SCAS220C - JUNE 1992 - REVISED OCTOBER 1997

- **Dual Independent FIFOs Organized as:** 64 Words by 1 Bit Each - SN74ACT2227 256 Words by 1 Bit Each - SN74ACT2229
- Free-Running Read and Write Clocks Can Be Asynchronous or Coincident on Each **FIFO**
- Input-Ready Flags Synchronized to Write
- **Output-Ready Flags Synchronized to Read**
- Half-Full and Almost-Full/Almost-Empty
- Support Clock Frequencies up to 60 MHz
- Access Times of 9 ns
- 3-State Data Outputs
- Low-Power Advanced CMOS Technology
- Packaged in 28-Pin SOIC Package

### description

The SN74ACT2227 and SN74ACT2229 are dual FIFOs suited for a wide range of serial-data buffering applications including elastic stores for frequencies up to OC-1 telecommunication rates. Each FIFO on the chip is arranged as  $64 \times 1$  (SN74ACT2227) or  $256 \times 1$  (SN74ACT2229) and has control signals and status flags for independent operation. Output flags for each FIFO include input ready (1IR or 2IR), output ready (1OR or 2OR), half full (1HF or 2HF), and almost full/almost empty (1AF/AE or 2AF/AE).

Serial data is written into a FIFO on the low-to-high transition of the write-clock (1WRTCLK or 2WRTCLK) input when the write-enable (1WRTEN or 2WRTEN) input and input-ready flag (1IR or 2IR) output are both high. Serial data is read from a FIFO on the low-to-high transition of the read-clock (1RDCLK or 2RDCLK) input when the read-enable (1RDEN or 2RDEN) input and output-ready flag (1OR or 2OR) output are both high. The read and write clocks of a FIFO can be asynchronous to one another. A FIFO data output (1Q or 2Q) is in the high-impedance state when its output-enable (10E or 20E) input is low.

Each input-ready flag (1IR or 2IR) is synchronized by two flip-flop stages to its write clock (1WRTCLK or 2WRTCLK), and each output-ready flag (1OR or 2OR) is synchronized by three flip-flop stages to its read clock (1RDCLK or 2RDCLK). This multistage synchronization ensures reliable flag-output states when data is written and read asynchronously.

A half-full flag (1HF or 2HF) is high when the number of bits stored in its FIFO is greater than or equal to half the depth of the FIFO. An almost-full/almost-empty flag (1AF/AE or 2AF/AE) is high when eight or fewer bits are stored in its FIFO and when eight or fewer empty locations are left in the FIFO. A bit present on the data output is not stored in the FIFO.

The SN74ACT2227 and SN74ACT2229 are characterized for operation from -40°C to 85°C.

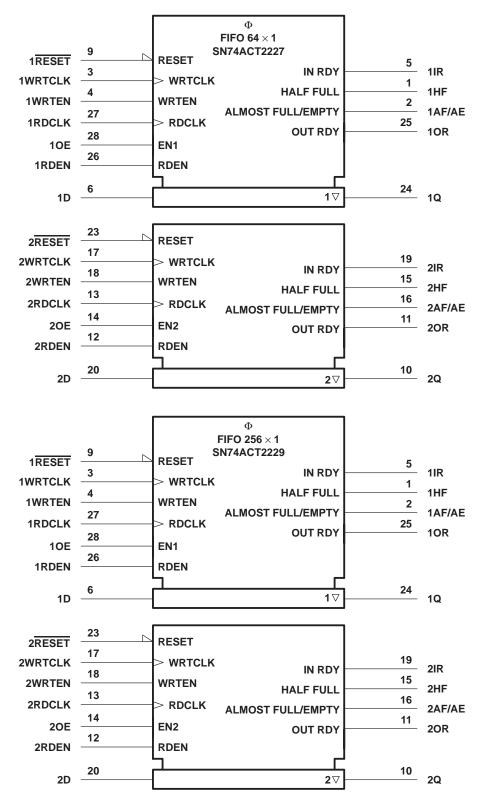

For more information on this device family, see the application report FIFOs With a Word Width of One Bit (literature number SCAA006).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

 $<sup>\ ^\</sup>dagger$  These symbols are in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.

# SN74ACT2227 functional block diagram (each FIFO)

# SN74ACT2229 functional block diagram (each FIFO)

# **Terminal Functions**

TERMIN	NAL	1/0	DESCRIPTION
NAME	NO.	1/0	DESCRIPTION
1AF/AE 2AF/AE	2 16	0	Almost-full/almost-empty flag. AF/AE is high when the memory is eight locations or fewer from a full or empty state. AF/AE is set high after reset.
1D 2D	6 20	Ι	Data input
GND	7, 8		Ground
1HF 2HF	1 15	0	Half-full flag. HF is high when the number of bits stored in memory is greater than or equal to half the FIFO depth. HF is set low after reset.
1IR 2IR	5 19	0	Input-ready flag. IR is synchronized to the low-to-high transition of WRTCLK. When IR is low, the FIFO is full and writes are disabled. IR is set low during reset and is set high on the second low-to-high transition of WRTCLK after reset.
10E 20E	28 14	ı	Output enable. The data output of a FIFO is active when OE is high and in the high-impedance state when OE is low.
1OR 2OR	25 11	0	Output-ready flag. OR is synchronized to the low-to-high transition of RDCLK. When OR is low, the FIFO is empty and reads are disabled. Ready data is present on the data output when OR is high. OR is set low during reset and set high on the third low-to-high transition of RDCLK after the first word is loaded to empty memory.
1Q 2Q	24 10	0	Data outputs. After the first valid write to empty memory, the first bit is output on the third rising edge of RDCLK. OR for the FIFO is asserted high to indicate ready data.
1RDCLK 2RDCLK	27 13	I	Read clock. RDCLK is a continuous clock and can be independent of any other clock on the device. A low-to-high transition of RDCLK reads data from memory when the FIFO RDEN and OR are high. OR is synchronous with the low-to-high transition of RDCLK.
1RDEN 2RDEN	26 12	ı	Read enable. When the RDEN and OR of a FIFO are high, data is read from the FIFO on the low-to-high transition of RDCLK.
1RESET 2RESET	9 23	I	Reset. To reset the FIFO, four low-to-high transitions of RDCLK and four low-to-high transitions of WRTCLK must occur while RESET is low. This sets HF, IR, and OR low and AF/AE high. Before it is used, a FIFO must be reset after power up.
VCC	21, 22		Supply voltage
1WRTCLK 2WRTCLK	3 17	ı	Write clock. WRTCLK is a continuous clock and can be independent of any other clock on the device. A low-to-high transition of WRTCLK writes data to memory when WRTEN and IR are high. IR is synchronous with the low-to-high transition of WRTCLK.
1WRTEN 2WRTEN	4 18	I	Write enable. When WRTEN and IR are high, data is written to the FIFO on a low-to-high transition of WRTCLK.

### PARAMETER MEASUREMENT INFORMATION

NOTE A: C<sub>L</sub> includes probe and jig capacitance.

Figure 4. Load Circuit and Voltage Waveforms

### TYPICAL CHARACTERISTICS

# SINGLE FIFO SUPPLY CURRENT vs CLOCK FREQUENCY

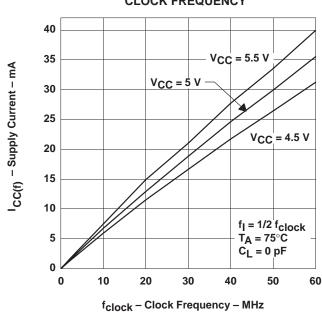

Figure 5

### calculating power dissipation

Data for Figure 5 is taken with one FIFO active and one FIFO idle on the device. The active FIFO has both writes and reads enabled with its read clock (RDCLK) and write clock (WRTCLK) operating at the rate specified by f<sub>clock</sub>. The data input rate and data output rate are half the f<sub>clock</sub> rate, and the data output is disconnected. A close approximation to the total device power can be found by Figure 5, determining the capacitive load on the data output and determining the number of SN74ACT2227/2229 inputs driven by TTL high levels.

With  $I_{CC(f)}$  taken from Figure 5, the maximum power dissipation (P<sub>T</sub>) of one FIFO on the SN74ACT2227 or SN74ACT2229 can be calculated by:

$$\mathsf{P}_\mathsf{T} = \mathsf{V}_\mathsf{CC} \times [\mathsf{I}_\mathsf{CC}(\mathsf{f}) + (\mathsf{N} \times \Delta \mathsf{I}_\mathsf{CC} \times \mathsf{dc})] + (\mathsf{C}_\mathsf{L} \times \mathsf{V}_\mathsf{CC}^2 \times \mathsf{f}_\mathsf{o})$$

where:

N = number of inputs driven by TTL levels

 $\Delta I_{CC}$  = increase in power-supply current for each input at a TTL high level

dc = duty cycle of inputs at a TTL high level of 3.4 V

C<sub>L</sub> = output capacitive load

f<sub>o</sub> = switching frequency of an output

### **APPLICATION INFORMATION**

An example of concentrating two independent serial-data signals into a single composite data signal with the use of an SN74ACT2227 or SN74ACT2229 device is shown in Figure 6. The input data to the FIFOs share the same average (mean) frequency and the mean frequency of the SYS\_CLOCK is greater than or equal to the sum of the individual mean input rates. A single-bit FIFO is needed for each additional input data signal that is time-division multiplexed into the composite signal.

The FIFO memories provide a buffer to absorb clock jitter generated by the transmission systems of incoming signals and synchronize the phase-independent inputs to one another. FIFO half-full (HF) flags are used to signal the multiplexer to start fetching data from the buffers. The state of the flags also can be used to indicate when a FIFO read should be suppressed to regulate the output flow (pulse-stuffing control). The FIFO almost-full/almost-empty (AF/AE) flags can be used in place of the half-full flags to reduce transmission delay.

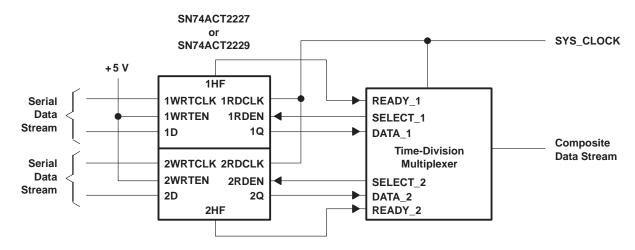

Figure 6. Time-Division Multiplexing Using the SN74ACT2227 or SN74ACT2229

SN74ACT2229DW.A	Active	Production	SOIC (DW)   28	20   TUBE	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	ACT2229

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

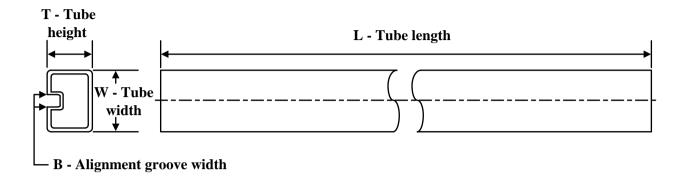

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
