

SNx4LVCH245A Octal Bus Transceivers With Tri-State Outputs

1 Features

- Operate From 1.65 V to 3.6 V
- Inputs Accept Voltages to 5.5 V
- Max t_{pd} of 6.3 ns at 3.3 V
- Typical V_{OLP} (Output Ground Bounce) <0.8 V at $V_{CC} = 3.3$ V, $T_A = 25^\circ\text{C}$
- Typical V_{OHV} (Output V_{OH} Undershoot) >2 V at $V_{CC} = 3.3$ V, $T_A = 25^\circ\text{C}$
- Support Mixed-Mode Signal Operation on All Ports (5-V Input/Output Voltage With 3.3-V V_{CC})
- I_{off} Supports Live Insertion, Partial-Power-Down Mode, and Back-Drive Protection
- Bus Hold on Data Inputs Eliminates the Need for External Pullup or Pulldown Resistors
- Latch-Up Performance Exceeds 250 mA Per JESD 17
- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
- On Products Compliant to MIL-PRF-38535, All Parameters Are Tested Unless Otherwise Noted. On All Other Products, Production Processing Does Not Necessarily Include Testing of All Parameters.

2 Applications

- Servers
- PCs and Notebooks
- Network Switches
- Wearable Health and Wellness Devices
- Telecom Infrastructures
- Electronic Points of Sale

3 Description

The SN54LVCH245A octal bus transceiver is designed for 2.7-V to 3.6-V V_{CC} operation, and the SN74LVCH245A octal bus transceiver is designed for 1.65-V to 3.6-V V_{CC} operation. Inputs can be driven from either 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V/5-V system environment.

4 Revision History

Changes from Revision P (July 2014) to Revision Q

| | | Page |
|---|--|------|
| • | Changed part number column to include specific orderable parts. | 1 |
| • | Removed package name GQN. | 6 |
| • | Added ZXY package pinout section. | 6 |
| • | Changed Handling Ratings to ESD ratings. | 7 |
| • | Deleted storage temperature from ESD Ratings table. | 7 |
| • | Changed only include commercial device specifications in this table. | 10 |
| • | Added new table for military device specifications. | 11 |
| • | Deleted bulleted list of features. | 16 |
| • | Added Output Types, Input Types, Clamp Diode Structure, and Special Features sections. | 16 |

Changes from Revision O (December 2005) to Revision P

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|--|-----------|------|----------------|------|
| Supply voltage range, V_{CC} | | –0.5 | 6.5 | V |
| Input voltage range, V_I ⁽²⁾ | | –0.5 | 6.5 | V |
| Voltage range applied to any output in the high-impedance or power-off state, V_O ⁽²⁾ | | –0.5 | 6.5 | V |
| Voltage range applied to any output in the high or low state, V_O ⁽²⁾⁽³⁾ | | –0.5 | $V_{CC} + 0.5$ | V |
| Input clamp current, I_{IK} | $V_I < 0$ | | –50 | mA |
| Output clamp current, I_{OK} | $V_O < 0$ | | –50 | mA |
| Continuous output current, I_O | | | ±50 | mA |
| Continuous current through V_{CC} or GND | | | ±100 | mA |
| Operating virtual junction temperature, T_j | | | 150 | °C |
| Storage temperature range, T_{stg} | | –65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V_{CC} is provided in the *Recommended Operating Conditions* table.

6.2 ESD Ratings

| | | MIN | MAX | UNIT |
|-------------|-------------------------|--|-----|------|
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾ | 0 | 2000 |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | 0 | 1500 |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions: SN74LVCH245A

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

8 Detailed Description

8.1 Overview

The SN54LVCH245A octal bus transceiver is designed for a 2.7-V to 3.6-V V_{CC} operation, and the SN74LVCH245A octal bus transceiver is designed for a 1.65-V to 3.6-V V_{CC} operation. Inputs can be driven from either the 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V or 5-V system environment.

These devices are designed for asynchronous communication between data buses. These devices transmit data from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable (\overline{OE}) input can be used to disable the device, so the buses are effectively isolated.

These devices are fully specified for partial-power-down applications using I_{off} . The I_{off} circuitry disables the outputs which prevents damaging current backflow through the devices when they are powered down. To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver. Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level. The bus-hold circuitry is part of the input circuit and is not disabled by \overline{OE} or DIR, so use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads, so routing and load conditions should be taken into consideration to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The power output of the device must be limited to avoid thermal runaway and damage caused by over-current. Follow the electrical and thermal limits defined in the [Absolute Maximum Ratings](#) at all times.

8.3.2 Standard CMOS Inputs

Standard CMOS inputs are high impedance, and these inputs are typically modeled as a resistor in parallel with the input capacitance given in the [Electrical Characteristics: SN74LVCH245A](#). The worst case resistance is calculated with the maximum input voltage, given in the [Absolute Maximum Ratings](#), and the maximum input leakage current, given in the [Electrical Characteristics: SN74LVCH245A](#), using ohm's law ($R = V \div I$).

Feature Description (continued)

Signals applied to the inputs need to have fast edge rates, as defined by $\Delta t/\Delta v$ in [Recommended Operating Conditions: SN54LVCH245A](#) to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the standard CMOS input.

8.3.3 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [Figure 8](#).

Figure 8. Electrical Placement of Clamping Diodes for Each Input and Output

8.3.4 Bus-Hold Data Inputs

Each data input on this device includes a weak latch that maintains a valid logic level on the input. The state of these latches is unknown at startup and remains unknown until the input has been forced to a valid high or low state. After data has been sent through a channel, the latch then maintains the previous state on the input if the line is left floating.

NOTE

It is highly recommended to not use pull-up or pull-down resistors together with a bus-hold input.

Bus-hold data inputs prevent floating inputs on this device. The [Implications of Slow or Floating CMOS Inputs](#) application report explains the problems associated with leaving CMOS inputs floating.

These latches remain active at all times, independent of output disable signals such as direction selection or output enables.

The [Bus-Hold Circuit](#) application report has additional details regarding bus-hold inputs.

Feature Description (continued)

8.3.5 Partial Power Down (I_{off})

The inputs and outputs for this device enter a high-impedance state when the supply voltage is 0 V. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the [Electrical Characteristics: SN74LVCH245A](#).

8.3.6 Over-voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage, as long as the input signals remain below the maximum input voltage value specified in the [Recommended Operating Conditions: SN54LVCH245A](#).

8.3.7 Output Enable

This device has an output enable (OE) pin that functions according to . When the outputs of the device are disabled, they are placed into a high impedance state where it will neither source nor sink current. High-impedance outputs are also commonly referred to as three-state or tri-state outputs. The maximum leakage for the output in this state is defined by I_{OZ} in the [Electrical Characteristics: SN74LVCH245A](#) table.

9 Application and Implementation

9.1 Application Information

The SN74LVCH245A device is a high-drive CMOS device with bus-hold inputs that can be used for a multitude of bus interface type applications where the data needs to be transmitted and received. The device's output can produce 24 mA of drive current at 3.3 V. Therefore, this device is ideal for driving multiple outputs and for high-speed applications up to 100 MHz. The inputs are 5.5-V tolerant which allows the devices to translate down to V_{CC} .

Figure 10 shows a typical down-translation application in which the device is being used with a fixed direction to reduce an 8-bit 5-V bus to an 8-bit 1.8-V bus.

Figure 11 shows a typical application in which a bus must switch directions for data transfer between a master and a slave device. The SN74LVCH245A allows either V_{CC1} or V_{CC3} to be shut down completely because it has bus-hold inputs that maintains valid states on the floating lines. In this example, V_{CC1} , V_{CC2} , and V_{CC3} all have the same value, but each supply can be delivered by a separate source.

Figure 12 shows a functional diagram for a single channel of the device, including the bus-hold, direction, and output enable logic components. When the direction is set as 'A to B,' the buffer labeled 'A' is disabled and the buffer labeled 'B' is enabled. When the direction is set as 'B to A,' the buffer labeled 'B' is disabled and the buffer labeled 'A' is enabled. When the output enable pin is deasserted, the buffers labeled 'A' and 'B' are both disabled. The bus-hold circuitry remains active at all times.

Typical Application (continued)

9.2.1 Design Requirements

This device uses CMOS technology and has a balanced output drive. Care should be taken to avoid bus contention because the device's output can drive currents that exceed maximum limits. The high drive also creates fast edges into light loads; therefore, routing and load conditions should be considered to prevent ringing.

This device has bus-hold inputs, which are always active regardless of DIR or \overline{OE} input values. For more information, refer to the [Bus-Hold Data Inputs](#).

9.2.2 Detailed Design Procedure

1. Recommended Input Conditions

- See $(\Delta t/\Delta V)$ in the [Recommended Operating Conditions: SN54LVCH245A](#) table for the input transition rate specification.
- See $(V_{IH}$ and V_{IL}) in the [Recommended Operating Conditions: SN54LVCH245A](#) table for the input voltage high level and input voltage low level specifications.
- The inputs are overvoltage tolerant. This allows them to rise up to 5.5 V at any valid V_{CC} .
- The inputs can be left floating. The internal bus-hold circuits maintains the last valid state at the inputs.

2. Recommended Output Conditions

- Do not exceed 25 mA per output and 50 mA in total for the device.
- Do not pull outputs above V_{CC} .

9.2.3 Application Curves

Figure 13. I_{CC} vs Frequency

10 Power Supply Recommendations

The [Recommended Operating Conditions: SN54LVCH245A](#) table shows the power supply can be any voltage between the minimum and maximum supply voltage rating that are listed.

Each V_{CC} pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, 0.1 μ F is recommended; if there are multiple V_{CC} pins, then 0.01 μ F or 0.022 μ F is recommended for each power pin. It is acceptable to parallel multiple bypass capacitors to reject different noise frequencies. A 0.1 μ F and a 1 μ F are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

11 Layout

11.1 Layout Guidelines

When using multiple-bit logic devices, inputs should never float.

In many cases, functions or parts of functions of digital logic devices are unused. For example, when two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. [Figure 14](#) specifies the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally, they will be tied to GND or V_{CC}, the deciding factor is based on whichever makes more sense or is more convenient at the time. It is generally acceptable to float outputs, unless the part is a transceiver. If the transceiver has an output enable pin, then asserting the output enable pin will disable the output section of the part. This will not disable the input section of the I/Os, so they cannot float when disabled.

11.2 Layout Example

[Figure 14](#) shows an example layout for the ZXY package. This package has a 0.5-mm pitch and requires either micro-vias or very small traces to access the center pins. In this example, 4-mil vias with 10-mil pads are used to access the center pins. All pins are connected by 5-mil traces except for the supply pins which use 10-mil traces.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

W (R-GDFP-F20)

CERAMIC DUAL FLATPACK

NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- C. This package can be hermetically sealed with a ceramic lid using glass frit.
- D. Index point is provided on cap for terminal identification only.
- E. Falls within Mil-Std 1835 GDFP2-F20

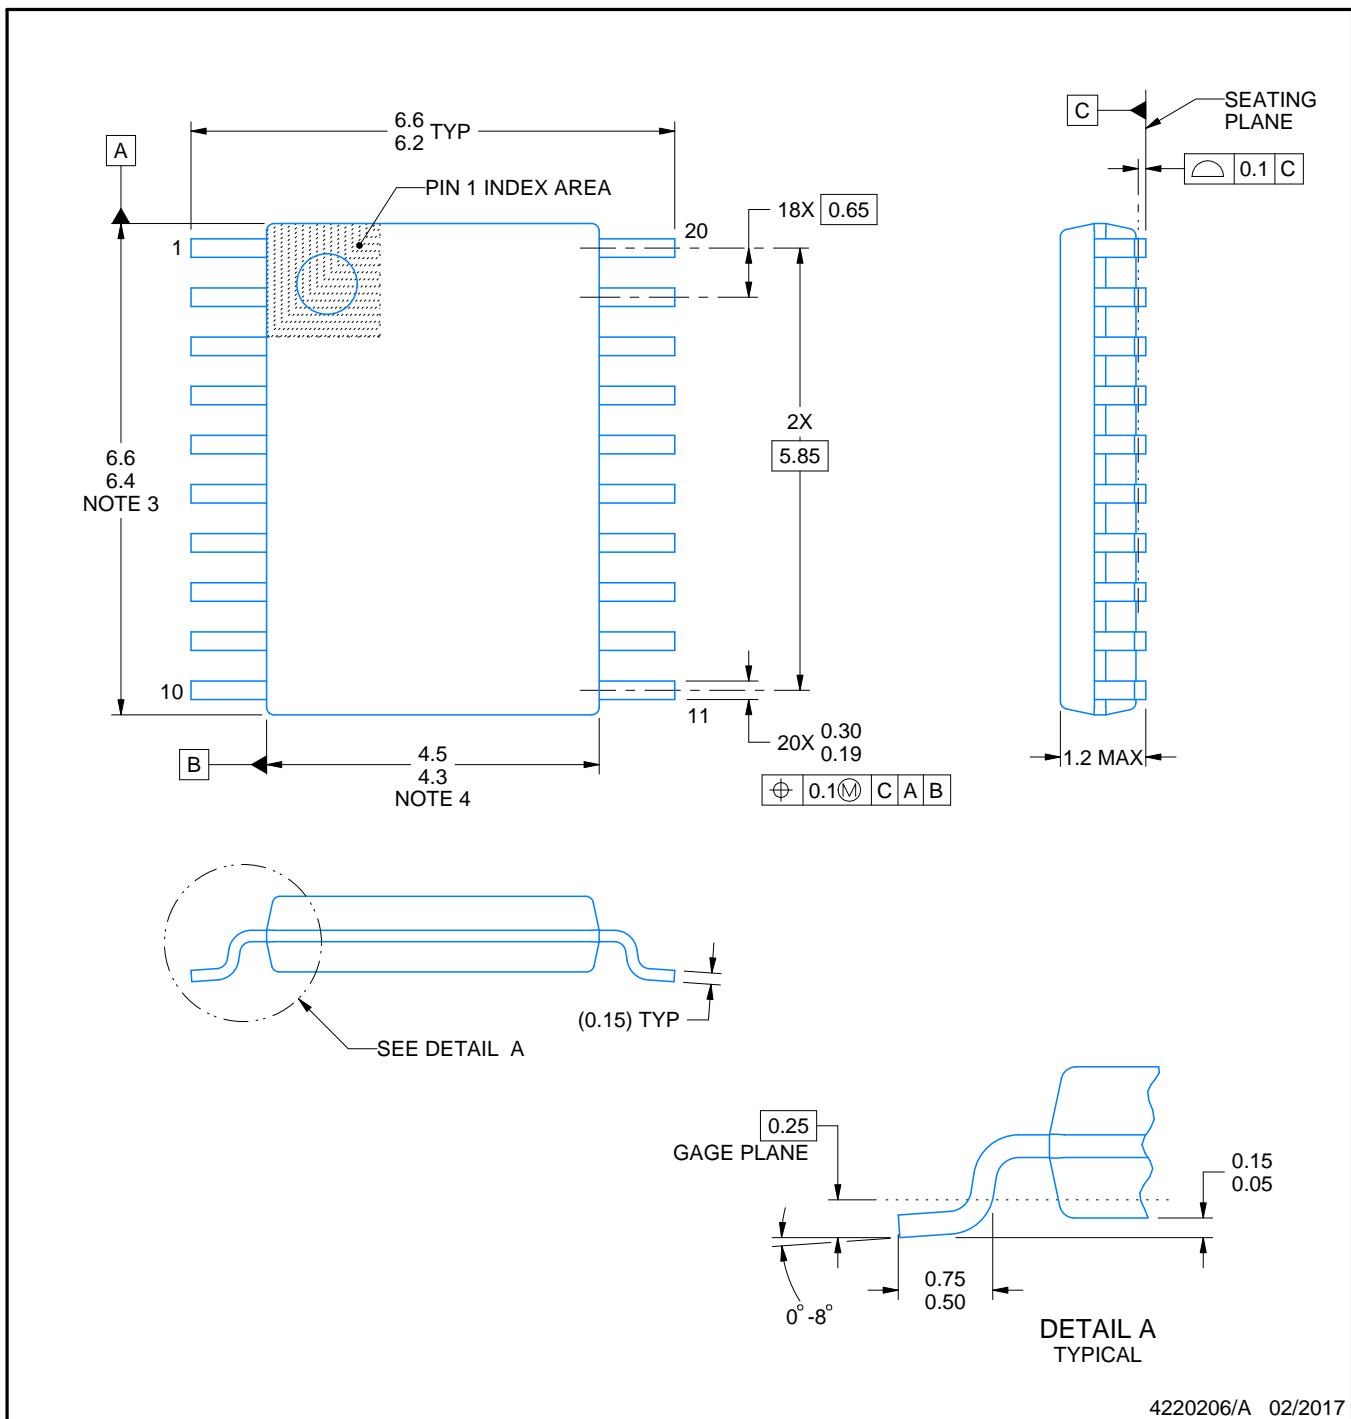

PACKAGE OUTLINE

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.
