected 1h = SPI fault is detected
5	OCP	R	0h	Overcurrent Status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No overcurrent condition is detected 1h = Overcurrent condition is detected
4	RESERVED	R-0	0h	Reserved
3	OVP	R	0h	Over Voltage Status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No over voltage condition is detected 1h = Over voltage condition is detected
2	UVP	R	0h	Supply Undervoltage Status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No undervoltage voltage condition is detected on CP 1h = Undervoltage voltage condition is detected on CP
1	OTF	R	0h	Overtemperature Fault Status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No overtemperature warning / shutdown is detected 1h = Overtemperature warning / shutdown is detected
0	FAULT	R	0h	Device Fault status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No fault condition is detected 1h = Fault condition is detected

### 8.1.2 Device Raw Status Register (Offset = 2h) [Reset = 0280h]

Device Raw Status Register is shown in [Table 8-4](#).

Return to the [Summary Table](#).

**Table 8-4. Device Raw Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-13	RESERVED	R-0	0h	Reserved
12	DRVOFF_RSTS	R	0h	Status of DRV_OFF pin 0h = DRV_OFF is not active 1h = DRV_OFF is active
11	OTW_RSTS	R	0h	OT Warning Raw Status 0h = OTW not active 1h = OTW is active
10	RESERVED	R	0h	Reserved
9	DNRDY_RSTS	R	1h	Device Not Ready Status 0h = Device is Ready 1h = Device is NOT Ready
8	SYSFLT_RSTS	R	0h	OTP Read fault occurred. Status remains latched until cleared by write to FLT_CLR 0h = No OTP read fault is detected 1h = OTP read fault detected
7	RESET	R	1h	Device power on status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = Cleared by FW after read 1h = Device has undergone power on reset
6	SPIFLT_RSTS	R	0h	SPI Fault status. Status remains latched until cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No SPI fault is detected 1h = SPI fault is detected
5	OCP_RSTS	R	0h	Overcurrent Fault Raw Status. Status remains latched until completion of Auto Retry or write to FLT_CLR or reset pulse on nSLEEP. 0h = Overcurrent condition is not active 1h = Overcurrent condition is active
4	RESERVED	R-0	0h	Reserved
3	OVP_RSTS	R	0h	Over Voltage Raw Fault Status. 0h = Over Voltage condition is not active. 1h = Over Voltage condition is active.
2	UVP_RSTS	R	0h	CP Undervoltage Raw Fault Status. 0h = Chare Pump Under voltage condition is not active. 1h = Chare Pump Under voltage condition is active.
1	OTF_RSTS	R	0h	Overtemperature Shutdown Raw Fault Status. 0h = Overtemperature shutdown is not active. 1h = Overtemperature shutdown is active.
0	RESERVED	R-0	0h	Reserved

### 8.1.3 Over Temperature Status Register (Offset = 4h) [Reset = 0000h]

Over Temperature Status Register is shown in [Table 8-5](#).

Return to the [Summary Table](#).

**Table 8-5. Over Temperature Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-2	RESERVED	R-0	0h	Reserved
1	OTW	R	0h	Overtemperature Warning Fault status. Can be cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No overtemperature warning is detected 1h = Overtemperature warning is detected
0	OTSD	R	0h	Overtemperature Shutdown Fault status. Can be cleared by write to FLT_CLR or reset pulse on nSLEEP 0h = No overtemperature shutdown is detected 1h = Overtemperature shutdown is detected

### 8.1.4 Supply Status Register (Offset = 5h) [Reset = 0000h]

Supply Status Register is shown in [Table 8-6](#).

Return to the [Summary Table](#).

**Table 8-6. Supply Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-7	RESERVED	R-0	0h	Reserved
6	VM_OV	R	0h	Vm Over Voltage Fault Status 0h = No Vm over voltage is detected 1h = Vm over voltage is detected
5	RESERVED	R-0	0h	Reserved
4	CP_UV	R	0h	Charge Pump Undervoltage fault status 0h = No charge pump undervoltage is detected 1h = Charge pump undervoltage is detected
3-0	RESERVED	R-0	0h	Reserved

### 8.1.5 Driver Status Register (Offset = 6h) [Reset = 0000h]

Driver Status Register is shown in [Table 8-7](#).

Return to the [Summary Table](#).

**Table 8-7. Driver Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-7	RESERVED	R-0	0h	Reserved
6	OCPC_HS	R	0h	Overcurrent Status on High-side switch of OUTC 0h = No overcurrent detected on high-side MOSFET of OUTC 1h = Overcurrent detected on high-side MOSFET of OUTC
5	OCPB_HS	R	0h	Overcurrent Status on High-side switch of OUTB 0h = No overcurrent detected on high-side MOSFET of OUTB 1h = Overcurrent detected on high-side MOSFET of OUTB
4	OCPA_HS	R	0h	Overcurrent Status on High-side switch of OUTA 0h = No overcurrent detected on high-side MOSFET of OUTA 1h = Overcurrent detected on high-side MOSFET of OUTA
3	RESERVED	R-0	0h	Reserved
2	OCPC_LS	R	0h	Overcurrent Status on Low-side switch of OUTC 0h = No overcurrent detected on low-side MOSFET of OUTC 1h = Overcurrent detected on low-side MOSFET of OUTC
1	OCPB_LS	R	0h	Overcurrent Status on Low-side switch of OUTB 0h = No overcurrent detected on low-side MOSFET of OUTB 1h = Overcurrent detected on low-side MOSFET of OUTB
0	OCPA_LS	R	0h	Overcurrent Status on Low-side switch of OUTA 0h = No overcurrent detected on low-side MOSFET of OUTA 1h = Overcurrent detected on low-side MOSFET of OUTA

### 8.1.6 System Interface Status Register (Offset = 7h) [Reset = 0000h]

System Interface Status Register is shown in [Table 8-8](#).

Return to the [Summary Table](#).

**Table 8-8. System Interface Status Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-5	RESERVED	R-0	0h	Reserved
4	OTPLD_ERR	R	0h	OTP CRC error during load 0h = No OTP read error is detected 1h = OTP read error is detected
3	RESERVED	R-0	0h	Reserved
2	SPI_PARITY	R	0h	SPI Parity Error 0h = No SPI Parity Error is detected 1h = SPI Parity Error is detected
1	RESERVED	R-0	0h	Reserved
0	FRM_ERR	R	0h	SPI Frame Error 0h = No SPI Frame Error is detected 1h = SPI Frame Error is detected

## 8.2 CONTROL Registers

Table 8-9 lists the memory-mapped registers for the CONTROL registers. All register offset addresses not listed in Table 8-9 are considered as reserved locations and the register contents are not to be modified.

**Table 8-9. CONTROL Registers**

Offset	Acronym	Register Name	Section
10h	Fault Mode Register	Fault Mode Register	<a href="#">Section 8.2.1</a>
13h	Drviver Fault Control Register	Drviver Fault Control Register	<a href="#">Section 8.2.2</a>
17h	Fault Clear Register	Fault Clear Register	<a href="#">Section 8.2.3</a>
20h	PWM Control Register 1	PWM Control Register 1	<a href="#">Section 8.2.4</a>
22h	Predriver control Register	Predriver control Register	<a href="#">Section 8.2.5</a>
23h	CSA Control Register	CSA Control Register	<a href="#">Section 8.2.6</a>
3Fh	System Control Register	System Control Register	<a href="#">Section 8.2.7</a>

Complex bit access types are encoded to fit into small table cells. Table 8-10 shows the codes that are used for access types in this section.

**Table 8-10. CONTROL Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1C	W1C	Write 1 to clear
Reset or Default Value		
-n		Value after reset or the default value

### 8.2.1 Fault Mode Register (Offset = 10h) [Reset = 2811h]

Fault Mode Register is shown in [Table 8-11](#).

Return to the [Summary Table](#).

**Table 8-11. Fault Mode Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14	RESERVED	R-0	0h	Reserved
13	ILIMFLT_MODE	R/W	1h	ILIMIT Fault mode 0h = ILIMIT reporting on nFAULT pin is disabled 1h = ILIMIT reporting on nFAULT pin is enabled
12-11	RESERVED	R/W	0h	Reserved
10	RESERVED	R-0	0h	Reserved
9	OVP_MODE	R/W	0h	Over Voltage Protection Fault mode 0h = Over Voltage protection is disabled 1h = Over Voltage protection is enabled
8	RESERVED	R-0	0h	Reserved
7	SPIFLT_MODE	R/W	0h	SPI Fault mode 0h = SPI fault reporting on nFAULT pin is disabled 1h = SPI fault reporting on nFAULT pin is enabled
6	RESERVED	R-0	0h	Reserved
5-4	OCP_MODE	R/W	1h	Overcurrent Protection Fault mode 0h = Over Current causes a latched fault 1h = Over Current causes an automatic retrying fault 2h = Over Current is report only but no action is taken 3h = Over Current is not reported and no action is taken
3-1	RESERVED	R-0	0h	Reserved
0	OTW_MODE	R/W	1h	Overtemperature Warning Fault mode 0h = Over temperature reporting on nFAULT is disabled 1h = Over temperature reporting on nFAULT is enabled

### 8.2.2 Driver Fault Control Register (Offset = 13h) [Reset = 1010h]

Driver Fault Control Register is shown in [Table 8-12](#).

Return to the [Summary Table](#).

**Table 8-12. Driver Fault Control Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14	RESERVED	R-0	0h	Reserved
13-12	RESERVED	R/W	0h	Reserved
11	RESERVED	R-0	0h	Reserved
10	RESERVED	R/W	0h	Reserved
9	RESERVED	R-0	0h	Reserved
8	OVP_SEL	R/W	0h	Overvoltage level setting 0h = VM overvoltage level is 65V 1h = VM overvoltage level is 35V
7-6	RESERVED	R-0	0h	Reserved
5-4	OCP_DEG	R/W	1h	OCP Deglitch time 0h = OCP Deglitch time is 0.6 $\mu$ s 1h = OCP Deglitch time is 1.25 $\mu$ s 2h = OCP Deglitch time is 1.6 $\mu$ s 3h = OCP Deglitch time is 2 $\mu$ s
3	RESERVED	R-0	0h	Reserved
2	OCP_TRETRY	R/W	0h	OCP Retry Time 0h = 5ms 1h = 500ms
1	RESERVED	R-0	0h	Reserved
0	OCP_LVL	R/W	0h	OCP Level 0h = 4.5A 1h = 2.5A

### 8.2.3 Fault Clear Register (Offset = 17h) [Reset = 0000h]

Fault Clear Register is shown in [Table 8-13](#).

Return to the [Summary Table](#).

**Table 8-13. Fault Clear Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-1	RESERVED	R-0	0h	Reserved
0	FLT_CLR	R-0/W1C	0h	Clear latched faults 0h = No clear fault command is issued 1h = To clear the latched fault bits. This bit automatically resets after being written.

### 8.2.4 PWM Control Register 1 (Offset = 20h) [Reset = 0020h]

PWM Control Register 1 is shown in [Table 8-14](#).

Return to the [Summary Table](#).

**Table 8-14. PWM Control Register 1 Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-12	RESERVED	R/W	0h	Reserved
11	RESERVED	R/W	0h	Reserved
10	RESERVED	R/W	0h	Reserved
9-8	RESERVED	R/W	0h	Reserved
7-6	PWM_100_FREQ_SEL	R/W	0h	Frequency of PWM at 100% Duty cycle 0h = 20KHz 1h = 40KHz 2h = 10KHz 3h = None
5	ILIM_MODE	R/W	1h	Current limit recirculation settings 0h = Current recirculation through FETs (Brake mode) 1h = Current recirculation through diodes (coast mode)
4	RESERVED	R/W	0h	Reserved
3	EN_AAR	R/W	0h	Enable AAR where LS FET gets turned off when current goes negative. 0h = Active Demagnetization AAR is Disabled 1h = Active Demagnetization AAR is Enabled
2	EN_ASR	R/W	0h	Active Demag Enable 0h = Active Demagnetization is Disabled 1h = Active Demagnetization is Enabled
1-0	PWM_MODE	R/W	0h	PWM mode selection 0h = 6x mode 1h = 6x mode 2h = 3x mode 3h = 3x mode

### 8.2.5 Predriver control Register (Offset = 22h) [Reset = 0080h]

Predriver control Register is shown in [Table 8-15](#).

Return to the [Summary Table](#).

**Table 8-15. Predriver control Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-11	RESERVED	R-0	0h	Reserved
10-8	ILIM_BLANK_SEL	R/W	0h	Current Limit Blanking Time Selection 0h = 5.5us for slew rate of 50 and 1.8us for all other slew rates. 1h = 6.0us for slew rate of 50 and 2.3us for all other slew rates. 2h = 6.5us for slew rate of 50 and 2.8us for all other slew rates. 3h = 7.5us for slew rate of 50 and 3.8us for all other slew rates.
7-4	ADMAG_TMARGIN	R/W	8h	Wait time before determining HiZ. N*4*100ns
3	AD_COMP_TH_HS	R/W	0h	Active demag high side comparator threshold 0h = active demag comparator threshold is 100mA 1h = active demag comparator threshold is 150mA
2	AD_COMP_TH_LS	R/W	0h	Active demag low side comparator threshold 0h = active demag comparator threshold is 100mA 1h = active demag comparator threshold is 150mA
1-0	SLEW_RATE	R/W	0h	Slew rate settings 0h = Slew rate is 1100 V/μs 1h = Slew rate is 500 V/μs 2h = Slew rate is 250 V/μs 3h = Slew rate is 50 V/μs

### 8.2.6 CSA Control Register (Offset = 23h) [Reset = 0000h]

CSA Control Register is shown in [Table 8-16](#).

Return to the [Summary Table](#).

**Table 8-16. CSA Control Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-2	RESERVED	R-0	0h	Reserved
1-0	CSA_GAIN	R/W	0h	CSA Gain settings 0h = CSA gain is 0.4 V/A 1h = CSA gain is 1.0 V/A 2h = CSA gain is 2.5 V/A 3h = CSA gain is 5.0 V/A

### 8.2.7 System Control Register (Offset = 3Fh) [Reset = 0008h]

System Control Register is shown in [Table 8-17](#).

Return to the [Summary Table](#).

**Table 8-17. System Control Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PARITY	R	0h	Parity Bit if SPI_PEN is set to '1' otherwise reserved
14-12	WRITE_KEY	R-0/W	0h	0x5 Write Key Specific to this register.
11	SDO_VSEL	R/W	0h	SDO Output Voltage Select 0h = AVDD 1h = GVDD
10	SDO_ODEN	R/W	0h	SDO in Open Drain Mode 0h = SDO in Push Pull Mode 1h = SDO in Open Drain Mode
9-8	RESERVED	R-0	0h	Reserved
7	REG_LOCK	R/W	0h	Register Lock Bit 0h = Registers Unlocked 1h = Registers Locked
6	SPI_PEN	R/W	0h	Parity Enable for SPI 0h = Parity Disabled 1h = Parity Enabled
5-4	RESERVED	R/W	0h	Reserved
3	RESERVED	R/W	0h	Reserved
2-0	RESERVED	R-0	0h	Reserved

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The DRV8376 can be used to drive Brushless-DC motors. A primary application schematic is shown in Figure 9-1.

Figure 9-1. Primary Application Schematics

## 9.2 Typical Applications

### 9.2.1 Three-Phase Brushless-DC Motor Control

In this application, the DRV8376 is used to drive a Brushless-DC motor.

#### 9.2.1.1 Detailed Design Procedure

Table 9-1 lists the example input parameters for the system design.

**Table 9-1. Design Parameters**

DESIGN PARAMETERS	REFERENCE	EXAMPLE VALUE
Supply voltage	$V_{VM}$	48V
Motor RMS current	$I_{RMS}$	0.5A
Motor peak current	$I_{PEAK}$	1.25A
Limit Current	$I_{LIMIT}$	2A
PWM Frequency	$f_{PWM}$	20kHz
Slew Rate Setting	SR	1100V/ $\mu$ s
ADC reference voltage	$V_{VREF}$	3.3V
System ambient temperature	$T_A$	-20°C to +105°C

##### 9.2.1.1.1 Motor Voltage

The DRV8376 support wide operating supply voltage rating from 4.5V to 65V. Ensure that the maximum supply voltage is not violating the operating voltage specification.

##### 9.2.1.1.2 Using Active Demagnetization

Active demagnetization reduces power losses in the device by turning on the MOSFETs automatically when the body diode starts conducting to reduce diode conduction losses. Active demagnetization is used in trapezoidal commutation when switching commutation states (turning a high-side MOSFET off and another high-side MOSFET on while keeping a low-side MOSFET on). Active demagnetization is enabled when EN\_ASR and EN\_AAR bits are set in the SPI variant or OCP/SR pin is set to Mode 2 or Mode 4 in the H/W variant.

When switching commutation states with active demagnetization disabled, dead time is inserted and the low-side MOSFET's body diode conducts while turning another high-side MOSFET on to continue sourcing current through the motor. This conduction period causes higher power losses due to the forward-bias voltage of the diode and slower dissipation of current. Figure 9-2 shows the body diode conducting when switching commutation states.

DRV8376

SLVSHD4A – OCTOBER 2024 – REVISED MARCH 2025

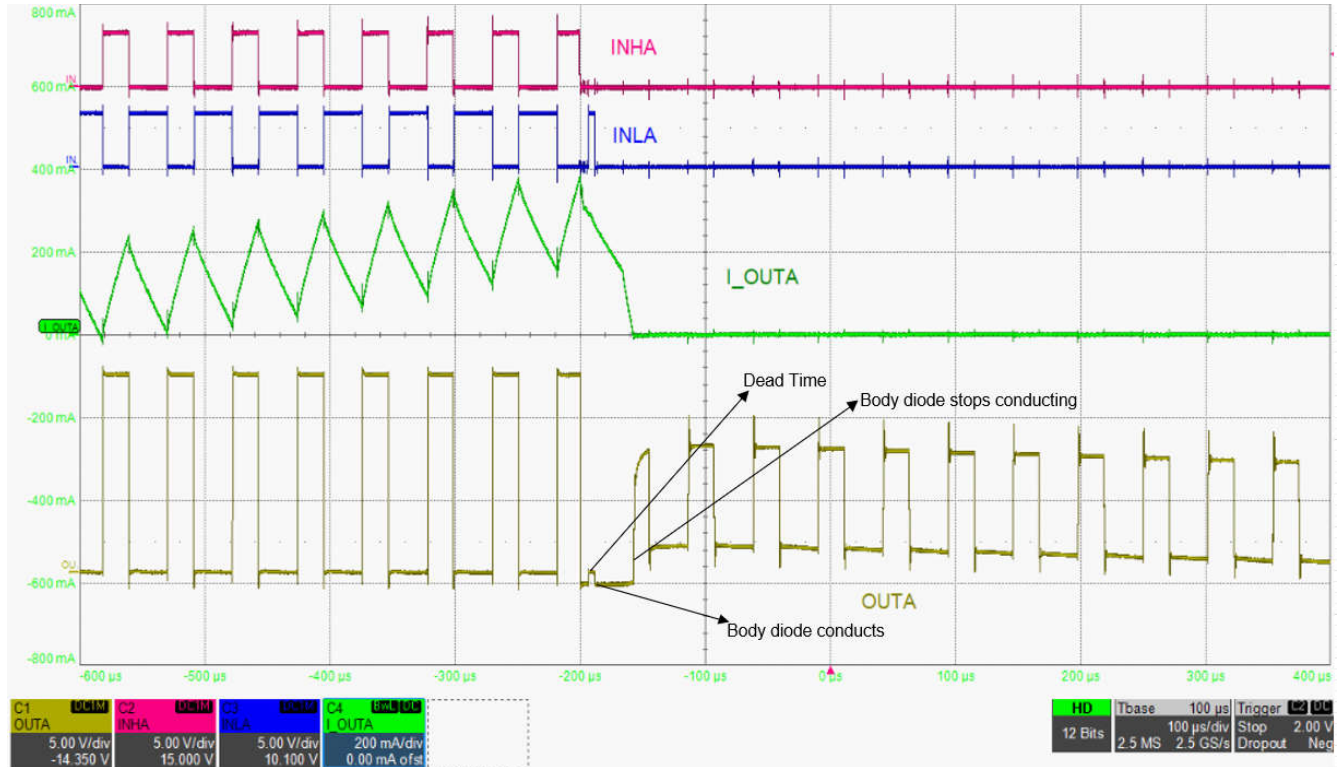

Figure 9-2. Active demagnetization disabled in DRV8376

When active demagnetization is enabled, the AD\_HS and AD\_LS comparators detect when the sense FET voltage is higher or lower than the programmed threshold. After the dead time period, if the threshold is exceeded for a fixed amount of time, the body diode is conducting and the logic core turns the low-side FET on to provide a conduction path with smaller power losses. Once the  $V_{DS}$  voltage is below the comparator threshold, the MOSFET turns off and current briefly conducts through the body diode until the current completely decays to zero. This is shown in Figure 9-3.

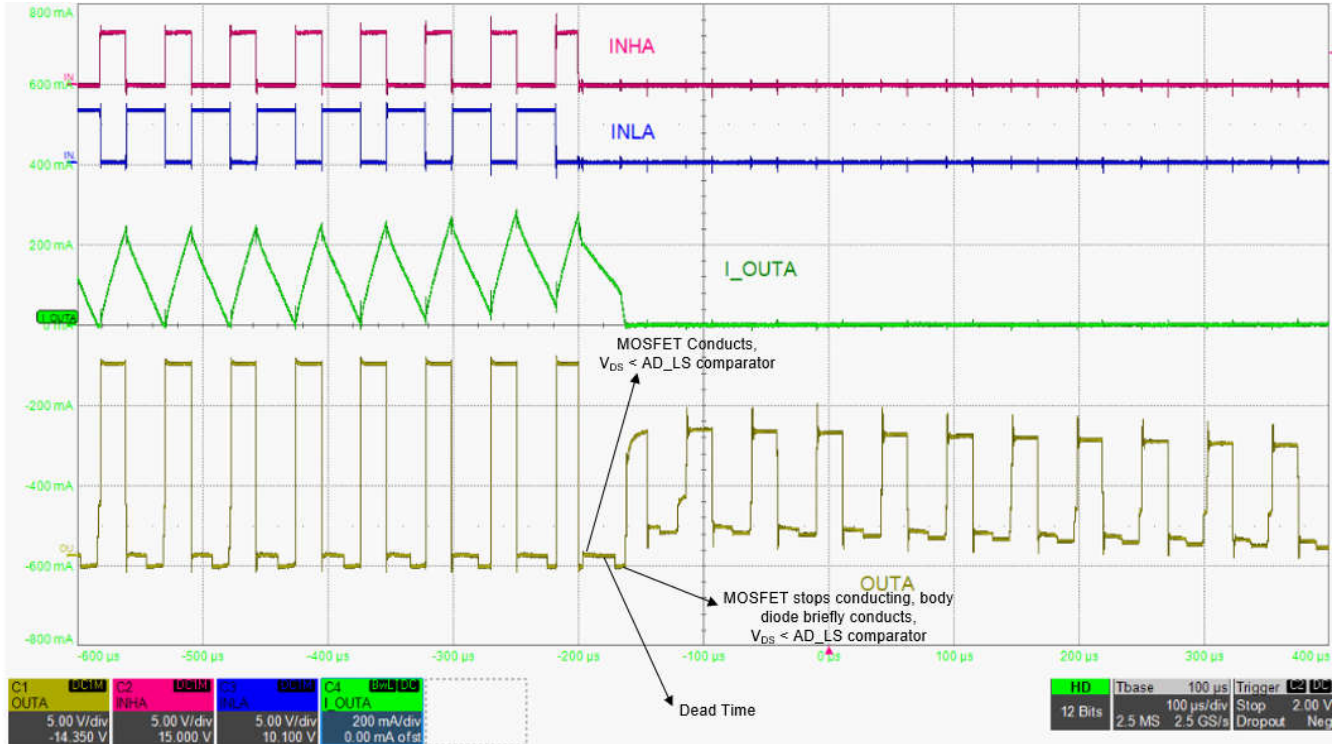

Figure 9-3. Active demagnetization enabled in DRV8376

### 9.2.1.1.3 Current Limit Implementation

The ILIMIT pin on the DRV8376 device is used to set a cycle-by-cycle current limit proportional to the voltage on the ILIMIT pin ( $V_{LIM}$ ). The analog voltage  $V_{LIM}$  can be set using a digital-to-analog converter from an external microcontroller or a resistor divider. Applying voltage equal to  $V_{VREF}$  on the ILIMIT pin disables the cycle-by-cycle current limit, and applying  $(V_{VREF}/2 - 0.25)$  V on ILIMIT pin sets the current limit at the maximum threshold of 4A.

The equations below shows how to set the ILIMIT pin voltage ( $V_{LIM}$ ) with respect to  $V_{VREF} = 3.3V$ , current sense amplifier gain ( $GAIN = 1V/A$ ), to set cycle-by-cycle current limit to 2A (sum of all the low side FET current).

$$V_{LIM} = \frac{V_{VREF}}{2} + (I_{OUT} \times \frac{GAIN}{3}) \quad (6)$$

Use Equation 7 to calculate values for a GVDD sourced resistor divider with resistors  $R_{ILIM1}$  and  $R_{ILIM2}$  to set current limit equal to the 2A calculated current limit. Other voltage rails like AVDD or VREF voltage can also be used to derive the ILIMIT pin voltage. Use appropriate capacitive filter at ILIMIT pin if needed.

$$V_{LIM}(V) = GVDD \times \left( \frac{R_{ILIM2}}{R_{ILIM1} + R_{ILIM2}} \right) \quad (7)$$

To reduce current load on GVDD,  $R_{ILIM2}$  is configured to 10kΩ in this example.

$$2.317 = 5 \times \left( \frac{10k\Omega}{R_{ILIM1} + 10k\Omega} \right) \quad (8)$$

$$R_{ILIM1} = 11.6k\Omega \quad (9)$$

Cycle-by-cycle limit can also occur with 100% PWM duty cycle inputs using an internal PWM pulse to monitor the current with ILIM. Setting the PWM\_100\_DUTY\_SEL configures the frequency of the internal PWM pulse to 20kHz or 40kHz.

**Note**

If the voltage on the ILIMIT pin is less than  $V_{VREF}/2$ , ILIMIT threshold is 0A.

**9.2.1.1.4 Current Sensing and Output Filtering**

The SOx pins are typically sampled by an analog-to-digital converter in the MCU to calculate the phase current. Phase current calculations are used for closed-loop feedback such as Field-oriented control.

An example calculation of SOx voltage is shown below, for a system using  $V_{VREF} = 3.3V$ ,  $GAIN = 1V/A$ , and peak motor current ( $I_{OUTx}$ ) of  $\pm 1.25A$ .

$$SOx = \frac{V_{VREF}}{2} \pm GAIN \times I_{OUTx} \tag{10}$$

$$SOx = \frac{3.3V}{2} \pm 1V/A \times 1.25 \tag{11}$$

$$SOx = 0.4V \text{ to } 2.9V \tag{12}$$

Sometimes high-frequency noise appears at the SOx signals due to voltage ripple at VREF, added inductance in the SOx traces, or the proximity of SOx traces to high-frequency components. Adding a low-pass RC filter near the MCU, with a cutoff frequency at least 10 times the PWM switching frequency for trapezoidal commutation and 100 times the PWM switching frequency for sinusoidal commutation, effectively eliminates high-frequency noise. Selecting the capacitor depends on various parameters, such as bandwidth requirements, ADC sampling capacitor, and ADC acquisition time. The current sensing output stage manages only currents in the order of a few hundred micro-amperes. Using a capacitor with a maximum value of 100pF maintains optimum performance. Choose a resistor based on the bandwidth requirements. The cutoff frequency for the low-pass RC filter is in [Equation 13](#).

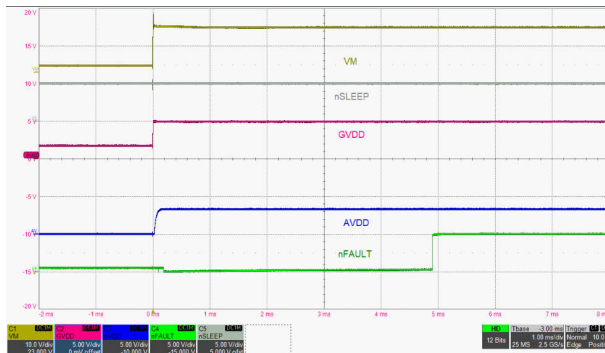

$$f_c = \frac{1}{2\pi RC} \tag{13}$$

**9.2.1.1.5 Power Dissipation and Junction Temperature Losses**

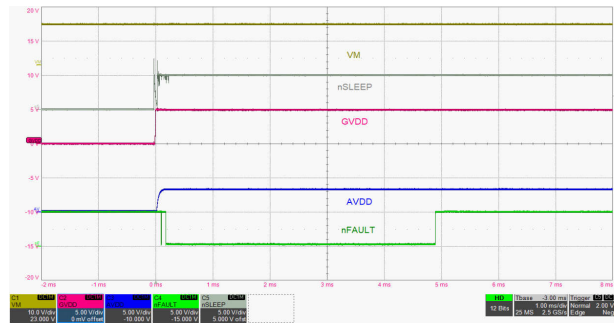

To calculate the junction temperature of the DRV8376 from power losses, use [Equation 14](#). Note that the thermal resistance  $\theta_{JA}$  depends on PCB configurations such as the ambient temperature, numbers of PCB layers, copper thickness on top and bottom layers, and the PCB area.

$$T_J[^\circ C] = P_{loss}[W] \times \theta_{JA}[\frac{^\circ C}{W}] + T_A[^\circ C] \tag{14}$$

### 9.3 Power Supply Recommendations

#### 9.3.1 Bulk Capacitance

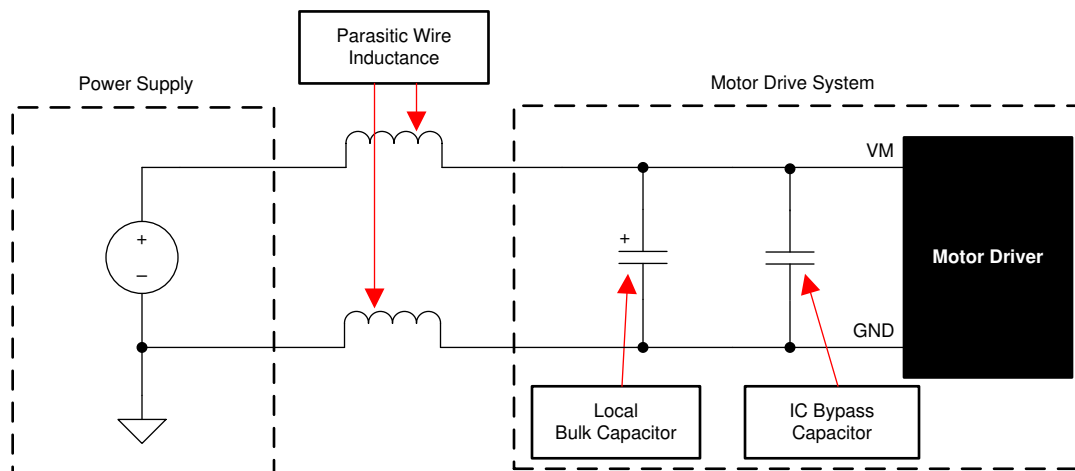

Having an appropriate local bulk capacitance is an important factor in motor drive system design. Having more bulk capacitance is generally beneficial, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The capacitance and current capability of the power supply
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed dc, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and the motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

**Figure 9-8. Example Setup of Motor Drive System With External Power Supply**

Make the voltage rating for bulk capacitors higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

## 9.4 Layout

### 9.4.1 Layout Guidelines

The bulk capacitor is placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths is as wide as possible, and numerous vias are used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors such as the charge pump, GVDD, AVDD, and VREF capacitors are ceramic and placed closely to device pins.

The high-current device outputs use wide metal traces.

To reduce noise coupling and EMI interference from large transient currents into small-current signal paths, grounding are partitioned between PGND and AGND. TI recommends connecting all non-power stage circuitry (including the thermal pad) to AGND to reduce parasitic effects and improve power dissipation from the device. Verify grounds are connected through net-ties or wide resistors to reduce voltage offsets and maintain gate driver performance.

The device thermal pad are soldered to the PCB top-layer ground plane. Multiple vias are used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias helps dissipate the  $I^2 \times R_{DS(on)}$  heat that is generated in the device.

To improve thermal performance, maximize the ground area that is connected to the thermal pad ground across all possible layers of the PCB. Using thick copper pours can lower the junction-to-air thermal resistance and improve thermal dissipation from the die surface.

### 9.4.2 Layout Example

#### Recommended Layout Example for VQFN Package

### 9.4.3 Thermal Considerations

The DRV8376 has thermal shutdown (TSD) as previously described. A die temperature in excess of 150°C (minimally) disables the device until the temperature drops to a safe level.

Any tendency of the device to enter thermal shutdown is an indication of excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

#### 9.4.3.1 Power Dissipation

The power loss in DRV8376 include standby power losses, LDO power losses, FET conduction and switching losses, and diode losses. The FET conduction loss dominates the total power dissipation in DRV8376. At start-up and fault conditions, the output current is much higher than normal current; remember to take these peak currents and their duration into consideration. The total device dissipation is the power dissipated in each of the three half bridges added together. The maximum amount of power that the device can dissipate depends on ambient temperature and heatsinking. Note that  $R_{DS,ON}$  increases with temperature, so as the device heats, the power dissipation increases. Take this into consideration when designing the PCB and heatsinking.

## 10 Device and Documentation Support

### 10.1 Documentation Support

### 10.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

Changes from Revision * (October 2024) to Revision A (March 2025)	Page
• Updated the charge pump fly cap value from 10nF to 47nF.....	16

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">DRV8376HNLGR</a>	Active	Production	VQFN (NLG)   28	5000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	DRV 8376H
DRV8376HNLGR.A	Active	Production	VQFN (NLG)   28	5000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	DRV 8376H
<a href="#">DRV8376SNLGR</a>	Active	Production	VQFN (NLG)   28	5000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	DRV 8376S
DRV8376SNLGR.A	Active	Production	VQFN (NLG)   28	5000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	DRV 8376S

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
