

FDC2112-Q1, FDC2114-Q1, FDC2212-Q1, FDC2214-Q1 Multi-Channel 12-Bit or 28-Bit Capacitance-to-Digital Converter (FDC) for Capacitive Sensing

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: -40°C to $+125^{\circ}\text{C}$ Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C5
- EMI-Resistant Architecture
- Maximum Output Rates (One Active Channel):
 - 13.3 ksp/s (FDC2112-Q1, FDC2114-Q1)
 - 4.08 ksp/s (FDC2212-Q1, FDC2214-Q1)
- Maximum Input Capacitance: 250 nF (at 10 kHz with 1-mH inductor)
- Sensor Excitation Frequency: 10 kHz to 10 MHz
- Number of Channels: 2, 4
- Resolution: Up to 28 bits
- RMS noise: 0.3 fF at 100 sps and $f_{\text{SENSOR}} = 5\text{MHz}$
- Supply Voltage: 2.7 V to 3.6 V
- Power Consumption: Active: 2.1 mA
- Low-Power Sleep Mode: 35 μA
- Shutdown: 200 nA
- Interface: I²C
- Temperature Range: -40°C to $+125^{\circ}\text{C}$

2 Applications

- EMI-Resistant Proximity Sensor
- EMI-Resistant Gesture Recognition
- EMI-Resistant Foreign Object Detection
- EMI-Resistant Rain / Fog / Ice / Snow Sensor
- Automotive Door / Kick Sensors

3 Description

Capacitive sensing is a low-power, low-cost, high-resolution contactless sensing technique that can be applied to a variety of applications ranging from proximity detection to gesture recognition. The sensor in a capacitive sensing system is any metal or conductor, allowing for low cost and highly flexible system design.

The main challenge limiting sensitivity in capacitive sensing applications is noise susceptibility of the sensors. With the FDC2x1x-Q1 innovative EMI resistant architecture, performance can be maintained even in presence of high-noise environments.

The FDC2x1x-Q1 is a multi-channel family of noise- and EMI-resistant, high-resolution, high-speed capacitance-to-digital converters for implementing capacitive sensing solutions. The devices employ an innovative narrow-band based architecture to offer high rejection of noise and interferers while providing high resolution at high speed. The devices support a wide excitation frequency range, offering flexibility in system design.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------|-------------------|
| FDC2112-Q1 | WSON (12) | 4.00 mm x 4.00 mm |
| FDC2114-Q1 | WQFN (16) | 4.00 mm x 4.00 mm |
| FDC2212-Q1 | WSON (12) | 4.00 mm x 4.00 mm |
| FDC2214-Q1 | WQFN (16) | 4.00 mm x 4.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Pin Functions

| PIN | | TYPE ⁽¹⁾ | DESCRIPTION |
|-----|--------------------|---------------------|--|
| NO. | NAME | | |
| 1 | SCL | I | I2C clock input |
| 2 | SDA | I/O | I2C data input/output |
| 3 | CLKIN | I | Master Clock input. Tie this pin to GND if internal oscillator is selected |
| 4 | ADDR | I | I2C Address selection pin: when ADDR=L, I2C address = 0x2A, when ADDR=H, I2C address = 0x2B. |
| 5 | INTB | O | Configurable Interrupt output pin |
| 6 | SD | I | Shutdown input |
| 7 | VDD | P | Power Supply |
| 8 | GND | G | Ground |
| 9 | IN0A | A | Capacitive sensor input 0 |
| 10 | IN0B | A | Capacitive sensor input 0 |
| 11 | IN1A | A | Capacitive sensor input 1 |
| 12 | IN1B | A | Capacitive sensor input 1 |
| 13 | IN2A | A | Capacitive sensor input 2 (FDC2114 / FDC2214 only) |
| 14 | IN2B | A | Capacitive sensor input 2 (FDC2114 / FDC2214 only) |
| 15 | IN3A | A | Capacitive sensor input 3 (FDC2114 / FDC2214 only) |
| 16 | IN3B | A | Capacitive sensor input 3 (FDC2114 / FDC2214 only) |
| DAP | DAP ⁽²⁾ | N/A | Connect to ground |

(1) I = Input, O = Output, P=Power, G=Ground, A=Analog

(2) There is an internal electrical connection between the exposed Die Attach Pad (DAP) and the GND pin of the device. Although the DAP can be left floating, for best performance the DAP should be connected to the same potential as the device's GND pin. Do not use the DAP as the primary ground for the device. The device GND pin must always be connected to ground.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------|----------------------------------|------|-----------|------|
| VDD | Supply voltage | | 5 | V |
| V _i | Voltage on any pin | -0.3 | VDD + 0.3 | V |
| I _A | Input current on any INx pin | -8 | 8 | mA |
| I _D | Input current on any digital pin | -5 | 5 | mA |
| T _J | Junction temperature | -55 | 150 | °C |
| T _{stg} | Storage temperature | -65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|---|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per AEC Q100-011 | ±750 |

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Unless otherwise specified, all limits ensured for T_A = 25°C, VDD = 3.3 V

| | | MIN | NOM | MAX | UNIT |
|----------------|-----------------------|-----|-----|-----|------|
| VDD | Supply voltage | 2.7 | | 3.6 | V |
| T _A | Operating temperature | -40 | | 125 | °C |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | FDC2112 / FDC2212 | FDC2214 / FDC2214 | UNIT |
|-------------------------------|--|----------------------|----------------------|------|
| | | DNT (WSON) | RGH (WQFN) | |
| | | 12 PINS | 16 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 36.7 | 35.6 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 36.2 | 36.2 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 14 | 13.4 | °C/W |
| Ψ _{JT} | Junction-to-top characterization parameter | 0.4 | 0.4 | °C/W |
| Ψ _{JB} | Junction-to-board characterization parameter | 14.2 | 13.4 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 3.5 | 3.5 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Unless otherwise specified, all limits ensured for $T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{ V}^{(1)}$

| PARAMETER | | TEST CONDITIONS ⁽²⁾ | MIN ⁽³⁾ | TYP ⁽⁴⁾ | MAX ⁽³⁾ | UNIT |
|--------------------------|--|--|--------------------|--------------------|--------------------|---------------|
| POWER | | | | | | |
| V_{DD} | Supply voltage | $T_A = -40^\circ\text{C}$ to 125°C | 2.7 | | 3.6 | V |
| I_{DD} | Supply current (not including sensor current) ⁽⁵⁾ | CLKIN = 10MHz ⁽⁶⁾ | | 2.1 | | mA |
| I_{DDSL} | Sleep mode supply current ⁽⁵⁾ | | | 35 | 60 | μA |
| I_{SD} | Shutdown mode supply current ⁽⁵⁾ | | | 0.2 | 1 | μA |
| CAPACITIVE SENSOR | | | | | | |
| $C_{\text{SENSORMAX}}$ | Maximum sensor capacitance | 1-mH inductor, 10-kHz oscillation | | 250 | | nF |
| C_{IN} | Sensor pin parasitic capacitance | | | 4 | | pF |
| N_{BITS} | Number of bits | FDC2112, FDC2114 RCOUNT \geq 0x0400 | | | 12 | bits |
| | | FDC2212, FDC2214 RCOUNT = 0xFFFF | | | 28 | bits |
| f_{CS} | Maximum channel sample rate | FDC2112, FDC2114 single active channel continuous conversion, SCL = 400 kHz | | | 13.3 | kSPS |
| | | FDC2212, FDC2214 single active channel continuous conversion, SCL = 400 kHz | | | 4.08 | kSPS |
| EXCITATION | | | | | | |
| f_{SENSOR} | Sensor excitation frequency | $T_A = -40^\circ\text{C}$ to 125°C | 0.01 | | 10 | MHz |
| $V_{\text{SENSORMIN}}$ | Minimum sensor oscillation amplitude (pk) ⁽⁷⁾ | | | 1.2 | | V |
| $V_{\text{SENSORMAX}}$ | Maximum sensor oscillation amplitude (pk) | | | 1.8 | | V |
| $I_{\text{SENSORMAX}}$ | Sensor maximum current drive | HIGH_CURRENT_DRV = b0 DRIVE_CURRENT_CH0 = 0xF800 | | 1.5 | | mA |
| | | HIGH_CURRENT_DRV = b1 DRIVE_CURRENT_CH0 = 0xF800 Channel 0 only | | 6 | | mA |

- (1) *Electrical Characteristics* values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. *Absolute Maximum Ratings* indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) Register values are represented as either binary (b is the prefix to the digits), or hexadecimal (0x is the prefix to the digits). Decimal values have no prefix.
- (3) Limits are ensured by testing, design, or statistical analysis at 25°C . Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
- (4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (5) I2C read/write communication and pullup resistors current through SCL, SDA not included.
- (6) Sensor capacitor: 1 layer, $20.9 \times 13.9\text{ mm}$, Bourns CMH322522-180KL sensor inductor with $L=18\ \mu\text{H}$ and $33\ \text{pF}$ 1% COG/NP0 Target: Grounded aluminum plate ($176 \times 123\text{ mm}$), Channel = Channel 0 (continuous mode) CLKIN = 40 MHz, CHx_FIN_SEL = b10, CHx_FREQ_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100, DRIVE_CURRENT_CH0 = 0xF800.
- (7) Lower $V_{\text{SENSORMIN}}$ oscillation amplitudes can be used, but will result in lower SNR.

Electrical Characteristics (continued)

Unless otherwise specified, all limits ensured for $T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{ V}^{(1)}$

| PARAMETER | | TEST CONDITIONS ⁽²⁾ | MIN ⁽³⁾ | TYP ⁽⁴⁾ | MAX ⁽³⁾ | UNIT |
|-----------------------------------|---|--|----------------------------|--------------------|---------------------|-----------------------|
| MASTER CLOCK | | | | | | |
| f_{CLKIN} | External master clock input frequency (CLKIN) | $T_A = -40^\circ\text{C}$ to 125°C | 2 | | 40 | MHz |
| $\text{CLKIN}_{\text{DUTY_MIN}}$ | External master clock minimum acceptable duty cycle (CLKIN) | | | 40% | | |
| $\text{CLKIN}_{\text{DUTY_MAX}}$ | External master clock maximum acceptable duty cycle (CLKIN) | | | 60% | | |
| $V_{\text{CLKIN_LO}}$ | CLKIN low voltage threshold | | | | $0.3 V_{\text{DD}}$ | V |
| $V_{\text{CLKIN_HI}}$ | CLKIN high voltage threshold | | $0.7 \times V_{\text{DD}}$ | | | V |

6.6 Timing Requirements

| | | MIN | NOM | MAX | UNIT |
|-----------------------------------|---|-----|-----|------|---------------|
| t_{SDWAKEUP} | Wake-up time from SD high-low transition to I2C readback | | | 2 | ms |
| $t_{\text{SLEEPWAKEUP}}$ | Wake-up time from sleep mode | | | 0.05 | ms |
| $t_{\text{WD-TIMEOUT}}$ | Sensor recovery time (after watchdog timeout) | | 5.2 | | ms |
| I2C TIMING CHARACTERISTICS | | | | | |
| f_{SCL} | Clock frequency | 10 | | 400 | kHz |
| t_{LOW} | Clock low time | 1.3 | | | μs |
| t_{HIGH} | Clock high time | 0.6 | | | μs |
| $t_{\text{HD;STA}}$ | Hold time (repeated) START condition: after this period, the first clock pulse is generated | 0.6 | | | μs |
| $t_{\text{SU;STA}}$ | Setup time for a repeated START condition | 0.6 | | | μs |
| $t_{\text{HD;DAT}}$ | Data hold time | 0 | | | μs |
| $t_{\text{SU;DAT}}$ | Data setup time | 100 | | | ns |
| $t_{\text{SU;STO}}$ | Setup time for STOP condition | 0.6 | | | μs |
| t_{BUF} | Bus free time between a STOP and START condition | 1.3 | | | μs |
| $t_{\text{VD;DAT}}$ | Data valid time | | | 0.9 | μs |
| $t_{\text{VD;ACK}}$ | Data valid acknowledge time | | | 0.9 | μs |
| t_{SP} | Pulse width of spikes that must be suppressed by the input filter ⁽¹⁾ | | | 50 | ns |

(1) This parameter is specified by design and/or characterization and is not tested in production.

6.7 Switching Characteristics - I2C

Unless otherwise specified, all limits ensured for $T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{ V}$

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------------------|--|---------------------|---------------------|---------------------|------|
| VOLTAGE LEVELS | | | | | |
| V_{IH} | Input high voltage | $0.7 \times V_{DD}$ | | | V |
| V_{IL} | Input low voltage | | | $0.3 \times V_{DD}$ | V |
| V_{OL} | Output low voltage (3 mA sink current) | | | 0.4 | V |
| HYS | Hysteresis | | $0.1 \times V_{DD}$ | | V |

6.8 Typical Characteristics

Common test conditions (unless specified otherwise): Sensor capacitor: 1 layer, 20.9 × 13.9 mm, Bourns CMH322522-180KL sensor inductor with L = 18 μH and 33 pF 1% COG/NP0 Target: Grounded aluminum plate (176 × 123 mm), Channel = Channel 0 (continuous mode) CLKIN = 40 MHz, CHx_FIN_SEL = b01, CHx_FREF_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100, DRIVE_CURRENT_CH0 = 0x7800.

Typical Characteristics (continued)

Common test conditions (unless specified otherwise): Sensor capacitor: 1 layer, 20.9 × 13.9 mm, Bourns CMH322522-180KL sensor inductor with L = 18 μH and 33 pF 1% COG/NP0 Target: Grounded aluminum plate (176 × 123 mm), Channel = Channel 0 (continuous mode) CLKIN = 40 MHz, CHx_FIN_SEL = b01, CHx_FREF_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100, DRIVE_CURRENT_CH0 = 0x7800.

7 Detailed Description

7.1 Overview

The FDC2112, FDC2114, FDC2212, and FDC2214 are high-resolution, multichannel capacitance-to-digital converters for implementing capacitive sensing solutions. In contrast to traditional switched-capacitance architectures, the FDC2112, FDC2114, FDC2212, and FDC2214 employ an L-C resonator, also known as L-C tank, as a sensor. The narrow-band architecture allows unprecedented EMI immunity and greatly reduced noise floor when compared to other capacitive sensing solutions.

Using this approach, a change in capacitance of the L-C tank can be observed as a shift in the resonant frequency. Using this principle, the FDC is a capacitance-to-digital converter (FDC) that measures the oscillation frequency of an LC resonator. The device outputs a digital value that is proportional to frequency. This frequency measurement can be converted to an equivalent capacitance

7.2 Functional Block Diagrams

Figure 10. Block Diagram for the FDC2112 and FDC2212

Functional Block Diagrams (continued)

Figure 11. Block Diagram for the FDC2114 and FDC2214

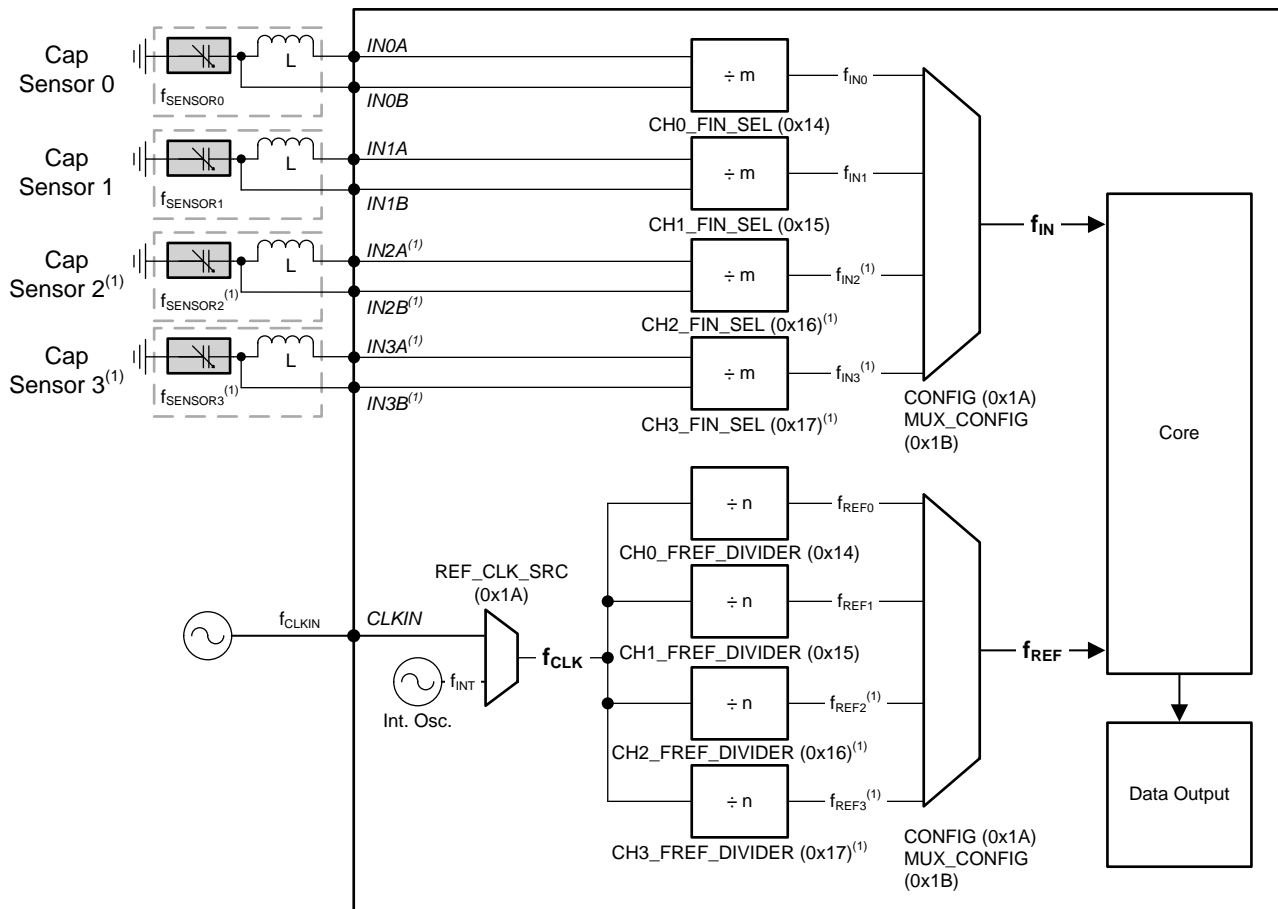

The FDC is composed of front-end resonant circuit drivers, followed by a multiplexer that sequences through the active channels, connecting them to the core that measures and digitizes the sensor frequency (f_{SENSOR}). The core uses a reference frequency (f_{REF}) to measure the sensor frequency. f_{REF} is derived from either an internal reference clock (oscillator), or an externally supplied clock. The digitized output for each channel is proportional to the ratio of $f_{\text{SENSOR}}/f_{\text{REF}}$. The I2C interface is used to support device configuration and to transmit the digitized frequency values to a host processor. The FDC can be placed in shutdown mode, saving current, using the SD pin. The INTB pin may be configured to notify the host of changes in system status.

7.3 Feature Description

7.3.1 Clocking Architecture

Figure 12 shows the clock dividers and multiplexers of the FDC.

Feature Description (continued)

(1) FDC2114 / FDC2214 only

Figure 12. Clocking Diagram

In Figure 12, the key clocks are f_{IN} , f_{REF} , and f_{CLK} . f_{CLK} is selected from either the internal clock source or external clock source (CLKIN). The frequency measurement reference clock, f_{REF} , is derived from the f_{CLK} source. TI recommends that precision applications use an external master clock that offers the stability and accuracy requirements needed for the application. The internal oscillator may be used in applications that require low cost and do not require high precision. The f_{INx} clock is derived from sensor frequency for a channel x , $f_{SENSORx} \cdot f_{REFx}$ and f_{INx} must meet the requirements listed in Table 1, depending on whether f_{CLK} (master clock) is the internal or external clock.

Feature Description (continued)
Table 1. Clock Configuration Requirements

| MODE ⁽¹⁾ | CLKIN SOURCE | VALID f_{REFx} RANGE (MHz) | VALID f_{INx} RANGE | SET CHx_FIN_SEL to ⁽²⁾ | SET CHx_SETTLECO UNT to | SET CHx_RCOUNT to |
|---------------------|-----------------------------|------------------------------|-----------------------|---|-------------------------|-------------------|
| Multi-channel | Internal | $f_{REFx} \leq 55$ | $< f_{REFx} / 4$ | Differential sensor configuration: b01: 0.01MHz to 8.75MHz (divide by 1) b10: 5MHz to 10MHz (divide by 2) Single-ended sensor configuration b10: 0.01MHz to 10MHz (divide by 2) | > 3 | > 8 |
| | External | $f_{REFx} \leq 40$ | | | | |
| Single-channel | Either external or internal | $f_{REFx} \leq 35$ | | | | |

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214.

(2) Refer to [Sensor Configuration](#) for information on differential and single-ended sensor configurations.

[Table 2](#) shows the clock configuration registers for all channels.

Table 2. Clock Configuration Registers

| CHANNEL ⁽¹⁾ | CLOCK | REGISTER | FIELD [BIT(S)] | VALUE |
|------------------------|---------------------------------|--------------------------------|------------------------|--|
| All | f_{CLK} = Master Clock Source | CONFIG, addr 0x1A | REF_CLK_SRC [9] | b0 = internal oscillator is used as the master clock b1 = external clock source is used as the master clock |
| 0 | f_{REF0} | CLOCK_DIVIDER S_CH0, addr 0x14 | CH0_FREF_DIVIDER [9:0] | $f_{REF0} = f_{CLK} / CH0_FREF_DIVIDER$ |
| 1 | f_{REF1} | CLOCK_DIVIDER S_CH1, addr 0x15 | CH1_FREF_DIVIDER [9:0] | $f_{REF1} = f_{CLK} / CH1_FREF_DIVIDER$ |
| 2 | f_{REF2} | CLOCK_DIVIDER S_CH2, addr 0x16 | CH2_FREF_DIVIDER [9:0] | $f_{REF2} = f_{CLK} / CH2_FREF_DIVIDER$ |
| 3 | f_{REF3} | CLOCK_DIVIDER S_CH3, addr 0x17 | CH3_FREF_DIVIDER [9:0] | $f_{REF3} = f_{CLK} / CH3_FREF_DIVIDER$ |
| 0 | f_{IN0} | CLOCK_DIVIDER S_CH0, addr 0x14 | CH0_FIN_SEL [13:12] | $f_{IN0} = f_{SENSOR0} / CH0_FIN_SEL$ |
| 1 | f_{IN1} | CLOCK_DIVIDER S_CH1, addr 0x15 | CH1_FIN_SEL [13:12] | $f_{IN1} = f_{SENSOR1} / CH1_FIN_SEL$ |
| 2 | f_{IN2} | CLOCK_DIVIDER S_CH2, addr 0x16 | CH2_FIN_SEL [13:12] | $f_{IN2} = f_{SENSOR2} / CH2_FIN_SEL$ |
| 3 | f_{IN3} | CLOCK_DIVIDER S_CH3, addr 0x17 | CH3_FIN_SEL [13:12] | $f_{IN3} = f_{SENSOR3} / CH3_FIN_SEL$ |

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214

7.3.2 Multi-Channel and Single-Channel Operation

The multi-channel package of the FDC enables the user to save board space and support flexible system design. For example, temperature drift can often cause a shift in component values, resulting in a shift in resonant frequency of the sensor. Using a second sensor as a reference provides the capability to cancel out a temperature shift. When operated in multi-channel mode, the FDC sequentially samples the active channels. In single-channel mode, the FDC samples a single channel, which is selectable. [Table 3](#) shows the registers and values that are used to configure either multi-channel or single-channel modes.

Table 3. Single- and Multi-Channel Configuration Registers

| MODE | REGISTER | FIELD [BIT(S)] | VALUE |
|-------------------------|----------------------|---------------------|---|
| Single channel | CONFIG, addr 0x1A | ACTIVE_CHAN [15:14] | 00 = chan 0 |
| | | | 01 = chan 1 |
| | | | 10 = chan 2 |
| | | | 11 = chan 3 |
| | MUX_CONFIG addr 0x1B | AUTOSCAN_EN [15] | 0 = continuous conversion on a single channel (default) |
| Multi-channel | MUX_CONFIG addr 0x1B | AUTOSCAN_EN [15] | 1 = continuous conversion on multiple channels |
| | MUX_CONFIG addr 0x1B | RR_SEQUENCE [14:13] | 00 = Ch0, Ch 1 |
| | | | 01 = Ch0, Ch 1, Ch 2 |
| 10 = Ch0, CH1, Ch2, Ch3 | | | |

The digitized sensor measurement for each channel (DATA_x) represents the ratio of the sensor frequency to the reference frequency.

The data output (DATA_x) of the FDC2112 and FDC2114 is expressed as the 12 MSBs of a 16-bit result:

$$DATA_x = \frac{f_{SENSORx} * 2^{12}}{f_{REFx}} \quad (1)$$

The data output (DATA_x) of the FDC2212 and FDC2214 is expressed as:

$$DATA_x = \frac{f_{SENSORx} * 2^{28}}{f_{REFx}} \quad (2)$$

Table 4 lists the registers that contain the fixed point sample values for each channel.

Table 4. Sample Data Registers

| CHANNEL ⁽¹⁾ | REGISTER ⁽²⁾ | FIELD NAME [BITS(S)] AND VALUE (FDC2112, FDC2114) | FIELD NAME [BITS(S)] AND VALUE (FDC2212, FDC2214) ⁽³⁾⁽⁴⁾ |
|------------------------|-------------------------|--|---|
| 0 | DATA_CH0, addr 0x00 | DATA0 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range | DATA0 [27:16]: 12 MSBs of the 28 bit conversion result |
| | DATA_LSB_CH0, addr 0x01 | Not applicable | DATA0 [15:0]: 16 LSBs of the 28 bit conversion result |
| 1 | DATA_CH1, addr 0x02 | DATA1 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range | DATA1 [27:16]: 12 MSBs of the 28 bit conversion result |
| | DATA_LSB_CH1, addr 0x03 | Not applicable | DATA1 [15:0]: 16 LSBs of the 28 bit conversion result |
| 2 | DATA_CH2, addr 0x04 | DATA2 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range | DATA2 [27:16]: 12 MSBs of the 28 bit conversion result |
| | DATA_LSB_CH2, addr 0x05 | Not applicable | DATA2 [15:0]: 16 LSBs of the 28 bit conversion result |

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214.

(2) The DATA_CHx.DATAx register must always be read first, followed by the DATA_LSB_CHx.DATAx register of the same channel to ensure data coherency.

(3) A DATA value of 0x0000000 = under range for FDC2212/FDC2214.

(4) A DATA value of 0xFFFFFFFF = over range for FDC2212/FDC2214.

Table 4. Sample Data Registers (continued)

| CHANNEL ⁽¹⁾ | REGISTER ⁽²⁾ | FIELD NAME [BITS(S)] AND VALUE (FDC2112, FDC2114) | FIELD NAME [BITS(S)] AND VALUE (FDC2212, FDC2214) ⁽³⁾⁽⁴⁾ |
|------------------------|-------------------------|--|---|
| 3 | DATA_CH3, addr 0x06 | DATA3 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range | DATA3 [27:16]: 12 MSBs of the 28 bit conversion result |
| | DATA_LSB_CH3, addr 0x07 | Not applicable | DATA3 [15:0]: 16 LSBs of the 28 bit conversion result |

When the FDC sequences through the channels in multi-channel mode, the dwell time interval for each channel is the sum of three parts:

1. sensor activation time
2. conversion time
3. channel switch delay

The sensor activation time is the amount of settling time required for the sensor oscillation to stabilize, as shown in Figure 13. The settling wait time is programmable and should be set to a value that is long enough to allow stable oscillation. The settling wait time for channel x is given by:

$$t_{sx} = (CHX_SETTLECOUNT \times 16) / f_{REFx} \tag{3}$$

Table 5 illustrates the registers and values for configuring the settling time for each channel.

Figure 13. Multi-channel Mode Sequencing

Figure 14. Single-channel Mode Sequencing

Table 5. Settling Time Register Configuration

| CHANNEL ⁽¹⁾ | REGISTER | FIELD | CONVERSION TIME ⁽²⁾ |
|------------------------|----------------------------|------------------------|--|
| 0 | SETTLECOUNT_CH0, addr 0x10 | CH0_SETTLECOUNT [15:0] | (CH0_SETTLECOUNT*16)/f _{REF0} |
| 1 | SETTLECOUNT_CH1, addr 0x11 | CH1_SETTLECOUNT [15:0] | (CH1_SETTLECOUNT*16)/f _{REF1} |
| 2 | SETTLECOUNT_CH2, addr 0x12 | CH2_SETTLECOUNT [15:0] | (CH2_SETTLECOUNT*16)/f _{REF2} |
| 3 | SETTLECOUNT_CH3, addr 0x13 | CH3_SETTLECOUNT [15:0] | (CH3_SETTLECOUNT*16)/f _{REF3} |

(1) Channels 2 and 3 are available only in the FDC2114 and FDC2214.

(2) f_{REFx} is the reference frequency configured for the channel.

The SETTLECOUNT for any channel x must satisfy:

$$\text{CH}_x\text{_SETTLECOUNT} > V_{pk} \times f_{\text{REF}x} \times C \times \pi^2 / (32 \times \text{IDRIVE}_x)$$

where

- V_{pk} = Peak oscillation amplitude at the programmed IDRIVE setting
 - f_{REFx} = Reference frequency for Channel x
 - C = sensor capacitance including parasitic PCB capacitance
 - IDRIVE_x = setting programmed into the IDRIVE register in amps
- (4)

Round the result to the next highest integer (for example, if Equation 4 recommends a minimum value of 6.08, program the register to 7 or higher).

The conversion time represents the number of reference clock cycles used to measure the sensor frequency. It is set by the CHx_RCOUNT register for the channel. The conversion time for any channel x is:

$$t_{Cx} = (\text{CH}_x\text{_RCOUNT} \times 16 + 4) / f_{\text{REF}x}$$

(5)

The reference count value must be chosen to support the required number of effective bits (ENOB). For example, if an ENOB of 13 bits is required, then a minimum conversion time of 2¹³ = 8192 clock cycles is required. 8192 clock cycles correspond to a CHx_RCOUNT value of 0x0200.

Table 6. Conversion Time Configuration Registers, Channels 0 - 3⁽¹⁾

| CHANNEL | REGISTER | FIELD [BIT(S)] | CONVERSION TIME |
|---------|-----------------------|-------------------|-------------------------------------|
| 0 | RCOUNT_CH0, addr 0x08 | CH0_RCOUNT [15:0] | (CH0_RCOUNT × 16)/f _{REF0} |
| 1 | RCOUNT_CH1, addr 0x09 | CH1_RCOUNT [15:0] | (CH1_RCOUNT × 16)/f _{REF1} |
| 2 | RCOUNT_CH2, addr 0x0A | CH2_RCOUNT [15:0] | (CH2_RCOUNT × 16)/f _{REF2} |
| 3 | RCOUNT_CH3, addr 0x0B | CH3_RCOUNT [15:0] | (CH3_RCOUNT × 16)/f _{REF3} |

(1) Channels 2 and 3 are available only for FDC2114 and FDC2214.

The typical channel switch delay time between the end of conversion and the beginning of sensor activation of the subsequent channel is:

$$\text{Channel Switch Delay} = 692 \text{ ns} + 5 / f_{\text{ref}}$$

(6)

The deterministic conversion time of the FDC allows data polling at a fixed interval. For example, if the programmed SETTLECOUNT is 128 F_{REF} cycles (SETTLECOUNT = 0x0008) and RCOUNT is 512 F_{REF} cycles (RCOUNT=0x0020), then one conversion takes 3.2 ms (sensor-activation time) + 12.8ms (conversion time) + 0.8μs (channel-switch delay) = 16.0 ms per channel. If the FDC is configured for dual-channel operation by setting AUTOSCAN_EN = 1 and RR_SEQUENCE = 00, then one full set of conversion results will be available from the data registers every 32 ms.

A data ready flag (DRDY) is also available for interrupt driven system designs (see the STATUS register description in [Register Maps](#)).

7.3.2.1 Gain and Offset (FDC2112, FDC2114 only)

The FDC2112 and FDC2114 have internal 16-bit data converters, but the standard conversion output word width is only 12 bits; therefore only 12 of the 16 bits are available from the data registers. By default, the gain feature is disabled and the DATA registers contain the 12 MSBs of the 16-bit word. However, it is possible to shift the data output by up to 4 bits. Figure 15 shows the segment of the 16-bit sample that is reported for each possible gain setting.

Figure 15. Conversion Data Output Gain

For systems in which the sensor signal variation is less than 25% of the full-scale range, the FDC can report conversion results with higher resolution by setting the output gain. The output gain is applied to all device channels. An output gain can be used to apply a 2-bit, 3-bit, or 4-bit shift to the output code for all channels, allowing access to the 4 LSBs of the original 16-bit result. The MSBs of the sample are shifted out when a gain is applied. Do not use the output gain if the MSBs of any active channel are toggling, as the MSBs for that channel will be lost when gain is applied.

Example: If the conversion result for a channel is 0x07A3, with OUTPUT_GAIN = 0x0, the reported output code is 0x07A. If OUTPUT_GAIN is set to 0x3 in the same condition, then the reported output code is 0x7A3. The original 4 MSBs (0x0) are no longer accessible.

Table 7. Output Gain Register (FDC2112 and FDC2114 only)

| CHANNEL ⁽¹⁾ | REGISTER | FIELD [BIT(S)] | VALUES | EFFECTIVE RESOLUTION (BITS) | OUTPUT RANGE |
|------------------------|----------------------|----------------------|--------------------------------------|-----------------------------|------------------|
| All | RESET_DEV, addr 0x1C | OUTPUT_GAIN [10:9] | 00 (default): Gain =1 (0 bits shift) | 12 | 100% full scale |
| | | | 01: Gain = 4 (2 bits left shift) | 14 | 25% full scale |
| | | | 10: Gain = 8 (3 bits left shift) | 15 | 12.5% full scale |
| | | | 11 : Gain = 16 (4 bits left shift) | 16 | 6.25% full scale |

(1) Channels 2 and 3 are available for FDC2114 only.

An offset value may be subtracted from each DATA value to compensate for a frequency offset or maximize the dynamic range of the sample data. The offset values should be $< f_{\text{SENSORx_MIN}} / f_{\text{REFx}}$. Otherwise, the offset might be so large that it masks the LSBs which are changing.

Table 8. Frequency Offset Registers

| CHANNEL ⁽¹⁾ | REGISTER | FIELD [BIT(S)] | VALUE |
|------------------------|-----------------------|---------------------|---|
| 0 | OFFSET_CH0, addr 0x0C | CH0_OFFSET [15:0] | $f_{\text{OFFSET0}} = \text{CH0_OFFSET} \times (f_{\text{REF0}}/2^{16})$ |
| 1 | OFFSET_CH1, addr 0x0D | CH1_OFFSET [15:0] | $f_{\text{OFFSET1}} = \text{CH1_OFFSET} \times (f_{\text{REF1}}/2^{16})$ |
| 2 | OFFSET_CH2, addr 0x0E | CH2_OFFSET [15:0] | $f_{\text{OFFSET2}} = \text{CH2_OFFSET} \times (f_{\text{REF2}}/2^{16})$ |
| 3 | OFFSET_CH3, addr 0x0F | CH3_OFFSET [15:0] | $f_{\text{OFFSET3}} = \text{CH3_OFFSET} \times (f_{\text{REF3}}/2^{16})$ |

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214.

The sensor capacitance C_{SENSOR} of a differential sensor configuration can be determined by:

$$C_{\text{SENSOR}} = \frac{1}{L * (2\pi * f_{\text{SENSORx}})^2} - C$$

where

- C = parallel sensor capacitance (see [Figure 55](#)) (7)

The FDC2112 and FDC2114 sensor frequency f_{SENSORx} can be determined by:

$$f_{\text{SENSORx}} = \text{CHx_FIN_SEL} * f_{\text{REFx}} * \left(\frac{\text{DATAx}}{2^{(12+\text{OUTPUT_GAIN})}} + \frac{\text{CHx_OFFSET}}{2^{16}} \right)$$

where

- DATAx = Conversion result from the DATA_CHx register
- CHx_OFFSET = Offset value set in the OFFSET_CHx register
- OUTPUT_GAIN = output multiplication factor set in the RESET_DEVICE.OUTPUT_GAIN register (8)

The FDC2212 and FDC2214 sensor frequency f_{SENSORx} can be determined by:

$$f_{\text{SENSORx}} = \frac{\text{CHx_FIN_SEL} * f_{\text{REFx}} * \text{DATAx}}{2^{28}} \quad (\text{FDC2212, FDC2214})$$

where

- DATAx = Conversion result from the DATA_CHx register (9)

7.3.3 Current Drive Control Registers

The registers listed in [Table 9](#) are used to control the sensor drive current. The recommendations listed in the last column of the table should be followed.

Table 9. Current Drive Control Registers

| CHANNEL ⁽¹⁾ | REGISTER | FIELD [BIT(S)] | VALUE |
|------------------------|------------------------------|--------------------------|--|
| All | CONFIG, addr 0x1A | SENSOR_ACTIVATE_SEL [11] | Sets current drive for sensor activation. Recommended value is b0 (full current mode). |
| 0 | CONFIG, addr 0x1A | HIGH_CURRENT_DRV [6] | b0 = normal current drive (1.5 mA) b1 = Increased current drive (> 1.5 mA) for Ch 0 in single channel mode only. Cannot be used in multi-channel mode. |
| 0 | DRIVE_CURRENT_CH0, addr 0x1E | CH0_IDRIVE [15:11] | Drive current used during the settling and conversion time for Ch. 0. Set such that $1.2\text{ V} \leq \text{sensor oscillation amplitude (pk)} \leq 1.8\text{ V}$ |
| 1 | DRIVE_CURRENT_CH1, addr 0x1F | CH1_IDRIVE [15:11] | Drive current used during the settling and conversion time for Ch. 1. Set such that $1.2\text{ V} \leq \text{sensor oscillation amplitude (pk)} \leq 1.8\text{ V}$ |
| 2 | DRIVE_CURRENT_CH2, addr 0x20 | CH2_IDRIVE [15:11] | Drive current used during the settling and conversion time for Ch. 2. Set such that $1.2\text{ V} \leq \text{sensor oscillation amplitude (pk)} \leq 1.8\text{ V}$ |
| 3 | DRIVE_CURRENT_CH3, addr 0x21 | CH3_IDRIVE [15:11] | Drive current used during the settling and conversion time for Ch. 3. Set such that $1.2\text{ V} \leq \text{sensor oscillation amplitude (pk)} \leq 1.8\text{ V}$ |

(1) Channels 2 and 3 are available for FDC2114 and FDC2214 only.

The CH_x_IDRIVE field should be programmed such that the sensor oscillates at an amplitude between 1.2 V_{pk} (V_{SENSORMIN}) and 1.8 V_{pk} (V_{SENSORMAX}). An IDRIVE value of 00000 corresponds to 16 μA, and IDRIVE = b11111 corresponds to 1563 μA.

A high sensor current drive mode can be enabled to drive sensor coils with > 1.5mA on channel 0, only in single channel mode. This feature can be used when the sensor minimum recommended oscillation amplitude of 1.2V cannot be achieved with the highest IDRIVE setting. Set the HIGH_CURRENT_DRV register bit to b1 to enable this mode.

7.3.4 Device Status Registers

The registers listed in [Table 10](#) may be used to read device status.

Table 10. Status Registers

| CHANNEL ⁽¹⁾ | REGISTER | FIELDS [BIT(S)] | VALUES |
|------------------------|--------------------------|--|--|
| All | STATUS, addr 0x18 | 12 fields are available that contain various status bits [15:0] | Refer to Register Maps for a description of the individual status bits. |
| All | STATUS_CONFIG, addr 0x19 | 12 fields are available that are used to configure status reporting [15:0] | Refer to Register Maps for a description of the individual error configuration bits. |

(1) Channels 2 and 3 are available for FDC2114 and FDC2114 only.

See the STATUS and STATUS_CONFIG register description in [Register Maps](#). These registers can be configured to trigger an interrupt on the INTB pin for certain events. The following conditions must be met:

1. The error or status register must be unmasked by enabling the appropriate register bit in the STATUS_CONFIG register
2. The INTB function must be enabled by setting CONFIG.INTB_DIS to 0

When a bit field in the STATUS register is set, the entire STATUS register content is held until read or until the DATA_CHx register is read. Reading also de-asserts INTB.

Interrupts are cleared by one of the following events:

1. Entering sleep mode
2. Power-on reset (POR)
3. Device enters shutdown mode (SD is asserted)
4. S/W reset
5. I2C read of the STATUS register: Reading the STATUS register clears any error status bit set in STATUS along with the ERR_CHAN field and de-assert INTB

Setting register CONFIG.INTB_DIS to b1 disables the INTB function and holds the INTB pin high.

7.3.5 Input Deglitch Filter

The input deglitch filter suppresses EMI and ringing above the sensor frequency. It does not impact the conversion result as long as its bandwidth is configured to be above the maximum sensor frequency. The input deglitch filter can be configured in MUX_CONFIG.DEGLITCH register field as shown in Table 11. For optimal performance, TI recommends selection of the lowest setting that exceeds the sensor oscillation frequency. For example, if the maximum sensor frequency is 2 MHz, choose MUX_CONFIG.DEGLITCH = b100 (3.3 MHz).

Table 11. Input Deglitch Filter Register

| CHANNEL ⁽¹⁾ | MUX_CONFIG.DEGLITCH (addr 0x1B) REGISTER VALUE | DEGLITCH FREQUENCY |
|------------------------|--|--------------------|
| ALL | 001 | 1 MHz |
| ALL | 100 | 3.3 MHz |
| ALL | 101 | 10 MHz |
| ALL | 011 | 33 MHz |

(1) Channels 2 and 3 are available for FDC2114 / FDC2214 only.

7.4 Device Functional Modes

7.4.1 Start-Up Mode

When the FDC powers up, it enters into sleep mode and waits for configuration. Once the device is configured, exit sleep mode by setting CONFIG.SLEEP_MODE_EN to b0.

TI recommends configuring the FDC while in sleep mode. If a setting on the FDC needs to be changed, return the device to sleep mode, change the appropriate register, and then exit sleep mode.

7.4.2 Normal (Conversion) Mode

When operating in the normal (conversion) mode, the FDC is periodically sampling the frequency of the sensor(s) and generating sample outputs for the active channel(s).

7.4.3 Sleep Mode

Sleep mode is entered by setting the CONFIG.SLEEP_MODE_EN register field to 1. While in this mode, the device configuration is maintained. To exit sleep mode, set the CONFIG.SLEEP_MODE_EN register field to 0. After setting CONFIG.SLEEP_MODE_EN to b0, sensor activation for the first conversion begins after 16,384 f_{INT} clock cycles. While in sleep mode the I2C interface is functional so that register reads and writes can be performed. While in sleep mode, no conversions are performed. In addition, entering sleep mode will clear conversion results, any error condition, and de-assert the INTB pin.

7.4.4 Shutdown Mode

When the SD pin is set to high, the FDC enters shutdown mode. Shutdown mode is the lowest power state. To exit shutdown mode, set the SD pin to low. Entering shutdown mode returns all registers to their default state.

Device Functional Modes (continued)

While in shutdown mode, no conversions are performed. In addition, entering shutdown mode clears any error condition and de-assert the INTB pin. While the device is in shutdown mode, is not possible to read to or write from the device via the I2C interface.

7.4.4.1 Reset

The FDC can be reset by writing to RESET_DEV.RESET_DEV. Any active conversion stops, and all register values return to their default value. This register bit always returns 0b when read.

7.5 Programming

The FDC device uses an I2C interface to access control and data registers.

7.5.1 I2C Interface Specifications

The FDC uses an extended start sequence with I2C for register access. The maximum speed of the I2C interface is 400 kbit/s. This sequence follows the standard I2C 7-bit slave address followed by an 8-bit pointer register byte to set the register address. When the ADDR pin is set low, the FDC I2C address is 0x2A; when the ADDR pin is set high, the FDC I2C address is 0x2B. The ADDR pin must not change state after the FDC exits Shutdown Mode.

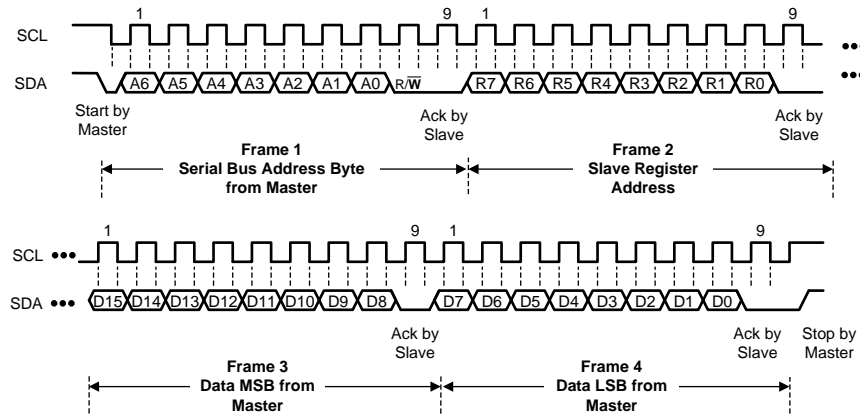

Figure 16. I2C Write Register Sequence

Figure 17. I2C Read Register Sequence

7.6 Register Maps

7.6.1 Register List

Fields indicated with Reserved must be written only with indicated values, otherwise improper device operation may occur. The R/W column indicates the Read-Write status of the corresponding field. A 'R/W' entry indicates read and write capability, a 'R' indicates read-only, and a 'W' indicates write-only.

Figure 18. Register List

| ADDRESS | NAME | DEFAULT VALUE | DESCRIPTION |
|---------|--------------------|---------------|---|
| 0x00 | DATA_CH0 | 0x0000 | Channel 0 Conversion Result and status (FDC2112 / FDC2114 only) |
| | | 0x0000 | Channel 0 MSB Conversion Result and status (FDC2212 / FDC2214 only) |
| 0x01 | DATA_LSB_CH0 | 0x0000 | Channel 0 LSB Conversion Result. Must be read after Register address 0x00 (FDC2212 / FDC2214 only) |
| 0x02 | DATA_CH1 | 0x0000 | Channel 1 Conversion Result and status (FDC2112 / FDC2114 only) |
| | | 0x0000 | Channel 1 MSB Conversion Result and status (FDC2212 / FDC2214 only) |
| 0x03 | DATA_LSB_CH1 | 0x0000 | Channel 1 LSB Conversion Result. Must be read after Register address 0x02 (FDC2212 / FDC2214 only) |
| 0x04 | DATA_CH2 | 0x0000 | Channel 2 Conversion Result and status (FDC2114 only) |
| | | 0x0000 | Channel 2 MSB Conversion Result and status (FDC2214 only) |
| 0x05 | DATA_LSB_CH2 | 0x0000 | Channel 2 LSB Conversion Result. Must be read after Register address 0x04 (FDC2214 only) |
| 0x06 | DATA_CH3 | 0x0000 | Channel 3 Conversion Result and status (FDC2114 only) |
| | | 0x0000 | Channel 3 MSB Conversion Result and status (FDC2214 only) |
| 0x07 | DATA_LSB_CH3 | 0x0000 | Channel 3 LSB Conversion Result. Must be read after Register address 0x06 (FDC2214 only) |
| 0x08 | RCOUNT_CH0 | 0x0080 | Reference Count setting for Channel 0 |
| 0x09 | RCOUNT_CH1 | 0x0080 | Reference Count setting for Channel 1 |
| 0x0A | RCOUNT_CH2 | 0x0080 | Reference Count setting for Channel 2 (FDC2114 / FDC2214 only) |
| 0x0B | RCOUNT_CH3 | 0x0080 | Reference Count setting for Channel 3 (FDC2114 / FDC2214 only) |
| 0x0C | OFFSET_CH0 | 0x0000 | Offset value for Channel 0 (FDC2112 / FDC2114 only) |
| 0x0D | OFFSET_CH1 | 0x0000 | Offset value for Channel 1 (FDC2112 / FDC2114 only) |
| 0x0E | OFFSET_CH2 | 0x0000 | Offset value for Channel 2 (FDC2114 only) |
| 0x0F | OFFSET_CH3 | 0x0000 | Offset value for Channel 3 (FDC2114 only) |
| 0x10 | SETTLECOUNT_CH0 | 0x0000 | Channel 0 Settling Reference Count |
| 0x11 | SETTLECOUNT_CH1 | 0x0000 | Channel 1 Settling Reference Count |

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Sensor Configuration

The FDC supports two sensor configurations. Both configurations use an LC tank to set the frequency of oscillation. A typical choice is an 18- μ H shielded SMD inductor in parallel with a 33-pF capacitor, which result in a 6.5-MHz oscillation frequency. In the single-ended configuration in [Figure 54](#), a conductive plate is connected to IN0A. Together with a target object, the conductive plate forms a variable capacitor.

Copyright © 2016, Texas Instruments Incorporated

Figure 54. Single-ended Sensor Configuration

In the differential sensor configuration in [Figure 55](#), one conductive plate is connected to IN0A, and a second conductive plate is connected to IN0B. Together, they form a variable capacitor. When using an single-ended sensor configuration, set CHx_FIN_SEL to b10 (divide by 2).

Copyright © 2016, Texas Instruments Incorporated

Figure 55. Differential Sensor Configuration

The single-ended configuration allows higher sensing range than the differential configuration for a given total sensor plate area. In applications in which high sensitivity at close proximity is desired, the differential configuration performs better than the single-ended configuration.

Application Information (continued)

8.1.2 Shield

in order to minimize interference from external objects, some applications require an additional plate which acts as a shield. The shield can either be:

- actively driven shield: The shield is a buffered signal of the INxA pin. The signal is buffered by an external amplifier with a gain of 1.
- passive shield: The shield is connected to GND. Adding a passive shield decreases sensitivity of the sensor, but is dependent on the distance between the sensing plate and the shield. The distance between the sensing plate and the shield should be adjusted to achieve the required sensitivity

8.1.3 Power-Cycled Applications

For applications which do not require high sample rates or maximum conversion resolution, the total active conversion time of the FDC can be minimized to reduce power consumption. This can be done by either by using sleep mode or shutdown mode during times in which conversions are not required (see [Device Functional Modes](#)).

As an example, for an application which only needs 10 samples per second with a resolution of 16 bits can utilize the low-power modes. The sensor requires SETTLECOUNT = 16 and IDRIVE of 01111b (0.146 mA). Given FREF = 40 MHz and RCOUNT = 4096 will provide the resolution required. This corresponds to $4096 \times 16 \times 10 / 40 \text{ MHz} \rightarrow 16.4 \text{ ms}$ of active conversion time per second. Start-up time and channel switch delay account for an additional 0.34 ms. For the remainder of the time, the device can be in sleep mode: Therefore, the average current is $19.4 \text{ ms} \times 3.6 \text{ mA}$ active current + 980.6 ms of $35 \mu\text{A}$ of sleep current, which is approximately $104.6 \mu\text{A}$ of average supply current. Sleep mode retains register settings and therefore requires less I2C writes to wake up the FDC than shutdown mode.

Greater current savings can be realized by use of shutdown mode during inactive periods. In shutdown mode, device configuration is not retained, so the device must be configured for each sample. For this example, configuring each sample takes approximately 1.2 ms ($13 \text{ registers} \times 92.5 \mu\text{s}$ per register). The total active time is 20.6 ms. The average current is $20 \text{ ms} \times 3.6 \text{ mA}$ active current + $980 \text{ ms} \times 2 \mu\text{A}$ of shutdown current, which is approximately $75 \mu\text{A}$ of average supply current.

For further information on power-cycled applications, refer to [Power Reduction Techniques for the FDC2214/2212/2114/2112 in Capacitive Sensing Applications](#).

8.1.4 Inductor Self-Resonant Frequency

Every inductor has a distributed parasitic capacitance, which is dependent on construction and geometry. At the self-resonant frequency (SRF), the reactance of the inductor cancels the reactance of the parasitic capacitance. Above the SRF, the inductor will electrically appear to be a capacitor. Because the parasitic capacitance is not well-controlled or stable, TI recommends: $f_{\text{SENSOR}} < 0.8 \times f_{\text{SR}}$.

Figure 56. Example Coil Inductance vs Frequency

The example inductor in [Figure 56](#), has a SRF at 6.38 MHz; therefore, the inductor must not be operated above $0.8 \times 6.38 \text{ MHz}$, or 5.1 MHz.

Application Information (continued)

8.1.5 Application Curves for Proximity Sensing

Common test conditions (unless specified otherwise): Sensor capacitor: 1 layer, 20.9 × 13.9 mm, Bourns CMH322522-180KL sensor inductor with L=18 μH and 33 pF 1% COG/NP0 Target: Grounded aluminum plate (176 × 123 mm), Channel = Channel 0 (continuous mode) CLKIN = 40 MHz, CHx_FIN_SEL = b10, CHx_FREF_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100, DRIVE_CURRENT_CH0 = 0x7800

Figure 58. FDC2112 / FDC2114: Capacitance vs Target Distance (20 to 40 mm)

Figure 59. FDC2212 / FDC2214: Capacitance vs Target Distance (40 to 60 mm)

8.2 Typical Application

The FDC can be used to measure liquid level in non-conductive containers. Due to its very high excitation rate capability, it is able to measure soapy water, ink, soap, and other conductive liquids. Capacitive sensors can be attached to the outside of the container or be located remotely from the container, allowing for contactless measurements.

The working principle is based on a ratiometric measurement; Figure 60 shows a possible system implementation which uses three electrodes. The level electrode provides a capacitance value proportional to the liquid level. The reference environmental electrode and the reference liquid electrode are used as references. The reference liquid electrode accounts for the liquid dielectric constant and its variation, while the reference environmental electrode is used to compensate for any other environmental variations that are not due to the liquid itself. Note that the reference environmental electrode and the reference liquid electrode are the same physical size (hREF).

For this application, single-ended measurements on the active channels are appropriate, as the tank is grounded. Use to determine the liquid level from the measured capacitances:

Typical Application (continued)

$$Level = h_{ref} \frac{C_{Lev} - C_{Lev}(0)}{C_{RL} - C_{RE}}$$

where

- C_{RE} is the capacitance of the reference environmental electrode,
- C_{RL} is the capacitance of the reference liquid electrode,
- C_{Lev} is the current value of the capacitance measured at the level electrode sensor,
- $C_{Lev}(0)$ is the capacitance of the Level electrode when the container is empty, and
- h_{REF} is the height in the desired units of the container or liquid reference electrodes.

The ratio between the capacitance of the level and the reference electrodes allows simple calculation of the liquid level inside the container itself. Very high sensitivity values (that is, many LSB/mm) can be obtained due to the high resolution of the FDC2x1x, even when the sensors are located remotely from the container. Note that this approach assumes that the container has a uniform cross section from top to bottom, so that each incremental increase or decrease in the liquid represents a change in volume that is directly related to the height of the liquid.

Figure 60. FDC (Liquid Level Measurement)

8.2.1 Design Requirements

The liquid level measurement should be independent of the liquid, which can be achieved using the 3-electrode design described above. Moreover, the sensor should be isolated from environmental interferers such as a human body, other objects, or EMI.

8.2.2 Detailed Design Procedure

In capacitive sensing systems, the design of the sensor plays an important role in determining system performance and capabilities. In most cases the sensor is simply a metal plate that can be designed on the PCB.

Typical Application (continued)

The sensor used in this example is implemented with a two-layer PCB. On the top layer, which faces the tank, there are the 3 electrodes (reference environmental, reference liquid, and level) with a ground plane surrounding the electrodes.

Depending on the shape of the container, the FDC can be located on the sensor PCB to minimize the length of the traces between the input channels and the sensors. In case the shape of the container or other mechanical constraints do not allow having the sensors and the FDC on the same PCB, the traces which connect the channels to the sensor need to be shielded with the appropriate shield.

8.2.3 Application Performance Plot

A liquid level sensor with 3 electrodes like the one shown in the schematic was connected to the EVM. The plot shows the capacitance measured by Level sensor at different levels of liquid in the tank. The capacitance of the Reference Liquid and Reference Environmental sensors have a steady value because they experience consistent exposure to liquid and air, while the capacitance of the level sensor (Level) increases linearly with the height of the liquid in the tank.

Figure 61. Electrodes' Capacitance vs Liquid Level

8.2.4 Recommended Initial Register Configuration Values

The application requires 100SPS ($T_{\text{SAMPLE}} = 10 \text{ ms}$). A sensor with an 18- μH inductor and a 33-pF capacitor is used. Additional pin, trace, and wire capacitance accounts for 20 pF, so the total capacitance is 53-pF.

Using L and C, $f_{\text{SENSOR}} = 1/2\pi\sqrt{LC} = 1/2\pi\sqrt{(18 \times 10^{-6} \times 50 \times 10^{-12})} = 5.15 \text{ MHz}$. This represents the maximum sensor frequency. When the sensor capacitance is added, the frequency will decrease.

Using a system master clock of 40 MHz applied to the CLKIN pin allows flexibility for setting the internal clock frequencies. The sensor coils are connected to channel 0 (IN0A and IN0B pins), channel 1 (IN1A and IN1B pins), and channel 2 (IN2A and IN2B pins).

After powering on the FDC, it will be in Sleep Mode. Program the registers as follows (example sets registers for channel 0 only; channel 1 and channel 2 registers can use equivalent configuration):

- Set the dividers for channel 0.
 - Because the sensor is in a single-ended configuration, the sensor frequency select register should be set to 2, which means setting field CH0_FIN_SEL to b10.
 - The design constraint for f_{REF0} is $> 4 \times f_{\text{SENSOR}}$. To satisfy this constraint, f_{REF0} must be greater than 20.6 MHz, so the reference divider should be set to 1. This is done by setting the CH0_FREQ_DIVIDER field to 0x01.
 - The combined value for Chan. 0 divider register (0x14) is 0x2001.
- Sensor drive current: to ensure that the oscillation amplitude is between 1.2V and 1.8V, measure the oscillation amplitude on an oscilloscope and adjust the IDRIVE value, or use the integrated FDC GUI feature to determine the optimal setting. In this case the IDRIVE value should be set to 15 (decimal), which results in an oscillation amplitude of 1.68 V(pk). The INIT_DRIVE current field should be set to 0x00. The combined value for the DRIVE_CURRENT_CH0 register (addr 0x1E) is 0x7C00.

Typical Application (continued)

3. Program the settling time for Channel 0 (see [Multi-Channel and Single-Channel Operation](#)).
 - (a) $CHx_SETTLECOUNT > V_{pk} \times f_{REFx} \times C \times \pi^2 / (32 \times IDRIVE_x) \rightarrow 7.5$, rounded up to 8. To provide margin to account for system tolerances, a higher value of 10 is chosen.
 - (b) Register 0x10 should be programmed to a minimum of 10.
 - (c) The settle time is: $(10 \times 16)/40,000,000 = 4 \mu s$
 - (d) The value for Channel 0 SETTLECOUNT register (0x10) is 0x000A.
4. The channel switching delay is approximately 1 μs for $f_{REF} = 40$ MHz (see [Multi-Channel and Single-Channel Operation](#))
5. Set the conversion time by the programming the reference count for Channel 0. The budget for the conversion time is : $1/N \times (T_{SAMPLE} - \text{settling time} - \text{channel switching delay}) = 1/3 (10,000 - 4 - 1) = 3.33$ ms
 - (a) To determine the conversion time register value, use the following equation and solve for CH0_RCOUNT: Conversion Time (t_{C0})= $(CH0_RCOUNT \times 16)/f_{REF0}$.
 - (b) This results in CH0_RCOUNT having a value of 8329 decimal (rounded down). Note that this yields an ENOB > 13 bits.
 - (c) Set the CH0_RCOUNT register (0x08) to 0x2089.
6. Use the default values for the ERROR_CONFIG register (address 0x19). By default, no interrupts are enabled
7. Program the MUX_CONFIG register
 - (a) Set the AUTOSCAN_EN to b1 bit to enable sequential mode
 - (b) Set RR_SEQUENCE to b10 to enable data conversion on three channels (channel 0, channel 1, channel 2)
 - (c) Set DEGLITCH to b101 to set the input deglitch filter bandwidth to 10 MHz, the lowest setting that exceeds the oscillation tank frequency.
 - (d) The combined value for the MUX_CONFIG register (address 0x1B) is 0xC20D
8. Finally, program the CONFIG register as follows:
 - (a) Set the ACTIVE_CHAN field to b00 to select channel 0.
 - (b) Set SLEEP_MODE_EN field to b0 to enable conversion.
 - (c) Set SENSOR_ACTIVATE_SEL = b0, for full current drive during sensor activation
 - (d) Set the REF_CLK_SRC field to b1 to use the external clock source.
 - (e) Set the other fields to their default values.
 - (f) The combined value for the CONFIG register (address 0x1A) is 0x1601.

We then read the conversion results for channel 0 to channel 2 every 10ms from register addresses 0x00 to 0x05.

Based on the example configuration above, TI recommends the following register write sequence is recommended:

Table 47. Recommended Initial Register Configuration Values (Multi-channel Operation)

| ADDRESS | VALUE | REGISTER NAME | COMMENTS |
|---------|--------|-------------------|---|
| 0x08 | 0x8329 | RCOUNT_CH0 | Reference count calculated from timing requirements (100 SPS) and resolution requirements |
| 0x09 | 0x8329 | RCOUNT_CH1 | Reference count calculated from timing requirements (100 SPS) and resolution requirements |
| 0x0A | 0x8329 | RCOUNT_CH2 | Reference count calculated from timing requirements (100 SPS) and resolution requirements |
| 0x10 | 0x000A | SETTLECOUNT_CH0 | Minimum settling time for chosen sensor |
| 0x11 | 0x000A | SETTLECOUNT_CH1 | Minimum settling time for chosen sensor |
| 0x12 | 0x000A | SETTLECOUNT_CH2 | Minimum settling time for chosen sensor |
| 0x14 | 0x2002 | CLOCK_DIVIDER_CH0 | CH0_FIN_DIVIDER = 1, CH0_FREF_DIVIDER = 2 |
| 0x15 | 0x2002 | CLOCK_DIVIDER_CH1 | CH1_FIN_DIVIDER = 1, CH1_FREF_DIVIDER = 2 |
| 0x16 | 0x2002 | CLOCK_DIVIDER_CH2 | CH1_FIN_DIVIDER = 1, CH1_FREF_DIVIDER = 2 |
| 0x19 | 0x0000 | ERROR_CONFIG | Can be changed from default to report status and error conditions |

Typical Application (continued)

Table 47. Recommended Initial Register Configuration Values (Multi-channel Operation) (continued)

| ADDRESS | VALUE | REGISTER NAME | COMMENTS |
|---------|--------|-------------------|--|
| 0x1B | 0xC20D | MUX_CONFIG | Enable Ch 0 , Ch 1, and Ch 2 (sequential mode), set Input deglitch bandwidth to 10MHz |
| 0x1E | 0x7C00 | DRIVE_CURRENT_CH0 | Sets sensor drive current on ch 0 |
| 0x1F | 0x7C00 | DRIVE_CURRENT_CH1 | Sets sensor drive current on ch 1 |
| 0x20 | 0x7C00 | DRIVE_CURRENT_CH2 | Sets sensor drive current on ch 2 |
| 0x1A | 0x1601 | CONFIG | Enable full current drive during sensor activation, select external clock source, wake up device to start conversion. This register write must occur last because device configuration is not permitted while the FDC is in active mode. |

8.3 Do's and Don'ts

- Do leave a small gap between sensor plates in differential configurations. 2-3mm minimum separation is recommended.
- The FDC does not support hot-swapping of the sensors. Do not hot-swap sensors, for example by using external multiplexers.

9 Power Supply Recommendations

The FDC requires a voltage supply within 2.7 V and 3.6 V. TI recommends multilayer ceramic bypass X7R capacitors of 0.1 μ F and 1 μ F between the VDD and GND pins. If the supply is located more than a few inches from the FDC, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. An electrolytic capacitor with a value of 10 μ F is a typical choice.

The optimum placement is closest to the VDD and GND pins of the device. Care should be taken to minimize the loop area formed by the bypass capacitor connection, the VDD pin, and the GND pin of the device. See [Figure 62](#) and [Figure 65](#) for layout examples.

10 Layout

10.1 Layout Guidelines

- Avoid long traces to connect the sensor to the FDC. Short traces reduce parasitic capacitances between sensor inductor and offer higher system performance.
- Systems that require matched channel response need to have matched trace length on all active channels.

10.2 Layout Examples

[Figure 62](#) to [Figure 65](#) show the FDC2114 / FDC2214 evaluation module (EVM) layout.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
