

LM9044 Lambda Sensor Interface Amplifier

Check for Samples: [LM9044](#)

FEATURES

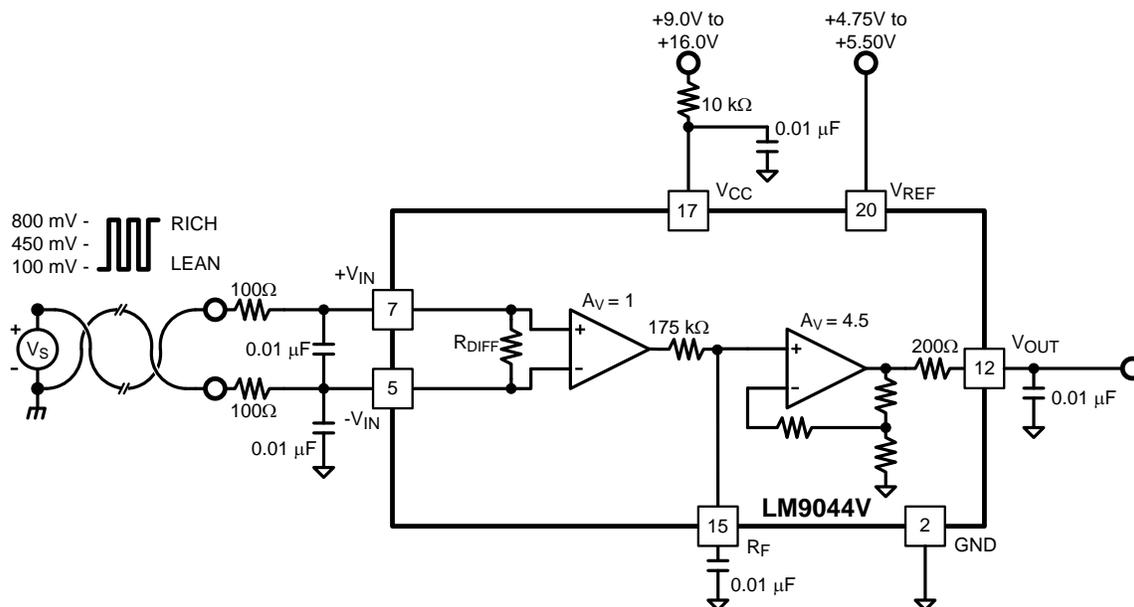

- Normal Circuit Operation Specified with Inputs up to 3V Below Ground on a Single Supply.
- Gain Factory Trimmed and Specified over Temperature ($\pm 3\%$ of Full-scale from -40°C to $+125^{\circ}\text{C}$)
- Low Power Consumption (Typically 1 mA)
- Fully Protected Inputs
- Input Open Circuit Detection
- Operation Specified over the Entire Automotive Temperature Range (-40°C to $+125^{\circ}\text{C}$)

DESCRIPTION

The LM9044 is a precision differential amplifier specifically designed for operation in the automotive environment. Gain accuracy is specified over the entire automotive temperature range (-40°C to $+125^{\circ}\text{C}$) and is factory trimmed after package assembly. The input circuitry has been specifically designed to reject common-mode signals as much as 3V below ground without the need for a negative voltage supply. This facilitates the use of sensors which are grounded at the engine block while the LM9044 itself is grounded at chassis potential. An external capacitor on the R_F pin sets the maximum operating frequency of the amplifier, thereby filtering high frequency transients. Both inputs are protected against accidental shorting to the battery and against load dump transients. The input impedance is typically 1.2 M Ω .

The output op amp is capable of driving capacitive loads and is fully protected. Also, internal circuitry has been provided to detect open circuit conditions on either or both inputs and force the output to a "home" position (a ratio of the external reference voltage).

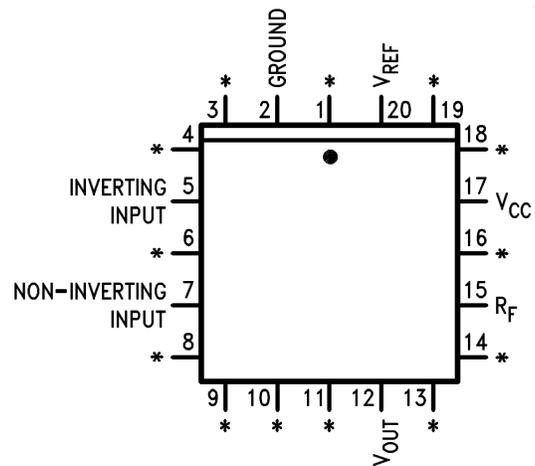

Typical Application

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾

V _{CC} Supply Voltage (R _{VCC} = 15 kΩ)	±60V
V _{REF} Supply Voltage	-0.3V to +6V
DC Input Voltage (Either input) ⁽³⁾	-3V to +16V
Input Transients ⁽⁴⁾	±60V
Power Dissipation see ⁽⁵⁾	1350 mW
Output Short Circuit Duration	Indefinite
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Soldering Information	
PLCC Package	
Vapor Phase (60 seconds)	215°C
Infrared (15 seconds)	220°C

See <http://www.ti.com> for other methods of soldering surface mount devices.

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) With a 100Ω series resistor on each input pin.
- (4) This test is performed with a 1000Ω source impedance.
- (5) For operation in ambient temperatures above 25°C the device must be derated based on a maximum junction temperature of 150°C and a thermal resistance of 93°C/W junction to ambient.

ELECTRICAL CHARACTERISTICS

APPLICATION INFORMATION

CIRCUIT DESCRIPTION

The LM9044 is a single channel device intended to act as a linear interface between a zirconium dioxide oxygen sensor and an A-to-D convertor. The LM9044 is fabricated in Bipolar technology and requires two supplies: a nominal 12V automotive supply (i.e. $V_{BATTERY}$), and a well regulated 5V supply.

The IC consists of a single channel differential input amplifier with a nominal DC gain of 4.5 V/V. The differential inputs have a specified common mode voltage operating range of 1V above and below ground. The circuitry also contains provisions for default output voltage in the cases of cold sensor and open sensor wiring. Additional support circuitry includes one pin for an optional user programmed low pass filter.

COLD SENSOR

Typically, a Lambda sensor will have an impedance of less than 10 k Ω when operating at temperatures between 300°C, and 500°C. When a Lambda sensor is not at operating temperature, its impedance can be more than 10 Meg Ω . Any voltage signal that may be developed is seriously attenuated. During this high impedance condition the LM9044 will provide a default output voltage.

While the Lambda sensor is high impedance the internal non-inverting input bias current (380 nA typical) will flow through the differential input resistance (1.2 M Ω typical) and out the inverting input pin to ground. This will cause a voltage to be developed across the differential inputs:

$$V_{IN(DIFF)} = 380 \text{ nA} \times 1.2 \text{ M}\Omega$$

$$V_{IN(DIFF)} = 456 \text{ mV}$$

The 456 mV across differential input resistance will be the dominant input signal, and the typical V_{OUT} will be:

$$V_{OUT} = V_{IN(DIFF)} \times 4.50$$

$$V_{OUT} = 456 \text{ mV} \times 4.50$$

$$V_{OUT} = 2.0\text{V}$$

As the Lambda sensor is heated, and the sensor impedance begins to drop, the voltage signal from the sensor will become the dominate signal.

The non-inverting input bias current is scaled to the V_{REF} voltage. As the V_{REF} voltage increases, or decreases, this bias current will change proportionally.

OPEN INPUT PINS DEFAULTS

In any remote sensor application it is desirable to be able to deal with the possibility of open connections between the sensor and the control module. The LM9044 is capable of providing a default output voltage should either, or both, of the wires to the Lambda sensor open. The two inputs handle the open circuit condition differently.

For the case of an open connection at the non-inverting input, the device would react exactly the same as for the Cold Sensor condition. The internal non-inverting input bias current (380 nA typical) flowing through the differential input resistance (1.2 M Ω typical) would cause the typical output voltage to be at a value defined by:

$$V_{OUT} = ((380 \text{ nA} \times 1.2\text{M}\Omega) \times 4.50)$$

$$V_{OUT} = 2.0\text{V}$$

The inverting input would still be connected to the Lambda sensor ground, so common mode signals would still need to be considered in this condition.

For the case of an open connection of the inverting input, the device output stage switches from the amplifier output to a resistive voltage divider. The LM9044 has a comparator to monitor the voltage on the inverting input pin, and a 65 μA (typical) current source that will force the pin high if the pin is open. When the voltage on the inverting pin goes above typically 1.5V, the comparator will switch the output pin from the amplifier output to the resistive voltage divider stage. In this case, the default V_{OUT} is not dependent on the gain stage, and any signal on the non-inverting input will be ignored.

In this condition V_{OUT} is:

$$V_{OUT} = V_{REF} \times ((14k + 4k) / (26.5k + 14k + 4k))$$

$$V_{OUT} = V_{REF} \times 0.4045$$

When V_{REF} is at 5.0V, V_{OUT} is defined as:

$$V_{OUT} = 5.0V \times 0.4045$$

$$V_{OUT} = 2.0V$$

In the cases where both the inverting and non-inverting pins are open, the open inverting pin condition (i.e.: a voltage divider across the output) will be the dominant condition.

Any common mode voltage transient on the inverting input pin which goes above the comparator threshold will immediately cause the output to switch to the resistive voltage divider mode. The output will return to normal operation when the voltage on the inverting input falls below the 1.5V threshold.

OUTPUT RESISTANCE

Under normal operating conditions the output pin resistance is typically 200Ω.

If the LM9044 is operating in a default output mode due an open connection on the inverting input, the output resistance will typically appear to be close to 11 kΩ.

An external output filter capacitor value of no more than 0.01 μF is generally recommended. Since the output pin voltage drive is basically a simple NPN emitter follower, the output pin pull-down is done by the internal feedback resistor string. With larger value capacitors on the output pin the effect will be somewhat similar to a voltage peak detector where the output capacitor is charged through the 200Ω resistor, and discharged back through the 200Ω resistor and the 18 kΩ feedback resistor string to ground.

The output resistance provides current limiting for the output stage should it become shorted to Ground. Any DC loading of the output will cause an error in the output voltage.

SUPPLY BYPASSING

For best performance the LM9044 requires a V_{REF} supply which is stable and noise free. The same 5V reference supply used for the A/D converter is the recommended LM9044 V_{REF} supply.

The LM9044 V_{CC} pin has an internal zener shunt voltage regulator, typically 7.5V, and requires a series resistor to limit the current. The V_{CC} pin should be bypassed with a minimum 0.01 μF capacitor to the Ground pin, and should be located as close to the device as possible. Some applications may require an additional bypass capacitance if the system voltage is unusually noisy.

SETTING THE BANDWIDTH

The LM9044 bandwidth is limited by an external capacitor (C_F) on the R_F pin.

This pin has an internal 175 kΩ resistor. The external capacitor and the internal resistor form a simple RC low-pass filter with a corner frequency (f_C) defined as:

$$f_C = 1 / (2 \times \pi \times 175 \text{ k}\Omega \times C_F)$$

With a C_F capacitor value of 0.001 μF, the corner frequency is:

$$f_C = 1 / (2 \times \pi \times 175 \text{ k}\Omega \times 0.001 \text{ }\mu\text{F})$$

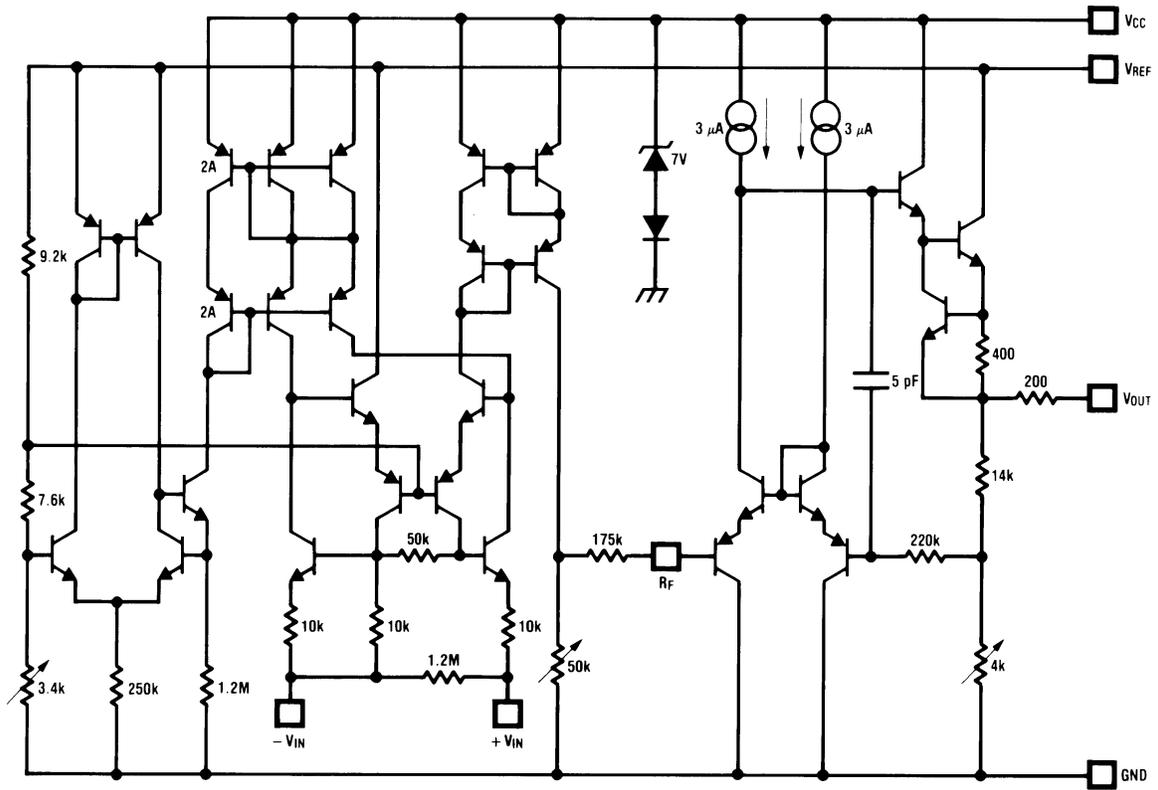

$$f_C = 909 \text{ Hz}$$

INPUT FILTERING

Filtering at the differential inputs is strongly recommended. Both the differential voltage signal and the common mode voltage signal should have low pass filters.

Input filtering is accomplished with series resistors on the input pins, and appropriate bypass capacitors. Typical input pin series resistance values are in the 100Ω to 1kΩ range. Series resistance values larger than 1kΩ will generate offset voltages that affect the accuracy of the signal voltage seen at the differential input pins.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
LM9044V/NOPB	Obsolete	Production	PLCC (FN) 20	-	-	Call TI	Call TI	-40 to 125	LM9044V

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
