

MCT8314Z Sensored Trapezoidal Integrated FET BLDC Motor Driver

1 Features

- Three-phase BLDC motor driver with integrated sensored trapezoidal control
 - Hall Sensor based trapezoidal (120°) commutation
 - Supports analog or digital hall inputs
 - Configurable PWM modulation: synchronous/asynchronous
 - Cycle-by-cycle current limit to limit phase current
 - Supports up to 100-kHz PWM frequency
 - Automatic synchronous rectification to reduce power losses
- 5.0-V to 35-V operating voltage (40-V abs max)
- High output current capability: 1.5-A Peak
- Low MOSFET on-state resistance
 - 575-mΩ $R_{DS(ON)}$ (HS + LS) at $T_A = 25^\circ\text{C}$
- Low-power sleep mode
 - 1.5-μA at $V_{VM} = 24\text{-V}$, $T_A = 25^\circ\text{C}$
- Integrated current limiting eliminates external current sense resistors
- Flexible device configuration options
 - MCT8314ZS: 5-MHz 16-bit SPI interface for device configuration and fault status
 - MCT8314ZH: Hardware pin-based configuration
- Supports 1.8-V, 3.3-V, and 5-V logic inputs
- Built-in 5-V (5%), 30-mA LDO regulator
- A suite of integrated protection features
 - Supply undervoltage lockout (UVLO)
 - Charge pump undervoltage (CPUV)
 - Overcurrent protection (OCP)
 - Motor lock protection
 - Thermal warning and shutdown (OTW/OTSD)
 - Fault condition indication pin (nFAULT)
 - Optional fault diagnostics over SPI

2 Applications

- Brushless-DC (BLDC) Motor Modules
- HVAC motors
- Small home appliances
- Office automation machines
- Factory automation and robotics

3 Description

The MCT8314Z provides a single-chip, code-free sensored trapezoidal commutation device for customers driving 12- to 24-V brushless-DC motors. The MCT8314Z integrates three 1/2-H bridges with 40-V absolute maximum capability and a low $R_{DS(ON)}$

of 575-mΩ (high-side and low-side combined) to enable high power drive capability. The integrated current limiting feature limits motor currents during start-up or high load conditions while eliminating the need for external sense resistors. An integrated 5-V LDO generates the necessary voltage rail for the device and can power external circuits.

MCT8314Z implements sensored trapezoidal control in a fixed-function state machine, so an external microcontroller is not required to spin the brushless DC motor. The MCT8314Z device integrates three analog Hall comparators for position sensing to achieve sensored trapezoidal BLDC motor control. The control scheme is highly configurable through hardware pins or registers settings ranging from motor current limiting behavior to fault response. The speed can be controlled through a PWM input.

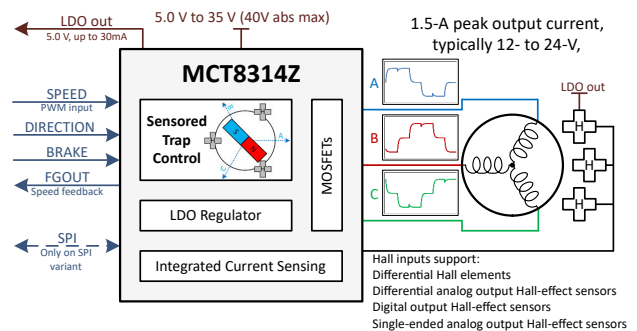

There are a large number of protection features integrated into the MCT8314Z that are designed to protect the device, motor, and system against fault events.

Refer [Application Information](#) for design consideration and recommendation on device usage.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
MCT8314ZS ⁽²⁾	WQFN (24)	3.00 mm × 3.00 mm
MCT8314ZH	WQFN (24)	3.00 mm × 3.00 mm

- For all available packages, see the orderable addendum at the end of the data sheet.
- Device is available for preview only.

4 Device Comparison Table

DEVICE	PACKAGES	INTERFACE
MCT8314ZS	24-pin WQFN (3x3 mm)	SPI
MCT8314ZH		Hardware

Table 4-1. MCT8314ZS (SPI variant) vs. MCT8314ZH configuration comparison

Parameters	MCT8314ZS (SPI variant)	MCT8314ZH (Hardware variant)
PWM control mode settings	PWM_MODE bits (4 settings)	MODE pin (7 settings)
Direction settings	DIR bit (2 settings)	DIR pin (2 settings)
Current limit threshold	Selectable by resistor to AGND on ILIM pin	
Current limit configuration	ILIM_RECIR bit (2 settings), PWM_100_DUTY_SEL bit	Recirculation fixed to Brake mode and PWM frequency for 100% duty fixed to 20 kHz
Lead angle settings	ADVANCE_LVL bits (8 settings)	ADVANCE pin (7 settings)
FG configuration	FGOUT_SEL bits (4 settings)	3x or 1x commutation frequency depending FGSEL/LOCK_DET_TIME pin configuration
Motor lock configuration: mode, detection and retry timing	MTR_LOCK_MODE bits (4 settings), MTR_LOCK_TDET bits (4 settings), MTR_LOCK_RETRY bit (2 settings)	Enabled with 500-ms automatic retry time, FGSEL/LOCK_DET_TIME pin (3 or 4 detection time settings, depending on configuration)
Automatic synchronous rectification	EN_ASR bit (2 settings)	MODE pin (6 settings)
OCP configuration	OCP_MODE bits (4 settings), $I_{OCP,min} = 3\text{ A}$, OCP_DEG bits (4 settings), and OCP_RETRY bits (2 settings)	Enabled with latched shutdown mode, $I_{OCP,min} = 3\text{ A}$, 0.6 μs deglitch time
Overvoltage protection configuration	OVP_EN bit (2 settings), OVP_SEL bit (2 settings)	Enabled and level is fixed to 34 V (typ)
SDO pin configuration	SDO_MODE bit (2 settings)	NA
SPI fault configuration	SPI_PARITY bit (2 settings), SPI_SCLK_FLT bit (2 settings), SPI_ADDR_FLT bit (2 settings)	NA

5 Pin Configuration and Functions

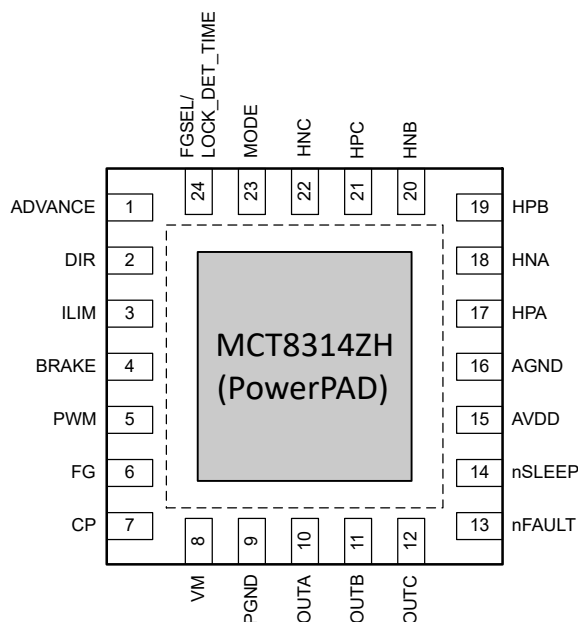

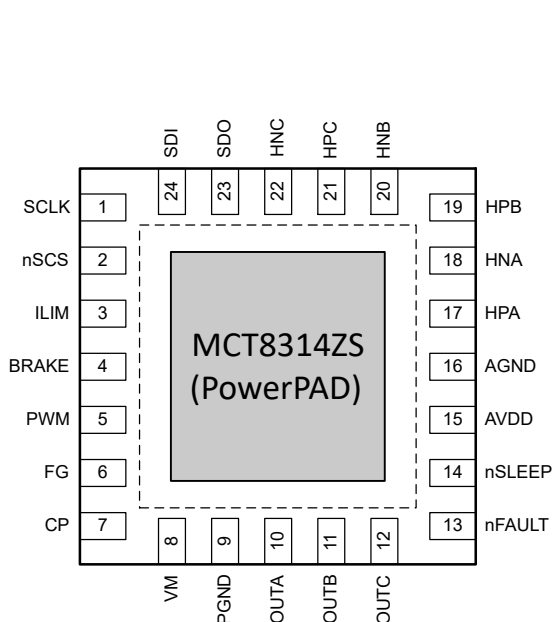

Figure 5-1. MCT8314ZS 24-Pin VQFN With Exposed Thermal Pad Top View **Figure 5-2. MCT8314ZH 24-Pin VQFN With Exposed Thermal Pad Top View**

Table 5-1. Pin Functions

PIN NAME	24-pin Package		TYPE ⁽¹⁾	DESCRIPTION
	MCT8314ZS	MCT8314ZH		
ADVANCE	—	1	I	Advance angle level setting. This pin is a 7-level input pin set by an external resistor.
AGND	16	16	GND	Device analog ground. Refer Layout Guidelines for connections recommendation.
AVDD	15	15	PWR O	5.0-V internal regulator output. Connect an X5R or X7R, 2.2-μF, 16-V ceramic capacitor between the AVDD and AGND pins. This regulator can source up to 30 mA externally.
BRAKE	4	4	I	High → Brake the motor when High by turning all low side MOSFETs ON Low → normal operation
CP	7	7	PWR O	Charge pump output. Connect a X5R or X7R, 0.22-μF, 16-V ceramic capacitor between the CP and VM pins.
DIR	—	2	I	Direction pin for setting the direction of the motor rotation to clockwise or counterclockwise.
FG	6	6	O	Motor Speed indicator output. Open-drain output requires an external pull-up resistor to 1.8V to 5.0V. It can be set to different division factor of Hall signals (see FG Signal)
FGSEL/ LOCK_DE T_TIME	—	24	I	Electrical frequency generation output mode and Motor lock detection time settings. This pin is a 7-level input pin set by an external resistor.
HNA	18	18	I	Phase A hall element negative input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.
HNB	20	20	I	Phase B hall element negative input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.
HNC	22	22	I	Phase C hall element negative input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.

Table 5-1. Pin Functions (continued)

PIN NAME	24-pin Package		TYPE ⁽¹⁾	DESCRIPTION
	MCT8314ZS	MCT8314ZH		
HPA	17	17	I	Phase A hall element positive input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.
HPB	19	19	I	Phase B hall element positive input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.
HPC	21	21	I	Phase C hall element positive input. Noise filter capacitors may be desirable, connected between the positive and negative hall inputs.
ILIM	3	3	I	Set the threshold for phase current used in cycle by cycle current limit.
MODE	—	23	I	PWM input mode setting. This pin is a 7-level input pin set by an external resistor.
nFAULT	13	13	O	Fault indicator. Pulled logic-low with fault condition; Open-drain output requires an external pull-up resistor to 1.8V to 5.0V. Tie nFAULT to GND if not used.
nSCS	2	—	I	Serial chip select. A logic low on this pin enables serial interface communication.
nSLEEP	14	14	I	Driver nSLEEP. When this pin is logic low, the device goes into a low-power sleep mode. An 20 to 40-μs low pulse can be used to reset fault conditions without entering sleep mode.
OUTA	10	10	PWR O	Half bridge output A
OUTB	11	11	PWR O	Half bridge output B
OUTC	12	12	PWR O	Half bridge output C
PGND	9	9	GND	Device power ground. Refer Layout Guidelines for connections recommendation.
PWM	5	5	I	PWM input for motor control. Set the duty cycle and switching frequency of the phase voltage of the motor.
SCLK	1	—	I	Serial clock input. Serial data is shifted out and captured on the corresponding rising and falling edge on this pin (SPI devices).
SDI	24	—	I	Serial data input. Data is captured on the falling edge of the SCLK pin (SPI devices).
SDO	23	—	O	Serial data output. Data is shifted out on the rising edge of the SCLK pin. This pin requires an external pullup resistor (SPI devices).
VM	8	8	PWR I	Power supply. Connect to motor supply voltage; bypass to PGND with two 0.1-μF capacitors (for each pin) plus one bulk capacitor rated for VM. TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device.
Thermal pad			GND	Must be connected to analog ground.

(1) I = input, O = output, GND = ground pin, PWR = power, NC = no connect

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Power supply pin voltage (V _M)	−0.3	40	V
Power supply voltage ramp (V _M) from V _{VM} < 4.2 V to V _{VM} = 35 V and from 6 V < V _{VM} to V _{VM} = 35 V		4	V/μs
Power supply voltage ramp (V _M) from 4.2 V ≤ V _{VM} ≤ 6 V to V _{VM} = 35 V		1	V/μs
Voltage difference between ground pins (PGND, AGND)	−0.3	0.3	V
Charge pump voltage (CP)	−0.3	V _M + 6	V
Analog regulators pin voltage (AVDD)	−0.3	5.75	V
Hall pin input voltage (HPx, HNx)	−0.3	5.75	V
Configuration pin input voltage (ILIM, ADVANCE, LOCK_DET_TIME, MODE)	−0.3	5.75	V
Logic pin input voltage (PWM, BRAKE, DIR, nSLEEP, nSCS, SCLK, SDI)	−0.3	5.75	V
Logic pin output voltage (nFAULT, SDO)	−0.3	5.75	V
Output pin voltage (OUTA, OUTB, OUTC)	−1	V _{VM} + 1	V
Ambient temperature, T _A	−40	125	°C
Junction temperature, T _J	−40	150	°C
Storage temperature, T _{stg}	−65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V _{VM}	Power supply voltage	V _{VM}	5	24	35	V
f _{PWM}	Output PWM frequency	OUTA, OUTB, OUTC			100	kHz
I _{OUT} ⁽¹⁾	Peak output winding current	OUTA, OUTB, OUTC			1.5	A
V _{IN}	Logic input voltage	PWM, BRAKE, DIR, nSLEEP, nSCS, SCLK, SDI	−0.1		5.5	V
	Configuration input voltage	ILIM, ADVANCE, FGSEL/ LOCK_DET_TIME, MODE	−0.1		AVDD	V
V _{OD}	Open drain pullup voltage	nFAULT, SDO	−0.1		5.5	V
V _{SDO}	Push-pull voltage	SDO	2.2		5.5	V
I _{OD}	Open drain output current	nFAULT, SDO			5	mA
T _A	Operating ambient temperature		−40		125	°C
T _J	Operating Junction temperature		−40		150	°C

- (1) Power dissipation and thermal limits must be observed

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		MCT8314Z	UNIT
		WQFN (RRM)	
		24 Pins	
R _{θJA}	Junction-to-ambient thermal resistance	43.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	39.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	17.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.7	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	17.6	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	6.1	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

T_J = –40°C to +150°C, V_{VM} = 5 to 35 V (unless otherwise noted). Typical limits apply for T_A = 25°C, V_{VM} = 24 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES						
I _{VMQ}	VM sleep mode current	V _{VM} > 6 V, nSLEEP = 0, T _A = 25 °C		1.5	2.5	μA
		nSLEEP = 0		1.5	5	μA
I _{VMS}	VM standby mode current	nSLEEP = 1, PWM = BRAKE = 0, SPI = 'OFF'		6.8	10	mA
		V _{VM} > 6 V, nSLEEP = 1, PWM = BRAKE = 0, SPI = 'OFF', T _A = 25 °C		6.8	8	mA
I _{VM}	VM operating mode current	V _{VM} > 6 V, nSLEEP = 1, f _{PWM} = 25 kHz, T _A = 25 °C		8	9	mA
		V _{VM} > 6 V, nSLEEP = 1, f _{PWM} = 100 kHz, T _A = 25 °C		9	10	mA
		nSLEEP = 1, f _{PWM} = 25 kHz		9	11	mA
		nSLEEP = 1, f _{PWM} = 100 kHz		9	11	mA
V _{AVDD}	Analog regulator voltage	V _{VM} > 6 V, 0 mA ≤ I _{AVDD} ≤ 30 mA	4.7	5	5.3	V
I _{AVDD}	External analog regulator load				30	mA
C _{AVDD}	Capacitance for AVDD ⁽¹⁾	External load: 0mA ≤ I _{AVDD} ≤ 30 mA	0.7	2.2	2.64	μF
V _{CP}	Charge pump regulator voltage	V _{CP} with respect to VM	3.5	4.7	5.2	V
C _{CP}	Charge pump capacitance ⁽¹⁾	Capacitance between CP and VM	80	220	330	nF
t _{WAKE}	Wakeup time	V _{VM} > V _{UVLO} , nSLEEP = 1 to outputs ready and nFAULT released		3.5	5	ms
t _{SLEEP}	Time to enter sleep mode	nSLEEP = 0 period to enter sleep mode			120	μs
t _{RST}	Reset Pulse time	nSLEEP = 0 period to reset faults	20		40	μs
LOGIC-LEVEL INPUTS (PWM, BRAKE, DIR, nSLEEP, SCLK, SDI, nSCS)						
V _{IL}	Input logic low voltage		0		0.6	V
V _{IH}	Input logic high voltage	Other Pins	1.5		5.5	V
		nSLEEP	1.6		5.5	V
V _{HYS}	Input logic hysteresis	Other Pins	150	250	420	mV
		nSLEEP	95	300	420	mV
I _{IL}	Input logic low current	V _{PIN} (Pin Voltage) = 0 V	–1		1	μA

$T_J = -40^{\circ}\text{C}$ to $+150^{\circ}\text{C}$, $V_{VM} = 5$ to 35 V (unless otherwise noted). Typical limits apply for $T_A = 25^{\circ}\text{C}$, $V_{VM} = 24\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{IH}	Input logic high current	nSCS, V_{nSCS} (Pin Voltage) = 5 V , $V_M < 6\text{ V}$	-1		1	μA
		nSCS, V_{nSCS} (Pin Voltage) = 5 V , $V_M \geq 6\text{ V}$	-1		1	μA
		nSLEEP, V_{nSLEEP} (Pin Voltage) = 5 V	10		30	μA
		Other pins, V_{PIN} (Pin Voltage) = 5 V	25		75	μA
R_{PD}	Input pulldown resistance	nSLEEP	150	225	300	$\text{k}\Omega$
		Other pins	70	100	130	$\text{k}\Omega$
C_{ID}	Input capacitance			30		pF
SEVEN-LEVEL INPUTS (ADVANCE, MODE, FGSEL/LOCK_DET_TIME)						
V_{L1}	Input mode 1 voltage	Tied to AGND	0		$0.09 \cdot V_{AVDD}$	V
V_{L2}	Input mode 2 voltage	$22\text{ k}\Omega \pm 5\%$ to AGND	$0.12 \cdot V_{AVDD}$	$0.15 \cdot V_{AVDD}$	$0.2 \cdot V_{AVDD}$	V
V_{L3}	Input mode 3 voltage	$100\text{ k}\Omega \pm 5\%$ to AGND	$0.27 \cdot V_{AVDD}$	$0.33 \cdot V_{AVDD}$	$0.4 \cdot V_{AVDD}$	V
V_{L4}	Input mode 4 voltage	Hi-Z	$0.45 \cdot V_{AVDD}$	$0.5 \cdot V_{AVDD}$	$0.55 \cdot V_{AVDD}$	V
V_{L5}	Input mode 5 voltage	$100\text{ k}\Omega \pm 5\%$ to AVDD	$0.6 \cdot V_{AVDD}$	$0.66 \cdot V_{AVDD}$	$0.73 \cdot V_{AVDD}$	V
V_{L6}	Input mode 6 voltage	$22\text{ k}\Omega \pm 5\%$ to AVDD	$0.77 \cdot V_{AVDD}$	$0.85 \cdot V_{AVDD}$	$0.9 \cdot V_{AVDD}$	V
V_{L7}	Input mode 7 voltage	Tied to AVDD	$0.94 \cdot V_{AVDD}$		V_{AVDD}	V
R_{PU}	Input pullup resistance	To AVDD	80	100	120	$\text{k}\Omega$
R_{PD}	Input pulldown resistance	To AGND	80	100	120	$\text{k}\Omega$
OPEN-DRAIN OUTPUTS (FG, SDO)						
V_{OL}	Output logic low voltage	$I_{OD} = 5\text{ mA}$			0.4	V
I_{OH}	Output logic high current	$V_{OD} = 5\text{ V}$	-1		1	μA
C_{OD}	Output capacitance				30	pF
PUSH-PULL OUTPUTS (SDO)						
V_{OL}	Output logic low voltage	$I_{OP} = 5\text{ mA}$	0		0.4	V
V_{OH}	Output logic high voltage	$I_{OP} = 5\text{ mA}$	2.2		5.5	V
I_{OL}	Output logic low leakage current	$V_{OP} = 0\text{ V}$	-1		1	μA
I_{OH}	Output logic high leakage current	$V_{OP} = 5\text{ V}$	-1		1	μA
C_{OD}	Output capacitance				30	pF
DRIVER OUTPUTS						
$R_{DS(ON)}$	Total MOSFET on resistance (High-side + Low-side)	$V_{VM} > 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_A = 25^{\circ}\text{C}$		575	630	$\text{m}\Omega$
		$V_{VM} < 6\text{ V}$, $I_{OUT} = 1\text{ A}$, $T_A = 25^{\circ}\text{C}$		596	660	$\text{m}\Omega$

7 Detailed Description

7.1 Overview

The MCT8314Z device is an integrated 575-m Ω (combined high-side and low-side MOSFET's on-state resistance) driver for 3-phase motor-drive applications. The device reduces system component count, cost, and complexity by integrating three half-bridge MOSFETs, gate drivers, a charge pump, and a linear regulator for the external load. A standard serial peripheral interface (SPI) provides a simple method for configuring the various device settings and reading fault diagnostic information through an external controller. Alternatively, a hardware interface (H/W) option allows for configuring the most commonly used settings through fixed external resistors.

The MCT8314Z device architecture uses an internal state machine to protect against short-circuit events, and protect against dv/dt parasitic turnon of the internal power MOSFET. The device also integrates a three-phase sensed trapezoidal commutation state machine using analog or digital hall sensors for position detection.

In addition to the high level of device integration, the MCT8314Z device provides a wide range of integrated protection features. These features include power-supply Undervoltage lockout (UVLO), charge-pump Undervoltage lockout (CPUV), overcurrent protection (OCP), AVDD Undervoltage lockout (AVDD_UV), and overtemperature shutdown (OTW and OTSD). Fault events are indicated by the nFAULT pin with detailed information available in the SPI registers on the SPI device version.

The MCT8314ZZS and MCT8314ZZH devices are available in 0.4-mm pin pitch, WQFN surface-mount packages. The WQFN package size is 3 mm \times 3 mm.

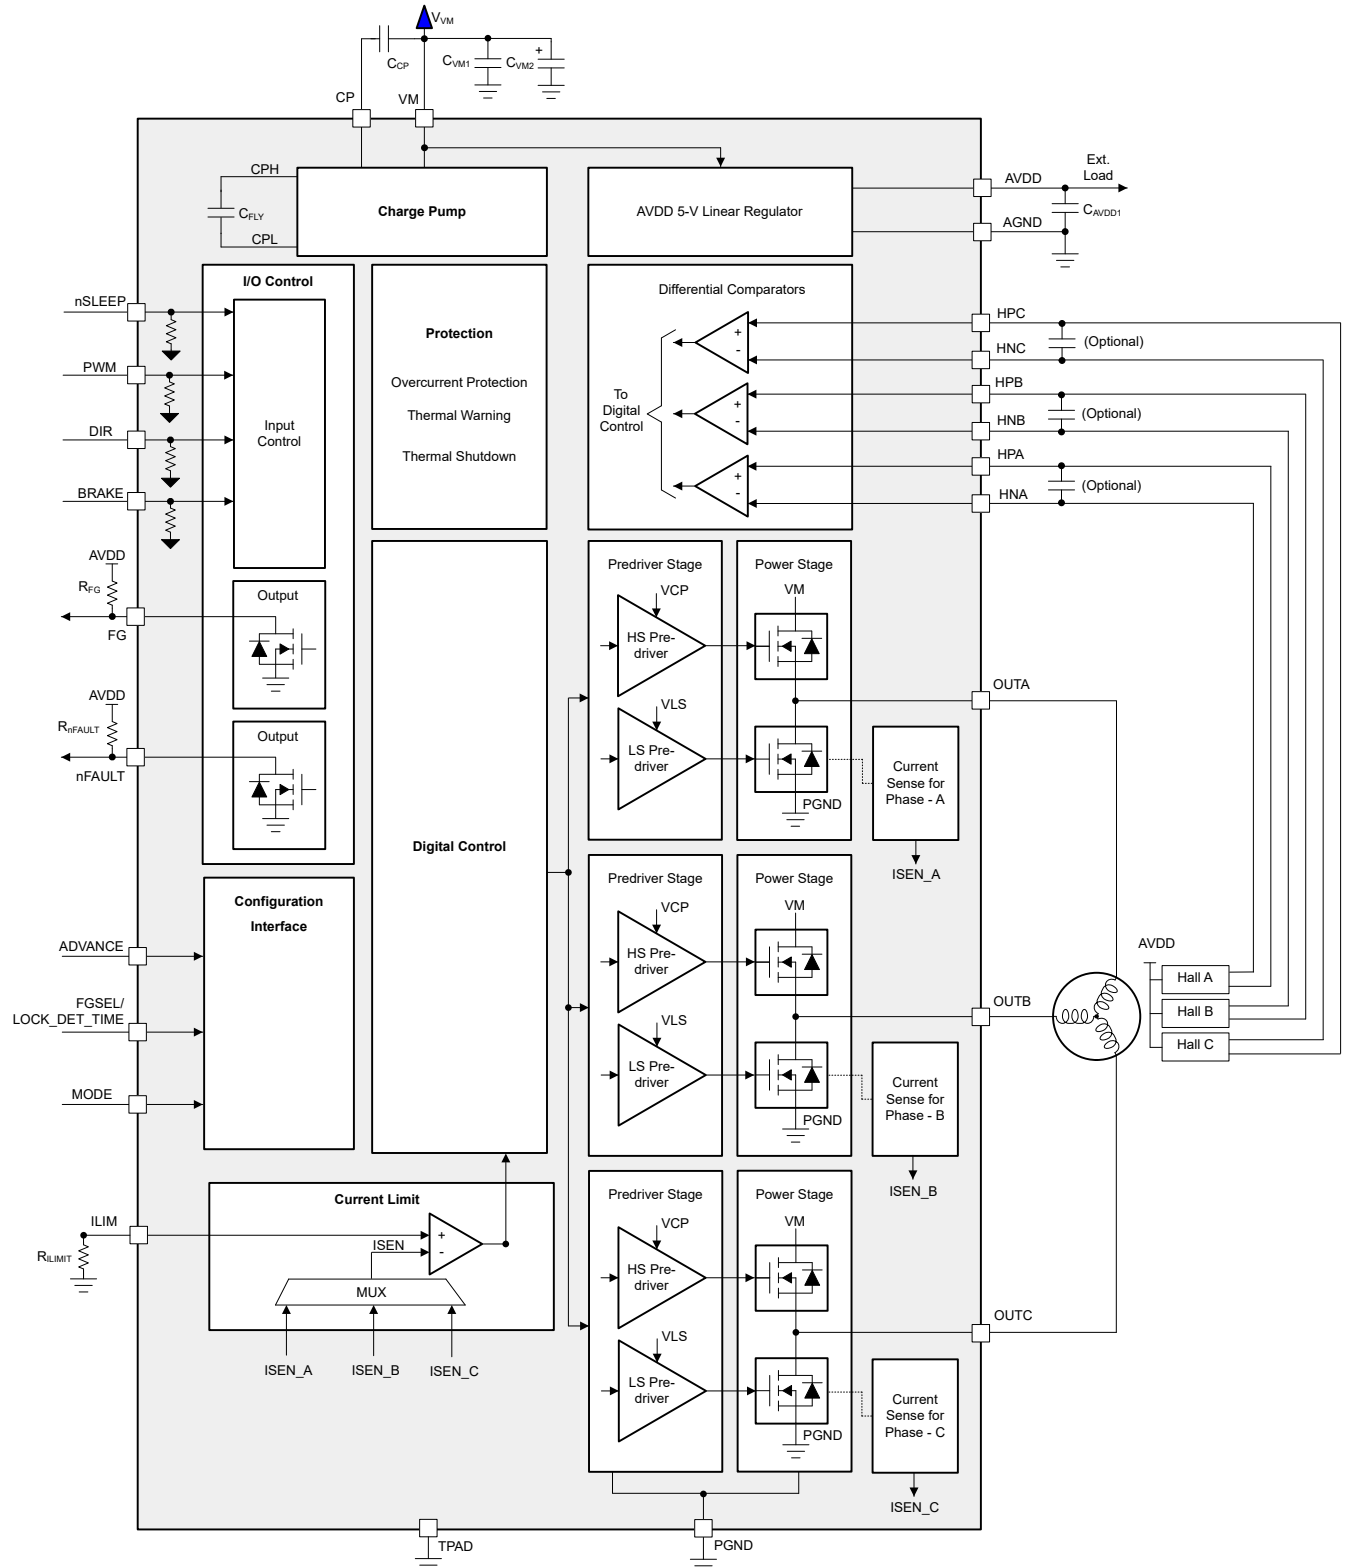

Figure 7-2. MCT8314ZH Block Diagram

7.3 Feature Description

Table 7-1 lists the recommended values of the external components for the driver.

Table 7-1. MCT8314Z External Components

COMPONENTS	PIN 1	PIN 2	RECOMMENDED
C _{VM1}	VM	PGND	X5R or X7R, 0.1-μF, TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device
C _{VM2}	VM	PGND	≥ 10-μF, TI recommends a capacitor voltage rating at least twice the normal operating voltage of the device
C _{CP}	CP	VM	X5R or X7R, ≥16-V, 0.22-μF capacitor
C _{AVDD}	AVDD	AGND	X5R or X7R, 2.2-μF, ≥16-V capacitor. In order for AVDD to accurately regulate output voltage, capacitor should have effective capacitance between 0.7-μF to 2.64-μF at 5 V across operating temperature.
R _{nFAULT}	VCC	nFAULT	5.1-kΩ, Pullup resistor
R _{FG}	VCC	FG	5.1-kΩ, Pullup resistor
R _{SDO}	VCC	SDO	5.1-kΩ, Pullup resistor
R _{MODE}	MODE	AGND or AVDD	MCT8314ZH hardware interface
R _{ADVANCE}	ADVANCE	AGND or AVDD	MCT8314ZH hardware interface
R _{LOCK}	FGSEL/LOCK_DET_TIME	AGND	MCT8314ZH hardware interface
R _{ILIMIT}	ILIM	AGND	See Section 7.3.11

7.3.1 Output Stage

The MCT8314Z device consists of an integrated 575-mΩ (combined high-side and low-side FET's on-state resistance) NMOS FETs connected in a three-phase bridge configuration. A doubler charge pump provides the proper gate-bias voltage to the high-side NMOS FETs across a wide operating voltage range in addition to providing 100% duty-cycle support. An internal linear regulator provides the gate-bias voltage for the low-side MOSFETs. The device has three VM motor power-supply pins which are to be connected to the motor-supply voltage.

7.3.2 PWM Control Mode (1x PWM Mode)

The MCT8314Z family of devices provides seven different control modes to support various commutation and control methods. The MCT8314Z device provides a 1x PWM control mode for driving the BLDC motor in trapezoidal current-control mode. The MCT8314Z device uses 6-step block commutation tables that are stored internally. This feature lets a three-phase BLDC motor be controlled using a single PWM sourced from a simple controller. The PWM is applied on the PWM pin and determines the output frequency and duty cycle of the half-bridges.

The MCT8314Z family of devices supports both analog and digital hall inputs by changing mode input setting. Differential hall inputs should be connected to HPx and HNx pins (see [Figure 7-3](#)). Digital hall inputs should be connected to the HPx pins while keeping the HNx pins floating (see [Figure 7-4](#)).

The half-bridge output states are managed by the HPA, HNA, HPB, HNB, HPC and HNC pins in analog mode and HPA, HPB, HPC in digital mode which are used as state logic inputs. The state inputs are the position feedback of the BLDC motor. The 1x PWM mode usually operates with synchronous rectification (low-side MOSFET recirculation); however, the mode can be configured to use asynchronous rectification (MOSFET body diode freewheeling) as shown in [Table 7-2](#).

Table 7-2. PWM mode Configuration

MODE Type	MODE Pin (Hardware Variant)	Hall Configuration	Modulation	ASR configuration	ASR Mode
Mode 1	Connected to AGND	Analog Hall Input	Asynchronous	EN_ASR = 0	ASR Disabled
Mode 2	Connected to AGND with R _{MODE1}	Digital Hall Input			
Mode 3	Connected to AGND with R _{MODE2}	Analog Hall Input			
Mode 4	Hi-Z	Digital Hall Input	Synchronous	EN_ASR = 1	ASR Enabled
Mode 5	Connected to AVDD with R _{MODE2}	Analog Hall Input			
Mode 6	Connected to AVDD with R _{MODE1}	Digital Hall Input			
Mode 7	Connected to AVDD				

Note

Texas Instruments does not recommend changing the MODE pin or PWM_MODE register during operation of the power MOSFETs. Set PWM to a low level before changing the MODE pin or PWM_MODE register.

7.3.2.1 Analog Hall Input Configuration

Figure 7-3 shows the connection of analog Hall inputs to the driver. Analog Hall elements are fed to the Hall comparators, which zero crossing is used to generate the commutation logic.

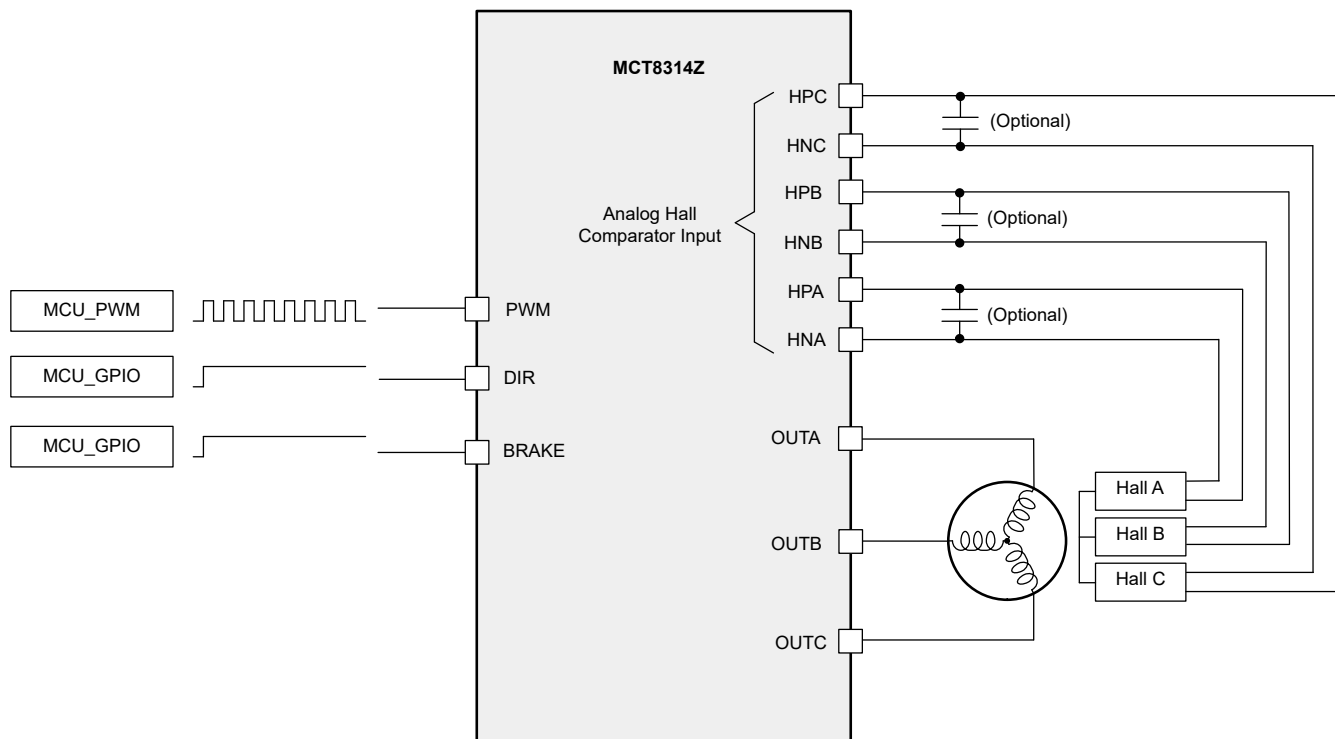

Figure 7-3. 1x PWM Mode with Analog Hall Input

7.3.2.2 Digital Hall Input Configuration

Figure 7-4 shows the connection of digital Hall inputs to the driver.

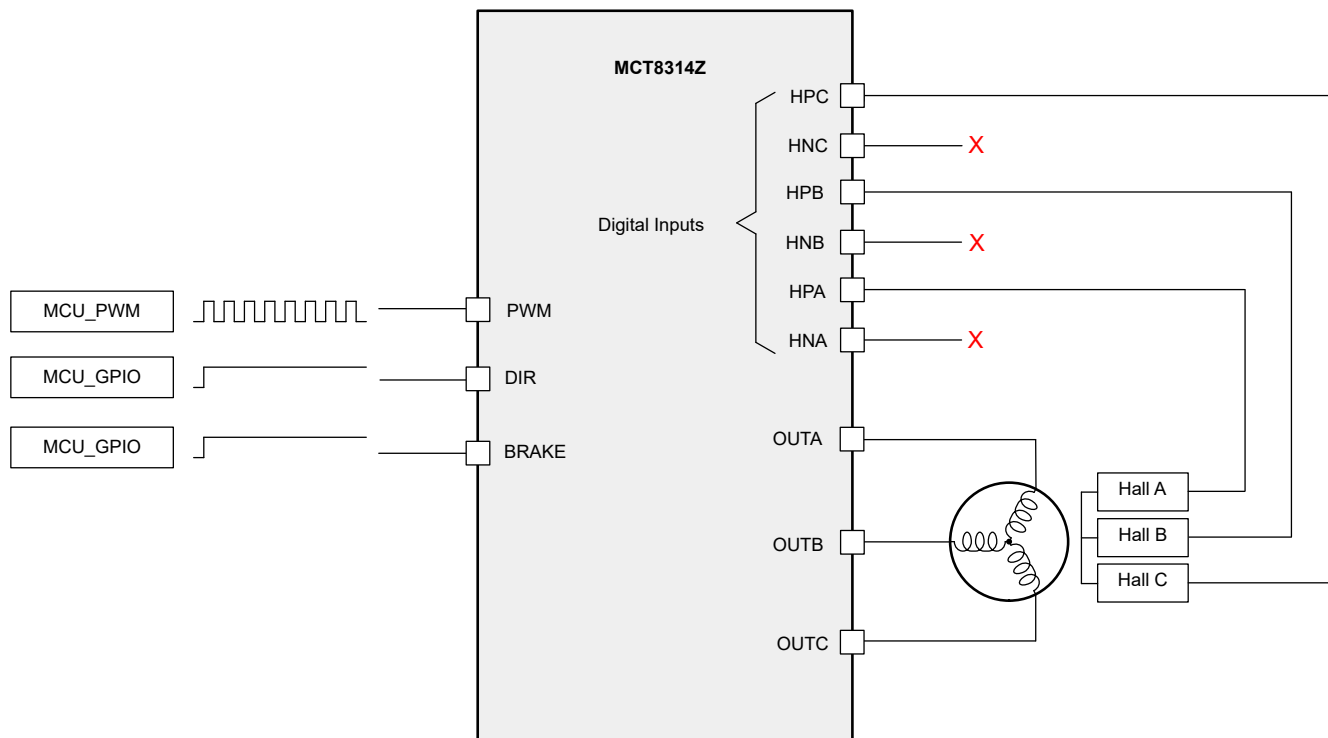

Figure 7-4. 1x PWM Mode with Digital Hall Input

7.3.2.3 Asynchronous Modulation

The DIR pin controls the direction of BLDC motor in either clockwise or counter-clockwise direction. Tie the DIR pin low if this feature is not required.

The BRAKE input halts the motor by turning off all high-side MOSFETs and turning on all low-side MOSFETs when it is pulled high. This brake is independent of the states of the other input pins. Tie the BRAKE pin low if this feature is not required.

Table 7-3 shows the configuration in 1x PWM mode with asynchronous modulation.

Table 7-3. Asynchronous Modulation

HALL INPUTS							DRIVER OUTPUTS						
STATE	DIR = 0			DIR = 1			PHASE A		PHASE B		PHASE C		DESCRIPTION
	HALL_A /HPA	HALL_B /HPB	HALL_C /HPC	HALL_A /HPA	HALL_B /HPB	HALL_C /HPC	High Side	Low Side	High Side	Low Side	High Side	Low Side	
Stop	0	0	0	0	0	0	L	L	L	L	L	L	Stop
	1	1	1	1	1	1							
1	1	1	0	0	0	1	L	L	PWM	L	L	H	B → C
2	1	0	0	0	1	1	PWM	L	L	L	L	H	A → C

5	0	1	1	1	0	0	L	H	L	L	PWM	L	C → A
6	0	1	0	1	0	1	L	H	PWM	L	L	L	B → A

7.3.2.4 Synchronous Modulation

Table 7-4 shows the configuration in 1x PWM mode with synchronous modulation.

Table 7-4. Synchronous Modulation

HALL INPUTS							DRIVER OUTPUTS						
STATE	DIR = 0			DIR = 1			PHASE A		PHASE B		PHASE C		DESCRIPTION
	HALL_A /HPA	HALL_B /HPB	HALL_C /HPC	HALL_A /HPA	HALL_B /HPB	HALL_C /HPC	High Side	Low Side	High Side	Low Side	High Side	Low Side	
Stop	0	0	0	0	0	0	L	L	L	L	L	L	Stop
	1	1	1	1	1	1							
1	1	1	0	0	0	1	L	L	PWM	!PWM	L	H	B → C
2	1	0	0	0	1	1	PWM	!PWM	L	L	L	H	A → C
3	1	0	1	0	1	0	PWM	!PWM	L	H	L	L	A → B
4	0	0	1	1	1	0	L	L	L	H	PWM	!PWM	C → B
5	0	1	1	1	0	0	L	H	L	L	PWM	!PWM	C → A
6	0	1	0	1	0	1	L	H	PWM	!PWM	L	L	B → A

7.3.2.5 Motor Operation

Figure 7-5 and Figure 7-6 shows the BLDC motor commutation with direction setting DIR (bit or pin) as 0 and 1 respectively.

Figure 7-5. BLDC Motor Commutation with DIR = 0 Figure 7-6. BLDC Motor Commutation with DIR = 1

Note

Texas Instruments recommends motor direction (DIR) change when the motor is stationary.

7.3.3 Device Interface Modes

The MCT8314Z family of devices supports two different interface modes (SPI and hardware) to let the end application design for either flexibility or simplicity (Figure 7-7 and Figure 7-8). The two interface modes share the same four pins, allowing the different versions to be pin-to-pin compatible. This compatibility lets application designers evaluate with one interface version and potentially switch to another with minimal modifications to their design.

Figure 7-7. MCT8314ZZS SPI Interface

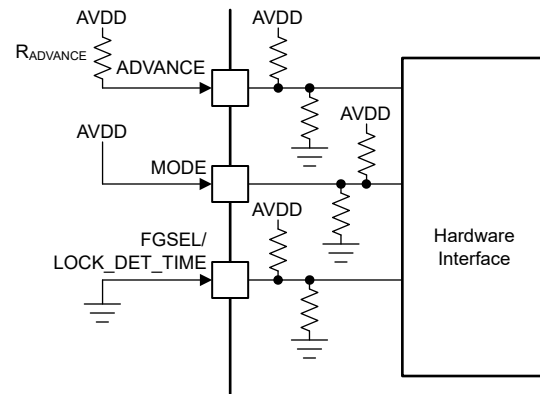

Figure 7-8. MCT8314ZZH Hardware Interface

7.3.3.1 Serial Peripheral Interface (SPI)

The SPI devices support a serial communication bus that lets an external controller send and receive data with the MCT8314Z. This variant lets the external controller configure device settings and read detailed fault information. The interface is a four wire interface using the SCLK, SDI, SDO, and nSCS pins which are described as follows:

- The SCLK pin is an input that accepts a clock signal to determine when data is captured and propagated on the SDI and SDO pins.
- The SDI pin is the data input.
- The SDO pin is the data output. The SDO pin can be configured to either open-drain or push-pull through SDO_MODE.
- The nSCS pin is the chip select input. A logic low signal on this pin enables SPI communication with the MCT8314Z. Placing an option pull-up resistor on this pin helps to avoid accidental SPI communication during power cycling on the controller or the driver.

For more information on the SPI, see the [Section 7.5](#) section.

7.3.3.2 Hardware Interface

Hardware interface devices use three resistor-configurable inputs (in the place of SPI pins) which are ADVANCE, MODE, and FGSEL/LOCK_DET_TIME. This variant lets the application designer configure the most common device settings by tying the pin logic high or logic low, or with a simple pullup or pulldown resistor. This removes the requirement for an SPI bus from the external controller. General fault information can still be obtained through the nFAULT pin.

- The MODE pin configures the PWM control mode.
- The ADVANCE pin configures the lead angle of the output with respect to hall signals.
- The FGSEL/LOCK_DET_TIME pin configures the electrical frequency generation output mode and t_{MTR_LOCK} .

For more information on the hardware interface, see the [Section 7.3.9](#) section.

7.3.4 AVDD Linear Voltage Regulator

A 5-V linear regulator is integrated into the MCT8314Z family of devices and is available for use by external circuitry. The AVDD regulator is used for powering up the internal digital circuitry of the device and additionally, this regulator can also provide the supply voltage for a low-power MCU or other circuitry supporting low current (up to 30 mA). The output of the AVDD regulator should be bypassed near the AVDD pin with a X5R or X7R, 2.2-μF, 10-V ceramic capacitor routed directly back to the adjacent AGND ground pin. The AVDD nominal, no-load output voltage is 5 V.

Figure 7-9. AVDD Linear Regulator Block Diagram

Use [Equation 1](#) to calculate the power dissipated in the device by the AVDD linear regulator with VM as supply.

$$P = (V_{VM} - V_{AVDD}) \times I_{AVDD} \quad (1)$$

For example, at a V_{VM} of 24 V, drawing 20 mA out of AVDD results in a power dissipation as shown in [Equation 2](#).

$$P = (24 \text{ V} - 5 \text{ V}) \times 20 \text{ mA} = 380 \text{ mW} \quad (2)$$

7.3.5 Charge Pump

Because the output stages use N-channel FETs, the device requires a gate-drive voltage higher than the VM power supply to enhance the high-side FETs fully. The MCT8314Z integrates a charge-pump circuit that generates a voltage above the VM supply for this purpose. The charge pump requires one external capacitor, C_{CP} , for operation. Use a X5R or X7R, 220-nF, 16-V ceramic capacitor for C_{CP} and place it near the VM and CP pins. The charge pump shuts down when nSLEEP is low.

7.3.6 Slew Rate

The slew rate of each half-bridge is 200-V/ μ s. The slew rate is calculated by the rise time and fall time of the voltage on OUTx pin as shown in [Figure 7-10](#).

Figure 7-10. Slew Rate Timings

7.3.7 Cross Conduction (Dead Time)

The device is fully protected for any cross conduction of MOSFETs. In half-bridge configuration, the operation of high-side and low-side MOSFETs are ensured to avoid any shoot-through currents by inserting a dead time (t_{dead}). This is implemented by sensing the gate-source voltage (V_{GS}) of the high-side and low-side MOSFETs and ensuring that V_{GS} of high-side MOSFET has reached below turn-off levels before switching on the low-side MOSFET of same half-bridge as shown in Figure 7-11 and Figure 7-12.

Figure 7-11. Cross Conduction Protection

Figure 7-12. Dead Time

7.3.8 Propagation Delay

The propagation delay time (t_{pd}) is measured as the time between an input logic edge to change in gate driver voltage. This time has three parts consisting of the digital input deglitcher delay, analog driver, and comparator delay.

The input deglitcher prevents high-frequency noise on the input pins from affecting the output state of the gate drivers. To support multiple control modes, a small digital delay is added as the input command propagates through the device.

Figure 7-13. Propagation Delay Timing

7.3.9 Pin Diagrams

This section presents the I/O structure of all digital input and output pins.

7.3.9.1 Logic Level Input Pin (Internal Pulldown)

Figure 7-14 shows the input structure for the logic level pins: BRAKE, DIR, nSLEEP, PWM, SCLK and SDI. The input can be with a voltage or external resistor. It is recommended to put these pins low in device sleep mode to reduce leakage current through internal pull-down resistors.

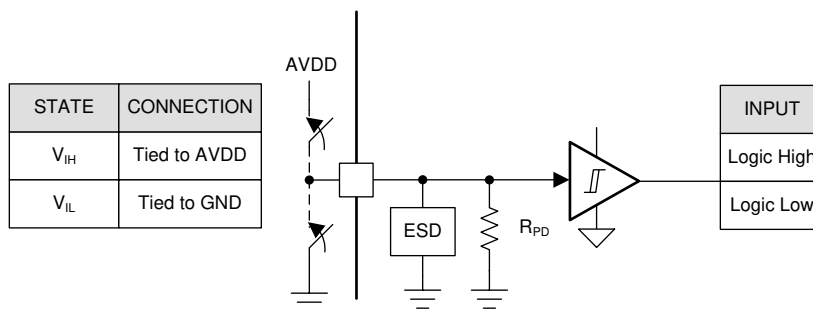

Figure 7-14. Logic-Level Input Pin Structure

7.3.9.2 Logic Level Input Pin (Internal Pullup)

Figure 7-15 shows the input structure for the logic level pin, nSCS. The input can be driven with a voltage or external resistor.

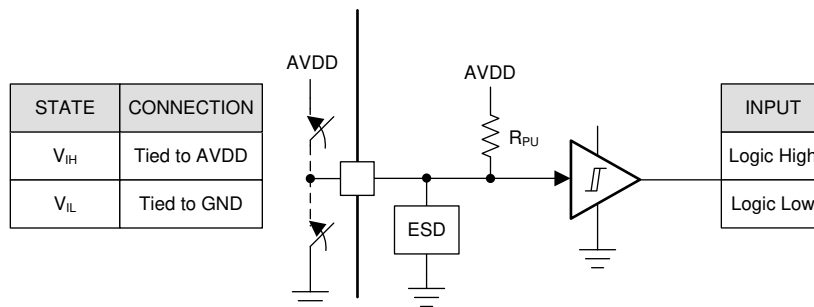

Figure 7-15. Logic nSCS

7.3.9.3 Open Drain Pin

Figure 7-16 shows the structure of the open-drain output pins, nFAULT, FG, and SDO in open drain mode. The open-drain output requires an external pullup resistor to function properly.

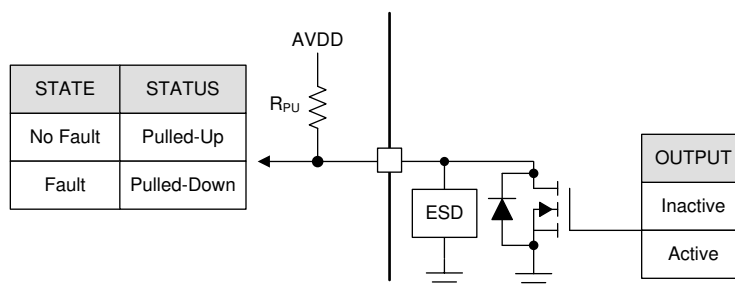

Figure 7-16. Open Drain

7.3.9.4 Push Pull Pin

Figure 7-17 shows the structure of SDO in push-pull mode.

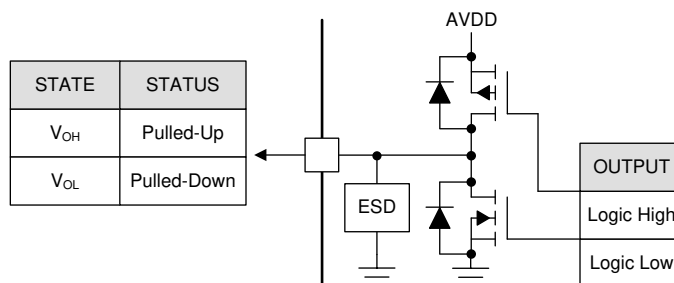

Figure 7-17. Push Pull

7.3.9.5 Seven Level Input Pin

Figure 7-18 shows the structure of the seven level input pins, ADVANCE and MODE, on hardware interface devices. The input can be set with an external resistor.

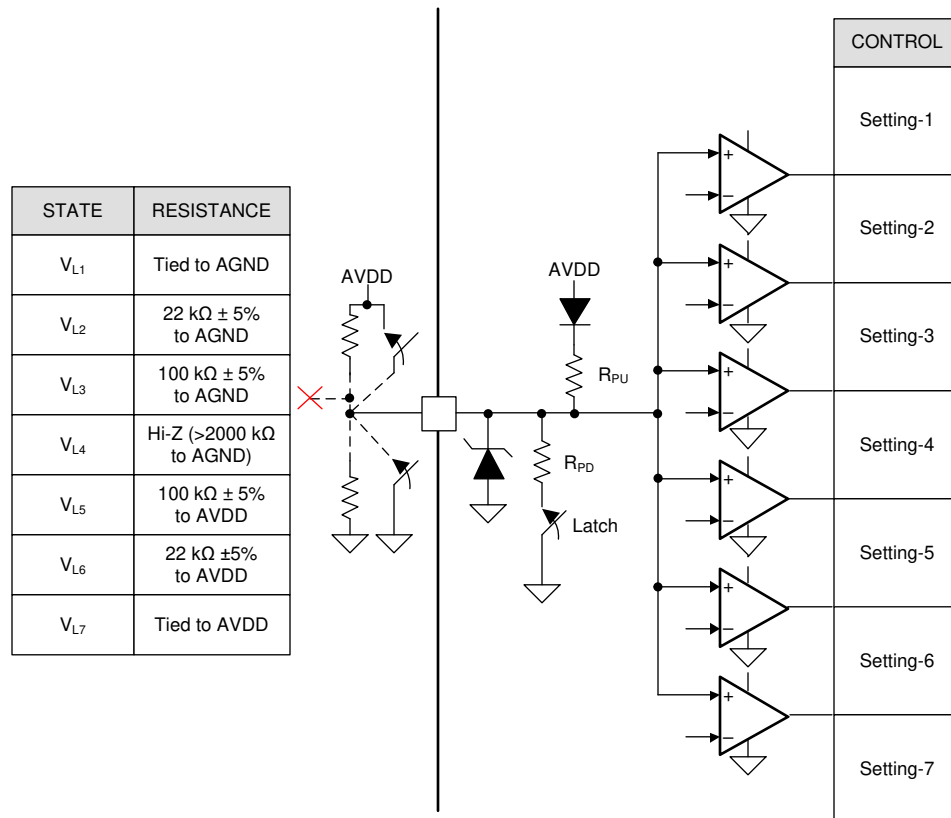

Figure 7-18. Seven Level Input Pin Structure

7.3.10 Automatic Synchronous Rectification Mode (ASR Mode)

The automatic synchronous rectification (ASR) mode in the MCT8314Z decreases power losses and thermal dissipation by reducing diode conduction losses in the low-side MOSFET. When this feature is enabled, the device automatically turns ON the low-side MOSFET during the PWM OFF time regardless of the device modulation setting. During the PWM OFF time, if the current drops to 0 A, the device automatically disables the MOSFET to avoid back EMF generating negative current in the motor windings. This negative current creates a negative torque on the BLDC motor, and it can reduce performance of low-inductance motors. When ASR mode is enabled, the current during the decay is monitored and the low-side FET is turned off as soon as the current reaches near to zero. This saves the negative current building in the BLDC motor which results in better noise performance and better thermal management. Figure 7-19 and Figure 7-20 compare asynchronous and synchronous PWM modes with ASR.

Figure 7-19. Comparing Asynchronous Modulation and ASR

Figure 7-20. Comparing Synchronous Modulation and ASR

The MCT8314Z device includes a low-side (ASR_LS) comparator which detects the negative flow of current in the device on each low-side MOSFET. The ASR_LS comparator compares the sense-FET output with the ground (0-V) threshold. When the current flows from PGND to OUTx, the ASR_LS comparator trips. This comparator provides a reference point for the operation of the ASR feature.

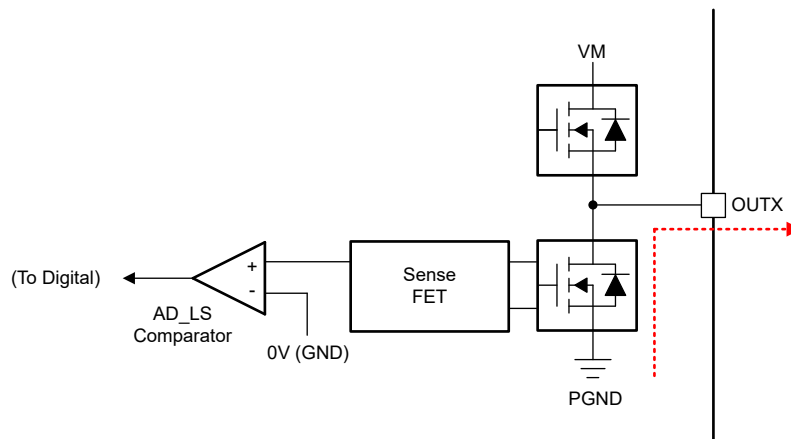

Figure 7-21. ASR Operation

In the SPI device variant, the EN_ASR bit configures active demagnetization. In the hardware variant, the MODE pin configures active demagnetization as shown in [Table 7-5](#).

Table 7-5. PWM_MODE Configuration

MODE Type	MODE Pin (Hardware Variant)	Hall Configuration	Modulation	ASR configuration	ASR Mode
Mode 1	Connected to AGND	Analog Hall Input	Asynchronous	EN_ASR = 0	ASR Disabled
Mode 2	Connected to AGND with R_{MODE1}	Digital Hall Input			
Mode 3	Connected to AGND with R_{MODE2}	Analog Hall Input	Synchronous		
Mode 4	Hi-Z	Digital Hall Input			
Mode 5	Connected to AVDD with R_{MODE2}	Analog Hall Input			
Mode 6	Connected to AVDD with R_{MODE1}	Digital Hall Input		EN_ASR = 1	ASR Enabled
Mode 7	Connected to AVDD				

This device does not support smart rectification through the high-side MOSFET. Currents returning to the VM will flow through the high-side body diodes.

7.3.11 Cycle-by-Cycle Current Limit

The current-limit circuit activates if the current flowing through the low-side MOSFETs exceeds the I_{LIMIT} current. Large currents may occur during motor start, high torque events, or stall conditions. The current-limit circuitry utilizes the internal sense FETs on the low-side power FETs of the three phases. Figure 7-22 shows the implementation of current limit circuitry. The ILIM pin sets the I_{LIMIT} by connecting an R_{LIMIT} from ILIM to AGND. Equation 3 calculates the resistor value in Ohms required for a target I_{LIMIT} threshold.

$$R_{LIMIT} = 9000 / I_{LIMIT} \quad (3)$$

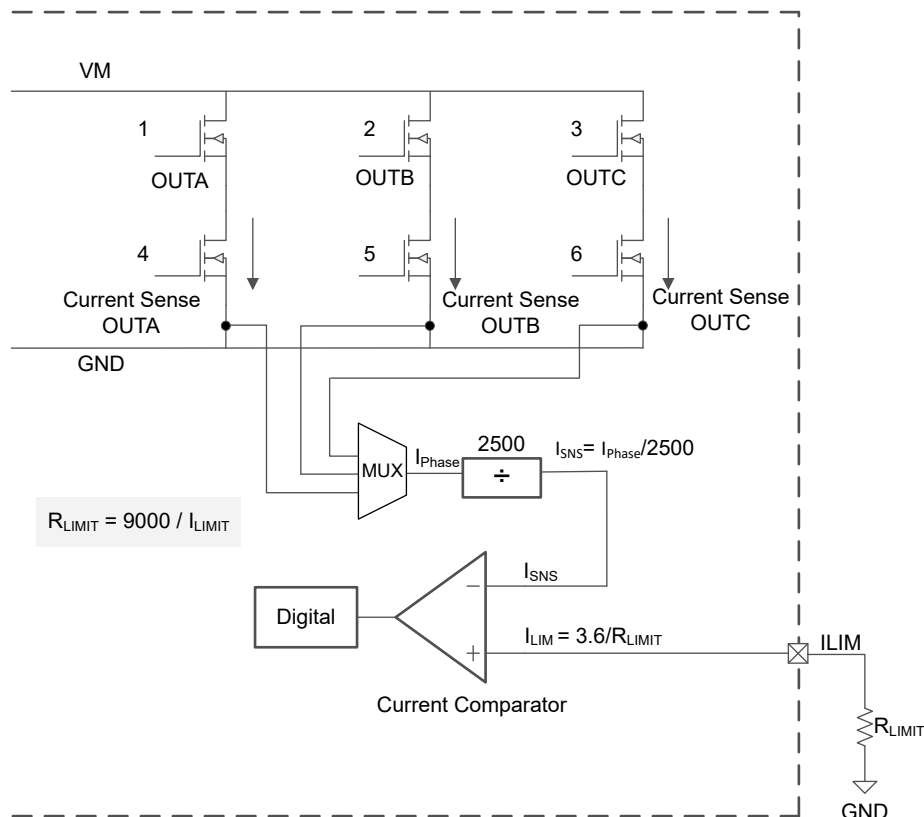

Figure 7-22. Current Limit Implementation

When the current limit activates, the high-side FETs disable until the beginning of the next PWM cycle as shown in Figure 7-23. The low-side FETs can operate in brake mode or coast (high-Z) mode by configuring the ILIM_RECIR bit in the SPI device variant. In the hardware device, the device operates in brake mode when current limiting trips.

Figure 7-23. Cycle-by-Cycle Current-Limit Operation

When the current limit activates in synchronous rectification mode, the current recirculates through the low-side FETs while the high-side FETs are disabled as shown in [Figure 7-24](#). When the current limit activates in asynchronous rectification mode, the current recirculates through the body diodes of the low-side FETs while the high-side FETs are disabled as shown in [Figure 7-25](#)

Figure 7-24. Brake State

Figure 7-25. Coast State

Note

The current-limit circuit is ignored immediately after the PWM signal goes active for a short blanking time to prevent false trips of the current-limit circuit.

Note

During the brake operation, a high-current can flow through the low-side FETs which can eventually trigger the over current protection circuit. This allows the body-diode of the high-side FET to conduct and pump brake energy to the VM supply rail.

7.3.11.1 Cycle by Cycle Current Limit with 100% Duty Cycle Input

In case of 100% duty cycle applied on PWM input, there is no edge available to turn high-side FET back on. To overcome this problem, MCT8314Z has built in internal PWM clock which is used to turn high-side FET back on once it is disabled after exceeding I_{LIMIT} threshold. In SPI variant MCT8314Z, this internal PWM clock can be configured to either 20 kHz or 40 kHz through PWM_100_DUTY_SEL. In H/W variant MCT8314Z PWM internal clock is set to 20 kHz. [Figure 7-26](#) shows operation with 100% duty cycle.

Figure 7-26. Cycle-by-Cycle Current-Limit Operation with 100% PWM Duty Cycle

7.3.12 Hall Comparators (Analog Hall Inputs)

Three comparators are provided to process the raw signals from the Hall-effect sensors to commutate the motor. The Hall comparators sense the zero crossings of the differential inputs and pass the information to digital logic. The Hall comparators have hysteresis, and their detect threshold is centered at 0 V. The hysteresis is defined as shown in Figure 7-27.

In addition to the hysteresis, the Hall inputs are deglitched with a circuit that ignores any extra Hall transitions for a period of t_{HDG} after sensing a valid transition. Ignoring these transitions for the t_{HDG} time prevents PWM noise from being coupled into the Hall inputs, which can result in erroneous commutation.

If excessive noise is still coupled into the Hall comparator inputs, adding capacitors between the positive and negative inputs of the Hall comparators may be required. The ESD protection circuitry on the Hall inputs implements a diode to the AVDD pin. Because of this diode, the voltage on the Hall inputs should not exceed the AVDD voltage.

Because the AVDD pin is disabled in sleep mode (nSLEEP inactive), the Hall inputs should not be driven by external voltages in sleep mode. If the Hall sensors are powered externally, the supply to the Hall sensors should be disabled if the MCT8314Z device is put into sleep mode. In addition, the Hall sensors' power supply should be powered up after enabling the motor otherwise an invalid Hall state may cause a delay in motor operation.

Figure 7-27. Hall Comparators Operation

7.3.13 Advance Angle

The MCT8314Z includes device an advance angle feature to advance the commutation by a specified electrical angle based on the voltage on the ADVANCE pin (in H/W device variant) or the ADVANCE bits (in SPI device variant). [Figure 7-28](#) shows the operation of advance angle feature.

Figure 7-28. Advance Angle

7.3.14 FG Signal

The MCT8314Z device also has an open-drain FG signal that can be used for closed-loop speed control of a BLDC motor. This signal includes the information of all three Hall-elements inputs as shown in [Section 7.3.14](#). In the MCT8314ZS (SPI variant), FG can be configured to be a different division factor of Hall signals as shown in [Section 7.3.14](#). In the MCT8314ZH (Hardware variant), the FGSEL/LOCK_DET_TIME pin selects between 3x (FGOUT_SEL = 00b) or 1x (FGOUT_SEL = 01b) commutation frequencies as shown in [Table 7-6](#).

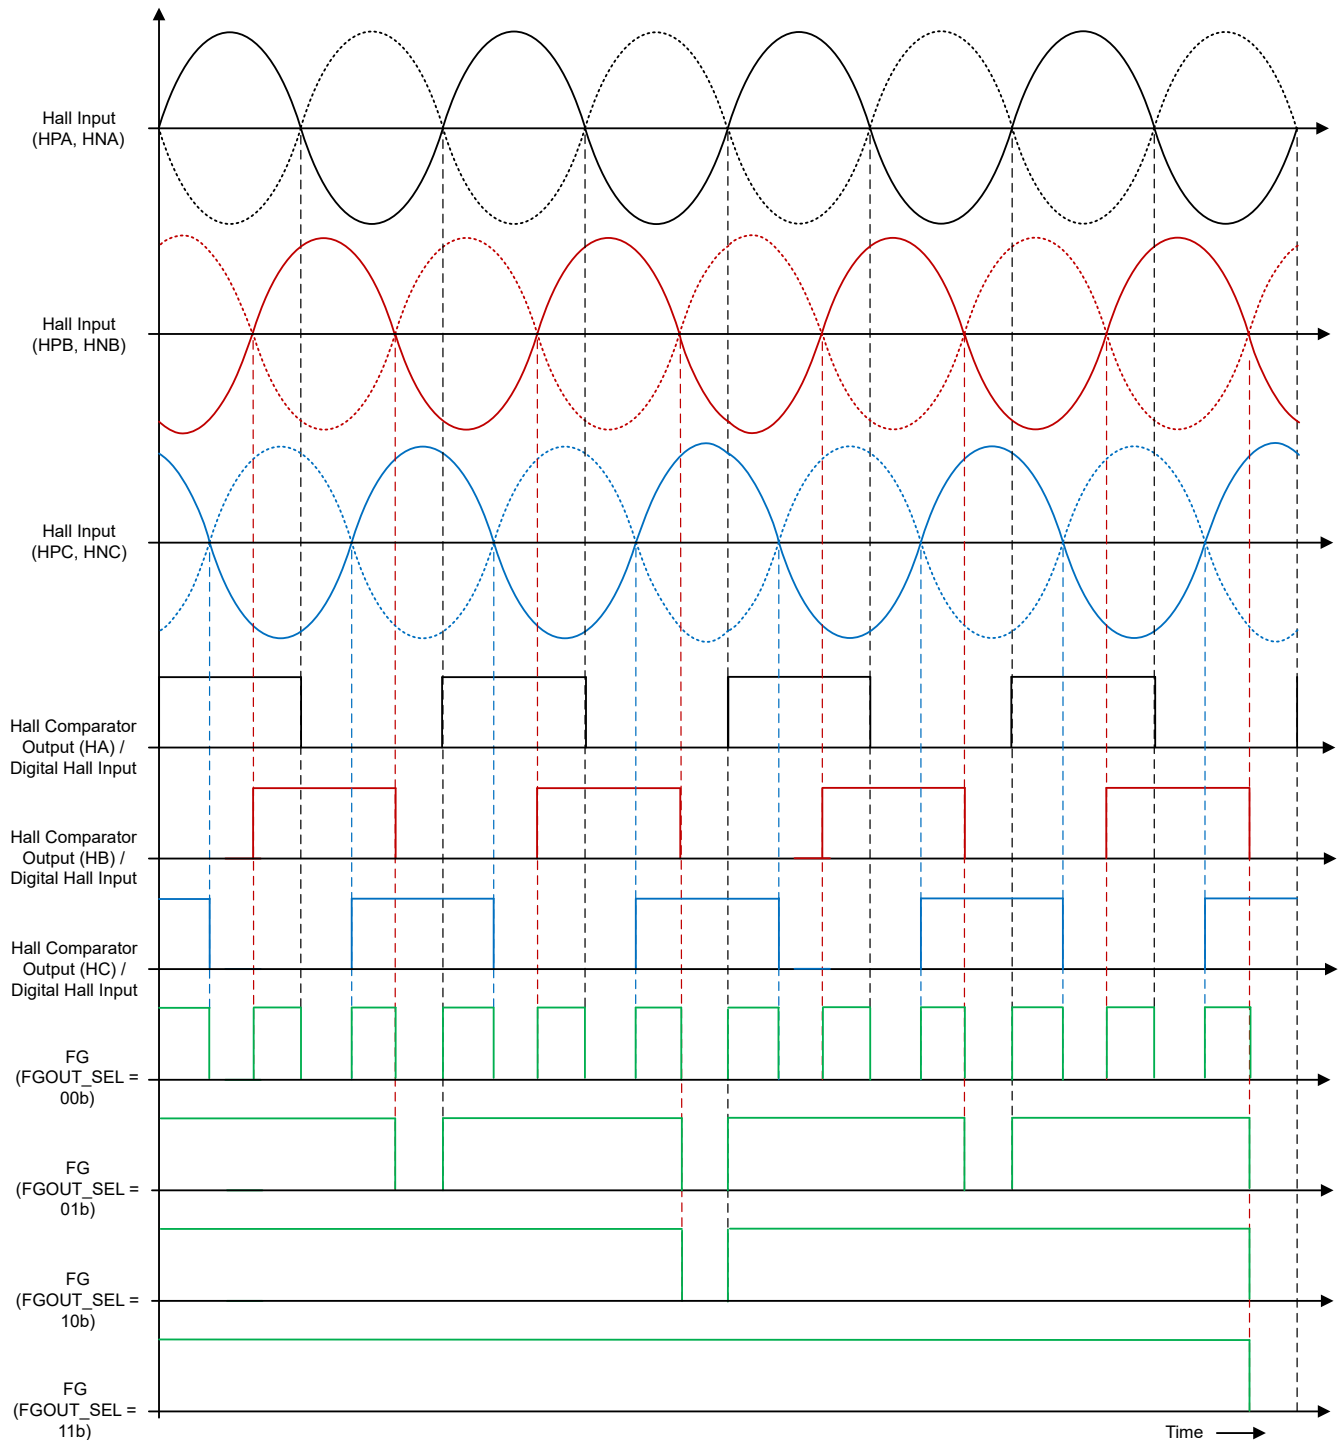

Figure 7-29. FG Signal

Table 7-6. FG_SEL for MCT8314Z

Setting	FGSEL/LOCK_DET_TIME Pin (Hardware Variant)	FG Output Commutation Frequency	t _{MTR_LOCK}
Setting-1	Connected to AGND	3x commutation frequency (FGOUT_SEL = 00b)	300 ms
Setting-2	Connected to AGND with R _{MODE1}		500 ms
Setting-3	Connected to AGND with R _{MODE2}		1000 ms
Setting-4	Hi-Z		5000 ms
Setting-5	Connected to AVDD with R _{MODE2}	1x commutation frequency (FGOUT_SEL = 01b)	300 ms
Setting-6	Connected to AVDD with R _{MODE1}		500 ms
Setting-7	Connected to AVDD		1000 ms

7.3.15 Protections

The MCT8314Z family of devices is protected against VM undervoltage, charge pump undervoltage, and overcurrent events. [Table 7-7](#) summarizes various faults details.

Table 7-7. Fault Action and Response

FAULT	CONDITION	CONFIGURATION	REPORT	H-BRIDGE	LOGIC	RECOVERY
VM undervoltage (NPOR)	$V_{VM} < V_{UVLO}$	Device default	—	Hi-Z	Disabled	Automatic: $V_{VM} > V_{UVLO_R}$ CLR_FLT, nSLEEP Reset Pulse (NPOR bit)
AVDD undervoltage (NPOR)	$V_{AVDD} < V_{AVDD_UV}$	Device default	—	Hi-Z	Disabled	Automatic: $V_{AVDD} > V_{AVDD_UV_R}$ CLR_FLT, nSLEEP Reset Pulse (NPOR bit)
Charge pump undervoltage (VCP_UV)	$V_{CP} < V_{CPUV}$	Device default	nFAULT	Hi-Z	Active	Automatic: $V_{VCP} > V_{CPUV}$ CLR_FLT, nSLEEP Reset Pulse (VCP_UV bit)
Overvoltage Protection (OVP)	$V_{VM} > V_{OVP}$	OVP_EN = 0b	None	Active	Active	No action (OVP Disabled)
		OVP_EN = 1b, HW device default	FAULT	Hi-Z	Active	Automatic: $V_{VM} < V_{OVP}$ CLR_FLT, nSLEEP Reset Pulse (OVP bit)
Overcurrent Protection (OCP)	$I_{PHASE} > I_{OCP}$	OCP_MODE = 00b, HW device default	nFAULT	Hi-Z	Active	Latched: CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		OCP_MODE = 01b	nFAULT	Hi-Z	Active	Retry: t_{RETRY}
		OCP_MODE = 10b	nFAULT	Active	Active	Automatic: CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		OCP_MODE = 11b	None	Active	Active	No action
SPI Error (SPI_FLT)	SCLK fault and ADDR fault	SPI_FLT_REP = 0b	nFAULT	Active	Active	Automatic: CLR_FLT, nSLEEP Reset Pulse (SPI_FLT bit)
		SPI_FLT_REP = 1b	None	Active	Active	No action
OTP Error (OTP_ERR)	OTP reading is erroneous	Device default	nFAULT	Hi-Z	Active	Latched: Power Cycle, nSLEEP Reset Pulse
Motor Lock (MTR_LOCK)	No Hall Signals > $t_{MTR_LOCK_TDET}$	MTR_LOCK_MODE = 00b	nFAULT	Hi-Z	Active	Latched: CLR_FLT, nSLEEP Pulse (MTR_LOCK bit)
		MTR_LOCK_MODE = 01b, HW device default	nFAULT	Hi-Z	Active	Retry: $t_{MTR_LOCK_RETRY}$
		MTR_LOCK_MODE = 10b	nFAULT	Active	Active	Automatic: CLR_FLT, nSLEEP Reset Pulse (OCP bits)
		MTR_LOCK_MODE = 11b	None	Active	Active	No action
Thermal warning (OTW)	$T_J > T_{OTW}$	OTW_REP = 0b	None	Active	Active	No action
		OTW_REP = 1b, HW device default	nFAULT	Active	Active	Automatic: $T_J < T_{OTW} - T_{OTW_HYS}$ CLR_FLT, nSLEEP Pulse (OTW bit)
Thermal shutdown (OTSD_FET)	$T_J > T_{TSD_FET}$	Device default	nFAULT	Hi-Z	Active	Automatic: $T_J < T_{TSD_FET} - T_{TSD_FET_HYS}$ CLR_FLT, nSLEEP Pulse (OTS bit)

7.3.15.1 VM Supply Undervoltage Lockout (NPOR)

If at any time the input supply voltage on the VM pin falls lower than the V_{UVLO} threshold (VM UVLO falling threshold), all of the integrated FETs, driver charge-pump and digital logic controller are disabled as shown in [Figure 7-30](#). Normal operation resumes (driver operation) when the VM undervoltage condition is removed. The NPOR bit is reset and latched low in the IC status (IC_STAT) register once the device presumes VM. The NPOR bit remains in reset condition until cleared through the CLR_FLT bit or an nSLEEP pin reset pulse (t_{RST}).

Figure 7-30. VM Supply Undervoltage Lockout

7.3.15.2 AVDD Undervoltage Lockout (AVDD_UV)

If at any time the voltage on AVDD pin falls lower than the V_{AVDD_UV} threshold, all of the integrated FETs, driver charge-pump and digital logic controller are disabled. Normal operation resumes (driver operation) when the AVDD undervoltage condition is removed. The NPOR bit is reset and latched low in the IC status (IC_STAT) register once the device presumes VM. The NPOR bit remains in reset condition until cleared through the CLR_FLT bit or an nSLEEP pin reset pulse (t_{RST}).

7.3.15.3 VCP Charge Pump Undervoltage Lockout (CPUV)

If at any time the voltage on the VCP pin (charge pump) falls lower than the V_{CPUV} threshold voltage of the charge pump, all of the integrated FETs are disabled and the nFAULT pin is driven low. The FAULT and VCP_UV bits are also latched high in the registers on SPI devices. Normal operation starts again (driver operation and the nFAULT pin is released) when the VCP undervoltage condition clears. The CPUV bit stays set until cleared through the CLR_FLT bit or an nSLEEP pin reset pulse (t_{RST}). The CPUV protection is always enabled in both hardware and SPI device variants.

7.3.15.4 Overvoltage Protections (OVP)

If at any time input supply voltage on the VM pins rises higher than the V_{OVP} threshold voltage, all of the integrated FETs are disabled and the nFAULT pin is driven low. The FAULT and OVP bits are also latched high in the registers on SPI devices. Normal operation starts again (driver operation and the nFAULT pin is released) when the OVP condition clears. The OVP bit stays set until cleared through the CLR_FLT bit or an nSLEEP pin reset pulse (t_{RST}). Setting the OVP_EN bit high on the SPI device (MCT8314ZS) enables this protection feature. The OVP threshold is also programmable on the SPI device variant and can be set to 22-V or 34-V based on the OVP_SEL bit. On hardware interface device (MCT8314ZH), the OVP protection is always enabled and set to a 34-V threshold.

Figure 7-31. Over Voltage Protection

7.3.15.5 Overcurrent Protection (OCP)

A MOSFET overcurrent event is sensed by monitoring the current flowing through FETs. If the current across a FET exceeds the I_{OCP} threshold for longer than the t_{OCP} deglitch time, an OCP event is recognized and action is done according to the OCP_MODE bit. The I_{OCP} threshold is fixed at 2.25-A threshold. On hardware interface devices, the t_{OCP_DEG} is fixed at 0.6- μs , and the default OCP response is latched shutdown. On SPI devices, the t_{OCP_DEG} is set through the OCP_DEG SPI register, and the OCP_MODE bit can operate in four different modes: OCP latched shutdown, OCP automatic retry, OCP report only, and OCP disabled.

7.3.15.5.1 OCP Latched Shutdown (OCP_MODE = 00b or MCT8314ZH)

After a OCP event in this mode, all MOSFETs are disabled and the $nFAULT$ pin is driven low. The FAULT, OCP, and corresponding FET's OCP bits are latched high in the SPI registers. Normal operation starts again (driver operation and the $nFAULT$ pin is released) when the OCP condition clears and a clear faults command is issued either through the CLR_FLT bit or an $nSLEEP$ reset pulse (t_{RST}).

Figure 7-32. Overcurrent Protection - Latched Shutdown Mode

7.3.15.5.2 OCP Automatic Retry (OCP_MODE = 01b)

After a OCP event in this mode, all the FETs are disabled and the nFAULT pin is driven low. The FAULT, OCP, and corresponding FET's OCP bits are latched high in the SPI registers. Normal operation starts again automatically (driver operation and the nFAULT pin is released) after the t_{RETRY} time elapses. After the t_{RETRY} time elapses, the FAULT, OCP, and corresponding FET's OCP bits stay latched until a clear faults command is issued either through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}).

Figure 7-33. Overcurrent Protection - Automatic Retry Mode

7.3.15.5.3 OCP Report Only (OCP_MODE = 10b)

No protective action occurs after a OCP event in this mode. The overcurrent event is reported by driving the nFAULT pin low and latching the FAULT, OCP, and corresponding FET's OCP bits high in the SPI registers. The MCT8314Z continues to operate as usual. The external controller manages the overcurrent condition by acting appropriately. The reporting clears (nFAULT pin is released) when the OCP condition clears and a clear faults command is issued either through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}).

7.3.15.5.4 OCP Disabled (OCP_MODE = 11b)

No action occurs after a OCP event in this mode.

7.3.15.6 Motor Lock (MTR_LOCK)

During motor is in lock condition the hall signals will be not available, so a motor lock event is sensed by monitoring the hall signals. If the Hall signals are not present for longer than the t_{MTR_LOCK} , the MCT8314Z recognizes a MTR_LCK event and responds according to the MTR_LOCK_MODE bits. On the MCT8314ZH, the FGSEL/LOCK_DET_TIME pin configures t_{MTR_LOCK} detection time, and the device recovers automatically after 500 ms. On SPI devices, the MTR_LOCK_TDET register sets the t_{MTR_LOCK} threshold, and the MTR_LOCK_MODE bit sets four different modes: MTR_LOCK latched shutdown, MTR_LOCK automatic retry, MTR_LOCK report only, and MTR_LOCK disabled.

Note

If the PWM pin is held low for longer than t_{PWM_LOW} , then motor lock detection disables.

7.3.15.6.1 MTR_LOCK Latched Shutdown (MTR_LOCK_MODE = 00b)

After a motor lock event in this mode, all FETs are disabled and the nFAULT pin is driven low. The FAULT and MTR_LOCK bits are latched high in the SPI registers. Normal operation starts again (driver operation and the nFAULT pin is released) after clearing the faults through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}).

7.3.15.6.2 MTR_LOCK Automatic Retry (MTR_LOCK_MODE = 01b or MCT8314ZH)

After a motor lock event in this mode, all the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT and MTR_LOCK bits are latched high in the SPI registers. Normal operation starts again automatically (driver operation and the nFAULT pin is released) after the $t_{MTR_LOCK_RETRY}$ time elapses. The FAULT and MTR_LOCK bits stay latched until the $t_{MTR_LOCK_RETRY}$ period expires.

MTR_LOCK automatic retry is the only motor lock response mode available in the hardware interface variant, MCT8314ZH. The retry period, $t_{MTR_LOCK_RETRY}$, is set to 500 ms. Table 7-8 shows the options for t_{MTR_LOCK} detection time selectable by external components on the FGSEL/LOCK_DET_TIME pin in the MCT8314ZH hardware variant.

Table 7-8. LOCK_DET_TIME Selection for MCT8314Z

Setting	FGSEL/LOCK_DET_TIME Pin (Hardware Variant)	FG Output Commutation Frequency	t_{MTR_LOCK}
Setting-1	Connected to AGND	3x commutation frequency (FGOUT_SEL = 00b)	300 ms
Setting-2	Connected to AGND with R_{MODE1}		500 ms
Setting-3	Connected to AGND with R_{MODE2}		1000 ms
Setting-4	Hi-Z		5000 ms
Setting-5	Connected to AVDD with R_{MODE2}	1x commutation frequency (FGOUT_SEL = 01b)	300 ms
Setting-6	Connected to AVDD with R_{MODE1}		500 ms
Setting-7	Connected to AVDD		1000 ms

7.3.15.6.3 MTR_LOCK Report Only (MTR_LOCK_MODE= 10b)

No protective action occurs after a MTR_LOCK event in this mode. The motor lock event is reported by driving the nFAULT pin low and latching the FAULT and MTR_LOCK bits high in the SPI registers. The MCT8314Z continues to operate as usual. The external controller manages the motor lock condition by acting appropriately. The reporting clears (nFAULT pin is released) when a clear faults command is issued either through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}).

7.3.15.6.4 MTR_LOCK Disabled (MTR_LOCK_MODE = 11b)

No action occurs after a MTR_LOCK event in this mode.

7.3.15.7 Thermal Warning (OTW)

MCT8314Z has two die temperature sensor for thermal warning, one of them near FETs and other one near the AVDD LDO. If the die temperature exceeds the trip point of the thermal warning (T_{OTW}), the OT bit in the IC status (IC_STAT) register and OTW bit in the status register is set. The reporting of OTW on the nFAULT pin can be enabled by setting the over-temperature warning reporting (OTW_REP) bit in the configuration control register. The device performs no additional action and continues to function. In this case, the nFAULT pin releases when the die temperature decreases below the hysteresis point of the thermal warning (T_{OTW_HYS}). The OTW bit remains set until cleared through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}) and the die temperature is lower than thermal warning trip (T_{OTW}).

Note

Over temperature warning is not reported on nFAULT pin by default.

7.3.15.8 Thermal Shutdown (OTS)

If the die temperature near FET exceeds the trip point of the thermal shutdown limit (T_{TSD_FET}), all the FETs are disabled and the nFAULT pin is driven low. The AVDD LDO remains active. In addition, the FAULT and OT bit in the IC status (IC_STAT) register and OTS bit in the status register is set. Normal operation starts again (driver operation and the nFAULT pin is released) when the overtemperature condition clears. The OTS bit stays latched high indicating that a thermal event occurred until a clear fault command is issued either through the CLR_FLT bit or an nSLEEP reset pulse (t_{RST}). This protection feature cannot be disabled.

7.4 Device Functional Modes

7.4.1 Functional Modes

7.4.1.1 Sleep Mode

The nSLEEP pin manages the state of the MCT8314Z family of devices. When the nSLEEP pin is low, the device goes to a low-power sleep mode. In sleep mode, all FETs are disabled, sense amplifiers are disabled, the charge pump is disabled, the AVDD regulator is disabled, and the SPI bus is disabled. The t_{SLEEP} time must elapse after a falling edge on the nSLEEP pin before the device goes to sleep mode. The device comes out of sleep mode automatically if the nSLEEP pin is pulled high. The t_{WAKE} time must elapse before the device is ready for inputs.

In sleep mode and when $V_{\text{VM}} < V_{\text{UVLO}}$, all MOSFETs are disabled.

Note

During power up and power down of the device through the nSLEEP pin, the nFAULT pin is held low as the internal regulators are enabled or disabled. After the regulators have enabled or disabled, the nFAULT pin is automatically released. The duration that the nFAULT pin is low does not exceed the t_{SLEEP} or t_{WAKE} time.

7.4.1.2 Operating Mode

When the nSLEEP pin is high and the V_{VM} voltage is greater than the V_{UVLO} voltage, the device goes to operating mode. The t_{WAKE} time must elapse before the device is ready for inputs. In this mode the charge pump, AVDD regulator, and SPI bus are active.

7.4.1.3 Fault Reset (CLR_FLT or nSLEEP Reset Pulse)

In the case of device latched faults, the MCT8314Z family of devices goes to a partial shutdown state to help protect the power MOSFETs and system.

When the fault condition clears, the device can go to the operating state again by either setting the CLR_FLT SPI bit on SPI devices or issuing a reset pulse to the nSLEEP pin on either interface variant. The nSLEEP reset pulse (t_{RST}) consists of a high-to-low-to-high transition on the nSLEEP pin. The low period of the sequence should fall with the t_{RST} time window or else the device will start the complete shutdown sequence. The reset pulse has no effect on any of the regulators, device settings, or other functional blocks.

7.5 SPI Communication

7.5.1 Programming

On MCT8314Z SPI devices, an SPI bus is used to set device configurations, operating parameters, and read out diagnostic information. The SPI operates in secondary mode and connects to a controller. The SPI input data (SDI) word consists of a 16-bit word, with a 6-bit address and 8 bits of data. The SPI output consists of 16 bit word, with a 8 bits of status information (STAT register) and 8-bit register data.

A valid frame must meet the following conditions:

- The SCLK pin should be low when the nSCS pin transitions from high to low and from low to high.
- The nSCS pin should be pulled high for at least 400 ns between words.
- When the nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is placed in the Hi-Z state.
- Data is captured on the falling edge of the SCLK pin and data is propagated on the rising edge of the SCLK pin.
- The most significant bit (MSB) is shifted in and out first.
- A full 16 SCLK cycles must occur for transaction to be valid.
- If the data word sent to the SDI pin is less than or more than 16 bits, a frame error occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin following the 8-bit status data.

The SPI registers are reset to the default settings on power up and when the device is enters sleep mode

7.5.1.1 SPI Format

The SDI input data word is 16 bits long and consists of the following format:

- 1 read or write bit, W (bit B15)
- 6 address bits, A (bits B14 through B9)
- Parity bit, P (bit B8). Parity bit is set such that the SDI input data word has even number of 1s and 0s
- 8 data bits, D (bits B7 through B0)

The SDO output data word is 16 bits long and the first 8 bits are status bits. The data word is the content of the register being accessed.

For a write command ($W0 = 0$), the response word on the SDO pin is the data currently in the register being written to.

For a read command ($W0 = 1$), the response word is the data currently in the register being read.

Figure 7-36. SPI Secondary Timing Diagram

SPI Error Handling

SPI Frame Error (SPI_SCLK_FLT): If the nSCS gets deasserted before the end of 16-bit frame, SPI frame error is detected and SPI_SCLK_FLT bit is set in STAT2. The SPI_SCLK_FLT status bit is latched and can be cleared when a clear faults command is issued either through the CLR_FLT bit or an nSLEEP reset pulse

SPI Address Error (SPI_ADDR_FLT): If an invalid address is provided in the ADDR field of the input SPI data on SDI, SPI address error is detected and SPI_ADDR_FLT bit in STAT2 is set. Invalid address is any address that is not defined in [Register Map](#) i.e. address not falling in the range of address 0x0 to 0xC. The SPI_ADDR_FLT status bit is latched and can be cleared when a clear faults command is issued either through the CLR_FLT bit or an nSLEEP reset pulse

8 Register Map

8.1 STATUS Registers

[Table 8-1](#) lists the memory-mapped registers for the STATUS registers. All register offset addresses not listed in [Table 8-1](#) should be considered as reserved locations and the register contents should not be modified.

Table 8-1. STATUS Registers

Address	Acronym	Register Name	Section
0h	IC Status Register	IC Status Register	Section 8.1.1
1h	Status Register 1	Status Register 1	Section 8.1.2
2h	Status Register 2	Status Register 2	Section 8.1.3

Complex bit access types are encoded to fit into small table cells. [Table 8-2](#) shows the codes that are used for access types in this section.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The MCT8314Z can be used to drive Brushless-DC motors. The following design procedure can be used to configure the MCT8314Z.

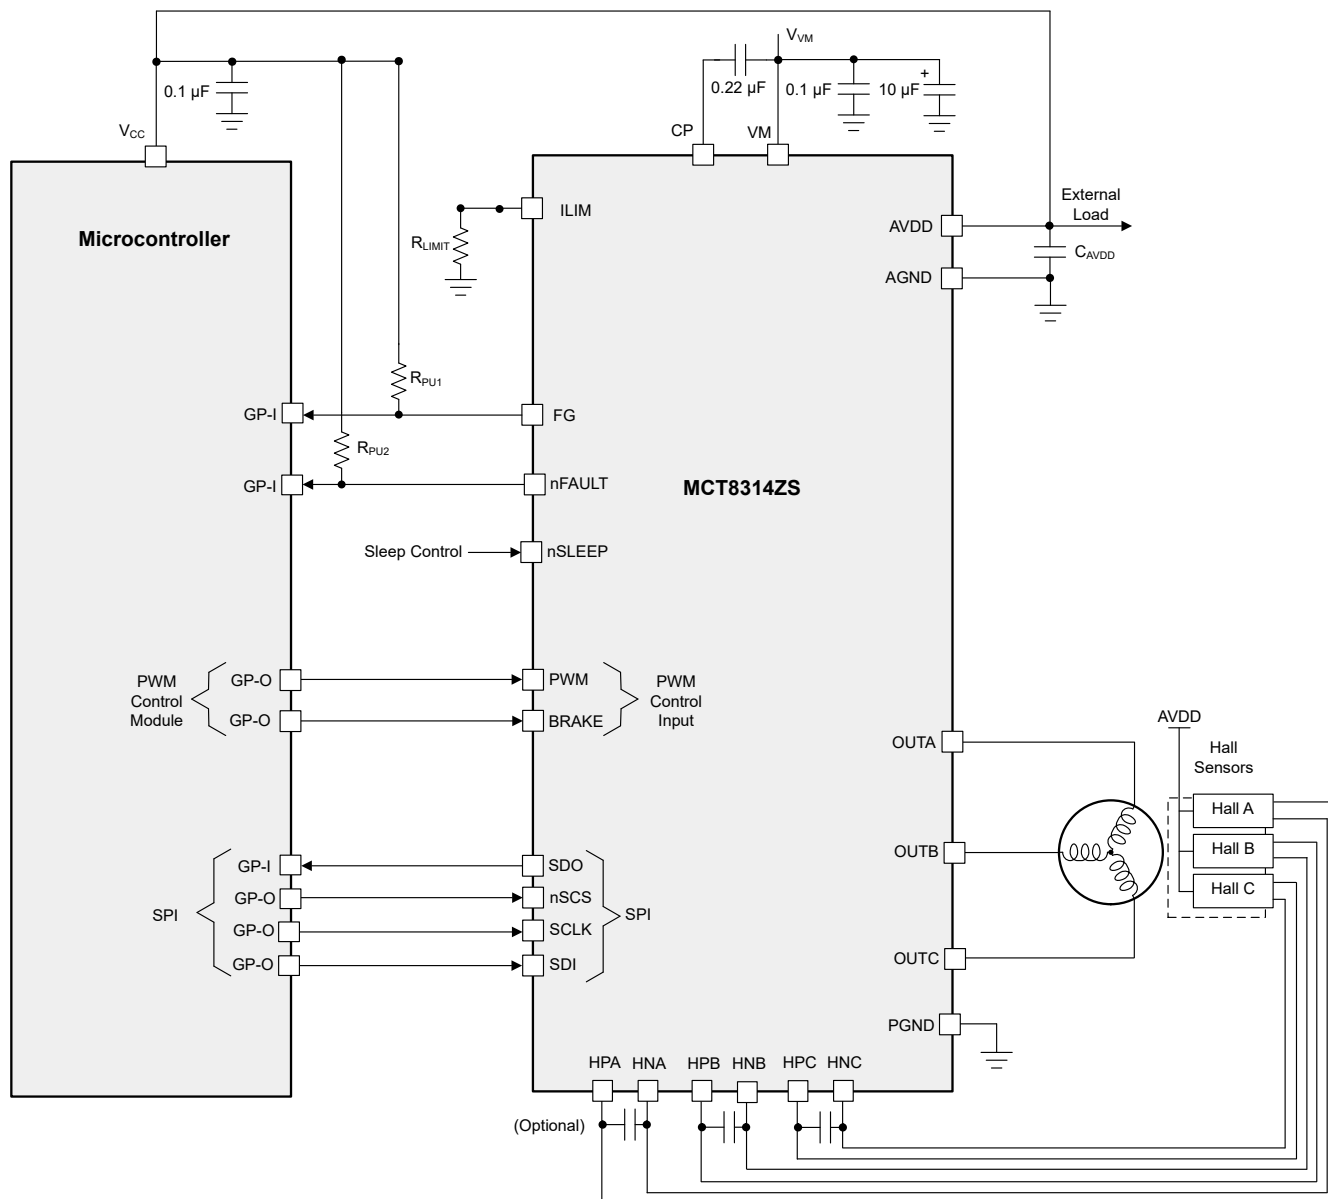

Figure 9-1. Primary Application Schematics for MCT8314ZS (SPI variant)

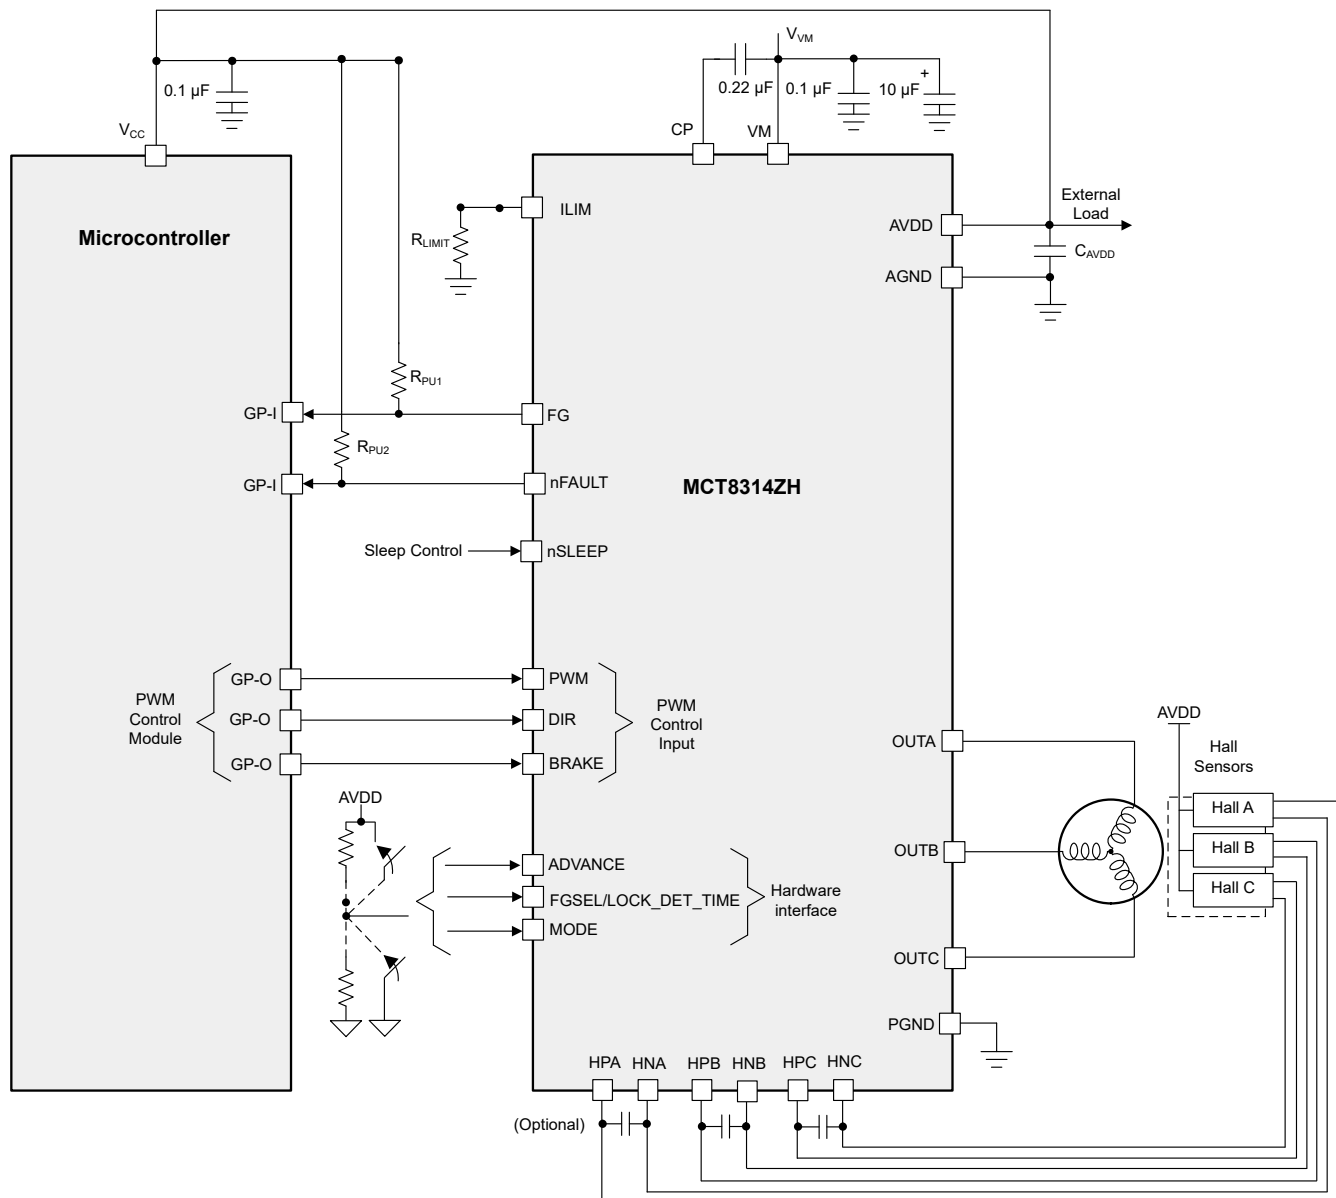

Figure 9-2. Primary Application Schematics for MCT8314ZH (Hardware variant)

9.2 Hall Sensor Configuration and Connection

The combinations of Hall sensor connections in this section are common connections.

9.2.1 Typical Configuration

The Hall sensor inputs on the MCT8314Z device can interface with a variety of Hall sensors. Typically, a Hall element is used, which outputs a differential signal. To use this type of sensor, the AVDD regulator can be used to power the Hall sensor. [Figure 9-3](#) shows the connections.

Figure 9-3. Typical Hall Sensor Configuration

Because the amplitude of the Hall-sensor output signal is very low, capacitors are often placed across the Hall inputs to help reject noise coupled from the motor. Capacitors with a value of 1 nF to 100 nF are typically used.

9.2.2 Open Drain Configuration

Some motors use digital Hall sensors with open-drain outputs. These sensors can also be used with the MCT8314Z device, with the addition of a few resistors as shown in Figure 9-4.

Figure 9-4. Open-Drain Hall Sensor Configuration

The negative (HNx) inputs are biased to $AVDD / 2$ by a pair of resistors between the AVDD pin and ground. For open-collector Hall sensors, an additional pullup resistor to the VREG pin is required on the positive (HPx) input. Again, the AVDD output can usually be used to supply power to the Hall sensors.

9.2.3 Series Configuration

Hall elements are also connected in series or parallel depending upon the Hall sensor current/voltage requirement. [Figure 9-5](#) shows the series connection of Hall sensors powered via the MCT8314Z internal LDO (AVDD). This configuration is used if the current requirement per Hall sensor is high (>10 mA)

Figure 9-5. Hall Sensor Connected in Series Configuration

9.2.4 Parallel Configuration

Figure 9-6 shows the parallel connection of Hall sensors which is powered by the AVDD. This configuration can be used if the current requirement per Hall sensor is low (<10 mA).

Figure 9-6. Hall Sensors Connected in Parallel Configuration

9.3 Typical Applications

9.3.1 Three-Phase Brushless-DC Motor Control With Current Limit

In this application, the MCT8314Z is used to drive a brushless-DC motor with current limit up to 100% duty cycle. The following design procedure can be used to configure the MCT8314Z in current limit mode.

9.3.1.1 Detailed Design Procedure

Table 9-1 lists the example input parameters for the system design.

Table 9-1. Design Parameters

DESIGN PARAMETERS	REFERENCE	EXAMPLE VALUE
Supply voltage	V_{VM}	24 V
Motor peak current	I_{PEAK}	1.5 A
PWM Frequency	f_{PWM}	50 kHz
Slew Rate Setting	SR	200 V/ μ s
AVDD output voltage	V_{AVDD}	5.0 V

9.3.1.1.1 Motor Voltage

Brushless-DC motors are typically rated for a certain voltage (for example 12 V or 24 V). Operating a motor at a higher voltage corresponds to a lower drive current to obtain the same motor power. Operating at lower voltages generally allows for more accurate control of phase currents. The MCT8314Z functions down to a supply of 5.0V. A higher operating voltage also corresponds to a higher obtainable rpm. The MCT8314Z allows for a range of possible operating voltages because of a maximum VM rating of 40 V.

9.3.1.1.2 Using Automatic Synchronous Rectification Mode (ASR Mode)

The automatic synchronous rectification (ASR) mode in the MCT8314Z decreases power losses and thermal dissipation by reducing diode conduction losses in the low-side MOSFET. Refer to [Section 7.3.10](#) for more details.

Figure 9-7. ASR Disabled in Synchronous Modulation

Figure 9-8. ASR Enabled in Synchronous Modulation

9.3.1.1.3 Power Dissipation and Junction Temperature Losses

To calculate the junction temperature of the MCT8314Z from power losses, use [Equation 4](#). Note that the thermal resistance θ_{JA} depends on PCB configurations such as the ambient temperature, numbers of PCB layers, copper thickness on top and bottom layers, and the PCB area.

$$T_J[^\circ\text{C}] = P_{\text{loss}}[\text{W}] \times \theta_{JA}\left[\frac{^\circ\text{C}}{\text{W}}\right] + T_A[^\circ\text{C}] \quad (4)$$

Figure 9-12. Driver PWM Operation with FGOUT

Figure 9-13. Power Management

Figure 9-14. Driver PWM Operation with Current Limit

9.4 Power Supply Recommendations

9.4.1 Bulk Capacitance

Having an appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The capacitance and current capability of the power supply
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed dc, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and the motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

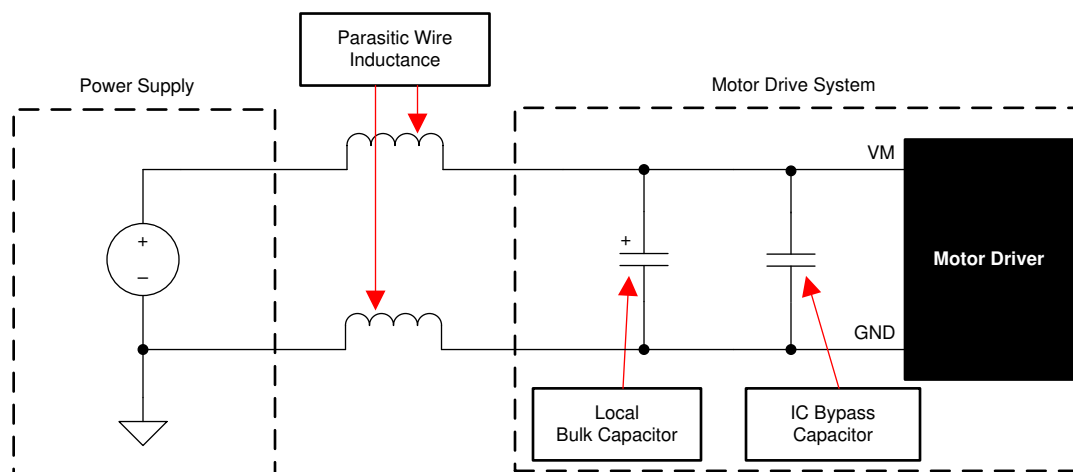

Figure 9-15. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

9.5 Layout

9.5.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors such as the charge pump and AVDD capacitors should be ceramic and placed closely to device pins.

The high-current device outputs should use wide metal traces.

To reduce noise coupling and EMI interference from large transient currents into small-current signal paths, grounding should be partitioned between PGND and AGND. TI recommends connecting all non-power stage circuitry (including the thermal pad) to AGND to reduce parasitic effects and improve power dissipation from the

device. Ensure grounds are connected through net-ties or wide resistors to reduce voltage offsets and maintain gate driver performance.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias helps dissipate the $I^2 \times R_{DS(on)}$ heat that is generated in the device.

To improve thermal performance, maximize the ground area that is connected to the thermal pad ground across all possible layers of the PCB. Using thick copper pours can lower the junction-to-air thermal resistance and improve thermal dissipation from the die surface.

[#none##none##none#Recommended Layout Example for VQFN Package](#) shows a layout example for the MCT8314Z.

9.5.2 Layout Example

Recommended Layout Example for VQFN Package

9.5.3 Thermal Considerations

The MCT8314Z has thermal shutdown (TSD) as previously described. A die temperature in excess of 150°C (minimally) disables the device until the temperature drops to a safe level.

Any tendency of the device to enter thermal shutdown is an indication of excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

9.5.3.1 Power Dissipation

The power loss in MCT8314Z include standby power losses, LDO power losses, FET conduction and switching losses, and diode losses. The FET conduction loss dominates the total power dissipation in MCT8314Z. At start-up and fault conditions, the output current is much higher than normal current; remember to take these peak currents and their duration into consideration. The total device dissipation is the power dissipated in each of the three half bridges added together. The maximum amount of power that the device can dissipate depends on ambient temperature and heatsinking. Note that $R_{DS,ON}$ increases with temperature, so as the device heats, the power dissipation increases. Take this into consideration when designing the PCB and heatsinking.

A summary of equations for calculating each loss is shown below for trapezoidal control.

Table 9-2. MCT8314Z Power Losses for Trapezoidal Control

Loss type	Trapezoidal
Standby power	$P_{\text{standby}} = V_M \times I_{V_M_TA}$
LDO (from VM)	$P_{\text{LDO}} = (V_M - V_{\text{AVDD}}) \times I_{\text{AVDD}}$
FET conduction	$P_{\text{CON}} = 2 \times I_{\text{RMS(trap)}} \times R_{\text{ds,on(TA)}}$
FET switching	$P_{\text{SW}} = I_{\text{PK(trap)}} \times V_{\text{PK(trap)}} \times t_{\text{rise/fall}} \times f_{\text{PWM}}$
Diode	$P_{\text{diode}} = I_{\text{RMS(trap)}} \times V_{\text{diode}} \times t_{\text{diode}} \times f_{\text{PWM}}$

10.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

12.1 Package Option Addendum

Packaging Information

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish ⁽⁶⁾	MSL Peak Temp ⁽³⁾	Op Temp (°C)	Device Marking ^{(4) (5)}
MCT8314Z0HR RWR	ACTIVE	WQFN	RRW	24	5000	RoHS & Green	NIPDAU	Level-1-260C- UNLIM	-40 to 125	8314XP

- (1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PRE_PROD Unannounced device, not in production, not available for mass market, nor on the web, samples not available.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
- (2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).
- (3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4226921/B 10/2021

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
