

OPAx383 Low-Power, High-Precision, 2.5MHz, Zero-Drift Op Amp

1 Features

Ultra-low offset voltage: ±5µV (maximum)

Zero drift: ±0.025µV/°C

Low-input bias current: 62pA (maximum)

Low noise: 32nV√Hz at 1kHz

No 1/f noise: 650nV_{PP} (0.1Hz to 10 Hz)

Common-mode input range ±100mV beyond supply rails

Gain bandwidth: 2.5MHz

Quiescent current: 65µA per amplifier

Single supply: 1.7V to 5.5V Dual supply: ±0.85V to ±2.75V EMI and RFI filtered inputs

2 Applications

Electronic thermometer

Weigh scale

Temperature transmitter

Ventilators

Data acquisition (DAQ)

Semiconductor test

Lab and field instrumentation

Merchant network and server PSU

Analog input module

Pressure transmitter

OPA383 OPA383

The OPA383 as a Bridge Sensor Front End

3 Description

The OPA383, OPA2383, and OPA4383 (OPAx383) family of precision amplifiers offers state-of-the-art performance. With zero-drift technology, the OPAx383 offset voltage and offset drift provide unparalleled long-term stability. With a ultra-low 65µA of quiescent current, the OPAx383 are able to achieve 2.5MHz of bandwidth, a broadband noise of 32nV/\(\overline{Hz}\), and a 1/f noise at 650nV_{PP}. These specifications are crucial to achieve extremely-high precision and no degradation of linearity in 16-bit to 24-bit analog to digital converters (ADCs). The OPAx383 feature flat bias current over temperature; therefore, little to no calibration is needed in high input impedance applications over temperature.

All versions are specified over the industrial temperature range of -40°C to +125°C.

Device Information

PART NUMBER	PART NUMBER CHANNEL COUNT		PACKAGE SIZE
OPA383	Single	DBV (SOT-23, 5)	2.9mm × 2.8mm
UPAS6S	Siligle	DCK (SC70, 5)(2)	2.0mm × 2.1mm
OPA2383	Dual	D (SOIC, 8) ⁽²⁾	4.9mm × 6.0mm
		DGK (VSSOP, 8)	3.0mm × 4.9mm
OPA4383	Quad	PW (TSSOP, 14)	5.0mm × 6.4mm

5.8 Typical Characteristics

6 Detailed Description

6.1 Overview

The OPAx383 family of low-power zero-drift amplifiers is engineered with state-of-the-art, proprietary, precision zero-drift technology. These amplifiers offer ultra-low input offset voltage and drift, and achieve excellent input and output dynamic linearity. The OPAx383 operate from 1.7V to 5.5V, are unity-gain stable, and are designed for a wide range of general-purpose and precision applications. The OPAx383 strengths also include a 2.5MHz bandwidth, $32\text{nV}/\sqrt{\text{Hz}}$ noise spectral density for typical 65uA of quiescent current per amplifier, and no 1/f noise. These features make the OPAx383 an excellent choice for interfacing with sensor modules, and buffering high-fidelity, digital-to-analog converters (DACs), and analog-to-digital convertors (ADCs).

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Input Bias Current

During normal operation, the typical input bias current of the OPAx383 is 10pA. The device exhibits low drift over the full temperature range of –40°C to +125°C. There are no antiparallel diodes between the input pins (+IN and –IN); therefore, the differential input maximum voltage is limited only by diodes connected to the supply voltage pins. However, use caution in cases where the input differential voltage exceeds the nominal operating input differential voltage. When inputs are separated, the switching offset-cancellation path internal to the amplifier exceeds normal operating conditions, and can potentially create long settling behavior upon return to normal operation. Figure 6-1 shows the equivalent input circuit of OPAx383.

Figure 6-1. Equivalent Input Circuit

6.3.2 EMI Susceptibility and Input Filtering

Operational amplifiers can exhibit sensitivity to electromagnetic interference (EMI). Typically, conducted EMI (that is, EMI that enters the device through conduction) is more commonly observed than radiated EMI (that is, EMI that enters the device through radiation). When conducted EMI enters the operational amplifier, the dc offset at the amplifier output can shift from the nominal value. This shift is a result of signal rectification associated with the internal semiconductor junctions. Although all operational amplifier pin functions can be affected by EMI, the input pins are likely to be the most susceptible. The OPAx383 operational amplifier family incorporates an internal input low-pass filter that reduces the amplifier response to EMI. Both common-mode and differential-mode filtering are provided by the input filter. The conducted EMI rejection of the OPAx383 is seen in Figure 6-2.

Figure 6-2. EMI Rejection Ratio

6.4 Device Functional Modes

The OPAx383 have a single functional mode and are operational when the power-supply voltage is greater than 1.7V (±0.85V). The maximum specified power-supply voltage for the OPAx383 is 5.5V (±2.75V).

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The OPAx383 are unity-gain stable, precision, operational amplifiers featuring state-of-the-art, zero-drift technology. The use of proprietary zero-drift circuitry gives the benefit of low input offset voltage over time and temperature, as well as lower 1/f noise component. As a result of the high PSRR, the devices work well in applications that run directly from battery power without regulation. The OPAx383 family is optimized for full rail-to-rail input, allowing for low-voltage, single-supply operation or split-supply use. These miniature, high-precision, low-noise amplifiers offer high-impedance inputs that have a common-mode range 100mV beyond the supplies without input crossover distortion, and a rail-to-rail output that swings within 5mV of the supplies under normal test conditions. The OPAx383 precision amplifiers are designed for upstream analog signal-chain applications in low or high gains, as well as downstream signal-chain functions, such as DAC buffering.

7.1.1 Zero-Drift Clocking

The OPAx383 use an advanced zero-drift architecture to achieve ultra-low offset and offset drift. This architecture uses a clock and switches internally to create a dc error-correction path. The clocking is filtered internally, and typically not observable for most configurations. Take the following precautions to minimize clock noise in the signal chain. The clocking creates a small charge-injection pulse at the input of the amplifier; therefore, do not use high-value resistors (> $100k\Omega$) in series with the inputs to avoid higher clock voltage noise at the output. The charge injection pulses are minimized when the impedance to the input pins is matched. If higher value resistors are used, then use matching impedances on both amplifier input pins.

7.2 Typical Applications

7.2.1 Bidirectional Current Sensing

This single-supply, low-side, bidirectional current-sensing design example detects load currents from -1A to +1A. The single-ended output spans from 110mV to 3.19V. This design uses the OPAx383 because of the device low offset voltage and rail-to-rail input and output. One of the amplifiers is configured as a difference amplifier and the other amplifier provides the reference voltage. Figure 7-1 shows the design example schematic.

Figure 7-1. Bidirectional Current-Sensing Schematic

7.2.1.1 Design Requirements

This design has the following requirements:

Supply voltage: 3.3VInput: -1A to +1A

Output: 1.65V ±1.54V (110mV to 3.19V)

7.2.1.2 Detailed Design Procedure

The load current, I_{LOAD} , flows through the shunt resistor, R_{SHUNT} , to develop the shunt voltage, V_{SHUNT} . The shunt voltage is then amplified by the difference amplifier consisting of U1A and R_1 through R_4 . The gain of the difference amplifier is set by the ratio of R_4 to R_3 . To minimize errors, set $R_2 = R_4$ and $R_1 = R_3$. The reference voltage, V_{REE} , is supplied by buffering a resistor divider using U1B. The transfer function is given by Equation 1:

$$V_{OUT} = V_{SHUNT} \times Gain_{Diff-Amp} + V_{REF}$$
 (1)

where

• $V_{SHUNT} = I_{LOAD} \times R_{SHUNT}$

•
$$Gain_{Diff-Amp} = \frac{R_4}{R_3}$$

•
$$V_{REF} = V_{CC} \times \left(\frac{R_6}{R_5 + R_6}\right)$$

There are two types of errors in this design: gain and offset. Gain errors are introduced by the tolerance of the shunt resistor and the ratios of R_4 to R_3 and, similarly, R_2 to R_1 . Offset errors are introduced by the voltage divider (R_5 and R_6) and how closely the ratio of R_4 / R_3 matches R_2 / R_1 . The latter value affects the CMRR of the difference amplifier, ultimately translating to an offset error.

The value of V_{SHUNT} is the ground potential for the system load because V_{SHUNT} is a low-side measurement. Therefore, a maximum value must be placed on V_{SHUNT} . In this design, the maximum value for V_{SHUNT} is set to 100mV. Equation 2 calculates the maximum value of the shunt resistor given a maximum shunt voltage of 100mV and maximum load current of 1A.

$$R_{SHUNT(MAX)} = \frac{V_{SHUNT(MAX)}}{I_{LOAD(MAX)}} = \frac{100mV}{1A} = 100m\Omega$$
 (2)

The tolerance of R_{SHUNT} is directly proportional to cost. For this design, a shunt resistor with a tolerance of 0.5% is selected. If greater accuracy is required, select a 0.1% resistor or better.

The load current is bidirectional; therefore, the shunt voltage range is -100 mV to +100 mV. This voltage is divided down by R_1 and R_2 before reaching the operational amplifier, U1A. Make sure that the voltage present at the noninverting node of U1A is within the common-mode range of the device. Use an operational amplifier, such as the OPAx383, that has a common-mode range that extends below the negative supply voltage. The offset error is minimal because the OPAx383 has a typical offset voltage of merely $\pm 0.5 \mu V$ ($\pm 5 \mu V$, maximum).

Given a symmetric load current of –1A to +1A, the voltage divider resistors, R_5 and R_6 , must be equal. To be consistent with the shunt resistor, a tolerance of 0.5% is selected. To minimize power consumption, $10k\Omega$ resistors are used.

To set the gain of the difference amplifier, the common-mode range and output swing of the OPAx383 must be considered. Equation 3 and Equation 4 depict the typical common-mode range and maximum output swing, respectively, of the OPAx383 given a 3.3V supply.

$$-100 \text{mV} < \text{V}_{\text{CM}} < 3.4 \text{V}$$
 (3)

$$100 \text{mV} < V_{\text{OUT}} < 3.2 \text{V}$$
 (4)

The gain of the difference amplifier is now calculated using Equation 5.

$$Gain_{Diff-Amp} = \frac{V_{OUT(MAX)} - V_{OUT(MIN)}}{R_{SHUNT} \times (I_{MAX} - I_{MIN})} = \frac{3.2V - 100mV}{100m\Omega \times (1A - (-1A))} = 15.5\frac{V}{V}$$
(5)

The resistor value selected for R_1 and R_3 is $1k\Omega$. $15.4k\Omega$ is selected for R_2 and R_4 because this number is the nearest standard value. Therefore, the calculated gain of the difference amplifier is 15.4V/V.

The gain error of the circuit primarily depends on R_1 through R_4 . As a result of this dependence, select 0.1% resistors. This configuration reduces the likelihood that the design requires a two-point calibration. A simple one-point calibration, if desired, removes the offset errors introduced by the 0.5% resistors.

7.2.1.3 Application Curve

Figure 7-2. Bidirectional Current-Sensing Circuit Performance: Output Voltage vs Input Current

7.2.2 Bridge Sensor Measurement

Figure 7-3 shows the OPAx383 in a high-CMRR dual-op-amp instrumentation amplifier with a trim resistor and six-wire bridge sensor for ratio metric precision measurement.

Figure 7-3. Bridge-Sensor Measurement Schematic

7.3 Power Supply Recommendations

The OPAx383 family of devices is specified for operation from 1.7V to 5.5V for single supplies, and ± 0.85 V to ± 2.75 V for dual supplies. Key parameters that can exhibit significant variance with regard to operating voltage are presented in Section 5.

CAUTION

Supply voltages greater than 6V can permanently damage the device (see Section 5.1).

7.4 Layout

7.4.1 Layout Guidelines

Pay attention to good layout practice. Keep traces short and, when possible, use a printed-circuit board (PCB) ground plane with surface-mount components placed as close to the device pins as possible. Place a 0.1µF capacitor close to the supply pins. These guidelines must be applied throughout the analog circuit to improve performance, and provide benefits such as reducing the electromagnetic interference (EMI) susceptibility.

For lowest offset voltage and precision performance, optimize circuit layout and mechanical conditions. Avoid temperature gradients that create thermoelectric (Seebeck) effects in the thermocouple junctions formed from connecting dissimilar conductors. Cancel these thermally-generated potentials by making sure that the potentials are equal on both input pins. Other layout and design considerations include:

- Use low thermoelectric-coefficient conditions (avoid dissimilar metals).
- Thermally isolate components from power supplies or other heat sources.
- · Shield operational amplifier and input circuitry from air currents, such as cooling fans.

Follow these guidelines to reduce the likelihood of junctions being at different temperatures, which can cause thermoelectric voltage drift of 0.1µV/°C or greater depending on materials used.

7.4.2 Layout Example

Figure 7-4. Schematic Representation

Figure 7-5. Layout Example

8 Device and Documentation Support

8.1 Device Support

8.1.1 Development Support

8.1.1.1 PSpice® for TI

PSpice® for TI is a design and simulation environment that helps evaluate performance of analog circuits. Create subsystem designs and prototype designs before committing to layout and fabrication, reducing development cost and time to market.

8.1.1.2 TINA-TI™ Simulation Software (Free Download)

TINA-TI™ simulation software is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TI simulation software is a free, fully-functional version of the TINA™ software, preloaded with a library of macromodels, in addition to a range of both passive and active models. TINA-TI simulation software provides all the conventional dc, transient, and frequency domain analysis of SPICE, as well as additional design capabilities.

Available as a free download from the Design and simulation tools web page, TINA-TI simulation software offers extensive post-processing capability that allows users to format results in a variety of ways. Virtual instruments offer the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

Note

These files require that either the TINA software or TINA-TI software be installed. Download the free TINA-TI simulation software from the TINA-TI™ software folder.

8.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.3 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.4 Trademarks

TINA-TI™ and TI E2E™ are trademarks of Texas Instruments.

TINA™ is a trademark of DesignSoft. Inc.

PSpice® is a registered trademark of Cadence Design Systems, Inc.

All trademarks are the property of their respective owners.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.6 Glossary

TI Glossary

This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

C	hanges from Revision B (June 2025) to Revision C (November 2025)	Page
<u>•</u>	Updated the status of OPA4383PWR from <i>preview</i> to <i>production</i>	1
C	hanges from Revision A (May 2025) to Revision B (June 2025)	Page
-	Updated the status of OPA383DBVR from preview to production	
•	Added the following footnote to the room temperature maximum for input offset voltage: "Specification	
•	established from device population bench system measurements across multiple lots."	7
	Added the following footnote to the room temperature maximum for input bias current: "Specification	/
•		7
	established from device population bench system measurements across multiple lots."	
•	Changed the room temperature maximum input bias current from 50pA to 62pA	
•	Changed the -40°C to +85°C maximum input bias current from 60pA to 76pA	
•	Changed the -40°C to +125°C maximum input bias current from 150pA to 212pA	/
•	Added the following footnote to the room temperature maximum for input offset current: "Specification	_
	established from device population bench system measurements across multiple lots."	
•	Changed the room temperature maximum input offset current from 100pA to 123pA	
•	Changed the room temperature minimum CMRR when $V_S = 5.5V$ from 125dB to 122dB	
•	Changed the -40°C to +125°C minimum CMRR when $V_S = 5.5V$ from 122dB to 120dB	
•	Added the following footnote to the room temperature minimum for CMRR where Vs = 1.7V: "Specificat	
	established from device population bench system measurements across multiple lots."	
•	Changed the room temperature minimum CMRR when $V_S = 1.7V$ from 122dB to 116dB	
•	Changed the -40°C to +125°C minimum CMRR when V_S = 1.7V from 120dB to 114dB	
•	Changed the room temperature minimum A_{OL} when $V_S = 5.5V$ and $R_L = 10k\Omega$ from 130dB to 120dB	<mark>7</mark>
•	Added a room temperature minimum A_{OL} for $V_S = 1.7V$ and $R_L = 10k\Omega$	<mark>7</mark>
•	Changed the -40°C to +125°C minimum A_{OL} when V_S = 5.5V and R_L = 10k Ω from 124dB to 119dB	<mark>7</mark>
•	Changed the room temperature minimum A_{OL} when $V_S = 5.5V$ and $R_L = 2k\Omega$ from 125dB to 119dB	
•	Added a room temperature minimum A_{OI} for $V_S = 1.7V$ and $R_I = 2k\Omega$	
•	Changed the -40°C to +125°C minimum A_{OL} when $V_S = 5.5V$ and $R_L = 2k\Omega$ from 122dB to 118dB	
•	Changed overload recovery time from 1500ns to 2200ns	
_		
С	hanges from Revision * (December 2024) to Revision A (May 2025)	Page
•	Update to APL the OPA383 and OPA4383.	1

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

www.ti.com 8-Dec-2025

PACKAGING INFORMATION

Orderable part number	Status	Material type	Package Pins	Package qty Carrier	RoHS	Lead finish/	MSL rating/	Op temp (°C)	Part marking
	(1)	(2)			(3)	Ball material	Peak reflow		(6)
						(4)	(5)		
OPA2383DGKR	Active	Production	VSSOP (DGK) 8	2500 LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	O2383
OPA2383DGKR.A	Active	Production	VSSOP (DGK) 8	2500 LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	O2383
OPA383DBVR	Active	Production	SOT-23 (DBV) 5	3000 LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	3PMF
OPA4383PWR	Active	Production	TSSOP (PW) 14	3000 LARGE T&R	-	NIPDAU	Level-1-260C-UNLIM	-40 to 125	O4383PW

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

SMALL OUTLINE TRANSISTOR

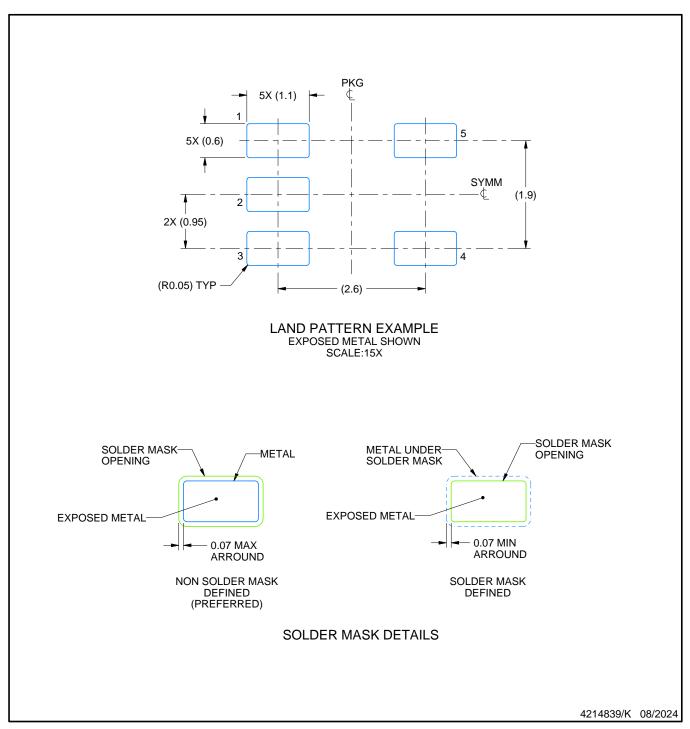

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
 3. Reference JEDEC MO-178.

- 4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
- 5. Support pin may differ or may not be present.

SMALL OUTLINE TRANSISTOR

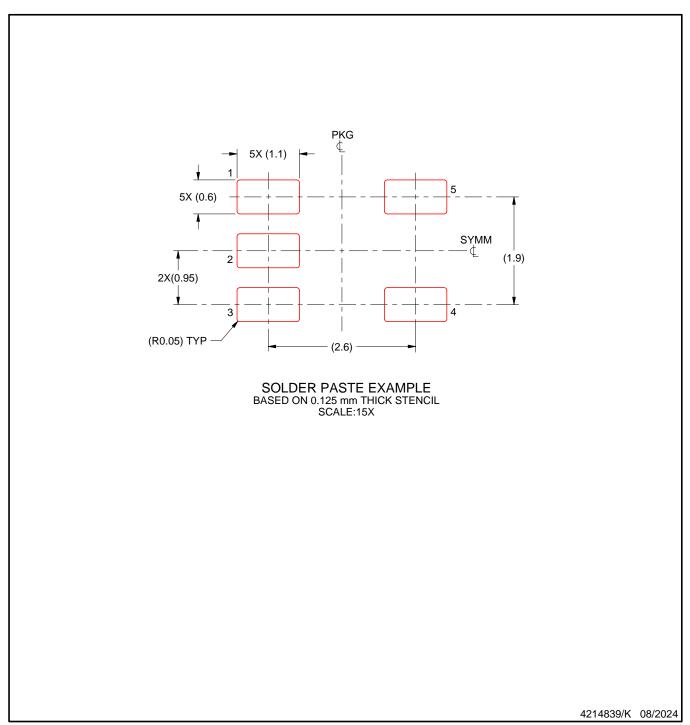

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE TRANSISTOR

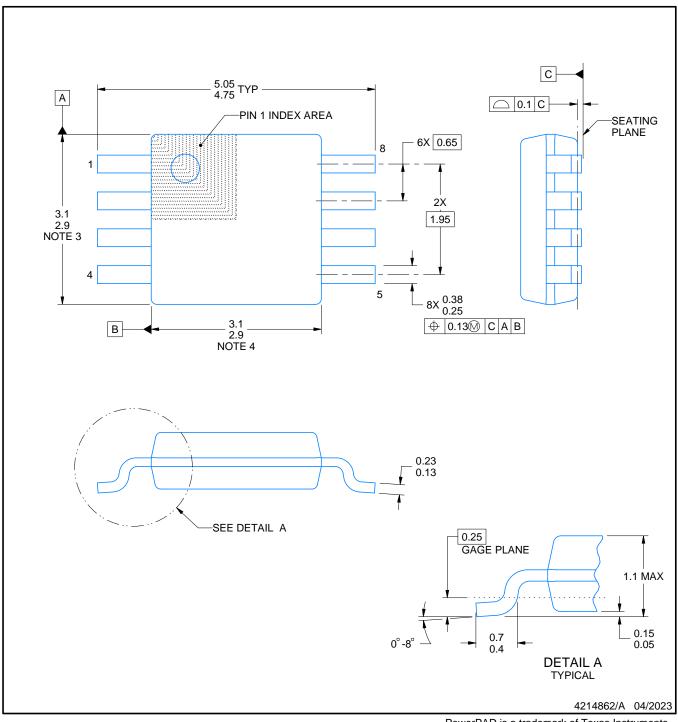

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

NOTES:

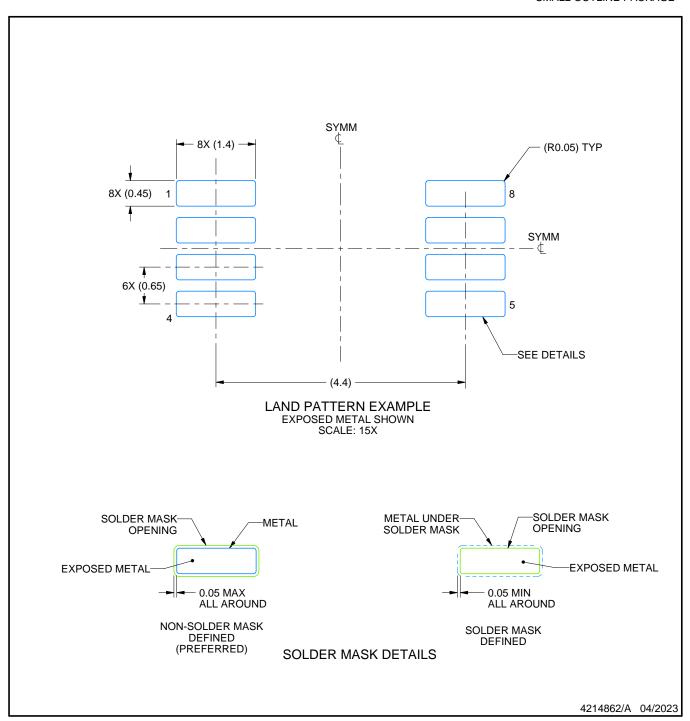

PowerPAD is a trademark of Texas Instruments.

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

 2. This drawing is subject to change without notice.

 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-187.

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
- 8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
- 9. Size of metal pad may vary due to creepage requirement.

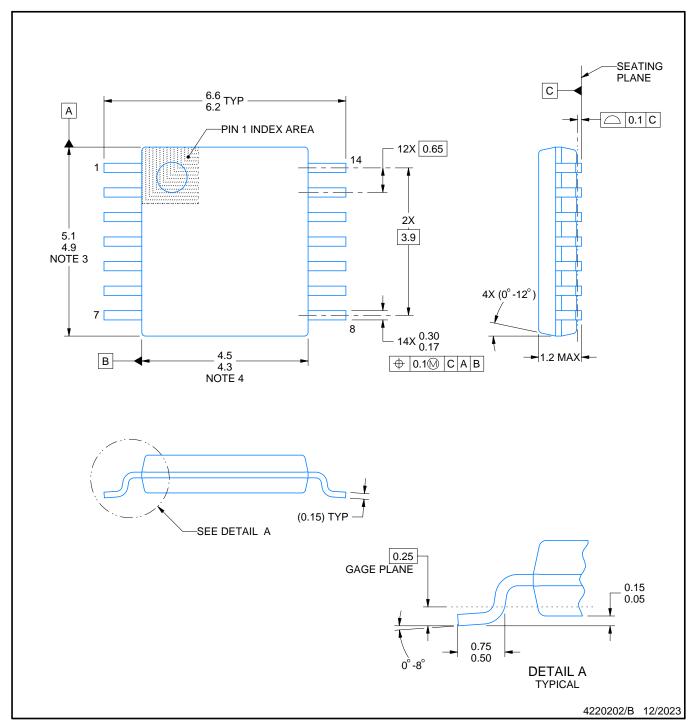

NOTES: (continued)

- 11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 12. Board assembly site may have different recommendations for stencil design.

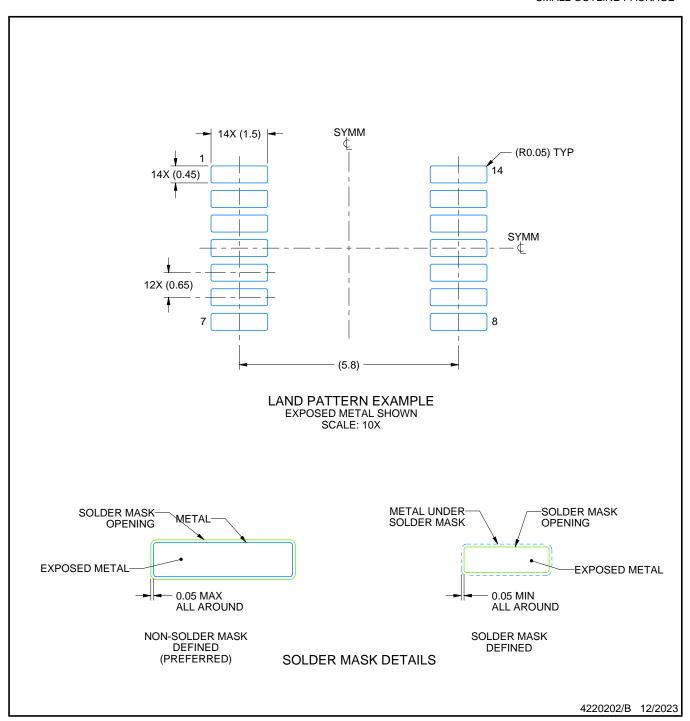

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

 2. This drawing is subject to change without notice.

 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-153.

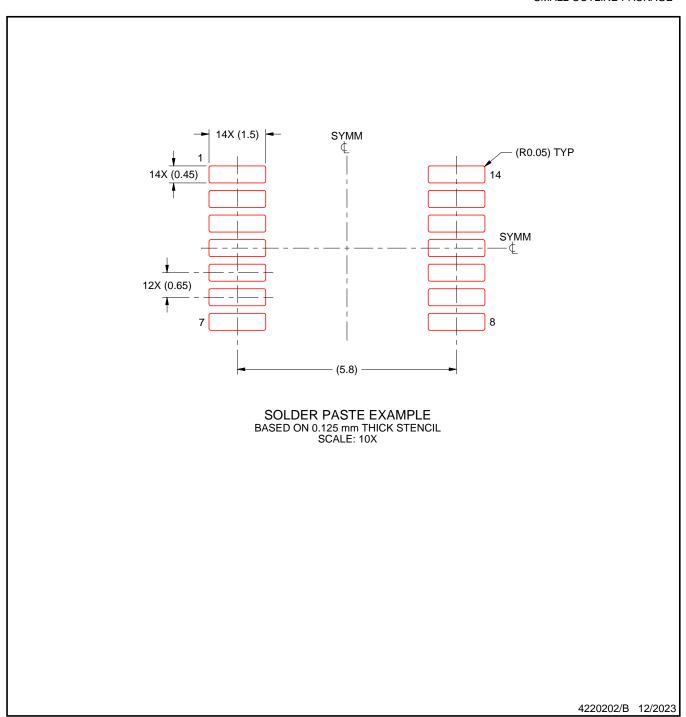

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER
