

## 24-Bit, 192-kHz Sampling, 6-Channel, Enhanced Multilevel, Delta-Sigma Digital-to-Analog Converter

Check for Samples: [PCM1602A](#)

### FEATURES

- **24-Bit Resolution**
- **Analog Performance:**
  - **Dynamic Range:** 105 dB, Typical
  - **SNR:** 105 dB, Typical
  - **THD+N:** 0.002%, Typical
  - **Full-Scale Output:** 3.1 V<sub>PP</sub>, Typical
- **4×/8× Oversampling Interpolation Filter:**
  - **Stop-Band Attenuation:** –55 dB
  - **Pass-Band Ripple:** ±0.03 dB
- **Sampling Frequency:**
  - **5 kHz to 200 kHz (Channels 1 and 2)**
  - **5 kHz to 100 kHz (Channels 3, 4, 5, and 6)**
- **Accepts 16-, 18-, 20-, and 24-Bit Audio Data**
- **Data Formats:** Standard, I<sup>2</sup>S™, and Left-Justified
- **System Clock:** 128 f<sub>S</sub>, 192 f<sub>S</sub>, 256 f<sub>S</sub>, 384 f<sub>S</sub>, 512 f<sub>S</sub>, or 768 f<sub>S</sub>
- **User-Programmable Functions:**
  - **Digital Attenuation:** 0 dB to –63 dB, 0.5 dB/Step
  - **Soft Mute**
  - **Zero Flags Can Be Used As General-Purpose Logic Output**
  - **Digital De-Emphasis**
  - **Digital Filter Rolloff:** Sharp or Slow
- **Dual-Supply Operation:**
  - **5-V Analog**
  - **3.3-V Digital**
- **5-V Tolerant Digital Logic Inputs**
- **Package:** LQFP-48

### APPLICATIONS

- **Integrated A/V Receivers**
- **DVD Movie and Audio Players**
- **HDTV Receivers**
- **Car Audio Systems**
- **DVD Add-On Cards for High-End PCs**
- **Digital Audio Workstations**
- **Other Multichannel Audio Systems**

### DESCRIPTION

The PCM1602A is a CMOS, monolithic integrated circuit that features six 24-bit audio digital-to-analog converters (DACs) and support circuitry in a small LQFP-48 package. The DACs use Texas Instruments' enhanced multilevel, delta-sigma architecture that employs fourth-order noise shaping and 8-level amplitude quantization to achieve excellent signal-to-noise performance and a high tolerance to clock jitter.

The PCM1602A accepts industry-standard audio data formats with 16- to 24-bit audio data. Sampling rates up to 200 kHz (channels 1 and 2) or 100 kHz (channels 3, 4, 5, and 6) are supported. A full set of user-programmable functions is accessible through a 4-wire serial control port that supports register write and read functions.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

I<sup>2</sup>S is a trademark of NXP Semiconductors.

All other trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Over operating free-air temperature range (unless otherwise noted).

|                  |                                          |                                |
|------------------|------------------------------------------|--------------------------------|
| $V_{DD}$         | Power supply voltage                     | –0.3 V to 4 V                  |
| $V_{CC}$         |                                          | –0.3 V to 6.5 V                |
| $V_{CC}, V_{DD}$ | Supply voltage difference                | $V_{CC} - V_{DD} < 3\text{ V}$ |
|                  | Ground voltage differences               | $\pm 0.1\text{ V}$             |
|                  | Digital input voltage                    | –0.3 V to 6.5 V                |
|                  | Input current (except power supply pins) | $\pm 10\text{ mA}$             |
|                  | Operating temperature under bias         | –40°C to 125°C                 |
|                  | Storage temperature                      | –55°C to 150°C                 |

|                  | Package temperature (reflow, peak)       | 260°C                          |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## RECOMMENDED OPERATING CONDITIONS

Over operating free-air temperature range.

(1) Pins 38, 40, 41, 45–47 (SCKI, BCK, LRCK, DATA1, DATA2, DATA3)

(2) Pins 34–37 (MDI, MC, ML,  $\overline{\text{RST}}$ )

(3) Analog performance specifications are tested using a System Two™ Cascade audio measurement system by Audio Precision™ in the averaging mode. The load connected to the analog output is 5 k $\Omega$  or larger, via capacitive loading.

(4) Conditions in 192-kHz operation are: system clock = 128  $f_S$ , DAC3 through DAC6 disabled in register 8, and oversampling rate = 64  $f_S$  in register 12.

## ELECTRICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{DD} = 3.3\text{ V}$ , system clock =  $384 f_S$  ( $f_S = 44.1\text{ kHz}$ ), and 24-bit data, unless otherwise noted.

## SYSTEM CLOCK AND RESET FUNCTIONS

### SYSTEM CLOCK INPUT

The PCM1602A requires a system clock for operating the digital interpolation filters and multilevel delta-sigma modulators. The system clock is applied at the SCKI input (pin 38). Table 1 shows examples of system clock frequencies for common audio sampling rates.

Figure 19 shows the timing requirements for the system clock input. For optimal performance, it is important to use a clock source with low phase jitter and noise. The PLL170x multiclock generator from Texas Instruments is an excellent choice for providing the PCM1602A system clock.

The 192-kHz sampling frequency operation is available on DATA1 for  $V_{OUT1}$  and  $V_{OUT2}$ . It is recommended that  $V_{OUT3}$ ,  $V_{OUT4}$ ,  $V_{OUT5}$ , and  $V_{OUT6}$  be forced to the bipolar zero level using the DAC3, DAC4, DAC5, and DAC6 bits of register 8 when operating at 192 kHz.

**Table 1. System Clock Rates for Common Audio Sampling Frequencies**

| SAMPLING FREQUENCY<br>(kHz) | SYSTEM CLOCK FREQUENCY ( $f_{SCLK}$ ) (MHz) |           |           |           |           |           |
|-----------------------------|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|
|                             | 128 $f_s$                                   | 192 $f_s$ | 256 $f_s$ | 384 $f_s$ | 512 $f_s$ | 768 $f_s$ |

**Figure 19. System Clock Timing**

### SYSTEM CLOCK OUTPUT

A buffered version of the system clock input is available at the SCKO output (pin 39). SCKO can operate at either full ( $f_{SCKI}$ ) or half ( $f_{SCKI}/2$ ) rate. The SCKO output frequency can be programmed using the CLKD bit of register 9. The SCKO output pin can also be enabled or disabled using the CLKE bit of register 9. If the SCKO output is not required, it is recommended to disable it using the CLKE bit. The default is SCKO enabled.

## POWER-ON AND EXTERNAL RESET FUNCTIONS

The PCM1602A includes a power-on-reset function, as shown in Figure 20. With the system clock active, and  $V_{DD} > 2\text{ V}$  (typical, 1.6 V to 2.4 V), the power-on-reset function is enabled. The initialization sequence requires 1024 system clocks from the time  $V_{DD} > 2\text{ V}$ . After the initialization period, the PCM1602A is set to its reset default state, as described in the *Mode Control Registers* section of this data sheet.

The PCM1602A also includes an external reset capability using the  $\overline{\text{RST}}$  input (pin 37). This allows an external controller or master reset circuit to force the PCM1602A to initialize to its reset default state. For normal operation,  $\overline{\text{RST}}$  should be set to a logic-1.

The external reset operation and timing is shown in Figure 21. The  $\overline{\text{RST}}$  pin is set to logic-0 for a minimum of 20 ns. After the initialization sequence is completed, the PCM1602A is set to its reset default state, as described in the *Mode Control Registers* section of this data sheet.

During the reset period (1024 system clocks), the analog outputs are forced to the bipolar zero level (or  $V_{CC}/2$ ). After the reset period, the internal registers are initialized in the next  $1/f_s$  period and, if SCKI, BCK, and LRCK are provided continuously, the PCM1602A provides proper analog output with the group delay time given in the *Electrical Characteristics* section of this data sheet.

The external reset is especially useful in applications where there is a delay between PCM1602A power-up and system-clock activation. In this case, the  $\overline{\text{RST}}$  pin should be held at a logic-0 level until the system clock has been activated.

Figure 21. External Reset Timing

## AUDIO SERIAL INTERFACE

The audio serial interface for the PCM1602A consists of a 5-wire synchronous serial port. It includes LRCK (pin 41), BCK (pin 40), DATA1 (pin 45), DATA2 (pin 46), and DATA3 (pin 47). BCK is the serial audio bit clock, and is used to clock the serial data present on DATA1, DATA2, and DATA3 into the audio interface serial shift register. Serial data is clocked into the PCM1602A on the rising edge of BCK. LRCK is the serial audio left/right clock. It is used to latch serial data into the serial audio interface internal registers.

Both LRCK and BCK must be synchronous to the system clock. Ideally, it is recommended that LRCK and BCK be derived from the system clock input, SCKI. LRCK is operated at the sampling frequency ( $f_s$ ). BCK can be operated at 32, 48, or 64 times the sampling frequency ( $I^2S$  format does not support  $BCK = 32 f_s$ ).

Internal operation of the PCM1602A is synchronized with LRCK. Accordingly, internal operation of the device is suspended when the sampling rate clock (LRCK) is changed, or when SCKI and/or BCK is interrupted at least for a 3-bit clock cycle. If SCKI, BCK, and LRCK are provided continuously after this suspended state, the internal operation is resynchronized automatically within a period of less than  $3/f_s$ . During this resynchronization period and for a  $3/f_s$  time thereafter, the analog outputs are forced to the bipolar zero level,  $V_{CC}/2$ . External resetting is not required.

## AUDIO DATA FORMATS AND TIMING

The PCM1602A supports industry-standard audio data formats, including standard,  $I^2S$ , and left-justified (see [Figure 22](#)). Data formats are selected using the format bits, FMT[2:0], in register 9. The default data format is 24-bit standard. All formats require binary 2s complement, MSB-first audio data. See [Figure 23](#) for a detailed timing diagram of the serial audio interface.

DATA1, DATA2, and DATA3 each carry two audio channels, designated as the left and right channels. The left-channel data always precedes the right-channel data in the serial data stream for all data formats. [Table 2](#) shows the mapping of the digital input data to the analog output pins.

**(1) Standard Data Format; L-Channel = HIGH, R-Channel = LOW****(2) I<sup>2</sup>S Data Format; L-Channel = LOW, R-Channel = HIGH****(3) Left-Justified Data Format; L-Channel = HIGH, R-Channel = LOW**

**SERIAL CONTROL INTERFACE**

The serial control interface is a 4-wire synchronous serial port that operates asynchronously to the serial audio interface. The serial control interface is used to program and read the on-chip mode registers. The control interface includes MDO (pin 33), MDI (pin 34), MC (pin 35), and ML (pin 36). MDO is the serial data output, used to read back the values of the mode registers; MDI is the serial data input, used to program the mode registers; MC is the serial bit clock, used to shift data in and out of the control port; and ML is the control port latch clock.

**REGISTER WRITE OPERATION**

All write operations for the serial control port use 16-bit data words. Figure 24 shows the control data word format. The most significant bit is the read/write R/W bit. When set to 0, this bit indicates a write operation. Seven bits, labeled IDX[6:0], set the register index (or address) for the write operation. The least significant eight bits, D[7:0], contain the data to be written to the register specified by IDX[6:0].

Figure 25 shows the functional timing diagram for writing to the serial control port. ML is held at a logic-1 state until a register is to be written. To start the register write cycle, ML is set to logic-0. Sixteen clocks are then provided on MC, corresponding to the 16 bits of the control data word on MDI. After the sixteenth clock cycle has completed, ML is set to logic-1 to latch the data into the indexed mode control register.

R0001-02

**Figure 24. Control Data Word Format for MDI**

T0048-02

**Figure 25. Write Operation Timing**

**SINGLE REGISTER READ OPERATION**

Read operations use the 16-bit control word format shown in Figure 24. For read operations, the R/W bit is set to 1. Read operations ignore the index bits, IDX[6:0], of the control data word. Instead, the REG[6:0] bits in control register 11 are used to set the index of the register that is to be read during the read operation. Bits IDX[6:0] should be set to 00h for read operations.

The details of the read operation are shown in Figure 26. First, control register 11 must be written with the index of the register to be read back. Additionally, the INC bit must be set to logic-0 in order to disable the auto-increment read function. The read cycle is then initiated by setting ML to logic-0 and setting the R/W bit of the control data word to logic-1, indicating a read operation. MDO remains in a high-impedance state until the last eight bits of the 16-bit read cycle, which correspond to the eight data bits of the register indexed by the REG[6:0] bits of control register 11. The read cycle is completed when ML is set to 1, immediately after the MC clock cycle for the least-significant bit of the indexed control register has completed.

T0075-01

NOTES: X = Don't care

Y = Last register to be read

In single-register read (INC = 0), the index which indicates the register to be read in read operation can be set by REG[6:0] in register 11. For example, setting REG[6:0] = 000 1001b means reading from register 9.

In auto-increment read (INC = 1), the index REG[6:0] indicates the first register to be read. For example, setting REG[6:0] = 000 1001b means reading registers from 9 to Y. Y is determined by the low-to-high transition of ML in serial mode control.

**Figure 26. Read Operation Timing**

## AUTO-INCREMENT READ OPERATION

The auto-increment read function allows for multiple registers to be read sequentially. The auto-increment read function is enabled by setting the INC bit of control register 11 to 1. The sequence always starts with the register indexed by the REG[6:0] bits in control register 11, and ends by the ML setting to 1 after MC clock cycle for the least-significant bit of last register.

Figure 26 shows the timing of the auto-increment read operation. The operation begins by writing control register 11, setting INC to 1, and setting REG[6:0] to the first register to be read in the sequence. The actual read operation starts on the next HIGH-to-LOW transition of the ML pin.

The read cycle starts by setting the R/W bit of the control word to 1, and setting all of the IDX[6:0] bits to 0. All subsequent bits input on MDI are ignored while ML is set to 0. For the first eight clocks of the read cycle, MDO is set to the high-impedance state. This is followed by a sequence of 8-bit words, each corresponding to the data contained in control registers N through Y, where N is defined by the REG[6:0] bits in control register 11, and where Y is the last register to be read. The read cycle is completed when ML is set to 1, immediately after the MC clock cycle for the least-significant bit of the last register has completed. If ML is held low and the MC clock continues beyond the last physical register (register 12), the read operation returns to control register 1 and subsequent control registers, continuing until ML is set to 1.

## CONTROL INTERFACE TIMING REQUIREMENTS

Figure 27 shows a detailed timing diagram for the serial control interface. Pay special attention to the setup and hold times, as well as  $t_{(MLS)}$  and  $t_{(MLH)}$ , which define minimum delays between the edges of the ML and MC clocks. These timing parameters are critical for proper control-port operation.

## MODE CONTROL REGISTERS

### User-Programmable Mode Controls

The PCM1602A includes a number of user-programmable functions that are accessed via control registers. The registers are programmed using the serial control interface that is previously discussed in this data sheet. [Table 3](#) lists the available mode control functions, along with their reset default conditions and associated register index.

**Table 3. User-Programmable Mode Controls**

| FUNCTION                                                    | RESET DEFAULT                      | CONTROL REGISTER | BIT(S) LABEL                                               |

## Reserved Registers

Register 0 is reserved for factory use. To ensure proper operation, the user should not write to or read from these registers.

## Register Map

The mode control register map is shown in [Table 4](#). Each register includes an  $\overline{R/W}$  bit that determines whether a register read ( $\overline{R/W} = 1$ ) or write ( $\overline{R/W} = 0$ ) operation is performed. Each register also includes an index (or address) indicated by the  $\text{IDX}[6:0]$  bits.

**Table 4. Mode Control Register Map**

| IDX<br>(B14–<br>B8) | REGISTER | B15              | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7                 | B6                 | B5   | B4   | B3   | B2   | B1   | B0   |

### **R/W – Read/Write Mode Select**

When  $R/\overline{W} = 0$ , a write operation is performed.

When  $R/\overline{W} = 1$ , a read operation is performed.

Default value: 0

### **ATx[7:0] – Digital Attenuation Level Setting**

where x = 1 through 6, corresponding to the DAC output  $V_{OUTX}$ .

These bits are read/write.

Default value: 1111 1111b

Each DAC output,  $V_{OUT1}$  through  $V_{OUT6}$ , includes a digital attenuator function. The attenuation level can be set from 0 dB to –63 dB in 0.5-dB steps. Changes in attenuation levels are made by incrementing or decrementing by one step (0.5 dB) for every  $8/f_S$  time interval until the programmed attenuator setting is reached. Alternatively, the attenuation level can be set to infinite attenuation, or mute.

The attenuation level is calculated using the following formula:

$$\text{Attenuation level (dB)} = 0.5 (\text{ATx}[7:0]_{\text{DEC}} - 255)$$

where  $\text{ATx}[7:0]_{\text{DEC}} = 0$  through 255.

For  $\text{ATx}[7:0]_{\text{DEC}} = 0$  through 128, the attenuator is set to infinite attenuation.

The following table shows attenuation levels for various settings.

| ATx[7:0]   | DECIMAL VALUE | ATTENUATOR LEVEL SETTING       |
|------------|---------------|--------------------------------|
| 1111 1111b | 255           | 0 dB, no attenuation (default) |
| 1111 1110b | 254           | –0.5 dB                        |
| 1111 1101b | 253           | –1 dB                          |
| :          | :             | :                              |
| 1000 0011b | 131           | –62 dB                         |
| 1000 0010b | 130           | –62.5 dB                       |
| 1000 0001b | 129           | –63 dB                         |
| 1000 0000b | 128           | Mute                           |
| :          | :             | :                              |
| 0000 0000b | 0             | Mute                           |

|            | B15 | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7  | B6  | B5   | B4   | B3   | B2   | B1   | B0   |
|------------|-----|------|------|------|------|------|------|------|-----|-----|------|------|------|------|------|------|
| REGISTER 7 | R/W | IDX6 | IDX5 | IDX4 | IDX3 | IDX2 | IDX1 | IDX0 | RSV | RSV | MUT6 | MUT5 | MUT4 | MUT3 | MUT2 | MUT1 |

**R/W – Read/Write Mode Select**

When  $\overline{R/W} = 0$ , a write operation is performed.

When  $\overline{R/W} = 1$ , a read operation is performed.

Default value: 0

**MUTx – Soft Mute Control**

Where x = 1 through 6, corresponding to the DAC output  $V_{OUTx}$ .

These bits are read/write.

Default value: 0

|          |                         |
|----------|-------------------------|
| MUTx = 0 | Mute disabled (default) |
| MUTx = 1 | Mute enabled            |

The mute bits, MUT1 through MUT6, are used to enable or disable the soft mute function for the corresponding DAC outputs,  $V_{OUT1}$  through  $V_{OUT6}$ . The soft mute function is incorporated into the digital attenuators. When mute is disabled ( $MUTx = 0$ ), the attenuator and DAC operate normally. When mute is enabled by setting  $MUTx = 1$ , the digital attenuator for the corresponding output is decreased from the current setting to the infinite attenuation setting, one attenuator step (0.5 dB) at a time. This provides a quiet, pop-free muting of the DAC output. On returning from soft mute, by setting  $MUTx = 0$ , the attenuator is increased one step at a time to the previously programmed attenuation level.

|            | B15 | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7  | B6  | B5   | B4   | B3   | B2   | B1   | B0   |
|------------|-----|------|------|------|------|------|------|------|-----|-----|------|------|------|------|------|------|
| REGISTER 8 | R/W | IDX6 | IDX5 | IDX4 | IDX3 | IDX2 | IDX1 | IDX0 | RSV | RSV | DAC6 | DAC5 | DAC4 | DAC3 | DAC2 | DAC1 |

**R/W – Read/Write Mode Select**

When  $\overline{R/W} = 0$ , a write operation is performed.

When  $\overline{R/W} = 1$ , a read operation is performed.

Default value: 0

**DACx – DAC Operation Control**

Where x = 1 through 6, corresponding to the DAC output  $V_{OUTx}$ .

These bits are read/write.

Default value: 0

|          |                                 |
|----------|---------------------------------|
| DACx = 0 | DAC operation enabled (default) |
| DACx = 1 | DAC operation disabled          |

The DAC operation controls are used to enable and disable the DAC outputs,  $V_{OUT1}$  through  $V_{OUT6}$ . When  $DACx = 0$ , the output amplifier input is connected to the DAC output. When  $DACx = 1$ , the output amplifier input is switched to the dc common-mode voltage ( $V_{COM}$ ), equal to  $V_{CC}/2$ .

|            | B15 | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7  | B6  | B5  | B4   | B3   | B2   | B1   | B0   |
|------------|-----|------|------|------|------|------|------|------|-----|-----|-----|------|------|------|------|------|
| REGISTER 9 | R/W | IDX6 | IDX5 | IDX4 | IDX3 | IDX2 | IDX1 | IDX0 | RSV | RSV | FLT | CLKD | CLKE | FMT2 | FMT1 | FMT0 |

### ***R/W – Read/Write Mode Select***

When  $\overline{R/W} = 0$ , a write operation is performed.

When  $\overline{R/W} = 1$ , a read operation is performed.

Default value: 0

### ***FLT – Digital Filter Rolloff Control***

This bit is read/write.

Default value: 0

|         |                         |
|---------|-------------------------|
| FLT = 0 | Sharp rolloff (default) |
| FLT = 1 | Slow rolloff            |

The FLT bit allows users to select the digital filter rolloff that is best suited to their application. Two filter rolloff selections are available: sharp or slow. The filter responses for these selections are shown in the *Typical Performance Curves* section of this data sheet.

### ***CLKD – SCKO Frequency Selection***

This bit is read/write.

Default value: 0

|          |                                            |
|----------|--------------------------------------------|
| CLKD = 0 | Full-rate, $f_{SCKO} = f_{SCKI}$ (default) |
| CLKD = 1 | Half-rate, $f_{SCKO} = f_{SCKI}/2$         |

The CLKD bit is used to determine the clock frequency at the system clock output pin, SCKO.

### ***CLKE – SCKO Output Enable***

This bit is read/write.

Default value: 0

|          |                        |
|----------|------------------------|
| CLKE = 0 | SCKO enabled (default) |
| CLKE = 1 | SCKO disabled          |

The CLKE bit is used to enable or disable the system clock output pin, SCKO. When SCKO is enabled, it outputs either a full- or half-rate clock, based on the setting of the CLKD bit. When SCKO is disabled, it is set to a LOW level.

### ***FMT[2:0] – Audio Interface Data Format***

These bits are read/write.

Default value: 000b

| FMT[2:0] | Audio Data Format Selection                            |
|----------|--------------------------------------------------------|
| 000      | 24-bit standard format, right-justified data (default) |
| 001      | 20-bit standard format, right-justified data           |
| 010      | 18-bit standard format, right-justified data           |
| 011      | 16-bit standard format, right-justified data           |
| 100      | I <sup>2</sup> S format, 16- to 24-bit                 |
| 101      | Left-justified format, 16- to 24-bit                   |
| 110      | Reserved                                               |
| 111      | Reserved                                               |

The FMT[2:0] bits are used to select the data format for the serial audio interface.

|             | B15 | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7  | B6   | B5   | B4   | B3   | B2  | B1  | B0  |
|-------------|-----|------|------|------|------|------|------|------|-----|------|------|------|------|-----|-----|-----|
| REGISTER 10 | R/W | IDX6 | IDX5 | IDX4 | IDX3 | IDX2 | IDX1 | IDX0 | RSV | ZREV | DREV | DMF1 | DMF0 | DMC | DMC | DMC |

**R/W – Read/Write Mode Select**

When  $\overline{R/W} = 0$ , a write operation is performed.

When  $\overline{R/W} = 1$ , a read operation is performed.

Default value: 0

**ZREV – Zero-Flag Polarity Select**

Default value: 0

|          |                                                |
|----------|------------------------------------------------|
| ZREV = 0 | Zero-flag pins HIGH at a zero detect (default) |
| ZREV = 1 | Zero-flag pins LOW at a zero detect            |

The ZREV bit allows the user to select the polarity of zero-flag pins.

**DREV – Output Phase Select**

Default value: 0

|          |                         |
|----------|-------------------------|
| DREV = 0 | Normal output (default) |
| DREV = 1 | Inverted output         |

The DREV bit allows the user to select the phase of the analog output signal.

**DMF[1:0] – Sampling Frequency Selection for the De-Emphasis Function**

These bits are read/write.

Default value: 00b

| DMF[1:0] | De-Emphasis Sample Rate Selection |
|----------|-----------------------------------|
| 00       | 44.1 kHz (default)                |
| 01       | 48 kHz                            |
| 10       | 32 kHz                            |
| 11       | Reserved                          |

The DMF[1:0] bits are used to select the sampling frequency used for the digital de-emphasis function when it is enabled. The de-emphasis curves are shown in the *Typical Performance Curves* section of this data sheet. The preceding table shows the available sampling frequencies.

**DMC – Digital De-Emphasis, All-Channel Function Control**

This bit is read/write.

Default value: 0

|         |                                                 |
|---------|-------------------------------------------------|
| DMC = 0 | De-emphasis disabled for all channels (default) |
| DMC = 1 | De-emphasis enabled for all channels            |

The DMC bits are used to enable or disable the de-emphasis function for all channels. The three DMC bits are ORed together. Setting any one DMC bit, any combination of two DMC bits, or all three DMC bits to 1 enables digital de-emphasis for all channels. Setting all three DMC bits to 0 disables digital de-emphasis for all channels.

|             | B15 | B14  | B13  | B12  | B11  | B10  | B9   | B8   | B7  | B6   | B5   | B4   | B3   | B2   | B1   | B0   |
|-------------|-----|------|------|------|------|------|------|------|-----|------|------|------|------|------|------|------|
| REGISTER 11 | R/W | IDX6 | IDX5 | IDX4 | IDX3 | IDX2 | IDX1 | IDX0 | INC | REG6 | REG5 | REG4 | REG3 | REG2 | REG1 | REG0 |

### ***R/W* – Read/Write Mode Select**

When  $R/\overline{W} = 0$ , a write operation is performed.

When  $R/\overline{W} = 1$ , a read operation is performed.

Default value: 0

### ***INC* – Auto-Increment Read Control**

This bit is read/write.

Default value: 0

|         |                                        |
|---------|----------------------------------------|
| INC = 0 | Auto-increment read disabled (default) |
| INC = 1 | Auto-increment read enabled            |

The INC bit is used to enable or disable the auto-increment read feature of the serial control interface. See the *Serial Control Interface* section of this data sheet for details regarding auto-increment read operation.

### ***REG[6:0]* – Read Register Index**

These bits are read/write.

Default value: 01h

The REG[6:0] bits are used to set the index of the register to be read when performing the single-register read operation. In the case of an auto-increment read operation, the REG[6:0] bits indicate the index of the last register to be read in the auto-increment read sequence. For example, if registers 1 through 6 are to be read during an auto-increment read operation, the REG[6:0] bits would be set to 06h. See the *Serial Control Interface* section of this data sheet for details regarding the single-register and auto-increment read operations.

**R/W – Read/Write Mode Select**

When  $\overline{R/W} = 0$ , a write operation is performed.

When  $\overline{R/W} = 1$ , a read operation is performed.

Default value: 0

**OVER – Oversampling Rate Control**

These bits are read/write.

Default value: 0

System clock rate = 256  $f_S$ , 384  $f_S$ , 512  $f_S$ , or 768  $f_S$ :

|          |                            |
|----------|----------------------------|
| OVER = 0 | 64× oversampling (default) |
| OVER = 1 | 128× oversampling          |

System clock rate = 128  $f_S$  or 192  $f_S$ :

|          |                            |
|----------|----------------------------|
| OVER = 0 | 32× oversampling (default) |
| OVER = 1 | 64× oversampling           |

The OVER bit is used to control the oversampling rate of the delta-sigma DACs. The OVER = 1 setting is recommended when the oversampling rate is 192 kHz (system clock rate is 128  $f_S$  or 192  $f_S$ ).

**GPOE – General-Purpose Output Enable**

This bit is read/write.

Default value: 0

|          |                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------|
| GPOE = 0 | General-purpose outputs disabled (default)<br>Pins default to zero-flag function (ZERO1 through ZERO6). |
| GPOE = 1 | General-purpose outputs enabled<br>Data written to GPO1 through GPO6 appears at the corresponding pins. |

**GPOx – General-Purpose Logic Output**

Where: x = 1 through 6, corresponding pins GPO1 through GPO6.

These bits are read/write.

Default value: 0

|          |                         |
|----------|-------------------------|
| GPOx = 0 | Set GPOx to 0 (default) |
| GPOx = 1 | Set GPOx to 1           |

The general-purpose output pins, GPO1 through GPO6, are enabled by setting GPOE = 1. These pins are used as general-purpose outputs for controlling user-defined logic functions. When general-purpose outputs are disabled (GPOE = 0), they default to the zero-flag function, ZERO1 through ZERO6.

## ANALOG OUTPUTS

The PCM1602A includes six independent output channels,  $V_{OUT1}$  through  $V_{OUT6}$ . These are unbalanced outputs, each capable of driving 3.1  $V_{PP}$  typical into a 5-k $\Omega$  ac load with  $V_{CC} = 5$  V. The internal output amplifiers for  $V_{OUT1}$  through  $V_{OUT6}$  are dc biased to the common-mode (or bipolar zero) voltage, equal to  $V_{CC}/2$ .

The output amplifiers include an RC continuous-time filter, which helps to reduce the out-of-band noise energy present at the DAC outputs due to the noise-shaping characteristics of the PCM1602A delta-sigma DACs. The frequency response of this filter is shown in Figure 28. By itself, this filter is not enough to attenuate the out-of-band noise to an acceptable level for most applications. An external low-pass filter is required to provide sufficient out-of-band noise rejection. Further discussion of DAC post-filter circuits is provided in the *Application Information* section of this data sheet.

Figure 28. Output-Filter Frequency Response

### $V_{COM}$ OUTPUT

One unbuffered, common-mode voltage output pin,  $V_{COM}$  (pin 15), is brought out for decoupling purposes. This pin is nominally biased to a dc voltage level equal to  $V_{CC}/2$ . If this pin is to be used to bias external circuitry, a voltage follower is required for buffering purposes. Figure 29 shows an example of using the  $V_{COM}$  pin for external biasing applications.

Figure 29. Biasing External Circuits Using the  $V_{COM}$  Pin

## ZERO FLAG

### Zero-Detect Condition

Zero detection for each output channel is independent from the others. If the data for a given channel remains at a 0 level for 1024 sample periods (or LRCK clock periods), a zero-detect condition exists for that channel.

### Zero Output Flags

Given that a zero-detect condition exists for one or more channels, the zero-flag pins for those channels are set to a logic-1 state. Each channel, ZERO1 through ZERO6 (pins 1 through 6), has zero-flag pins. In addition, all six zero flags are logically ANDed together, and the result is provided at the ZEROA pin (pin 48), which is set to a logic-1 state when all channels indicate a zero-detect condition. The zero-flag pins can be used to operate external mute circuits, or used as status indicators for a microcontroller, audio signal processor, or other digitally controlled function.

The active polarity of the zero-flag output can be inverted by setting to 1 the ZREV bit of control register 10. The reset default is active-high output, or ZREV = 0.

## APPLICATION INFORMATION

### CONNECTION DIAGRAMS

A basic connection diagram with the necessary power-supply bypassing and decoupling components is shown in Figure 30. Texas Instruments recommends using the component values shown in Figure 30 for all designs.

S0090-04

Figure 30. Basic Connection Diagram

- (1) Serial control and reset functions can be provided by DSP/decoder GPIO pins.
- (2) Actual clock output used is determined by the application.
- (3)  $R_S = 22\ \Omega$  to  $100\ \Omega$ .
- (4) See the *Application Information* section of this datasheet for more information.

**Figure 31. Typical Application Diagram**

A typical application diagram is shown in [Figure 31](#). The REG1117-3.3 from Texas Instruments is used to generate 3.3 V for  $V_{DD}$  from the 5-V analog power supply. The PLL170x from Texas Instruments is used to generate the system clock input at SCKI, as well as generating the clock for the audio signal processor.

Series resistors (22-Ω to 100-Ω) are recommended for SCKI, LRCK, BCK, DATA1, DATA2, and DATA3. The series resistor combines with the stray PCB and device input capacitance to form a low-pass filter which removes high-frequency noise from the digital signal, thus reducing high-frequency emission.

## POWER SUPPLIES AND GROUNDING

The PCM1602A requires a 5-V analog supply and a 3.3-V digital supply. The 5-V supply is used to power the DAC analog and output filter circuitry, whereas the 3.3-V supply is used to power the digital filter and serial interface circuitry. For best performance, the 3.3-V supply should be derived from the 5-V supply using a linear regulator (see [Figure 31](#)).

Two capacitors are required for supply bypassing (see [Figure 30](#)). These capacitors should be located as close as possible to the PCM1602A package. The 10-μF capacitors should be tantalum or aluminum electrolytic, whereas the 0.1-μF capacitors are ceramic (X7R type is recommended for surface-mount applications).

## DAC OUTPUT FILTER CIRCUITS

Delta-sigma DACs use noise-shaping techniques to improve in-band signal-to-noise ratio (SNR) performance at the expense of generating increased out-of-band noise above the Nyquist frequency, or  $f_S/2$ . The out-of-band noise must be low-pass filtered in order to provide optimal converter performance. This is accomplished by a combination of on-chip and external low-pass filtering.

[Figure 32](#) and [Figure 33](#) show the recommended external low-pass active filter circuits for dual- and single-supply applications. These circuits are second-order Butterworth filters using the multiple feedback (MFB) circuit arrangement, which reduces sensitivity to passive component variations over frequency and temperature. For more information regarding MFB active filter design, see the *FilterPro™ MFB and Sallen-Key Low-Pass Filter Design Program* application report ([SBFA001](#)), available from the TI Web site ([www.ti.com](http://www.ti.com)).

Because the overall system performance is defined by the quality of the DACs and their associated analog output circuitry, high-quality audio operational amplifiers are recommended for the active filters. The OPA2134 and OPA2353 dual operational amplifiers from Texas Instruments are shown in [Figure 32](#) and [Figure 33](#), and are recommended for use with the PCM1602A.

Figure 32. Dual-Supply Filter Circuit

S0056-05

Figure 33. Single-Supply Filter Circuit

## PCB LAYOUT GUIDELINES

A typical PCB floor plan for the PCM1602A is shown in Figure 34. A ground plane is recommended, with the analog and digital sections being isolated from one another using a split or cut in the circuit board. The PCM1602A should be oriented with the digital I/O pins facing the ground plane split/cut to allow for short, direct connections to the digital audio interface and control signals originating from the digital section of the board.

B0031-06

Figure 34. Recommended PCB Layout

Separate power supplies are recommended for the digital and analog sections of the board. This prevents the switching noise present on the digital supply from contaminating the analog power supply and degrading the dynamic performance of the DACs. In cases where a common 5-V supply must be used for the analog and digital sections, an inductance (RF choke, ferrite bead) should be placed between the analog and digital 5-V supply connections to avoid coupling of the digital switching noise into the analog circuitry. Figure 35 shows the recommended approach for single-supply applications.

B0032-06

Figure 35. Single-Supply PCB Layout

## THEORY OF OPERATION

The DAC section of the PCM1602A is based on a multi-bit delta-sigma architecture. This architecture uses a fourth-order noise shaper and an 8-level amplitude quantizer, followed by an analog low-pass filter. A block diagram of the delta-sigma modulator is shown in Figure 36. This architecture has the advantage of stability and improved jitter tolerance, when compared to traditional 1-bit (2-level) delta-sigma designs.

B0008-03

**Figure 36. Eight-Level Delta-Sigma Modulator**

The combined oversampling rate of the digital interpolation filter and the delta-sigma modulator is  $32 f_s$ ,  $64 f_s$ , or  $128 f_s$ . The total oversampling rate is determined by the desired sampling frequency. If  $f_s \leq 96$  kHz, then the OVER bit in register 12 can be set to an oversampling rate of  $64 f_s$  or  $128 f_s$ . If  $f_s > 96$  kHz, then the OVER bit can be used to set the oversampling rate to  $32 f_s$  or  $64 f_s$ . Figure 37 shows the out-of-band quantization-noise plots for both the  $64\times$  and  $128\times$  oversampling scenarios. Notice that the  $128\times$  oversampling plot shows significantly improved out-of-band noise performance, allowing for a simplified low-pass filter to be used at the output of the DAC.

**Figure 37. Quantization-Noise Spectrum**

Figure 38 illustrates the simulated jitter sensitivity of the PCM1602A. To achieve best performance, the system clock jitter should be less than 300 picoseconds. This is easily achieved using a quality clock generation IC, like the PLL170x from Texas Instruments.

**Figure 38. Jitter Sensitivity**

## KEY PERFORMANCE PARAMETERS AND MEASUREMENT

This section provides information on how to measure key dynamic performance parameters for the PCM1602A. In all cases, a System Two Cascade audio measurement system by Audio Precision or equivalent is used to perform the testing.

### TOTAL HARMONIC DISTORTION + NOISE

Total harmonic distortion + noise (THD+N) is a significant figure of merit for audio DACs, because it takes into account both harmonic distortion and all noise sources within a specified measurement bandwidth. The true RMS value of the distortion and noise is referred to as THD+N. The test setup for THD+N measurements is shown in Figure 39.

(1) There is little difference in measured THD+N when using the various settings for these filters.

(2) Required for THD+N test

**Figure 39. Test Setup for THD+N Measurements**

For the PCM1602A DACs, THD+N is measured with a full-scale, 1-kHz digital sine wave as the test stimulus at the input of the DAC. The digital generator is set to a 24-bit audio word length and a sampling frequency of 44.1 kHz or 96 kHz. The digital generator output is taken from the unbalanced S/PDIF connector of the measurement system. The S/PDIF data is transmitted via coaxial cable to the digital audio receiver on the DEM-DAI1602 demonstration board. The receiver is then configured to output 24-bit data in either I<sup>2</sup>S or left-justified data format. The DAC audio interface format is programmed to match the receiver output format. The analog output is then taken from the DAC post filter and connected to the analog analyzer input of the measurement system. The analog input is band-limited, using filters resident in the analyzer. The resulting THD+N is measured by the analyzer and displayed by the measurement system.

## DYNAMIC RANGE

Dynamic range is specified as A-weighted THD+N measured with a –60-dBFS, 1-kHz digital sine wave stimulus at the input of the DAC. This measurement is designed to give a good indication of how the DAC performs, given a low-level input signal.

The measurement setup for the dynamic range measurement is shown in Figure 40, and is similar to the THD+N test setup discussed previously. The differences include the band-limit filter selection, the additional A-weighting filter, and the –60-dBFS input level.

(1) Infinite-zero-detect mute disabled

(2) Results without A-weighting are approximately 3 dB worse.

**Figure 40. Test Setup for Dynamic Range and SNR Measurements**

## IDLE-CHANNEL SIGNAL-TO-NOISE RATIO

The SNR test provides a measure of the noise of the DAC. The input to the DAC is in all-0s data, and the DAC infinite-zero-detect mute function must be disabled (default condition at power up for the PCM1602A). This ensures that the delta-sigma modulator output is connected to the output amplifier circuit so that idle tones (if present) can be observed at the output. The dither function of the digital signal generator must also be disabled to ensure an all-0s data stream at the input of the DAC.

The measurement setup for SNR is identical to that used for dynamic range, with the exception of the input signal level (see the notes provided in Figure 40).

## DIFFERENCES BETWEEN THE PCM1602APTR AND PCM1602AMPTR

While the two devices are identical, the key difference between both orderable versions is the physical orientation of the devices in the reel. See the appended *Package Materials Information* sheet for more details on the orientation of the devices in the reels. When changing the orderable part number, remember to update the tooling program to compensate for the different orientation.

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Original (August, 2005) to Revision A                                                        | Page |
|-----------------------------------------------------------------------------------------------------------|------|
| • Deleted <i>lead temperature</i> specification from <a href="#">Absolute Maximum Ratings</a> table ..... | 2    |
| • Added <a href="#">Differences Between the PCM1602APTR and PCM1602AMPTR</a> section .....                | 39   |

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TRAY
