

LF156QML JFET Input Operational Amplifiers

Check for Samples: [LF156QML](#)

FEATURES

- **Advantages**
 - Replace Expensive Hybrid and Module FET Op Amps
 - Rugged JFETs Allow Blow-Out Free Handling Compared with MOSFET Input Devices
 - Excellent for Low Noise Applications Using Either High or Low Source Impedance—Very Low 1/f Corner
 - Offset Adjust Does Not Degrade Drift or Common-Mode Rejection as in Most Monolithic Amplifiers
 - New Output Stage Allows Use of Large Capacitive Loads (5,000 pF) Without Stability Problems
 - Internal Compensation and Large Differential Input Voltage Capability

APPLICATIONS

- Precision High Speed Integrators
- Fast D/A and A/D Converters
- High Impedance Buffers
- Wideband, Low Noise, Low Drift Amplifiers
- Logarithmic Amplifiers
- Photocell Amplifiers
- Sample and Hold Circuits

Connection Diagrams

**Figure 1. Top View
TO-99 Package (LMC)
See Package Number LMC**

COMMON FEATURES

- Low Input Bias Current: 30pA
- Low Input Offset Current: 3pA
- High Input Impedance: $10^{12}\Omega$
- Low Input Noise Current: $0.01 \text{ pA} / \sqrt{\text{Hz}}$
- High Common-Mode Rejection Ratio: 100 dB
- Large DC Voltage Gain: 106 dB

UNCOMMON FEATURES

- Extremely Fast Settling
 - Time to 0.01% 1.5 μ s
- Fast Slew Rate 12V/ μ s
- Wide Gain Bandwidth 5MHz
- Low Input Noise Voltage $12 \text{ nV} / \sqrt{\text{Hz}}$

DESCRIPTION

This is the first monolithic JFET input operational amplifier to incorporate well matched, high voltage JFETs on the same chip with standard bipolar transistors (BI-FET™ Technology). This amplifier features low input bias and offset currents/low offset voltage and offset voltage drift, coupled with offset adjust which does not degrade drift or common-mode rejection. The device is also designed for high slew rate, wide bandwidth, extremely fast settling time, low voltage and current noise and a low 1/f noise corner.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Simplified Schematic

*3pF in LF357 series.

Detailed Schematic

*C = 3pF in LF357 series.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾

Supply Voltage		±22V	
Differential Input Voltage		±40V	
Input Voltage Range ⁽²⁾		±20V	
Output Short Circuit Duration		Continuous	
T _{Jmax}		150°C	
Power Dissipation at T _A = 25°C ⁽³⁾⁽⁴⁾		Still Air	560 mW
		500 LF/Min Air Flow	1200 mW
Thermal Resistance	θ _{JA}	Still Air	162°C/W
		400 LF/Min Air Flow	89°C/W
	θ _{JC}		32°C/W
Storage Temperature Range		-65°C ≤ T _A ≤ +150°C	
Lead Temperature (Soldering 10 sec.)		300°C	
ESD tolerance ⁽⁵⁾		1200V	

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate condition for which the device is functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) Unless otherwise specified the absolute maximum negative input voltage is equal to the negative power supply voltage.
- (3) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{Jmax} (maximum junction temperature), θ_{JA} (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is P_D = (T_{Jmax} - T_A) / θ_{JA} or the number given in the Absolute Maximum Ratings, whichever is lower.
- (4) Maximum power dissipation (P_{Dmax}) is defined by the package characteristics. Operating the part near the P_{Dmax} may cause the part to operate outside specified limits.
- (5) Human body model, 100pF discharged through 1.5kΩ.

APPLICATION HINTS

These are op amps with JFET input devices. These JFETs have large reverse breakdown voltages from gate to source and drain eliminating the need for clamps across the inputs. Therefore large differential input voltages can easily be accommodated without a large increase in input current. The maximum differential input voltage is independent of the supply voltages. However, neither of the input voltages should be allowed to exceed the negative supply as this will cause large currents to flow which can result in a destroyed unit.

Exceeding the negative common-mode limit on either input will force the output to a high state, potentially causing a reversal of phase to the output. Exceeding the negative common-mode limit on both inputs will force the amplifier output to a high state. In neither case does a latch occur since raising the input back within the common-mode range again puts the input stage and thus the amplifier in a normal operating mode.

Exceeding the positive common-mode limit on a single input will not change the phase of the output however, if both inputs exceed the limit, the output of the amplifier will be forced to a high state.

These amplifiers will operate with the common-mode input voltage equal to the positive supply. In fact, the common-mode voltage can exceed the positive supply by approximately 100 mV independent of supply voltage and over the full operating temperature range. The positive supply can therefore be used as a reference on an input as, for example, in a supply current monitor and/or limiter.

Precautions should be taken to ensure that the power supply for the integrated circuit never becomes reversed in polarity or that the unit is not inadvertently installed backwards in a socket as an unlimited current surge through the resulting forward diode within the IC could cause fusing of the internal conductors and result in a destroyed unit.

All of the bias currents in these amplifiers are set by FET current sources. The drain currents for the amplifiers are therefore essentially independent of supply voltage.

As with most amplifiers, care should be taken with lead dress, component placement and supply decoupling in order to ensure stability. For example, resistors from the output to an input should be placed with the body close to the input to minimize “pickup” and maximize the frequency of the feedback pole by minimizing the capacitance from the input to ground.

A feedback pole is created when the feedback around any amplifier is resistive. The parallel resistance and capacitance from the input of the device (usually the inverting input) to AC ground set the frequency of the pole. In many instances the frequency of this pole is much greater than the expected 3dB frequency of the closed loop gain and consequently there is negligible effect on stability margin. However, if the feedback pole is less than approximately six times the expected 3 dB frequency a lead capacitor should be placed from the output to the input of the op amp. The value of the added capacitor should be such that the RC time constant of this capacitor and the resistance it parallels is greater than or equal to the original feedback pole time constant.

Typical Circuit Connections

Figure 26. V_{OS} Adjustment

- V_{OS} is adjusted with a 25k potentiometer
- The potentiometer wiper is connected to V^+
- For potentiometers with temperature coefficient of 100 ppm/°C or less the additional drift with adjust is $\approx 0.5\mu\text{V}/^\circ\text{C}/\text{mV}$ of adjustment
- Typical overall drift: $5\mu\text{V}/^\circ\text{C} \pm(0.5\mu\text{V}/^\circ\text{C}/\text{mV}$ of adj.)

Figure 27. Driving Capacitive Loads

- * LF156 R = 5k
- Due to a unique output stage design, these amplifiers have the ability to drive large capacitive loads and still maintain stability. $C_{L(MAX)} \approx 0.01 \mu F$.
- Overshoot $\leq 20\%$
- Settling time (t_s) $\approx 5 \mu s$

Typical Applications

Figure 28. Settling Time Test Circuit

- Settling time is tested with the LF156 connected as unity gain inverter.
- FET used to isolate the probe capacitance
- Output = 10V step

Figure 29. Large Signal Inverter Output, V_{OUT} (from Settling Time Circuit) LF356

Figure 30. Low Drift Adjustable Voltage Reference

- $\Delta V_{OUT}/\Delta T = \pm 0.002\%/^{\circ}\text{C}$
- All resistors and potentiometers should be wire-wound
- P1: drift adjust
- P2: V_{OUT} adjust

Figure 31. Fast Logarithmic Converter

- Dynamic range: $100\mu\text{A} \leq I_i \leq 1\text{mA}$ (5 decades), $|V_{O}| = 1\text{V/decade}$
 - Transient response: $3\mu\text{s}$ for $\Delta I_i = 1$ decade
 - C1, C2, R2, R3: added dynamic compensation
 - V_{OS} adjust the LF156 to minimize quiescent error
 - R_T : type Q81 +
- $$0.3\%/^{\circ}\text{C} |V_{OUT}| = \left[1 + \frac{R_2}{R_T} \right] \frac{kT}{q} \ln V_i \left[\frac{R_r}{V_{REF} R_i} \right] = \log V_i \frac{1}{R_i I_r} \quad R_2 = 15.7\text{k}, R_T = 1\text{k}, 0.3\%/^{\circ}\text{C} \text{ (for temperature compensation)}$$

Figure 32. Precision Current Monitor

- $V_0 = 5 R_1/R_2$ (V/mA of I_S)
- R1, R2, R3: 0.1% resistors

Figure 33. 8-Bit D/A Converter with Symmetrical Offset Binary Operation

- R1, R2 should be matched within $\pm 0.05\%$
- Full-scale response time: 3μs

E_0	B1	B2	B3	B4	B5	B6	B7	B8	Comments
+9.920	1	1	1	1	1	1	1	1	Positive Full-Scale
+0.040	1	0	0	0	0	0	0	0	(+) Zero-Scale
-0.040	0	1	1	1	1	1	1	1	(-) Zero-Scale
-9.920	0	0	0	0	0	0	0	0	Negative Full-Scale

Figure 34. Wide BW Low Noise, Low Drift Amplifier

- Power BW: $f_{MAX} = \frac{S_r}{2\pi V_p} \cong 191 \text{ kHz}$

- Parasitic input capacitance $C_1 \approx 3\text{pF}$ interacts with feedback elements and creates undesirable high frequency pole. To compensate add C_2 such that: $R_2 C_2 \approx R_1 C_1$.

Figure 35. Boosting the LF156 with a Current Amplifier

- $I_{OUT(MAX)} \approx 150\text{mA}$ (will drive $R_L \geq 100\Omega$)
- $\frac{\Delta V_{OUT}}{\Delta T} = \frac{0.15}{10^{-2}} \text{ V}/\mu\text{s}$ (with C_L shown)
- No additional phase shift added by the current amplifier

Figure 36. 3 Decades VCO

$$f = \frac{V_C (R_8 + R_7)}{(8 V_{PU} R_8 R_1) C'} \quad 0 \leq V_C \leq 30\text{V}, \quad 10 \text{ Hz} \leq f \leq 10 \text{ kHz}$$

R1, R4 matched. Linearity 0.1% over 2 decades.

Figure 37. Isolating Large Capacitive Loads

- Overshoot 6%
- t_s 10 μ s
- When driving large C_L , the V_{OUT} slew rate determined by C_L and $I_{OUT(MAX)}$: $\frac{\Delta V_{OUT}}{\Delta T} = \frac{I_{OUT}}{C_L} \cong \frac{0.02}{0.5} \text{ V}/\mu\text{s} = 0.04 \text{ V}/\mu\text{s}$ (with C_L shown)

Figure 38. Low Drift Peak Detector

- By adding D1 and R_f, V_{D1}=0 during hold mode. Leakage of D2 provided by feedback path through R_f.
- Leakage of circuit is essentially I_b plus capacitor leakage of C_p.
- Diode D3 clamps V_{OUT} (A1) to V_{IN}-V_{D3} to improve speed and to limit reverse bias of D2.
- Maximum input frequency should be $\ll \frac{1}{2}\pi R_f C_{D2}$ where C_{D2} is the shunt capacitance of D2.

Figure 39. High Impedance, Low Drift Instrumentation Amplifier

$$V_{OUT} = \frac{R3}{R} \left[\frac{2R2}{R1} + 1 \right] \Delta V, \quad V^- + 2V \leq V_{IN \text{ common-mode}} \leq V^+$$

- System V_{OS} adjusted via A2 V_{OS} adjust
- Trim R3 to boost up CMRR to 120 dB. Instrumentation amplifier resistor array recommended for best accuracy and lowest drift

Figure 40. Fast Sample and Hold

- Both amplifiers (A1, A2) have feedback loops individually closed with stable responses (overshoot negligible)
- Acquisition time T_A , estimated by:

$$T_A \cong \left[\frac{2R_{ON} V_{IN} C_h}{S_r} \right]^{1/2} \text{ provided that:}$$

$$V_{IN} < 2\pi S_r R_{ON} C_h \text{ and } T_A > \frac{V_{IN} C_h}{I_{OUT(MAX)}}, R_{ON} \text{ is of SW1}$$

$$\text{If inequality not satisfied: } T_A \cong \frac{V_{IN} C_h}{20 \text{ mA}}$$

(1)

- LF156 develops full S_r output capability for $V_{IN} \geq 1V$
- Addition of SW2 improves accuracy by putting the voltage drop across SW1 inside the feedback loop
- Overall accuracy of system determined by the accuracy of both amplifiers, A1 and A2

Figure 41. High Accuracy Sample and Hold

- By closing the loop through A2, the V_{OUT} accuracy will be determined uniquely by A1.
 - No V_{OS} adjust required for A2.
- T_A can be estimated by same considerations as previously but, because of the added
 - propagation delay in the feedback loop (A2) the overshoot is not negligible.
- Overall system slower than fast sample and hold
- R1, C_C : additional compensation
- Use LF156 for
 - Fast settling time
 - Low V_{OS}

Figure 42. High Q Notch Filter

- $2R1 = R = 10M\Omega$
 - $2C = C1 = 300pF$
- Capacitors should be matched to obtain high Q
- $f_{NOTCH} = 120\text{ Hz}$, notch = -55 dB, $Q > 100$
- Use LF155 for
 - Low I_B
 - Low supply current

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LF156H/883	ACTIVE	TO-99	LMC	8	20	RoHS & Green	Call TI	Level-1-NA-UNLIM	-55 to 125	LF156H/883 Q ACO LF156H/883 Q >T	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=100ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
