

TDA2Ex SoC for Advanced Driver Assistance Systems (ADAS)

23mm Package (ABC Package)

Silicon Revision 2.0 and 2.1

1 Device Overview

1.1 Features

- Architecture designed for ADAS applications
- Video, image, and graphics processing support
 - Full-HD video (1920 × 1080p, 60 fps)
 - Multiple video inputs and video outputs
- Arm[®] Cortex[®]-A15 microprocessor subsystem
- C66x floating-point VLIW DSP cores
 - Fully object-code compatible with C67x and C64x+
 - Up to thirty-two 16 × 16-bit fixed-point multipliers per cycle
- Up to 512KB of on-chip L3 RAM
- Level 3 (L3) and level 4 (L4) interconnects
- DDR3/DDR3L External Memory Interface (EMIF) module
 - Supports up to DDR3-1333 (667 MHz)
 - Up to 2GB across single chip select
- Dual Arm[®] Cortex[®]-M4 Image Processing Units (IPU)
- IVA-HD subsystem
- Display subsystem
 - Display controller with DMA engine and up to three pipelines
 - HDMI[™] encoder: HDMI 1.4a and DVI 1.0 compliant
- Single-core PowerVR[®] SGX544 3D GPU
- 2D-graphics accelerator (BB2D) subsystem
 - Vivante[®] GC320 core
- Video Processing Engine (VPE)
- One Video Input Port (VIP) module
 - Support for up to four multiplexed input ports
- General-Purpose Memory Controller (GPMC)
- Enhanced Direct Memory Access (EDMA) controller
- 2-Port Gigabit Ethernet switch
 - Up to two external ports, one internal
- Sixteen 32-bit general-purpose timers
- 32-bit MPU watchdog timer
- Six high speed Inter-Integrated Circuit (I²C[™]) ports
- Ten configurable UART/IrDA/CIR modules
- Four Multichannel Serial Peripheral Interfaces (McSPI)
- Quad Serial Peripheral Interface (QSPI[™])
- SATA interface
- Eight Multichannel Audio Serial Port (McASP) modules
- SuperSpeed USB 3.0 dual-role device
- High Speed USB 2.0 dual-role device
- High Speed USB 2.0 on-the-go
- Four MultiMedia Card/ Secure Digital[®]/Secure Digital Input Output interfaces (MMC[™]/SD[®]/SDIO)
- PCI-Express[®] (PCIe[®]) revision 3.0 Port with integrated PHY
 - One 2-lane gen2-compliant port
 - or Two 1-lane gen2-compliant ports
- Dual Controller Area Network (DCAN) modules
 - CAN 2.0B protocol
- MIPI[®] Camera Serial Interface 2 (CSI-2)
- Up to 215 General-Purpose I/O (GPIO) pins
- Real-Time Clock subsystem (RTCSS)
- Device Security Features
 - Hardware crypto accelerators and DMA
 - Firewalls
 - JTAG lock
 - Secure keys
 - Secure ROM and boot
 - Customer programmable keys (Silicon Revision 2.1)
- Power, reset, and clock management
- On-chip debug with CTools technology
- 28-nm CMOS technology
- 23 mm × 23 mm, 0.8-mm Pitch, 760-Pin BGA (ABC)

1.2 Applications

- Mono, Stereo or Tri-Optic Front Camera
 - Object detection
 - Pedestrian detection
 - Traffic sign recognition
 - Lane detection and departure warning
 - Automatic emergency braking
 - Adaptive cruise control
 - Forward collision warning
 - High beam assist
- LVDS or ethernet surround view
 - 2D surround view
 - 3D surround view
 - Rear object detection
 - Parking assist
 - Pedestrian detection
 - Lane tracking
 - Drive recording
- Sensor fusion – vision, radar, ultrasonic, lidar sensors
 - Object data fusion
 - Raw data fusion

1.3 Description

TI's new TDA2Ex System-on-Chip (SoC) is a highly optimized and scalable family of devices designed to meet the requirements of leading Advanced Driver Assistance Systems (ADAS). The TDA2Ex family enables broad ADAS applications in today's automobile by integrating an optimal mix of performance, low power, and ADAS vision analytics processing that aims to facilitate a more autonomous and collision-free driving experience.

The TDA2Ex SoC enables sophisticated embedded vision technology in today's automobile by enabling a board range of ADAS applications including park assist, surround view and sensor fusion on a single architecture.

The TDA2Ex SoC incorporates a heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x digital signal processor (DSP) generation core, Arm® Cortex®-A15 MPCore™ and dual- Arm® Cortex®-M4 processors. The integration of a video accelerator for decoding multiple video streams over an Ethernet AVB network, along with graphics accelerator for rendering virtual views, enable a 3D viewing experience. The TDA2Ex SoC also integrates a host of peripherals including multicamera interfaces (both parallel and serial, including CSI-2) to enable Ethernet or LVDS-based surround view systems, displays and GigB Ethernet AVB.

Additionally, TI provides a complete set of development tools for the Arm® and DSP, including C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a debugging interface for visibility into source code execution.

Cryptographic acceleration is available in all devices. All other supported security features, including support for secure boot, debug security and support for trusted execution environment is available on High-Security (HS) devices. For more information about HS devices, contact your TI representative.

The TDA2Ex ADAS processor is qualified according to the AEC-Q100 standard.

2 Revision History

| Changes from June 8, 2018 to February 15, 2019 (from F Revision (June 2018) to G Revision) | Page |
|--|---------------------|
| • Added Device Security Features for Silicon revision 2.1 in Section 1.1, Features | 1 |
| • Added clarification note regarding XDRA726 part number in Table 3-1, Device Comparison | 6 |
| • Added vpp details for Silicon revision 2.1 in Table 4-1, Unused Balls Specific Connection Requirements , Table 4-2, Ball Characteristics and Table 4-31, Power Supply Signal Descriptions | 9 |
| • Updated porz, resetn and rstoutn signal descriptions in Table 4-26, PRCM Signal Descriptions | 115 |
| • Added clarification note regarding TSHUT feature in Table 5-4, Recommended Operating Conditions | 127 |
| • Updated OPP_HIGH power supply value in note (6) under Table 5-7, Voltage Domains Operating Performance Points | 128 |
| • Added missing RTC details in Table 5-8, Supported OPP vs Max Frequency and added Section 5.7.6, LVCMOS OSC Buffers DC Electrical Characteristics | 128 |
| • Updated SYS_32K to FUNC_32K_CLK in Table 5-9, Maximum Supported Frequency | 129 |
| • Added Section 5.8, VPP Specifications for One-Time Programmable (OTP) eFuses for Silicon revision 2.1 | 157 |
| • Updated Section 5.10, Power Supply Sequences | 159 |
| • Updated system clock names in Section 6, Clock Specifications | 168 |
| • Added missing RTC details in Section 6, Clock Specifications | 168 |
| • Added Section 8.3.7, Loss of Input Power Event | 337 |
| • Added Section 8.5.5, SATA Board Design and Layout Guidelines | 359 |
| • Added Section 8.6, Clock Routing Guidelines | 365 |
| • Updated note for cosmetic marks on package..... | 390 |
| • Added Silicon revision 2.1 in support in Table 9-1, Nomenclature Description | 391 |
| • Added clarification note regarding XDRA726 part number in Table 9-1, Nomenclature Description | 391 |

| Changes from February 16, 2019 to November 15, 2019 (from G Revision (February 2019) to H Revision) | Page |
|---|---------------------|
| • Updated note regarding XDRA726 part number in Table 3-1, Device Comparison | 7 |
| • Added reminders to disable unused pulls and RX pads in Section 4.2, Ball Characteristics | 10 |
| • Removed uart2_rxd for Muxmode 0 | 12 |
| • Added clarification notes for EMU[1:0] connections in Table 4-22, GPIOs Signal Descriptions and Table 4-24, Debug Signal Descriptions | 107 |
| • Updated clock names in Table 5-9, Maximum Supported Frequency | 129 |
| • Updated EMIF_DLL_FCLK max rate in Table 6-15, DLL Characteristics | 181 |
| • Updated GPMC timing table footnotes..... | 218 |
| • Updated timing specification values for GPMC and MMC | 218 |
| • Updated information about WD_TIMER1 in Section 7.12, Timers | 241 |
| • Updated parameter in Table 7-42, Timing Requirements for QSPI | 254 |
| • Added MII_TXER timing to Section 7.22.1, GMAC MII Timings | 281 |
| • Updated MDIO Timing Diagram and MDIO7 parameter values | 283 |
| • Updated Delay time for MMC2 in Table 7-109, Switching Characteristics for MMC2 - JC64 High Speed DDR Mode | 304 |
| • Added note regarding DDR ECC solutions to Table 8-30, Supported DDR3 Device Combinations | 367 |
| • Added clarifications about validated DDR topology | 376 |
| • Updated note regarding XDRA726 part number in Table 9-1, Nomenclature Description | 392 |

4 Terminal Configuration and Functions

4.1 Terminal Assignment

Figure 4-1 shows the ball locations for the 760 plastic ball grid array (PBGA) package and is used in conjunction with Table 4-2 through Table 4-31 to locate signal names and ball grid numbers.

Figure 4-1. ABC S-PBGA-N760 Package (Bottom View)

NOTE

The following bottom balls are not pinned out: AF7, AF10, AF13, AF16, AF19, AE4, AE25, AB26, W3, W26, T3, T26, N3, N26, K3, K26, G3, D4, D25, C10, C13, C16, C19, C22.

These balls do not exist on the package.

NOTE

The following bottom balls are not connected: AH11, AH12, AG2, AG8, AG11, AG12, AF4, AF6, AF8, AF9, AE3, AE5, AE6, AE8, AE9, AD3, AD8, AD9, Y15, Y16, V18, V19, U18, U19, U22, U23, U24, U25, U26, U27, U28, T22, T23, T27, T28, R20, R22, R23, R24, R25, R26, R27, R28, P19, P22, P23, P24, P25, P26, P27, N20, N22, N23, N27, N28, M20, M21, M22, M23, M24, M25, M26, M27, M28, L20, L21, L22, L23, L24, L25, L26, L27, L28, K20, K21, K22, K23, K27, K28, J20, J21, J22, J23, J24, J25, J26, J27, H20, H21, H22, H23, H24, H25, H26, H27, H28, G22, G23, G24, G25, G26, G27, G28, F24, F25, F26, F27, F28, E24, E26, E27, E28

These balls can be connected as desired, including to VSS. For users designing TDA2x compatible PCB, please refer to TDA2x Data Manual for appropriate requirements.

4.1.1 Unused Balls Connection Requirements

This section describes the connection requirements of the unused and reserved balls.

NOTE

The following balls are reserved: A27, Y5, Y10, B28, AC1, AC2, AA1, AA2, AB1, AB2, AD14.

These balls must be left unconnected.

NOTE

All unused power supply balls must be supplied with the voltages specified in the [Section 5.4, Recommended Operating Conditions](#), unless alternative tie-off options are included in [Section 4.4, Signal Descriptions](#).

Table 4-1. Unused Balls Specific Connection Requirements

| BALLS | CONNECTION REQUIREMENTS |
|--|--|
| AE15 , AC15 , AE14 , D20 , AD17 , AC16 , V27 , AH25 , AE27 , AD27 , Y28 | These balls must be connected to GND through an external pull resistor if unused. |
| E20 , D21 , E23 , C20 , C21 , V28 , F18 , AG25 , AE28 , AD28 , Y27 , F17 , C25 | These balls must be connected to the corresponding power supply through an external pull resistor if unused. |
| K14 (vpp) | This ball must be left unconnected if unused |
| AF14 (rtc_iso) | This ball should be connected to the corresponding power supply through an external pull resistor if unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed) |
| AB17 (rtc_porz) | This ball should be connected to VSS when RTC is unused; or can be connected to F22 (porz) when RTC unused (level translation may be needed) |

NOTE

All other unused signal balls **with** a Pad Configuration register can be left unconnected with their internal pullup or pulldown resistor enabled.

NOTE

All other unused signal balls **without** a Pad Configuration register can be left unconnected.

4.2 Ball Characteristics

[Table 4-2](#) describes the terminal characteristics and the signals multiplexed on each ball. The following list describes the table column headers:

- BALL NUMBER:**This column lists ball numbers on the bottom side associated with each signal on the bottom.
- BALL NAME:** This column lists mechanical name from package device (name is taken from muxmode 0).
- SIGNAL NAME:**This column lists names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).

NOTE

[Table 4-2](#) does not take into account the subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.4, Signal Descriptions](#).

NOTE

In driver off mode, the buffer is configured in high-impedance.

NOTE

In some cases [Table 4-2](#) may present more than one signal name per muxmode for the same ball. First signal in the list is the dominant function as selected via CTRL_CORE_PAD_* register.

All other signals are virtual functions that present alternate multiplexing options. This virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

4. **MUXMODE:** Multiplexing mode number:

- a. MUXMODE 0 is the primary mode; this means that when MUXMODE=0 is set, the function mapped on the pin corresponds to the name of the pin. The primary muxmode is not necessarily the default muxmode.

NOTE

The default mode is the mode at the release of the reset; also see the RESET REL. MUXMODE column.

- b. MUXMODE 1 through 15 are possible muxmodes for alternate functions. On each pin, some muxmodes are effectively used for alternate functions, while some muxmodes are not used. Only MUXMODE values which correspond to defined functions should be used.
- c. An empty box means Not Applicable.

5. **TYPE:** Signal type and direction:

- I = Input
- O = Output
- IO = Input or Output
- D = Open drain
- DS = Differential Signaling
- A = Analog
- PWR = Power
- GND = Ground
- CAP = LDO Capacitor

NOTE

The RX buffer within the pad logic should be disabled on all pins that are not being used as an input. For more information, see the *Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration* section in the device TRM.

6. **BALL RESET STATE:** The state of the terminal at power-on reset:

- drive 0 (OFF): The buffer drives V_{OL} (pulldown or pullup resistor not activated)
- drive 1 (OFF): The buffer drives V_{OH} (pulldown or pullup resistor not activated)
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

NOTE

Designs that contain pullup or pulldown resistors, either on the board or in attached devices that oppose internal pullup or pulldown resistors, that are active while the device is held in reset, must not remain in reset for long periods of time.

7. **BALL RESET REL. STATE:** The state of the terminal at the deactivation of the rstoutn signal (also

mapped to the PRCM SYS_WARM_OUT_RST signal)

- drive 0 (OFF): The buffer drives V_{OL} (pulldown or pullup resistor not activated)
- drive clk (OFF): The buffer drives a toggling clock (pulldown or pullup resistor not activated)
- drive 1 (OFF): The buffer drives V_{OH} (pulldown or pullup resistor not activated)
- OFF: High-impedance
- PD: High-impedance with an active pulldown resistor
- PU: High-impedance with an active pullup resistor
- An empty box means Not Applicable

NOTE

For more information on the CORE_PWRON_RET_RST reset signal and its reset sources, see *Power, Reset, and Clock Management* chapter in the device TRM.

8. **BALL RESET REL. MUXMODE:** This muxmode is automatically configured at the release of the rstoutn signal (also mapped to the PRCM SYS_WARM_OUT_RST signal).
An empty box means Not Applicable.
9. **IO VOLTAGE VALUE:** This column describes the IO voltage value (VDDS supply).
An empty box means Not Applicable.
10. **POWER:** The voltage supply that powers the terminal IO buffers.
An empty box means Not Applicable.
11. **HYS:** Indicates if the input buffer is with hysteresis:
 - Yes: With hysteresis
 - No: Without hysteresis
 - An empty box: Not Applicable

NOTE

For more information, see the hysteresis values in [Section 5.7, Electrical Characteristics](#).

12. **BUFFER TYPE:** Drive strength of the associated output buffer.
An empty box means Not Applicable.

NOTE

For programmable buffer strength:

- The default value is given in [Table 4-2](#).
- A note describes all possible values according to the selected muxmode.

13. **PULLUP / PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
 - PU: Internal pullup
 - PD: Internal pulldown
 - PU/PD: Internal pullup and pulldown
 - PUx/PDy: Programmable internal pullup and pulldown
 - PDy: Programmable internal pulldown
 - An empty box means No pull

NOTE

Internal pullup or pulldown resistors must be disabled when opposed by an external pullup or pulldown resistor on the board or within an attached device.

14. **DSIS:** The deselected input state (DSIS) indicates the state driven on the peripheral input (logic "0" or logic "1") when the peripheral pin function is not selected by any of the PINCNTLx registers.
 - 0: Logic 0 driven on the peripheral's input signal port.

- 1: Logic 1 driven on the peripheral's input signal port.
- blank: Pin state driven on the peripheral's input signal port.

NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

NOTE

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

NOTE

Some of the EMIF1 signals have an additional state change at the release of porz. The state that the signals change to at the release of porz is as follows:

drive 0 (OFF) for: ddr1_csn0, ddr1_ck, ddr1_nck, ddr1_casn, ddr1_rasn, ddr1_wen, ddr1_ba[2:0], ddr1_a[15:0].

OFF for: ddr1_ecc_d[7:0], ddr1_dqm[3:0], ddr1_dqm_ecc, ddr1_dqs[3:0], ddr1_dqsn[3:0], ddr1_dqs_ecc, ddr1_dqsn_ecc, ddr1_d[31:0].

NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the TDA2xx family of devices.

- (1) N/A stands for Not Applicable.
- (2) For more information on recommended operating conditions, see [Table 5-4, Recommended Operating Conditions](#).
- (3) The pullup or pulldown block strength is equal to: minimum = 50 μ A, typical = 100 μ A, maximum = 250 μ A.
- (4) The output impedance settings of this IO cell are programmable; by default, the value is DS[1:0] = 10, this means 40 Ω . For more information on DS[1:0] register configuration, see the device TRM.
- (5) IO drive strength for usb1_dp, usb1_dm, usb2_dp and usb2_dm: minimum 18.3 mA, maximum 89 mA (for a power supply vdda33v_usb1 and vdda33v_usb2 = 3.46 V).
- (6) Minimum PU = 900 Ω , maximum PU = 3.090 k Ω and minimum PD = 14.25 k Ω , maximum PD = 24.8 k Ω . For more information, see chapter 7 of the USB2.0 specification, in particular section Signaling / Device Speed Identification.
- (7) This function will not be supported on some pin-compatible roadmap devices. Pin compatibility can be maintained in the future by not using these GPIO signals.
- (8) In PUx / PDy, x and y = 60 to 200 μ A. The output impedance settings (or drive strengths) of this IO are programmable (34 Ω , 40 Ω , 48 Ω , 60 Ω , 80 Ω) depending on the values of the I[2:0] registers.
- (9) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 0 as described in the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.
- (10) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSES](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

4.3 Multiplexing Characteristics

[Table 4-3](#) describes the device multiplexing (no characteristics are available).

NOTE

This table doesn't take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 4.4, Signal Descriptions](#).

NOTE

For more information, see *Control Module* chapter, *PAD Functional Multiplexing and Configuration* section in the device TRM.

NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration (Hi-Z mode is not an input signal).

NOTE

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This should be avoided.

NOTE

In some cases [Table 4-3](#) may present more than one signal per muxmode for the same ball. First signal in the list is the dominant function as selected via CTRL_CORE_PAD_* register.

All other signals are virtual functions that present alternate multiplexing options. This virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only if signals within a single IOSET are used. The IOSETs are defined in the corresponding tables.

NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the TDA2xx family of devices.

1. N/A stands for Not Applicable.

4.4 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

1. **SIGNAL NAME:** The name of the signal passing through the pin.

NOTE

The subsystem multiplexing signals are not described in [Table 4-2](#) and [Table 4-3](#).

2. **DESCRIPTION:** Description of the signal

3. **TYPE:** Signal direction and type:

- I = Input
- O = Output
- IO = Input or output
- D = Open Drain
- DS = Differential
- A = Analog
- PWR = Power
- GND = Ground

4. **BALL:** Associated ball(s) bottom
-

NOTE

For more information, see *Control Module* chapter, *Control Module Register Manual* section in the device TRM.

4.4.1 Video Input Ports (VIP)

NOTE

For more information, see *Video Input Port* chapter in the device TRM.

CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are valid only for VIN1 and VIN2 if signals within a single IOSET are used. The IOSETs are defined in [Table 7-4](#) and [Table 7-5](#).

4.4.5 External Memory Interface (EMIF SDRAM)

NOTE

For more information, see *Memory Subsystem* chapter, *EMIF Controller* section in the device TRM.

NOTE

Dual rank support is not available on this device, but signal names are retained for consistency with the TDA2xx family of devices.

NOTE

The index number 1 which is part of the EMIF1 signal prefixes (ddr1_*) listed in [Table 4-8, EMIF SDRAM Signal Descriptions](#), column "SIGNAL NAME" not to be confused with DDR1 type of SDRAM memories.

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .
- (2) The gpio6_16.clkout1 signal can be used as an "always-on" alternative to gpmc_clk provided that the external device can support the associated timing. See [Table 7-25 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default](#) and [Table 7-27 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate](#) for timing information.
- (3) The internal pull resistors for balls K7, M7, J5, K6, J4, J6, H4, H5 are permanently disabled when sysboot15 is set to 0 as described in the section Sysboot Configuration of the Device TRM. If internal pull-up/down resistors are desired on these balls then sysboot15 should be set to 1. If gpmc boot mode is used with SYSBOOT15=0 (not recommended) then external pull-downs should be implemented to keep the address bus at logic-1 value during boot since the gpmc ms-address bits are high-z during boot.

4.4.7 Timers

4.4.10 Multichannel Serial Peripheral Interface (McSPI)

CAUTION

The I/O timings provided in [Section 7, Timing Requirements and Switching Characteristics](#) are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in [Table 7-40](#).

NOTE

For more information, see *Multichannel Serial Peripheral Interface* section in the device TRM.

(1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .

4.4.11 Quad Serial Peripheral Interface (QSPI)

(1) By default, this clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. mmc1_clk and mmc2_clk have an optional software programmable setting to use an 'internal loopback clock' instead of the default 'pad loopback clock'. If the 'pad loopback clock' is used, series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .

(1) gpio8_30 is multiplexed with EMU0 and gpio8_31 is multiplexed with EMU1. These pins will be sampled at reset release by the test and emulation logic. Therefore, if they are used as GPIO pins, they must return to the high state whenever the device enters reset. This can be controlled by logic driven from rstoutn. After the device exits reset (indicated by rstoutn rising), these can return to GPIO mode.

Can be used externally for devices with non-critical timing requirements, or for debug, or as a reference clock on GPMC as described in Table 7-25 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Default and Table 7-27 GPMC/NOR Flash Interface Switching Characteristics - Synchronous Mode - Alternate . | O | F21 / P7 |
| clkout2 | Device Clock output 2. Can be used externally for devices with non-critical timing requirements, or for debug. | O | D18 / N1 |
| clkout3 | Device Clock output 3. Can be used externally for devices with non-critical timing requirements, or for debug. | O | C23 |
| rstoutn | Reset out (Active low) output is asserted low whenever any global reset condition exists. After a brief delay, it will be set high upon removal of the internal global reset condition (that is, porz, warm reset). It is only functional after its output buffer's reference voltage (vddshv3) is valid. If it is used as a reset for device peripheral components, then it should be AND gated with porz to avoid the possibility of reset signal glitches during a power up sequence. ⁽²⁾ | O | F23 |
| resetn | Reset (active low) input's falling edge can trigger a device warm reset state from an external component. This signal should be high prior to or simultaneous with, porz rising. If the signal is not used in the system, resetn should be pulled high with an external pull-up resistor to vddshv3. | I | E23 |
| porz | Power on Reset (active low) input must be asserted low during a device power up sequence or cold reset state when all supplies are disabled. Typically, an external PMIC is the source and sets porz high after all supplies reach valid operating levels. Asserting porz low puts the entire device in a safe reset state. | I | F22 |
| xref_clk0 | External Reference Clock 0. For Audio and other Peripherals. | I | D18 |
| xref_clk1 | External Reference Clock 1. For Audio and other Peripherals. | I | E17 |
| xref_clk2 | External Reference Clock 2. For Audio and other Peripherals. | I | B26 |
| xref_clk3 | External Reference Clock 3. For Audio and other Peripherals. | I | C23 |
| xi_osc0 | System Oscillator OSC0 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC0 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used. | I | AE15 |

Table 4-26. PRCM Signal Descriptions (continued)

| SIGNAL NAME | DESCRIPTION | TYPE | BALL |
|--------------------------------|--|------|------|
| xo_osc0 | System Oscillator OSC0 Crystal output | O | AD15 |
| xi_osc1 | Auxiliary Oscillator OSC1 Crystal input / LVCMOS clock input. Functions as the input connection to a crystal when the internal oscillator OSC1 is used. Functions as an LVCMOS-compatible input clock when an external oscillator is used. | I | AC15 |
| xo_osc1 | Auxiliary Oscillator OSC1 Crystal output | A | AC13 |
| RMII_MHZ_50_CLK ⁽¹⁾ | RMII Reference Clock (50MHz). This pin is an input when external reference is used or output when internal reference is used. | IO | U3 |

- (1) This clock signal is implemented as 'pad loopback' inside the device - the output signal is looped back through the input buffer to serve as the internal reference signal. Series termination is recommended (as close to device pin as possible) to improve signal integrity of the clock input. Any nonmonotonicity in voltage that occurs at the pad loopback clock pin between V_{IH} and V_{IL} must be less than V_{HYS} .
- (2) Note that rstoutn is only valid after vddshv3 is valid. If the rstoutn signal will be used as a reset into other devices attached to the SOC, it must be AND'ed with porz. This will prevent glitches occurring during supply ramping being propagated.

4.4.22.3 Real-Time Clock (RTC) Interface

NOTE

For more information, see *Real-Time Clock (RTC)* chapter in the device TRM.

Table 4-27. RTC Signal Descriptions

| SIGNAL NAME | DESCRIPTION | TYPE | BALL |
|------------------------------------|---|------|------|
| Wakeup0 | RTC External Wakeup Input 0 | I | AD17 |
| Wakeup1 | RTC External Wakeup Input 1 | I | AC17 |
| Wakeup2 | RTC External Wakeup Input 2 | I | AB16 |
| Wakeup3 | RTC External Wakeup Input 3 | I | AC16 |
| rtc_porz | RTC Power Domain Power-On Reset Input | I | AB17 |
| rtc_osc_xi_clk _{in3} 2 | RTC Oscillator Input. Crystal connection to internal RTC oscillator. Functions as an RTC clock input when an external oscillator is used. | I | AE14 |
| rtc_osc_xo | RTC Oscillator Output | O | AD14 |
| rtc_iso ⁽¹⁾ | RTC Domain Isolation Signal | I | AF14 |
| on_off | RTC Power Enable output pin | O | Y11 |

- (1) This signal must be kept 0 if device power supplies are not valid during RTC mode and 1 during normal operation. This can typically be achieved by connecting rtc_iso to the same signal driving porz (not rtc_porz) with appropriate voltage level translation if necessary.

(1) This pin must always be connected via a 1- μ F capacitor to vss.

(2) This signal is valid only for High-Security devices. For more details, see [Section 5.8 VPP Specification for One-Time Programmable \(OTP\) eFUSEs](#). For General Purpose devices do not connect any signal, test point, or board trace to this signal.

5 Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* section in the device TRM.

NOTE

The index numbers 1 which is part of the EMIF1 signal prefixes (ddr1_*) listed in [Table 4-8, EMIF SDRAM Signal Descriptions](#), column "SIGNAL NAME" not to be confused with DDR1 type of SDRAM memories.

NOTE

Audio Back End (ABE) module is not supported for this family of devices, but "ABE" name is still present in some clock or DPLL names.

CAUTION

All IO Cells are NOT Fail-safe compliant and should not be externally driven in absence of their IO supply.

5.1 Absolute Maximum Ratings

Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under [Section 5.4, Recommended Operating Conditions](#), is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

(1) See I/Os supplied by this power pin in [Table 4-2 Ball Characteristics](#)

(2) VDD is the voltage on the corresponding power-supply pin(s) for the IO.

(3) Per JEDEC JESD78 at 125°C with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.

(4) Per JEDEC JESD78 at 125°C.

(5) The maximum valid input voltage on an IO pin cannot exceed 0.3 volts when the supply powering the IO is turned off. This requirement applies to all the IO pins which are not fail-safe and for all values of IO supply voltage. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.

5.3 Power-On-Hour (POH) Limits

The information in the section below is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

NOTE

POH is a functional of voltage, temperature and time. Usage at higher voltages and temperatures will result in a reduction in POH to achieve the same reliability performance. For assessment of alternate use cases, contact your local TI representative.

Table 5-3. Power-On-Hour (POH) Limits

| IP | DUTY CYCLE | VOLTAGE DOMAIN | VOLTAGE (V) (MAX) | FREQUENCY (MHz) (MAX) | T _j (°C) | POH |
|-----|------------|----------------|--------------------|-----------------------|-----------------------------------|-------|
| All | 100% | All | All Supported OPPs | | Automotive Profile ⁽¹⁾ | 20000 |

(1) Automotive profile is defined as 20000 power on hours with junction temperature as follows: 5%@-40°C, 65%@70°C, 20%@110°C, 10%@125°C.

5.4 Recommended Operating Conditions

The device is used under the recommended operating conditions described in [Table 5-4](#).

NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

- (1) Refer to Power-On-Hour (POH) table [Table 5-3](#) for limitations.
- (2) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.
- (3) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.
- (4) The TSHUT feature of the SoC resets the device by default when one of the on-die temp sensors reports 123 °C. This is intended to protect the device from exceeding 125 °C. Though not recommended, the TSHUT temperature threshold can be modified in software if other mechanisms are in place to avoid exceeding 125 °C. Refer to the device TRM for details on the TSHUT feature.

5.5 Operating Performance Points

This section describes the operating conditions of the device. This section also contains the description of each Operating Performance Point (OPP) for processor clocks and device core clocks.

[Table 5-5](#) describes the maximum supported frequency per speed grade for TDA2Ex devices.

(1) The voltage ranges in this table are preliminary, and final voltage ranges may be different than shown. Systems should be designed with the ability to modify the voltage to comply with future recommendations.

(2) In a typical implementation, the power supply should target the NOM voltage.

(3) The voltage at the device ball should never be below the MIN voltage or above the MAX voltage for any amount of time. This requirement includes dynamic voltage events such as AC ripple, voltage transients, voltage dips, etc.

(4) The DC voltage at the device ball should never be above the MAX DC voltage to avoid impact on device reliability and lifetime POH (Power-On-Hours). The MAX DC voltage is defined as the highest allowed DC regulated voltage, without transients, seen at the ball.

(5) For all OPPs, AVS must be enabled to avoid impact on device reliability, lifetime POH (Power-On-Hours), and device power.

(6) The AVS voltages are device-dependent, voltage domain-dependent, and OPP-dependent. They must be read from the STD_FUSE_OPP Registers. For information about STD_FUSE_OPP Registers address, please refer to the *Control Module* chapter of the device TRM. The power supply should be adjustable over the following ranges for each required OPP:

- OPP_NOM for MPU: 0.85 V – 1.15 V
- OPP_NOM for CORE and Others: 0.85 V - 1.15 V
- OPP_OD: 0.94 V - 1.15 V
- OPP_HIGH: 1.01 V - 1.25 V

The AVS voltages will be within the above specified ranges.

(7) VD_RTC can optionally be tied to VD_CORE and operate at the VD_CORE AVS voltages.

(8) The power supply must be programmed with the AVS voltages for the MPU and the CORE voltage domain, either just after the ROM boot or at the earliest possible time in the secondary boot loader before there is significant activity seen on these domains.

Table 5-8 describes the standard processor clocks speed characteristics vs OPP of the device.

(2) Maximum supported frequency is limited to the device speed grade (see [Table 5-5](#), Speed Grade Maximum Frequency).

5.5.3 Maximum Supported Frequency

Device modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM. [Table 5-9](#) lists the clock source options for each module on this device, along with the maximum frequency that module can accept. To ensure proper module functionality, the device PLLs and dividers must be programmed not to exceed the maximum frequencies listed in this table.

5.6 Power Consumption Summary

NOTE

Maximum power consumption for this SoC depends on the specific use conditions for the end system. Contact your TI representative for assistance in estimating maximum power consumption for the end system use case.

5.7 Electrical Characteristics

NOTE

The data specified in [Section 5.7.1](#) through [Section 5.7.13](#) are subject to change.

NOTE

The interfaces or signals described in [Section 5.7.1](#) through [Section 5.7.13](#) correspond to the interfaces or signals available in multiplexing mode 0 (Function 1).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY/GPIO combination in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

5.7.1 LVC MOS DDR DC Electrical Characteristics

[Table 5-10](#) summarizes the DC electrical characteristics for LVC MOS DDR Buffers.

NOTE

For more information on the I/O cell configurations (i[2:0], sr[1:0]), see *Control Module* chapter in the device TRM.

- (1) V_{ITH} is the voltage at which the receiver is required to detect a high state in the input signal.
- (2) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. V_{ITL} is larger than the maximum single-ended line high voltage during HS transmission. Therefore, both low-power (LP) receivers will detect low during HS signaling.
- (3) To reduce noise sensitivity on the received signal, the LP receiver is required to incorporate a hysteresis, V_{HYST}. V_{HYST} is the difference between the V_{ITH} threshold and the V_{ITL} threshold.
- (4) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. Specification is relaxed for detecting 0 during ultralow power (ULP) state. The LP receiver is not required to detect HS single-ended voltage as 0 in this state.
- (5) Excluding possible additional RF interference of 200 mV_{PP} beyond 450 MHz.
- (6) This value includes a ground difference of 50 mV between the transmitter and the receiver, the static common-mode level tolerance and variations below 450 MHz.
- (7) This number corresponds to the VOD_{MAX} transmitter.
- (8) Common mode is defined as the average voltage level of X and Y: V_{CMRX} = (V_X + V_Y) / 2.
- (9) Common mode ripple may be due to t_R or t_F and transmission line impairments in the PCB.
- (10) For more information regarding the pin name (or ball name) and corresponding signal name, see [Table 4-7](#), *CSI 2 Signal Descriptions*.

5.7.12 SATAPHY DC Electrical Characteristics

NOTE

The SATA module is compliant with the electrical parameters specified in the *SATA-IO SATA Specification*, Revision 3.2, August 7, 2013.

5.7.13 PCIEPHY DC Electrical Characteristics

NOTE

The PCIe interfaces are compliant with the electrical parameters specified in PCI-Express® Base Specification Revision 3.0.

5.8 VPP Specifications for One-Time Programmable (OTP) eFuses

NOTE

This functionality is available only for Silicon Revision 2.1.

This section specifies the operating conditions required for programming the OTP eFuses and is applicable only for High-Security Devices.

Table 5-19. Recommended Operating Conditions for OTP eFuse Programming

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | DESCRIPTION | MIN | NOM | MAX | UNIT |
|------------------------|--|------|------|-----|------|
| vdd | Supply voltage range for the core domain during OTP operation | 1.11 | 1.15 | 1.2 | V |
| vpp | Supply voltage range for the eFuse ROM domain during normal operation | NC | | | V |
| | Supply voltage range for the eFuse ROM domain during OTP programming ⁽¹⁾⁽²⁾ | 1.8 | | | V |
| I(vpp) | | | | 100 | mA |
| Temperature (junction) | | 0 | 25 | 85 | °C |

(1) Supply voltage range includes DC errors and peak-to-peak noise. TI power management solutions [TLV70718](#) from the TLV707x family meet the supply voltage range needed for vpp.

(2) During normal operation, no voltage should be applied to vpp. This can be typically achieved by disabling the regulator attached to the vpp terminal. For more details, see [TLV707](#), [TLV707P 200-mA, Low-I_Q, Low-Noise, Low-Dropout Regulator for Portable Devices](#).

5.8.1 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The vpp power supply must be disabled when not programming OTP registers.
- The vpp power supply must be ramped up after the proper device power-up sequence (for more details, see [Section 5.10](#)).

5.8.2 Programming Sequence

Programming sequence for OTP eFuses:

1. Power on the board per the power-up sequencing. No voltage should be applied on the vpp terminal during power up and normal operation.
2. Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
3. Apply the voltage on the vpp terminal according to the specification in [Table 5-19](#).
4. Run the software that programs the OTP registers.
5. After validating the content of the OTP registers, remove the voltage from the vpp terminal.

5.8.3 Impact to Your Hardware Warranty

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse. CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

5.9 Thermal Characteristics

For reliability and operability concerns, the maximum junction temperature of the Device has to be at or below the T_J value identified in [Table 5-4, Recommended Operating Conditions](#).

A BCI compact thermal model for this Device is available and recommended for use when modeling thermal performance in a system.

Therefore, it is recommended to perform thermal simulations at the system level with the worst case device power consumption.

5.9.1 Package Thermal Characteristics

[Table 5-20](#) provides the thermal resistance characteristics for the package used on this device.

NOTE

Power dissipation of 1.9 W and an ambient temperature of 85°C is assumed for ABC package.

Table 5-20. Thermal Resistance Characteristics

5.10 Power Supply Sequences

This section describes the power-up and power-down sequence required to ensure proper device operation. The power supply names described in this section comprise a superset of a family of compatible devices. Some members of this family will not include a subset of these power supplies and their associated device modules. Refer to the [Section 4.2, Ball Characteristics](#) of the [Section 4, Terminal Configuration and Functions](#) to determine which power supplies are applicable.

[Figure 5-2](#) and [Figure 5-3](#) describe the device Power Sequencing.

Figure 5-2. Recommended Power-Up Sequencing

SPRS906_ELCH_01

(1) Time stamps:

- T0 = 0 ms; T1 = 0.55 ms; T2 = 1.1 ms; T3 = 1.65 ms; T4 = 2.2 ms; T5 = 2.75 ms; T6 = 3.3 ms; T7 = 5.85 ms; T8 = 6.4 ms; T9 = 8.4

ms. All “Tn” markers show total elapsed time from T0.

(2) Terminology:

- $V_{OPR\ MIN}$ = Minimum Operational Voltage level that ensures device functionality and specified performance per [Section 5.4, Recommended Operating Conditions](#).
- Ramp Up = transition time from V_{OFF} to $V_{OPR\ MIN}$.

(3) General timing diagram items:

- Grey shaded areas show valid transition times for supplies between $V_{OPR\ MIN}$ and V_{OFF} .
- Dashed horizontal lines are not valid ramp times but show alternate transition times based upon common sources and clarified in associated note.
- Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power sequencer circuit performance.

(4) vddshv5, vdd_rtc, and vdda_rtc domains:

- If RTC mode is used, then vdda_rtc, vdd_rtc and vddshv5 must be individually powered with separate power supplies and cannot be combined with other rails.
 - If RTC-mode is not supported then the following combinations are approved:
 - vdda_rtc can be combined with vdds18v
 - vdd_rtc can be combined with vdd
 - vddshv5 can be combined with other 1.8 V or 3.3 V vddshvn rails
- If combinations listed above are not followed then sequencing for these 3 voltage rails should follow the RTC mode timing requirements.

(5) vdda_* rails should not be combined with vdds18v_* for best performance to avoid transient switching noise impacts on analog domains. vdda_* should not ramp-up before vdds18v_* but could ramp concurrently if design ensures final operational voltage will not be reached until after vdds18v. The preferred sequence is to follow all vdds18v_* to ensure circuit components and PCB design do not cause an inadvertent violation.

(6) vdds_dds_* should not ramp-up before vdds18v_*. The preferred sequence has vdds_dds1 following vdds18v_* to ensure circuit components and PCB design do not cause an inadvertent violation. vdds_dds1 can ramp-up before, concurrently or after vdda_*, there are no dependencies between vdds_dds1 and vdda_* domains.

(7) vdd should not ramp-up before vdds18v_* or vdds_dds_* domains have reached $V_{OPR\ MIN}$.

(8) vdd_mpu, vdd_iva, vdd_gpu, vdd_dsp domains should follow vdd core supply as preferred sequence. If vdd_mpu, vdd_iva, vdd_gpu, vdd_dsp domains ramp concurrently or quicker than vdd core, then vdd core must remain at least 150 mV greater than vdd_mpu, vdd_iva, vdd_gpu, vdd_dsp domains during ramp. Circuit design (components and PCB) must ensure vdd reaches final operational voltage before any of the vdd_mpu, vdd_iva, vdd_gpu, vdd_dsp domains.

(9) VDDA_PHY group should not be combined with VDDA_PLL group to avoid transient switching noise impacts.

(10) vddshv[1-7, 9-11] domains:

- If 1.8 V I/O signaling is needed, then 1.8 V must be sourced from common vdds18v supply and ramp up concurrently with vdds18v.
- If 3.3 V I/O signaling is needed, then 3.3 V vddshvx rails must ramp up after vdd_mpu, vdd_iva, vdd_gpu, vdd_dsp, and VDDA_PHY group domains.

(11) vdda33v_usb[1-2] domain:

- If USB1 and USB2 interfaces are used, should be supplied from independent analog supply.
- If USB1/USB2 interface is not used, could be connected to VSS/GND if both conditions are met:
 - USB1/USB2 diff pair (usb1_dm/usb1_dp; usb2_dm/usb2_dp) pins are left unconnected
 - vdda_usb1 and/or vdda_usb2 PHY is not energized

(12) vddshv8 shows two ramp up options for 1.8 V I/O or 3.3 V I/O or SD Card operation:

- If 1.8 V I/O signaling is needed, then vddshv8 must ramp up after vdd and before or concurrently with 3.3 V vddshv* rails.
- If 3.3 V I/O signaling is needed, then vddshv8 must be combined with other 3.3 V vddshv* rails.
- If SD Card operation is needed, then vddshv8 must be sourced from a dual voltage (3.3 V / 1.8 V) power source per SDIO specifications and ramp up concurrently with 3.3 V vddshv* rails.

(13) Pulse duration: rtc_porz must remain low 1 ms after vdda_rtc, vddshv5, and vdd_rtc are ramped and stable or can be de-asserted before but no later than porz. The FUNK_32K_CLK source must be stable and at a valid frequency 1 ms prior to de-asserting rtc_porz high.

(14) porz must remain asserted low until both of the following conditions are met:

- Minimum of 12P, where $P = 1 / (\text{SYS_CLK1} / 610)$, units in ns.
- All device supply rails reach stable operational levels.

(15) Setup time: sysboot[15:0] pins must be valid 2P⁽¹⁴⁾ before porz is de-asserted high.

(16) Hold time: sysboot[15:0] pins must be valid 15P⁽¹⁴⁾ after porz is de-asserted high.

(17) rstoutn will be set high after global reset, due to porz, is de-asserted following an internal 2 ms delay. rstoutn is only valid after vddshv3 reaches an operational level. If used as a peripheral component reset, it should be AND gated with porz to avoid possible reset glitches during power up.

Figure 5-3. Recommended Power-Down Sequencing

- (1) Time stamps:
 - T0 = 0 ms, T1 > 100 μs, T2 = 0.5 ms, T3 = 1.0 ms, T4 = 1.5 ms; V1 = 2.7 V. All “Tn” markers are intended to show elapsed times from T0. Delta time: $\Delta T_{D1} > 100 \mu s$.
- (2) Terminology:
 - V_{OPR MIN} = Minimum Operational Voltage level that ensures device functionality and specified performance per [Section 5.4, Recommended Operating Conditions](#).
 - V_{OFF} = OFF Voltage level is defined to be less than 0.6 V where any current draw has no impact to POH.
 - Ramp Down = transition time from V_{OPR MIN} to V_{OFF} and is slew rate independent.
- (3) General timing diagram items:

- Grey shaded areas show valid transition times for supplies between V_{OPR_MIN} and V_{OFF} .
 - Dashed horizontal lines are not valid ramp times but show alternate transition times based upon common sources and clarified in associated note.
 - Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power-down sequencer circuit performance.
- (4) porz signals must be asserted low for 100 μ s min to ensure SoC is set to a safe functional state before any voltage begins to ramp down.
- (5) vddshv* domains supplied by 3.3 V:
- must remain greater than 2.7 V to enable Dual Voltage GPIO selector circuit operation for 100 μ s min after porz is asserted low.
 - must be in first group of supplies ramping down after porz has been asserted low for 100 μ s min.
 - must not exceed vdds18v by more than 2 V during ramp down, see [Figure 5-7](#) “vdds18v and vdda_* Discharge Relationship”.
- (6) vddshv* domains supplied by 1.8 V:
- must ramp down concurrently with vdds18v and be sourced from the same vdds18v supply.
- (7) vddshv8 domain:
- must be in first group of supplies to ramp down after porz has been asserted low for 100 μ s min.
 - if SDIO operation is needed, must be sourced from independent power resource that can provide dual voltage (3.3 V / 1.8 V) operation as required to be compliant to SDIO specification
 - if SDIO operation is not needed, must be grouped and ramped down with other vddshv* domains as noted above.
- (8) RTC domains (vddshv5, vdd_rtc, and vdda_rtc):
- If RTC mode is used:
 - rtc_porz can be asserted low before porz and RTC domains can be ramped down after 100 μ s elapsed time.
 - must be sourced from independent supplies and must not be combined with other rails.
 - timing diagram shows this mode of operation.
 - If RTC mode is not used, then:
 - rtc_porz must be connected to porz signal.
 - vddshv5 must be grouped and ramped down with other vddshv* domains as noted above.
 - vdd_rtc must be grouped and ramped down with vdd.
 - vdda_rtc must be grouped and ramped down with either VDDA_PHY group or vdds18v.
- (9) vdda_* domains:
- should not be combined with vdds18v for best performance to avoid transient switching noise impacts on analog domains.
 - can ramp down before or concurrently with vdds18v.
 - must satisfy the vdds18v and vdda_* Discharge Relationship (see [Figure 5-7](#)) if vdda_* disable point is later or discharge rate is slower than vdds18v.
 - can ramp down before, concurrently or after vdds_dds*, there is no dependency between these supplies.
- (10) vdda33v_usb* domains:
- can start ramping down 100 μ s after low assertion of porz
 - can ramp down concurrently or before VDDA_PHY group
- (11) vdd_dsp, vdd_gpu, vdd_iva, vdd_mpu domains can ramp down before or concurrently with vdd.
- (12) vdd can ramp down concurrently or after with vdd_dsp, vdd_gpu, vdd_iva, vdd_mpu domains.
- (13) vdds_dds* domains:
- should ramp down after vdd begins ramping down.
- (14) vdds18v domain:
- should maintain V_{OPR_MIN} ($V_{NOM} - 5\% = 1.71$ V) until all other supplies start to ramp down.
 - must satisfy the vdds18v versus vddshv[1-7, 9-11] Discharge Relationship (see [Figure 5-5](#)) if vddshv* is operating at 3.3 V
 - must satisfy the vdds18v and vdds_dds* Discharge Relationship (see [Figure 5-6](#)) if vdds_dds* discharge rate is slower than vdds18v.

Figure 5-4 describes the RTC-mode Power Sequencing.

SPRS906_ELCH_03

Figure 5-4. RTC Mode Sequencing

(1) Grey shaded areas are windows where it is valid to ramp the voltage rail.

- (2) Blue dashed lines are not valid windows but show alternate ramp possibilities based on the associated note.
- (3) vdd must ramp down after or at the same time as vdd_mpu, vdd_gpu, vdd_dsp and vdd_iva.
- (4) vdd_mpu, vdd_gpu, vdd_dsp, vdd_iva can be ramped at the same time or can be staggered.
- (5) vdd must ramp up before or at the same time as vdd_mpu, vdd_gpu, vdd_dsp and vdd_iva.
- (6) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v.
- (7) vddshv8 is separated out to show support for dual voltage. If single voltage is used then vddshv8 can be combined with other vddshvn rails but vddshv8 must ramp down before vdd and must ramp up after vdd.
- (8) If any of the vddshv[1-7,9-11] rails (not including vddshv8) are used as 1.8V only, then these rails can be combined with vdds18v. vddshv[1-7,9-11] is allowed to ramp down at either of the two points shown in the timing diagram in either 1.8V mode or in 3.3V mode. If vddshv[1-7,9-11] ramps down at the later time in the diagram then the board design must ensure that the vddshvn rail is never higher than 2.0 V above the vdds18v rail.
- (9) vddshv8 is separated out to show support for dual voltage. If a dedicated LDO/supply source is used for vddshv8, then vddshv8 ramp down should occur at one of the two earliest points in the timing diagram. If vddshv8 is powered by the same supply source as the other vddshvn rails, then it is allowed to ramp down at either of the last two points in the timing diagram.

Figure 5-5 describes vddshv[1-7,9-11] Supplies Falling Before vdds18v Supplies Delta.

Figure 5-5. vdds18v versus vddshv[1-7, 9-11] Discharge Relationship

- (1) Vdelta MAX = 2 V
- (2) If vddshv8 is powered by the same supply source as the other vddshv[1-7,9-11] rails.

If vdds18v and vdds_dds* are disabled at the same time due to a loss of input power event or if vdds_dds* discharges more slowly than vdds18v, analysis has shown no reliability impacts when the elapsed time period beginning with vdds18v dropping below 1.0 V and ending with vdds_dds* dropping below 0.6 V is less than 10 ms (Figure 5-6).

Figure 5-6. vdds18v and vdds_dds* Discharge Relationship⁽¹⁾

- (1) V1 > 1.0 V; V2 < 0.6V; T1 < 10 ms.

Figure 5-7. vdds18v and vdda_* Discharge Relationship⁽³⁾

- (1) vdda_* can be \geq vdds18v, until vdds18v drops below 1.62 V.
- (2) vdds18v must be \geq vdda_*, until vdds18v reaches 0.6 V.
- (3) V1 = 1.62 V; V2 < 0.6 V.

Figure 5-5 through Figure 5-8 and associated notes described the device abrupt power down sequence.

A "loss of input power event" occurs when the system's input power is unexpectedly removed. Normally, the recommended power-down sequence should be followed and can be accomplished within 1.5-2 ms of elapsed time. This is the typical range of elapsed time available following a loss of power event, see Section 8.3.7 for design recommendations. If sufficient elapse time is not provided, then an "abrupt" power down sequence can be supported without impacting POH reliability if all of the following conditions are met (Figure 5-8).

Figure 5-8. Abrupt Power-Down Sequencing⁽¹⁾

- (1) Time stamps:
 - V1 = 2.7 V; V2 = 3.3 V; V3 = 2.0 V; V4 = V5 = V6 = 0.6 V; V7 = V8 = 1.62 V; V9 = 1.3 V; V10 = 1.0 V; V11 = 0.0 V; T_{delta1} > 100 μ s; T_{delta2} < 10 ms.

- (2) Terminology:
- $V_{OPR\ MIN}$ = Minimum Operational Voltage level that ensures device functionality and specified performance in [Section 5.4, Recommended Operating Conditions table](#).
 - V_{OFF} = OFF Voltage level is defined to be less than 0.6 V, where any current draw has no impact to POH.
 - Ramp Down = transition time from $V_{OPR\ MIN}$ to V_{OFF} and is slew rate independent.
- (3) General timing diagram items:
- Grey shaded areas show valid transition times for supplies between $V_{OPR\ MIN}$ and V_{OFF} .
 - Dashed vertical lines show approximate elapse times based upon TI recommended PMIC power-down sequencer circuit performance.
- (4) `porz` and `rtc_porz` must be asserted low for 100 μ s min to ensure SoC is set to a safe functional state before any voltage begins to ramp down.
- Only if using RTC-mode with an independent RTC input power source, then `rtc_porz` can remain high and RTC-domains (`vdd_rtc`, `vdda_rtc`, and `vddshv5`) can remain energized while all other domains sourced from the system input power are powered down.
- (5) `vddshv[1-7, 9-11]` domains supplied by 3.3 V:
- must remain greater than 2.7 V to enable Dual Voltage GPIO selector circuit operation for 100 μ s min, after `porz` is asserted low.
 - must not exceed `vdds18v` voltage level by more than 2 V during ramp down, until `vdds18v` drops below V_{OFF} (0.6 V).
- (6) `vddshv[1-7, 9-11]` domains supplied by 1.8 V must ramp down concurrently with `vdds18v` and be sourced from common `vdds18v` supply.
- (7) `vddshv8` supporting SD Card:
- must be in first group of supplies to ramp down after `porz` has been asserted low for 100 μ s min.
 - must be sourced from independent power resource that can provide dual voltage (3.3 V / 1.8 V) operation as required to be compliant to SDIO specification.
 - if SDIO operation is not needed, must be grouped with other `vddshv[1-7, 9-11]` domains.
- (8) `vdda33v_usb[1-2]` domains must be in first group of supplies to ramp down after `porz` has been asserted low for 100 μ s min.
- (9) `vdd_dsp`, `vdd_gpu`, `vdd_iva`, `vdd_mpu`, `vdd`, `vdd_rtc`, `vdds_dds1`, `vdda_*` domains can all start to ramp down in any order after 100 μ s low assertion of `porz`.
- (10) `vdds_dds1` domains:
- can remain at $V_{OPR\ MIN}$ or a level greater than `vdds18v` during ramp down.
 - elapsed time from `vdds18v` dropping below 1.0 V to `vdds_dds1[1-3]` dropping below 0.6 V must not exceed 10 ms.
- (11) `vdda_*` domains:
- can start to ramp down before or concurrently with `vdds18v`.
 - must not exceed `vdds18v` voltage level after `vdds18v` drops below 1.62 V until `vdds18v` drops below V_{OFF} (0.6 V).
- (12) `vdds18v` domain should maintain a minimum level of 1.62 V ($V_{NOM} - 10\%$) until `vdd_dsp` and `vdd` start to ramp down.

6 Clock Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* chapter in the device TRM.

NOTE

Audio Back End (ABE) module is not supported for this family of devices, but “ABE” name is still present in some clock or DPLL names.

The device operation requires the following clocks:

- The 32 kHz frequency is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode. This is an optional clock and will be supplied by on chip divider + mux (FUNC_32K_CLK) incase it is not available on external pin.
- The system clocks, SYS_CLK1 (Mandatory) and SYS_CLK2 (Optional) are the main clock sources of the device. They supply the reference clock to the DPLLs as well as functional clock to several modules.

The Device also embeds an internal free-running 32-kHz oscillator that is always active as long as the the wake-up (WKUP) domain is supplied.

[Figure 6-1](#) shows the external input clock sources and the output clocks to peripherals.

Figure 6-1. Clock Interface

6.1 Input Clock Specifications

6.1.1 Input Clock Requirements

- The source of the internal system clock (SYS_CLK1) could be either:
 - A CMOS clock that enters on the xi_osc0 ball (with xo_osc0 left unconnected on the CMOS clock case).
 - A crystal oscillator clock managed by xi_osc0 and xo_osc0.
- The source of the internal system clock (SYS_CLK2) could be either:
 - A CMOS clock that enters on the xi_osc1 ball (with xo_osc1 left unconnected on the CMOS clock case).
 - A crystal oscillator clock managed by xi_osc1 and xo_osc1.
- The source of the internal system clock (FUNC_32K_CLK) could be either:
 - A CMOS clock that enters on the rtc_osc_xi_clkin32 ball and supports external LVCMOS clock generators
 - A crystal oscillator clock managed by rtc_osc_xi_clkin32 and rtc_osc_xo.

6.1.2 System Oscillator OSC0 Input Clock

SYS_CLK1 is received directly from oscillator OSC0. For more information about SYS_CLK1, see *Power, Reset, and Clock Management* chapter in the device TRM.

6.1.2.1 OSC0 External Crystal

An external crystal is connected to the device pins. [Figure 6-2](#) describes the crystal implementation.

Figure 6-2. OSC0 Crystal Implementation

NOTE

The load capacitors, C_{f1} and C_{f2} in [Figure 6-2](#), should be chosen such that the below equation is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator xi_osc0 , xo_osc0 , and $vssa_osc0$ pins.

$$C_L = \frac{C_{f1} C_{f2}}{(C_{f1} + C_{f2})}$$

Figure 6-3. Load Capacitance Equation

The crystal must be in the fundamental mode of operation and parallel resonant. [Table 6-1](#) summarizes the required electrical constraints.

6.1.2.2 OSC0 Input Clock

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillator to provide the SYS_CLK1 clock input to the system. The external connections to support this are shown in Figure 6-4. The xi_osc0 pin is connected to the 1.8-V LVCMOS-Compatible clock source. The xi_osc0 pin is left unconnected. The vssa_osc0 pin is connected to board ground (VSS).

6.1.4.3 RC On-die Oscillator Clock

NOTE

The OSC_32K_CLK clock, provided by the On-die 32K RC oscillator, inside of the SoC, is not accurate 32kHz clock.

The frequency may significantly vary with temperature and silicon characteristics.

For more information about OSC_32K_CLK, see *Power, Reset, and Clock Management* chapter in the device TRM.

6.2 DPLLs, DLLs Specifications

NOTE

For more information, see *Power, Reset, and Clock Management* and *Display Subsystem* chapters in the device TRM.

To generate high-frequency clocks, the device supports multiple on-chip DPLLs controlled directly by the PRCM module. They are of two types: type A and type B DPLLs.

- They have their own independent power domain (each one embeds its own switch and can be controlled as an independent functional power domain)
- They are fed with ALWAYS ON system clock, with independent control per DPLL.

The different DPLLs managed by the PRCM are listed below:

- DPLL_MPU: It supplies the MPU subsystem clocking internally.
- DPLL_IVA: It feeds the IVA subsystem clocking.
- DPLL_CORE: It supplies all interface clocks and also few module functional clocks.
- DPLL_PER: It supplies several clock sources: a 192-MHz clock for the display functional clock, a 96-MHz functional clock to subsystems and peripherals.
- DPLL_ABE: It provides clocks to various modules within the device.
- DPLL_USB: It provides 960M clock for USB modules (USB1/2/3/4).
- DPLL_GMAC: It supplies several clocks for the Gigabit Ethernet Switch (GMAC_SW).
- DPLL_DSP: It feeds the DSP Subsystem clocking.
- DPLL_GPU: It supplies clock for the GPU Subsystem.
- DPLL_DDR: It generates clocks for the two External Memory Interface (EMIF) controllers and their associated EMIF PHYs.
- DPLL_PCIE_REF: It provides reference clock for the APLL_PCIE in PCIE Subsystem.
- APLL_PCIE: It feeds clocks for the device Peripheral Component Interconnect Express (PCIe) controllers.

NOTE

The following DPLLs are controlled by the clock manager located in the always-on Core power domain (CM_CORE_AON):

- DPLL_MPU, DPLL_IVA, DPLL_CORE, DPLL_ABE, DPLL_DDR, DPLL_GMAC, DPLL_PCIE_REF, DPLL_PER, DPLL_USB, DPLL_DSP, DPLL_GPU, APLL_PCIE_REF.

For more information on CM_CORE_AON and CM_CORE or PRCM DPLLs, see *Power, Reset, and Clock Management* chapter in the device TRM.

The following DPLLs are not managed by the PRCM:

- DPLL_VIDEO1; (It is controlled from DSS)
- DPLL_HDMI; (It is controlled from DSS)
- DPLL_SATA; (It is controlled from SATA)
- DPLL_DEBUG; (It is controlled from DEBUGSS)
- DPLL_USB_OTG_SS; (It is controlled from OCP2SCP1)

NOTE

For more information for not controlled from PRCM DPLL's see the related chapters in TRM.

6.2.1 DPLL Characteristics

The DPLL has three relevant input clocks. One of them is the reference clock (CLKINP) used to generated the synthesized clock but can also be used as the bypass clock whenever the DPLL enters a bypass mode. It is therefore mandatory. The second one is a fast bypass clock (CLKINPULOW) used when selected as the bypass clock and is optional. The third clock (CLKINPHIF) is explained in the next paragraph.

The DPLL has three output clocks (namely CLKOUT, CLKOUTX2, and CLKOUTHIF). CLKOUT and CLKOUTX2 run at the bypass frequency whenever the DPLL enters a bypass mode. Both of them are generated from the lock frequency divided by a post-divider (namely M2 post-divider). The third clock, CLKOUTHIF, has no automatic bypass capability. It is an output of a post-divider (M3 post-divider) with the input clock selectable between the internal lock clock (Fdpll) and CLKINPHIF input of the PLL through an asynchronous multiplexing.

For more information, see *Power, Reset, and Clock Management* chapter in the device TRM.

Table 6-12 summarizes DPLL type described in Section 6.2, *DPLLs, DLLs Specifications* introduction.

NOTE

For more information on DPLL and DLL decoupling capacitor requirements, see *Core Power Domains* section.

7 Timing Requirements and Switching Characteristics

7.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

7.2 Interface Clock Specifications

7.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

7.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the Device IC and does not take into account any system consideration (PCB, peripherals).

The system designer will have to consider these system considerations and the Device IC timing characteristics as well to define properly the maximum operating frequency that corresponds to the maximum frequency supported to transfer the data on this interface.

7.3 Timing Parameters and Information

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

Table 7-1. Timing Parameters

| SUBSCRIPTS | |
|------------|--|
| SYMBOL | PARAMETER |
| c | Cycle time (period) |
| d | Delay time |
| dis | Disable time |
| en | Enable time |
| h | Hold time |
| su | Setup time |
| START | Start bit |
| t | Transition time |
| v | Valid time |
| w | Pulse duration (width) |
| X | Unknown, changing, or don't care level |
| F | Fall time |
| H | High |
| L | Low |
| R | Rise time |
| V | Valid |
| IV | Invalid |

| AE | Active Edge |
| FE | First Edge |
| LE | Last Edge |
| Z | High impedance |

7.3.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

pm_tstcirc_prs403

Figure 7-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.3.1.1 1.8V and 3.3V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. $V_{ref} = (V_{DD} I/O)/2$.

pm_io_volt_prs403

Figure 7-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL} MAX$ and $V_{IH} MIN$ for input clocks, $V_{OL} MAX$ and $V_{OH} MIN$ for output clocks.

Figure 7-3. Rise and Fall Transition Time Voltage Reference Levels

7.3.1.2 1.8V and 3.3V Signal Transition Rates

The default SLEWCONTROL settings in each pad configuration register must be used to ensure timings, unless specific instructions otherwise are given in the individual timing sub-sections of the datasheet.

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

7.3.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do not include delays by board routes. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends using the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the [Using IBIS Models for timing Analysis](#). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

7.4 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner. Monotonic transitions are more easily ensured with faster switching signals. Slower input transitions are more susceptible to glitches due to noise and special care should be taken for slow input clocks.

7.5 Virtual and Manual I/O Timing Modes

Some of the timings described in the following sections require the use of Virtual or Manual I/O Timing Modes. [Table 7-2](#) provides a summary of the Virtual and Manual I/O Timing Modes across all device interfaces. The individual interface timing sections found later in this document provide the full description of each applicable Virtual and Manual I/O Timing Mode. Refer to the "Pad Configuration" section of the TRM for the procedure on implementing the Virtual and Manual Timing Modes in a system.

These alternate functions are controlled via CTRL_CORE_VIP_MUX_SELECT register. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "*Manual IO Timing Modes*" in the device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See *Manual Functions Mapping for VIP1 1A IOSET7 and 2A IOSET10* for a definition of the Manual modes.

[Table 7-6](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

(1) Some signals listed are manual functions that present alternate multiplexing options. These manual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT registers. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-7 Manual Functions Mapping for VIN2A \(IOSET4/5/6\)](#) for a definition of the Manual modes.

(1) Some signals listed are manual functions that present alternate multiplexing options. These manual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT registers. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VIP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-10 Manual Functions Mapping for VIN1A \(IOSET5/6\) and VIN2A \(IOSET7/8/9\)](#) for a definition of the Manual modes.

[Table 7-10](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.7 Display Subsystem - Video Output Ports

Three Display Parallel Interfaces (DPI) channels are available in DSS named DPI Video Output 1, DPI Video Output 2 and DPI Video Output 3.

NOTE

The DPI Video Output i ($i = 1$ to 3) interface is also referred to as VOUT i .

Every VOUT interface consists of:

- 24-bit data bus (data[23:0])
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Field ID (FID)
- Pixel clock (CLK)

NOTE

For more information, see *Display Subsystem* chapter in the device TRM.

CAUTION

The I/O Timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in [Table 7-18](#).

CAUTION

The I/O Timings provided in this section are valid only for some DSS usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

CAUTION

All pads/balls configured as vout i _* signals must be programmed to use slow slew rate by setting the corresponding CTRL_CORE_PAD_*[SLEWCONTROL] register field to SLOW (0b1).

[Table 7-14](#) through [Table 7-17](#), and [Figure 7-6](#) assume testing over the recommended operating conditions and electrical characteristic conditions.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for VOUT1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-19 Virtual Functions Mapping for VOUT1](#) for a definition of the Virtual modes.

[Table 7-19](#) presents the values for DELAYMODE bit field.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "Manual IO Timing Modes" in the device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for VOUT1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-20 Manual Functions Mapping for DSS VOUT1](#) for a definition of the Manual modes.

[Table 7-20](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.8 Display Subsystem - High-Definition Multimedia Interface (HDMI)

The High-Definition Multimedia Interface is provided for transmitting digital television audiovisual signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. The HDMI interface is aligned with the HDMI TMDS single stream standard v1.4a (720p @60Hz to 1080p @24Hz) and the HDMI v1.3 (1080p @60Hz): 3 data channels, plus 1 clock channel is supported (differential).

NOTE

For more information, see *High-Definition Multimedia Interface* section in the device TRM.

7.9 Camera Serial Interface 2 CAL bridge (CSI2)

NOTE

For more information, see *Camera Interface Subsystem* chapter in the device TRM.

The camera adaptation layer (CAL) deals with the processing of the pixel data coming from an external image sensor, data from memory. The CAL is a key component for the following multimedia applications: camera viewfinder, video record, and still image capture. The CAL has two serial camera interfaces (primary and secondary):

- The primary serial interface (CSI2 Port A) is compliant with MIPI CSI-2 protocol with four data lanes.
- The secondary serial interface (CSI2 Port B) is compliant with MIPI CSI-2 protocol with two data lanes.

7.9.1 CSI-2 MIPI D-PHY

The CSI-2 port A is compliant with the MIPI D-PHY RX specification v1.00.00 and the MIPI CSI-2 specification v1.00, with 4 data differential lanes plus 1 clock differential lane in synchronous mode, double data rate:

- 1.5 Gbps (750 MHz) @OPP_NOM for each lane.

The CSI-2 port B is compliant with the MIPI D-PHY RX specification v1.00.00 and the MIPI CSI-2 specification v1.00, with 2 data lanes plus 1 clock lane (differential) in synchronous mode, double data rate:

- 1.5 Gbps (750 MHz) @OPP_NOM for each lane, in synchronous mode.

7.10 External Memory Interface (EMIF)

The device has a dedicated interface to DDR3 and DDR3L SDRAM. It supports JEDEC standard compliant DDR3 and DDR3L SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 128Mb, 256Mb, 512Mb, 1Gb, 2Gb, 4Gb and 8Gb devices
- One interface with associated DDR3/DDR3L PHYs

NOTE

For more information, see *EMIF Controller* section in the device TRM.

7.11 General-Purpose Memory Controller (GPMC)

The GPMC is the unified memory controller that interfaces external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

NOTE

For more information, see *General-Purpose Memory Controller* section in the device TRM.

7.11.1 GPMC/NOR Flash Interface Synchronous Timing

CAUTION

The I/O Timings provided in this section are valid only for some GPMC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Table 7-24 and Table 7-25 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 7-7, Figure 7-8, Figure 7-9, Figure 7-10, Figure 7-11 and Figure 7-12).

- (1) In $gpmc_csi$, $i = 0$ to 7. In $gpmc_waitj$, $j = 0$ to 1.
- (2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.
- (3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.
- (4) The "DIR" (direction control) output signal is NOT pinned out on any of the device pads. It is an internal signal only representing a signal direction on the GPMC data bus.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for GPMC. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-32 Virtual Functions Mapping for GPMC](#) for a definition of the Virtual modes.

[Table 7-32](#) presents the values for DELAYMODE bit field.

- (1) Some signals listed are virtual functions that present alternate multiplexing options. These virtual functions are controlled via CTRL_CORE_ALT_SELECT_MUX or CTRL_CORE_VIP_MUX_SELECT registers. For more information on how to use these options, see *Pad Configuration Registers* section, *Control Module* chapter in the device TRM.

7.12 Timers

The device has 16 general-purpose (GP) timers (TIMER1 - TIMER16), two watchdog timers, and a 32-kHz synchronized timer (COUNTER_32K) that have the following features:

- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
 - Compare and capture modes
 - Auto-reload mode
 - Start-stop mode
- On-the-fly read/write register (while counting)

The device has two system watchdog timer (WD_TIMER1 and WD_TIMER2) that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition

WD_TIMER2 is available in all devices as a system watchdog timer. WD_TIMER1 is only supported in security enabled devices.

The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

NOTE

For additional information on the Timer Module, see the Device TRM.

7.13 Inter-Integrated Circuit Interface (I2C)

The device includes 6 inter-integrated circuit (I2C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I2C) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I2C module.

NOTE

Note that, on I2C1 and I2C2, due to characteristics of the open drain IO cells, HS mode is not supported.

NOTE

Inter-integrated circuit *i* (*i*=1 to 6) module is also referred to as I2Ci.

NOTE

For more information, see *Multimaster High Speed I2C Controller* section in the device TRM.

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I2C device can be used in a Standard-mode I2C system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \text{ max} + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

| 16 | C _b | Capacitive load for SDAH + SDA line and SCLH + SCL line | | 400 | | 400 | pF |

(1) I2C HS-Mode is only supported on I2C3/4/5/6. I2C HS-Mode is not supported on I2C1/2.

(2) For bus line loads C_b between 100 and 400 pF the timing parameters must be linearly interpolated.

(3) A device must internally provide a Data hold time to bridge the undefined part between V_{IH} and V_{IL} of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

(1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

(2) Software must properly configure the I2C module registers to achieve the required timing parameters. For more information, see *Multimaster High Speed I2C Controller* section in the device TRM.

(3) These timings apply only to I2C1 and I2C2. I2C3, I2C4, I2C5 and I2C6 use standard LVCMOS buffers to emulate open-drain buffers and their rise/fall times should be referenced in the device IBIS model.

NOTE

I2C emulation is achieved by configuring the LVCMOS buffers to output Hi-Z instead of driving high when transmitting logic-1.

7.14 Universal Asynchronous Receiver Transmitter (UART)

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. There are 10 UART modules in the device. Only one UART supports IrDA features. Each UART can be used for configuration and data exchange with a number of external peripheral devices or interprocessor communication between devices

The UART_i (where $i = 1$ to 10) include the following features:

- 16C750 compatibility
- 64-byte FIFO buffer for receiver and 64-byte FIFO for transmitter
- Baud generation based on programmable divisors N (where $N = 1 \dots 16384$) operating from a fixed functional clock of 48 MHz or 192 MHz

- Break character detection and generation
- Configurable data format:
 - Data bit: 5, 6, 7, or 8 bits
 - Parity bit: Even, odd, none
 - Stop-bit: 1, 1.5, 2 bit(s)
- Flow control: Hardware (RTS/CTS) or software (XON/XOFF)
- Only UART1 module has extended modem control signals (CD, RI, DTR, DSR)
- Only UART3 supports IrDA

NOTE

For more information, see *UART/IrDA/CIR* section in the device TRM.

7.15 Multichannel Serial Peripheral Interface (McSPI)

The McSPI is a master/slave synchronous serial bus. There are four separate McSPI modules (SPI1, SPI2, SPI3, and SPI4) in the device. All these four modules support up to four external devices (four chip selects) and are able to work as both master and slave.

The McSPI modules include the following main features:

- Serial clock with programmable frequency, polarity, and phase for each channel
- Wide selection of SPI word lengths, ranging from 4 to 32 bits
- Up to four master channels, or single channel in slave mode
- Master multichannel mode:
 - Full duplex/half duplex
 - Transmit-only/receive-only/transmit-and-receive modes
 - Flexible input/output (I/O) port controls per channel
 - Programmable clock granularity
 - SPI configuration per channel. This means, clock definition, polarity enabling and word width
- Power management through wake-up capabilities
- Programmable timing control between chip select and external clock generation
- Built-in FIFO available for a single channel.
- Each SPI module supports multiple chip select pins `spim_cs[i]`, where $i = 1$ to 4.

NOTE

For more information, see *Multichannel Serial Peripheral Interface* section in the device TRM.

NOTE

The McSPIm module ($m = 1$ to 4) is also referred to as SPI m .

CAUTION

The I/O timings provided in this section are applicable for all combinations of signals for SPI1 and SPI2. However, the timings are valid only for SPI3 and SPI4 if signals within a single IOSET are used. The IOSETS are defined in [Table 7-40](#).

[Table 7-38](#), [Figure 7-26](#) and [Figure 7-27](#) present Timing Requirements for McSPI - Master Mode.

(1) This timing applies to all configurations regardless of SPI_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) Related to the SPI_CLK maximum frequency.

(3) 20.8ns cycle time = 48MHz

(4) P = SPICLK period.

(5) SPI_CLK phase is programmable with the PHA bit of the SPI_CH(i)CONF register.

(6) B = (TCS + 0.5) * TSPICLKREF * Fratio, where TCS is a bit field of the SPI_CH(i)CONF register and Fratio = Even ≥2.

(7) When P = 20.8 ns, A = (TCS + 1) * TSPICLKREF, where TCS is a bit field of the SPI_CH(i)CONF register. When P > 20.8 ns, A = (TCS + 0.5) * Fratio * TSPICLKREF, where TCS is a bit field of the SPI_CH(i)CONF register.

7.16 Quad Serial Peripheral Interface (QSPI)

The Quad SPI (QSPI) module is a type of SPI module that allows single, dual or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. It works as a master only. There is one QSPI module in the device and it is primary intended for fast booting from quad-SPI flash memories.

General SPI features:

- Programmable clock divider
- Six pin interface (DCLK, CS_N, DOUT, DIN, QDIN1, QDIN2)
- 4 external chip select signals
- Support for 3-, 4- or 6-pin SPI interface
- Programmable CS_N to DOUT delay from 0 to 3 DCLKs
- Programmable signal polarities
- Programmable active clock edge
- Software controllable interface allowing for any type of SPI transfer

NOTE

For more information, see *Quad Serial Peripheral Interface* section in the device TRM.

CAUTION

The I/O Timings provided in this section are only valid when all QSPI Chip Selects used in a system are configured to use the same Clock Mode (either Clock Mode 0 or Clock Mode 3).

CAUTION

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

- (1) The Y parameter is defined as follows:
 If DCLK_DIV is 0 or ODD then, Y equals 0.5.
 If DCLK_DIV is EVEN then, Y equals (DCLK_DIV/2) / (DCLK_DIV+1).
 For best performance, it is recommended to use a DCLK_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2_H13 output of DPLL_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK_DIV can be found in the device-specific Technical Reference Manual.
- (2) P = SCLK period.
- (3) M=QSPI_SPI_DC_REG.DDx + 1 when Clock Mode 0.
 M=QSPI_SPI_DC_REG.DDx when Clock Mode 3.
 N = 2 when Clock Mode 0.
 N = 3 when Clock Mode 3.

The I/O Timings provided in this section are valid only for some QSPI usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for QSPI. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-43 Manual Functions Mapping for QSPI](#) for a definition of the Manual modes.

[Table 7-43](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.17 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

The device have integrated 8 McASP modules (McASP1-McASP8) with:

- McASP1 and McASP2 modules supporting 16 channels with independent TX/RX clock/sync domain
- McASP3 through McASP8 modules supporting 4 channels with independent TX/RX clock/sync domain

NOTE

For more information, see *Multichannel Audio Serial Port* section in the device TRM.

CAUTION

The I/O Timings provided in this section are valid only for some McASP usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

CAUTION

The I/O Timings provided in this section are valid only for some McASP usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

Virtual IO Timings Modes must be used to ensure some IO timings for McASP1. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Virtual IO Timings Modes. See [Table 7-58 Virtual Functions Mapping for McASP1](#) for a definition of the Virtual modes.

[Table 7-58](#) presents the values for DELAYMODE bit field.

7.18 Universal Serial Bus (USB)

SuperSpeed USB DRD Subsystem has four instances in the device providing the following functions:

- USB1: SuperSpeed (SS) USB 3.0 Dual-Role-Device (DRD) subsystem with integrated SS (USB3.0) PHY and HS/FS (USB2.0) PHY.
- USB2: High Speed (HS) USB 2.0 Dual-Role-Device (DRD) subsystem with integrated HS/FS PHY.
- USB3: HS USB 2.0 Dual-Role-Device (DRD) subsystem with ULPI (SDR) interface to external HS/FS PHYs.

NOTE

For more information, see *SuperSpeed USB DRD* section in the device TRM.

7.18.1 USB1 DRD PHY

The USB1 DRD interface supports the following applications:

- USB2.0 High Speed PHY port (1.8 V and 3.3 V): this asynchronous high speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.
- USB3.0 SuperSpeed PHY port (1.8 V): this asynchronous differential super speed interface is compliant with the USB3.0 RX/TX PHY standard (USB3.0 standard v1.0) for a maximum data bit rate of 5Gbps.

7.18.2 USB2 PHY

The USB2 interface supports the following applications:

- USB2.0 High Speed PHY port (1.8 V and 3.3 V): this asynchronous high speed interface is compliant with the USB2.0 PHY standard with an internal transceiver (USB2.0 standard v2.0), for a maximum data rate of 480 Mbps.

7.18.3 USB3 DRD ULPI-SDR-Slave Mode-12-pin Mode

The USB3 DRD interfaces support the following application:

- USB ULPI port: this synchronous interface is compliant with the USB2.0 ULPI SDR standard (UTMI+ v1.22), for alternative off-chip USB2.0 PHY interface; that is, with external transceiver with a maximum frequency of 60 MHz (synchronous slave mode, SDR, 12-pin, 8-data-bit).

NOTE

The Universal Serial Bus k ULPI modules are also referred as USBk where k = 3, 4.

Table 7-61, Table 7-62 and Figure 7-44 assume testing over the recommended operating conditions and electrical characteristic conditions.

7.19 Serial Advanced Technology Attachment (SATA)

The SATA RX/TX PHY interface is compliant with the SATA standard v2.6 for a maximum data rate:

- Gen2i, Gen2m, Gen2x: 3Gbps.
- Gen1i, Gen1m, Gen1x: 1.5Gbps.

NOTE

For more information, see *SATA Controller* section in the device TRM.

7.20 Peripheral Component Interconnect Express (PCIe)

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. Each PCIe subsystem controller has support for PCIe Gen-II mode (5.0 Gbps /lane) and Gen-I mode (2.5 Gbps/lane) (Single Lane and Flexible dual lane configuration).

The device PCIe supports the following features:

- 16-bit operation @250 MHz on PIPE interface (per 16-bit lane)
- Supports 2 ports x 1 lane or 1 port x 2 lanes configuration
- Single virtual channel (VC0), single traffic class (TC0)
- Single function in end-point mode
- Automatic width and speed negotiation
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management
- ECRC generation and checking
- Configurable BAR filtering
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI-Express Active State Power Management (ASPM) state L0s and L1 (with exceptions)
- All PCI Device Power Management D-states with the exception of D3_{cold} / L2 state

The PCIe controller on this device conforms to the PCI-Express Base 3.0 Specification, revision 1.0 and the PCI Local Bus Specification, revision 3.0

NOTE

For more information, see *PCIe Controller* section in the device TRM.

7.21 Controller Area Network Interface (DCAN)

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

NOTE

For more information, see *DCAN* section in the device TRM.

NOTE

The Controller Area Network Interface x (x = 1 to 2) is also referred to as DCANx.

NOTE

Refer to the CAN Specification for calculations necessary to validate timing compliance. Jitter tolerance calculations must be performed to validate the implementation.

Table 7-64 and Table 7-65 present timing and switching characteristics for DCANx Interface.

(1) These values do not include rise/fall times of the output buffer.

7.22 Ethernet Interface (GMAC_SW)

The three-port gigabit ethernet switch subsystem (GMAC_SW) provides ethernet packet communication and can be configured as an ethernet switch. It provides the Gigabit Media Independent Interface (G/MII) in MII mode, Reduced Gigabit Media Independent Interface (RGMII), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) for physical layer device (PHY) management.

NOTE

For more information, see *Gigabit Ethernet Switch (GMAC_SW)* section in the device TRM.

NOTE

The Gigabit, Reduced and Media Independent Interface n (n = 0 to 1) are also referred to as MII_n, RMIIn and RGMII_n.

CAUTION

The I/O timings provided in this section are valid only if signals within a single IOSET are used. The IOSETs are defined in Table 7-70, Table 7-73, Table 7-78 and Table 7-85.

CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

7.22.3 GMAC RMIITimings

The main reference clock REF_CLK (RMII_50MHZ_CLK) of RMII interface is internally supplied from PRCM. The source of this clock could be either externally sourced from the RMII_MHZ_50_CLK pin of the device or internally generated from DPLL_GMAC output clock GMAC_RMII_HS_CLK. Please see the PRCM chapter of the device TRM for full details about RMII reference clock.

CAUTION

The I/O Timings provided in this section are valid only for some GMAC usage modes when the corresponding Virtual I/O Timings or Manual I/O Timings are configured as described in the tables found in this section.

| 5 | $t_{su}(\text{RXD-RXCH})$ | Setup time, receive selected signals valid before rgmiin_rxc high/low | RGMII0/1 | 1 | | ns |
| 6 | $t_h(\text{RXCH-RXD})$ | Hold time, receive selected signals valid after rgmiin_rxc high/low | RGMII0/1 | 1 | | ns |

(1) For RGMII, receive selected signals include: rgmiin_rxd[3:0] and rgmiin_rxctl.

SPRS906_TIMING_GMAC_RGMII_RX_08

- A. rgmiin_rxc must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. rgmiin_rxd[3:0] carries data bits 3-0 on the rising edge of rgmiin_rxc and data bits 7-4 on the falling edge of rgmiin_rxc. Similarly, rgmiin_rxctl carries RXDV on rising edge of rgmiin_rxc and RXERR on falling edge of rgmiin_rxc.

- (1) For RGMII, transmit selected signals include: rgmiiin_txd[3:0] and rgmiiin_txctl.
- (2) RGMII0 requires that the 4 data pins rgmii0_txd[3:0] and rgmii0_txctl have their board propagation delays matched within 50pS of rgmii0_txc.
- (3) RGMII1 requires that the 4 data pins rgmii1_txd[3:0] and rgmii1_txctl have their board propagation delays matched within 50pS of rgmii1_txc.

SPRS906_TIMING_GMAC_RGMII_TX_09

- A. TXC is delayed internally before being driven to the rgmiiin_txc pin. This internal delay is always enabled.
- B. Data and control information is transmitted using both edges of the clocks. rgmiiin_txd[3:0] carries data bits 3-0 on the rising edge of rgmiiin_txc and data bits 7-4 on the falling edge of rgmiiin_txc. Similarly, rgmiiin_txctl carries TXEN on rising edge of rgmiiin_txc and TXERR on falling edge of rgmiiin_txc.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section "*Manual IO Timing Modes*" of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for GMAC. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-86 Manual Functions Mapping for GMAC RGMII0](#) for a definition of the Manual modes.

[Table 7-86](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

7.23 eMMC/SD/SDIO

The Device includes the following external memory interfaces 4 MultiMedia Card/Secure Digital/Secure Digital Input Output Interface (MMC/SD/SDIO).

NOTE

The eMMC/SD/SDIO_i (i = 1 to 4) controller is also referred to as MMC_i.

7.23.1 MMC1-SD Card Interface

MMC1 interface is compliant with the SD Standard v3.01 and it supports the following SD Card applications:

- Default speed, 4-bit data, SDR, half-cycle
- High speed, 4-bit data, SDR, half-cycle
- SDR12, 4-bit data, half-cycle
- SDR25, 4-bit data, half-cycle
- UHS-I SDR50, 4-bit data, half-cycle
- UHS-I SDR104, 4-bit data, half-cycle
- UHS-I DDR50, 4-bit data

NOTE

For more information, see *eMMC/SD/SDIO* chapter in the device TRM.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in Table 4-3 and described in Device TRM, *Control Module Chapter*.

Virtual IO Timings Modes must be used to ensure some IO timings for MMC1. See Table 7-2 *Modes Summary* for a list of IO timings requiring the use of Virtual IO Timings Modes. See Table 7-101 *Virtual Functions Mapping for MMC1* for a definition of the Virtual modes.

Table 7-101 presents the values for DELAYMODE bit field.

7.23.2 MMC2 - eMMC

MMC2 interface is compliant with the JC64 eMMC Standard v4.5 and it supports the following eMMC applications:

- Standard JC64 SDR, 8-bit data, half cycle
- High Speed JC64 SDR, 8-bit data, half cycle
- High Speed HS200 JEDS84, 8-bit data, half cycle
- High Speed JC64 DDR, 8-bit data

7.23.3 MMC3 and MMC4-SDIO/SD

MMC3 and MMC4 interfaces are compliant with the SDIO3.0 standard v1.0, SD Part E1 and for generic SDIO devices, it supports the following applications:

- MMC3 8-bit data and MMC4 4-bit data, SD Default speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, SD High speed, SDR
- MMC3 8-bit data and MMC4 4-bit data, UHS-1 SDR12 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data and MMC4 4-bit data, UHS-I SDR25 (SD Standard v3.01), 4-bit data, SDR, half cycle
- MMC3 8-bit data, UHS-I SDR50

NOTE

The eMMC/SD/SDIOj (j = 3 to 4) controller is also referred to as MMCj.

NOTE

For more information, see eMMC/SD/SDIO chapter in the device TRM.

NOTE

To configure the desired Manual IO Timing Mode the user must follow the steps described in section Manual IO Timing Modes of the Device TRM.

The associated registers to configure are listed in the **CFG REGISTER** column. For more information, see *Control Module* chapter in the device TRM.

Manual IO Timings Modes must be used to ensure some IO timings for MMC3. See [Table 7-2 Modes Summary](#) for a list of IO timings requiring the use of Manual IO Timings Modes. See [Table 7-130 Manual Functions Mapping for MMC3](#) for a definition of the Manual modes.

[Table 7-130](#) lists the A_DELAY and G_DELAY values needed to calculate the correct values to be set in the CFG_x registers.

NOTE

To configure the desired virtual mode the user must set MODESELECT bit and DELAYMODE bit field for each corresponding pad control register.

The pad control registers are presented in [Table 4-3](#) and described in Device TRM, *Control Module Chapter*.

7.24 General-Purpose Interface (GPIO)

The general-purpose interface combines eight general-purpose input/output (GPIO) banks. Each GPIO module provides up to 32 dedicated general-purpose pins with input and output capabilities; thus, the general-purpose interface supports up to 215 pins.

These pins can be configured for the following applications:

- Data input (capture)/output (drive)
- Keyboard interface with a debounce cell
- Interrupt generation in active mode upon the detection of external events. Detected events are processed by two parallel independent interrupt-generation submodules to support biprocessor operations
- Wake-up request generation in idle mode upon the detection of external events

NOTE

For more information, see *General-Purpose Interface* chapter in the device TRM.

NOTE

The general-purpose input/output i ($i = 1$ to 8) bank is also referred to as GPIO i .

7.25 System and Miscellaneous interfaces

The Device includes the following System and Miscellaneous interfaces:

- Sysboot Interface
- System DMA Interface
- Interrupt Controllers (INTC) Interface
- Observability Signal (OBS) Interface

7.26 Test Interfaces

The Device includes the following Test interfaces:

- IEEE 1149.1 Standard-Test-Access Port (JTAG)
- Trace Port Interface Unit (TPIU)
- Advanced Event Triggering Interface (AET)

7.26.1 IEEE 1149.1 Standard-Test-Access Port (JTAG)

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The *trstn* pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. For maximum reliability, the device includes an internal Pulldown (IPD) on the *trstn* pin to ensure that *trstn* is always asserted upon power up and the device's internal emulation logic is always properly initialized. JTAG controllers from Texas Instruments actively drive *trstn* high. However, some third-party JTAG controllers may not drive *trstn* high but expect the use of a Pullup resistor on *trstn*. When using this type of JTAG controller, assert *trstn* to initialize the device after powerup and externally drive *trstn* high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB embedded trace buffer (ETB)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
 - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
 - EMU[4:2] - STM trace only (single direction)

8 Applications, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Introduction

This chapter is intended to communicate, guide and illustrate a PCB design strategy resulting in a PCB that can support TI's latest Application Processor. This Processor is a high-performance processor designed for automotive Infotainment based on enhanced OMAP™ architecture integrated on a 28-nm CMOS process technology.

These guidelines first focus on designing a robust Power Delivery Network (PDN) which is essential to achieve the desirable high performance processing available on Device. The general principles and step-by-step approach for implementing good power integrity (PI) with specific requirements will be described for the key Device power domains.

TI strongly believes that simulating a PCB's proposed PDN is required for first pass PCB design success. Key Device processor high-current power domains need to be evaluated for Power Rail IR Drop, Decoupling Capacitor Loop-Inductance and Power Rail Target Impedance. Only then can a PCB's PDN performance be truly accessed by comparing these model PI parameters vs. TI's recommended values. Ultimately for any high-volume product, TI recommends conducting a "Processor PDN Validation" test on prototype PCBs across processor "split lots" to verify PDN robustness meets desired performance goals for each customer's worst-case scenario. Please contact your TI representative to receive guidance on PDN PI modeling and validation testing.

Likewise, the methodology and requirements needed to route Device high speed, differential interfaces (that is, USB2.0, USB3.0, HDMI, PCIe, SATA), single-ended interfaces (that is, DDR3, QSPI) and general purpose interfaces using LVCMOS drivers that meet timing requirements while minimizing signal integrity (SI) distortions on the PCB's signaling traces. Signal trace lengths and flight times are aligned with FR-4 standard specification for PCBs.

Several different PCB layout stack-up examples have been presented to illustrate a typical number of layers, signal assignments and controlled impedance requirements. Different Device interface signals demand more or less complexity for routing and controlled impedance stack-ups. Optimizing the PCB's PDN stack-up needs with all of these different types of signal interfaces will ultimately determine the final layer count and layer assignments in each customer's PCB design.

This guideline must be used as a supplement in complement to TI's Application Processor, Power Management IC (PMIC) and Audio Companion components along with other TI component technical documentation (that is, Technical Reference Manual, Data Manual, Data Sheets, Silicon Errata, Pin-Out Spreadsheet, Application Notes, etc.).

NOTE

Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, for customer boards. The data described in this appendix are intended as guidelines only.

NOTE

These PCB guidelines are in a draft maturity and consequently, are subject to change depending on design verification testing conducted during IC development and validation.

8.1.1 Initial Requirements and Guidelines

Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between 35 Ω and 65 Ω to minimize the overshoot or undershoot on far-end loads.

Characteristic impedance for differential interfaces must be routed as differential traces on the same layer. The trace width and spacing must be chosen to yield the recommended differential impedance. For more information see [Section 8.5.1](#).

The PDN must be optimized for low trace resistance and low trace inductance for all high-current power nets from PMIC to the device.

An external interface using a connector must be protected following the IEC61000-4-2 level 4 system ESD.

8.2 Power Optimizations

This section describes the necessary steps for designing a robust Power Distribution Network (PDN):

- [Section 8.2.1, Step 1](#): PCB Stack-up
- [Section 8.2.2, Step 2](#): Physical Placement
- [Section 8.2.3, Step 3](#): Static Analysis
- [Section 8.2.4, Step 4](#): Frequency Analysis

8.2.1 Step 1: PCB Stack-up

The PCB stack-up (layer assignment) is an important factor in determining the optimal performance of the power distribution system. An optimized PCB stack-up for higher power integrity performance can be achieved by following these recommendations:

- Power and ground plane pairs must be closely coupled together. The capacitance formed between the planes can decouple the power supply at high frequencies. Whenever possible, the power and ground planes must be solid to provide continuous return path for return current.
- Use a thin dielectric between the power and ground plane pair. Capacitance is inversely proportional to the separation of the plane pair. Minimizing the separation distance (the dielectric thickness) maximizes the capacitance.
- Optimize the power and ground plane pair carrying high current supplies to key component power domains as close as possible to the same surface where these components are placed (see [Figure 8-1](#)). This will help to minimize “loop inductance” encountered between supply decoupling capacitors and component supply inputs and between power and ground plane pairs.

NOTE

1-2oz Cu weight for power / ground plane is preferred to enable better PCB heat spreading, helping to reduce Processor junction temperatures. In addition, it is preferable to have the power / ground planes be adjacent to the PCB surface on which the Processor is mounted.

Figure 8-1. Minimize Loop Inductance With Proper Layer Assignment

The placement of power and ground planes in the PCB stackup (determined by layer assignment) has a significant impact on the parasitic inductances of power current path as shown in Figure 8-1. For this reason, it is recommended to consider layer order in the early stages of the PCB PDN design cycle, putting high-priority supplies in the top half of the stackup (assuming high load and priority components are mounted on the top-side of PCB) and low-priority supplies in the bottom half of the stackup as shown in the examples below (vias have parasitic inductances which impact the bottom layers more, so it is advised to put the sensitive and high-priority power supplies on the top/same layers).

8.2.2 Step 2: Physical Placement

A critical step in designing an optimized PDN is that proper care must be taken to making sure that the initial floor planning of the PCB layout is done with good power integrity design guidelines in mind. The following points are important for optimizing a PCB's PDN:

- Minimizing the physical distance between power sources and key high load components is the first step toward optimization. Placing source and load components on the same side of the PCB is desirable. This will minimize via inductance impact for high current loads and steps
- External trace routing between components must be as wide as possible. The wider the traces, the lower the DC resistance and consequently the lower the static IR drop.
- Whenever possible for the internal layers (routing and plane), wide traces and copper area fills are preferred for PDN layout. The routing of power nets in plane provide for more interplane capacitance and improved high frequency performance of the PDN.
- Whenever possible, use a via to component pin/pad ratio of 1:1 or better (that is, especially decoupling capacitors, power inductors and current sensing resistors). Do not share vias among multiple capacitors for connecting power supply and ground planes.
- Placement of vias must be as close as possible or even within a component's solder pad if the PCB technology you are using provides this capability.
- To avoid any "ampacity" issue – maximum current-carrying capacity of each transitional via should be evaluated to determine the appropriate number of vias required to connect components.

Adding vias to bring the "via-to-pad" ratio to 1:1 will improve PDN performance.

- For noise sensitive power supplies (that is, Phase Lock-Loops, analog signals like audio and video), a Gnd shield can be used to isolate coplanar supplies that may have high step currents or high frequency switching transitions from coupling into low-noise supplies.

Figure 8-2. Coplanar Shielding of Power Net Using Ground Guard-band

8.2.3 Step 3: Static Analysis

Delivering reliable power to circuits is always of critical importance because voltage drops (also known as IR drops) can happen at every level within an electronic system, on-chip, within a package, and across the board. Robust system performance can only be ensured by understanding how the system elements will perform under typical stressful Use Cases. Therefore, it is a good practice to perform a Static or DC Analysis.

Static or DC analysis and design methodology results in a PDN design that minimizes voltage or IR drops across power and ground planes, traces and vias. This ensures the application processor’s internal transistors will be operating within their specified voltage ranges for proper functionality. The amount of IR drop that will be encountered is based upon amount power drawn for a desired Use Case and PCB trace (widths, geometry and number of parallel traces) and via (size, type and number) characteristics.

Components that are distant from their power source are particularly susceptible to IR drop. Designs that rely on battery power must minimize voltage drops to avoid unacceptable power loss that can negatively impact system performance. Early assessments a PDN’s static (DC) performance helps to determine basic power distribution parameters such as best system input power point, optimal PCB layer stackup, and copper area needed for load currents.

The resistance R_s of a plane conductor for a unit length and unit width is called the **surface resistivity** (ohms per square).

SPRS906_PCB_STATIC_01

Figure 8-3. Depiction of Sheet Resistivity and Resistance

Ohm’s Law ($V = I \times R$) relates conduction current to voltage drop. At DC, the relation coefficient is a constant and represents the resistance of the conductor. Even current carrying conductors will dissipate power at high currents even though their resistance may be very small. Both voltage drop and power dissipation are proportional to the resistance of the conductor.

Figure 8-4 shows a PCB-level static IR drop budget defined between the power management device (PMIC) pins and the application processor’s balls when the PMIC is supplying power.

- It is highly recommended to physically place the PMIC as close as possible to the processor and on the same side. The orientation of the PMIC vs. processor should be aligned to minimize distance for the highest current rail.

The resistance R_s of a plane conductor for a unit length and unit width is called the **surface resistivity** (ohms per square).

SPRS906_PCB_STATIC_01

Figure 8-4. Static IR Drop Budget for PCB Only

The system-level IR drop budget is made up of three portions: on-chip, package, and PCB board. Static IR or DC analysis/design methodology consists of designing the PDN such that the voltage drop (under DC operating conditions) across power and ground pads of the transistors of the application processor device is within a specified value of the nominal voltage for proper functionality of the device.

A PCB system-level voltage drop budget for proper device functionality is typically 1.5% of nominal voltage. For a 1.35-V supply, this would be ≤ 20 mV.

To accurately analyze PCB static IR drop, the actual geometry of the PDN must be modeled properly and simulated to accurately characterize long distribution paths, copper weight impacts, electro-migration violations of current-carrying vias, and “Swiss-cheese” effects via placement has on power rails. It is recommended to perform the following analyses:

- Lumped resistance/IR drop analysis
- Distributed resistance/IR drop analysis

NOTE

The PMIC companion device supporting this processor has been designed with voltage sensing feedback loop capabilities that enable a remote sense of the SMPS output voltage at the point of use.

The NOTE above means the SMPS feedback signals and returns must be routed across PCB and connected to the Device input power ball for which a particular SMPS is supplying power. This feedback loop provides compensation for some of the voltage drop encountered across the PDN within limits. As such, the effective resistance of the PDN within this loop should be determined in order to optimize voltage compensation loop performance. The resistance of two PDN segments are of interest: one from the power inductor/bulk power filtering capacitor node to the Processor's input power and second is the entire PDN route from SMPS output pin/ball to the Processor input power.

In the following sections each methodology is described in detail and an example has been provided of analysis flow that can be used by the PCB designer to validate compliance to the requirements on their PCB PDN design.

8.2.3.1 PDN Resistance and IR Drop

Lumped methodology consists of grouping all of the power pins on both the PMIC (voltage source) and processor (current sink) devices. Then the PMIC source is set to an expected Use Case voltage level and the processor load has its Use Case current sink value set as well. Now the lumped/effective resistance for the power rail trace/plane routes can be determine based upon the actual layout's power rail etch wide, shape, length, via count and placement [Figure 8-5](#) illustrates the pin-grouping/lumped concept.

The lumped methodology consists of importing the PCB layout database (from Cadence Allegro tool or any other layout design tool) into the static IR drop modeling and simulation tool of preference for the PCB designer. This is followed by applying the correct PCB stack-up information (thickness, material properties) of the PCB dielectric and metallization layers. The material properties of dielectric consist of permittivity (Dk) and loss tangent (Df).

For the conductor layers, the correct conductivity needs to be programmed into the simulation tool. This is followed by pin-grouping of the power and ground nets, and applying appropriate voltage/current sources. The current and voltage information can be obtained from the power and voltage specifications of the device under different operating conditions / Use Cases.

Figure 8-5. Pin-grouping concept: Lumped and Distributed Methodologies

8.2.4 Step 4: Frequency Analysis

Delivering low noise voltage sources are very important to allowing a system to operate at the lowest possible Operational Performance Point (OPP) for any one Use Case. An OPP is a combination of the supply voltage level and clocking rate for key internal processor domains. A SCH and PCB designed to provide low noise voltage supplies will then enable the processor to enter optimal OPPs for each Use Case that in turn will minimize power dissipation and junction temperatures on-die. Therefore, it is a good engineering practice to perform a Frequency Analysis over the key power domains.

Frequency analysis and design methodology results in a PDN design that minimizes transient noise voltages at the processor’s input power balls. This allows the processor’s internal transistors to operate near the minimum specified operating supply voltage levels. To accomplish this one must evaluate how a voltage supply will change due to impedance variations over frequency. This analysis will focus on the decoupling capacitor network (VDD_xxx and VSS/Gnd rails) at the load. Sufficient capacitance with a distribution of self-resonant points will provide for an overall lower impedance vs frequency response for each power domain.

Decoupling components that are distant from their load’s input power are susceptible to encountering spreading loop inductance from the PCB design. Early analysis of each key power domain’s frequency response helps to determine basic decoupling capacitor placement, optimal footprint, layer assignment, and types needed for minimizing supply voltage noise/fluctuations due to switching and load current transients.

NOTE

Evaluation of loop inductance values for decoupling capacitors placed ~300mils closer to the load’s input power balls has shown an 18% reduction in loop inductance due to reduced distance.

- Decoupling capacitors must be carefully placed in order to minimize loop inductance impact on supply voltage transients. A real capacitor has characteristics not only of capacitance but also inductance and resistance.

Figure 8-6 shows the parasitic model of a real capacitor. A real capacitor must be treated as an RLC circuit with effective series resistance (ESR) and effective series inductance (ESL).

Figure 8-6. Characteristics of a Real Capacitor With ESL and ESR

The magnitude of the impedance of this series model is given as:

$$|Z| = \sqrt{ESR^2 + \left(\omega ESL - \frac{1}{\omega C} \right)^2}$$

where : $\omega = 2\pi f$

SPRS906_PCB_FREQ_02

Figure 8-7. Series Model Impedance Equation

Figure 8-8 shows the resonant frequency response of a typical capacitor with a self-resonant frequency of 55 MHz. The impedance of the capacitor is a combination of its series resistance and reactive capacitance and inductance as shown in the equation above.

Figure 8-8. Typical Impedance Profile of a Capacitor

Because a capacitor has series inductance and resistance that impacts its effectiveness, it is important that the following recommendations are adopted in placing capacitors on the PDN.

Wherever possible, mount the capacitor with the geometry that minimizes the mounting inductance and resistance. This was shown earlier in Figure 8-1. The capacitor mounting inductance and resistance values include the inductance and resistance of the pads, trace, and vias. Whenever possible, use footprints that have the lowest inductance configuration as shown in Figure 8-9

The length of a trace used to connect a capacitor has a big impact on parasitic inductance and resistance of the mounting. This trace must be as short and as wide as possible. wherever possible, minimize distance to supply and Gnd vias by locating vias nearby or within the capacitor's solder pad landing. Further improvements can be made to the mounting by placing vias to the side of capacitor lands or doubling the number of vias as shown in Figure 8-9. If the PCB manufacturing processes allow it and if cost-effective, via-in-pad (VIP) geometries are strongly recommended.

In addition to mounting inductance and resistance associated with placing a capacitor on the PCB, the effectiveness of a decoupling capacitor also depends on the spreading inductance and resistance that the capacitor sees with respect to the load. The spreading inductance and resistance is strongly dependent on the layer assignment in the PCB stack-up. Therefore, try to minimize X, Y and Z dimensions where the Z is due to PCB thickness (as shown in [Figure 8-9](#)).

From left (highest inductance) to right (lowest inductance) the capacitor footprint types shown in [Figure 8-9](#) are known as:

- 2-via, Skinny End Exit (2vSEE)
- 2-via, Wide End Exit (2vWEE)
- 2-via, Wide Side Exit (2vWSE)
- 4-via, Wide Side Exit (4vWSE)
- 2-via, In-Pad (2vIP)

SPRS906_PCB_FREQ_04

Figure 8-9. Capacitor Placement Geometry for Improved Mounting Inductance

NOTE

Evaluation of loop inductance values for decoupling capacitor footprints 2vSEE (worst case) vs 4vWSE (2nd best) has shown a 30% reduction in inductance when 4vWSE footprint was used in place of 2vSEE.

Decoupling Capacitor (Dcap) Strategy:

1. Use lowest inductance footprint and trace connection scheme possible for given PCB technology and layout area in order to minimize Dcap loop inductance to power pin as much as possible (see [Figure 8-9](#)).
2. Place Dcaps on “same-side” as component within their power plane outline to minimize “decoupling loop inductance”. Target distance to power pin should be less than ~500mils depending upon PCB layout characteristics (plane's layer assignment and solid nature). Use PI modeling CAD tool to verify minimum inductance for top vs bottom-side placement.
3. Place Dcaps on “opposite-side” as component within their power plane outline if “same-side” is not feasible or if distance to power pin is greater than ~500mils for top-side location. Use PI modeling CAD tool to verify minimum inductance for top vs bottom-side placement.
4. Use minimum 10mil trace width for all voltage and gnd planes connections (that is, Dcap pads, component power pins, etc.).

5. Place all voltage and gnd plane vias “as close as possible” to point of use (that is, Dcap pads, component power pins, etc.).
6. Use a “Power/Gnd pad/pin to via” ratio of 1:1 whenever possible. Do not exceed 2:1 ratio for small number of vias within restricted PCB areas (that is, underneath BGA components).

Frequency analysis for the CORE power domain has yielded the vdd Impedance vs Frequency response shown in [Section 8.3.8.2](#), vdd Example Analysis. As the example shows the overall CORE PDN R_{eff} meets the maximum recommended PDN resistance of 10m Ω .

8.2.5 System ESD Generic Guidelines

8.2.5.1 System ESD Generic PCB Guideline

Protection devices must be placed close to the ESD source which means close to the connector. This allows the device to subtract the energy associated with an ESD strike before it reaches the internal circuitry of the application board.

To help minimize the residual voltage pulse that will be built-up at the protection device due to its nonzero turn-on impedance, it is mandatory to route the ESD device with minimum stub length so that the low-resistive, low-inductive path from the signal to the ground is granted and not increasing the impedance between signal and ground.

For ESD protection array being railed to a power supply when no decoupling capacitor is available in close vicinity, consider using a decoupling capacitor ($\geq 0.1 \mu\text{F}$) tight to the VCC pin of the ESD protection. A positive strike will be partially diverted to this capacitance resulting in a lower residual voltage pulse.

Ensure that there is sufficient metallization for the supply of signals at the interconnect side (VCC and GND in [Figure 8-10](#)) from connector to external protection because the interconnect may see between 15-A to 30-A current in a short period of time during the ESD event.

SPRS906_PCB_ESD_01

Figure 8-10. Placement Recommendation for an ESD External Protection

NOTE

To ensure normal behavior of the ESD protection (unwanted leakage), it is better to ground the ESD protection to the board ground rather than any local ground (example isolated shield or audio ground).

8.2.5.2 Miscellaneous EMC Guidelines to Mitigate ESD Immunity

- Avoid running critical signal traces (clocks, resets, interrupts, control signals, and so forth) near PCB edges.
- Add high frequency filtering: Decoupling capacitors close to the receivers rather than close to the drivers to minimize ESD coupling.
- Put a ground (guard) ring around the entire periphery of the PCB to act as a lightning rod.
- Connect the guard ring to the PCB ground plane to provide a low impedance path for ESD-coupled current on the ring.
- Fill unused portions of the PCB with ground plane.
- Minimize circuit loops between power and ground by using multilayer PCB with dedicated power and ground planes.
- Shield long line length (strip lines) to minimize radiated ESD.
- Avoid running traces over split ground planes. It is better to use a bridge connecting the two planes in one area.

Figure 8-11. Trace Examples

- Always route signal traces and their associated ground returns as close to one another as possible to minimize the loop area enclosed by current flow:
 - At high frequencies current follows the path of least inductance.
 - At low frequencies current flows through the path of least resistance.

8.2.5.3 ESD Protection System Design Consideration

ESD protection system design consideration is covered in [Section 8.5.2.2](#) of this document. The following are additional considerations for ESD protection in a system.

- Metallic shielding for both ESD and EMI
- Chassis GND isolation from the board GND
- Air gap designed on board to absorb ESD energy
- Clamping diodes to absorb ESD energy
- Capacitors to divert ESD energy
- The use of external ESD components on the DP/DM lines may affect signal quality and are not recommended.

8.2.6 EMI / EMC Issues Prevention

All high speed digital integrated circuits can be sources of unwanted radiation, which can affect nearby sensitive circuitry and cause the final product to have radiated emissions levels above the limits allowed by the EMC regulations if some preventative steps are not taken.

Likewise, analog and digital circuits can be susceptible to interference from the outside world and picked up by the circuitry interconnections.

To minimize the potential for EMI/EMC issues, the following guidelines are recommended to be followed.

8.2.6.1 Signal Bandwidth

To evaluate the frequency of a digital signal, an estimated rule of thumb is to consider its bandwidth f_{BW} with respect to its rise time, t_R :

$$f_{BW} \approx 0.35 / t_R$$

This frequency actually corresponds to the break point in the signal spectrum, where the harmonics start to decay at 40 dB per decade instead of 20 dB per decade.

8.2.6.2 Signal Routing

8.2.6.2.1 Signal Routing—Sensitive Signals and Shielding

Keep radio frequency (RF) sensitive circuitry (like GPS receivers, GSM/WCDMA, Bluetooth/WLAN transceivers, frequency modulation (FM) radio) away from high speed ICs (the device, power and audio manager, chargers, memories, and so forth) and ideally on the opposite side of the PCB. For improved protection it is recommended to place these emission sources in a shield can. If the shield can have a removable lid (two-piece shield), ensure there is low contact impedance between the fence and the lid. Leave some space between the lid and the components under it to limit the high-frequency currents induced in the lid. Limit the shield size to put any potential shield resonances above the frequencies of interest; see [Figure 8-8](#), *Typical Impedance Profile of a Capacitor*.

8.2.6.2.2 Signal Routing—Outer Layer Routing

In case there is a need to use the outer layers for routing outside of shielded areas, it is recommended to route only static signals and ensure that these static signals do not carry any high-frequency components (due to parasitic coupling with other signals). In case of long traces, make provision for a bypass capacitor near the signal source.

Routing of high-frequency clock signals on outer layers, even for a short distance, is discouraged, because their emissions energy is concentrated at the discrete harmonics and can become significant even with poor radiators.

Coplanar shielding of traces on outer layers (placing ground near the sides of a track along its length) is effective only if the distance between the trace sides and the ground is smaller than the trace height above the ground reference plane. For modern multilayer PCBs this is often not possible, so coplanar shielding will not be effective. Do not route high-frequency traces near the periphery of the PCB, as the lack of a ground reference near the trace edges can increase EMI: see [Section 8.2.6.3](#), *Ground Guidelines*.

8.2.6.3 Ground Guidelines

8.2.6.3.1 PCB Outer Layers

Ideally the areas on the top and bottom layers of the PCB that are not enclosed by a shield should be filled with ground after the routing is completed and connected with an adequate number of vias to the ground on the inner ground planes.

8.2.6.3.2 Metallic Frames

Ensure that all metallic parts are well connected to the PCB ground (like LCD screens metallic frames, antennas reference planes, connector cages, flex cables grounds, and so forth). If using flex PCB ribbon cables to bring high-frequency signals off the PCB, ensure they are adequately shielded (coaxial cables or flex ribbons with a solid reference ground).

8.2.6.3.3 Connectors

For high-frequency signals going to connectors choose a fully shielded connector, if possible (for example, SD card connectors). For signals going to external connectors or which are routed over long distances, it is recommended to reduce their bandwidth by using low-pass filters (resistor, capacitor (RC) combinations or lossy ferrite inductors). These filters will help to prevent emissions from the board and can also improve the immunity from external disturbances.

8.2.6.3.4 Guard Ring on PCB Edges

The major advantage of a multilayer PCB with ground-plane is the ground return path below each and every signal or power trace.

As shown in [Figure 8-12](#) the field lines of the signal return to PCB ground as long as an infinite ground is available.

Traces near the PCB-edges do not have this infinite ground and therefore may radiate more than the others. Thus, signals (clocks) or power traces (core power) identified to be critical must not be routed in the vicinity of PCB edges, or, if not avoidable, must be accompanied by a guard ring on the PCB edge.

Figure 8-12. Field Lines of a Signal Above Ground

Figure 8-13. Guard Ring Routing

The intention of the guard ring is that HF-energy, that otherwise would have been emitted from the PCB edge, is reflected back into the board where it partially will be absorbed. For this purpose ground traces on the borders of all layers (including power layer) must be applied as shown in [Figure 8-13](#).

As these traces must have the same (HF-) potential as the ground plane they must be connected to the ground plane at least every 10 mm.

8.2.6.3.5 Analog and Digital Ground

For the optimum solution, the AGND and the DGND planes must be connected together at the power supply source in a same point. This ensures that both planes are at the same potential, while the transfer of noise from the digital to the analog domain is minimized.

8.3 Core Power Domains

This section provides boundary conditions and theoretical background to be applied as a guide for optimizing a PCB design. The decoupling capacitor and PDN characteristics tables shown below give recommended capacitors and PCB parameters to be followed for schematic and PCB designs. Board designs that meet the static and dynamic PDN characteristics shown in tables below will be aligned to the expected PDN performance needed to optimize SoC performance.

8.3.1 General Constraints and Theory

- Max PCB static/DC voltage drop (IRd) budget of **1.5% of supply voltage** when using PMICs **without remote sensing** as measured from PMIC's power inductor and filter capacitor node to Processor input including any ground return losses.
- Max PCB static/DC voltage drop (IRd) budget can be relaxed to **5% of supply voltage** when using PMICs **with remote sensing at the load** as measured from PMIC's power inductor and filter capacitor node to Device's supply input including any ground return losses.
- PMIC component DM and guidelines should be referenced for the following:
 - Routing remote feedback sensing to optimize per each SMPS's implementation
 - Selecting power filtering capacitor values and PCB placement.
- Max Effective Resistance (Reff) budget can range from **4 – 50mΩ** for key Device power rails not including ground returns depending upon maximum load currents and maximum DC voltage drop budget (as discussed above).
- Max Device supply input voltage difference budget of **5mV** under max current loading shall be maintained across all balls connected to a common power rail. This represents any voltage difference that may exist between a remote sense point to any power input.
- Max PCB Loop Inductance (LL) budget between Device's power inputs and local bulk and high frequency decoupling capacitors including ground returns should range from **0.4 – 2.5nH depending upon maximum transient load currents**.
- Max PCB dynamic/AC peak-to-peak transient noise voltage budgets between PMIC and Device including ground returns are as follows:
 - **+/-3% of nominal supply voltage** for frequencies below the PMIC bandwidth (typ Fpmic ~ 200kHz)
 - **+/-5% of nominal supply voltage** for frequencies between Fpmic to Fpcb (typ 20 – 100MHz)

- Max PCB Impedance (Z) vs Frequency (F) budget between Device's power inputs and PMIC's output power filter node including ground return is determined by applying the Frequency Domain Target Impedance Method to determine the PCB's maximum frequency of interest (Fpcb). Ideally a properly designed and decoupled PDN will exhibit smoothly increasing Z vs. F curve. There are 2 general regions of interest as can be seen in [Figure 8-14](#).
 - 1st area is from DC (0Hz) up to Fpmic (typ a few 100 kHz) where a PMIC's transient response characteristic (that is, Switching Freq, Compensation Loop BW) dominate. A PDN's Z is typically very low due to power filtering & bulk capacitor values when PDN has very low trace resistance (that is, good Reff performance). The goal is to maintain a smoothly increasing Z that is less than Zt1 over this low frequency range. This will ensure that a max transient current event will not cause a voltage drop more than the PMIC's current step response can support (typ 3%).
 - 2nd area is from Fpmic up to Fpcb (typ 20-100MHz) where a PCB's inherent characteristics (that is, parasitic capacitance, planar spreading inductances) dominate. A PDN's Z will naturally increase with frequency. At frequencies between Fpmic up to Fpcb, the goal is to maintain a smoothly increasing Z to be less than Zt2. This will ensue that the high frequency content of a max transient current event will not cause a voltage drop to be more than 5% of the min supply voltage.

$$Z_T = \frac{\text{Max Voltage Rail Drop}^{\text{Note1}}}{\text{Max Transient Current}^{\text{Note2}}}$$

$$Z_{T1} = \frac{(\text{Min Voltage}) \times (\text{PMIC's Step Responce})}{(\sim 50\% \text{ of Max DC Current})} = \frac{V_{\text{min}} \times 3\%(\text{typ})}{I_{\text{max}} \times \sim 50\%}$$

$$Z_{T2} = \frac{(\text{Min Voltage}) \times (\text{High-Freq Transient Noise})}{(\sim 50\% \text{ of Max DC Current})} = \frac{V_{\text{min}} \times 5\%(\text{typ})}{I_{\text{max}} \times \sim 50\%}$$

2. Typical max transient current is defined as 50% of max current draw possible.

8.3.2 Voltage Decoupling

Recommended power supply decoupling capacitors main characteristics for commercial products whose ambient temperature is not to exceed +85C are shown in table below:

(1) Minimum value for each PCB capacitor: 100 nF.

(2) Among the different capacitors, 470 nF is recommended (not required) to filter at 5-MHz to 10-MHz frequency range.

(3) In comparison with the EIA Class 1 dielectrics, Class 2 dielectric capacitors tend to have severe temperature drift, high dependence of capacitance on applied voltage, high voltage coefficient of dissipation factor, high frequency coefficient of dissipation, and problems with aging due to gradual change of crystal structure. Aging causes gradual exponential loss of capacitance and decrease of dissipation factor.

Recommended power supply decoupling capacitors main characteristics for automotive products are shown in table below:

(2) Among the different capacitors, 470 nF is recommended (not required) to filter at 5-MHz to 10-MHz frequency range.

8.3.3 Static PDN Analysis

One power net parameter derived from a PCB's PDN static analysis is the Effective Resistance (R_{eff}). This is the total PCB power net routing resistance that is the sum of all the individual power net segments used to deliver a supply voltage to the point of load and includes any series resistive elements (that is, current sensing resistor) that may be installed between the PMIC outputs and Processor inputs.

8.3.4 Dynamic PDN Analysis

Three power net parameters derived from a PCB's PDN dynamic analysis are the Loop Inductance (LL), Impedance (Z) and PCB Frequency of Interest (F_{pcb}).

- LL values shown are the recommended max PCB trace inductance between a decoupling capacitor's power supply and ground reference terminals when viewed from the decoupling capacitor with a "theoretical shorted" applied across the Processor's supply inputs to ground reference.
- Z values shown are the recommended max PCB trace impedances allowed between F_{pmic} up to F_{pcb} frequency range that limits transient noise drops to no more than 5% of min supply voltage during max transient current events.
- F_{pcb} (Frequency of Interest) is defined to be a power rail's max frequency after which adding a reasonable number of decoupling capacitors no longer significantly reduces the power rail impedance below the desired impedance target (Z_{t2}). This is due to the dominance of the PCB's parasitic planar spreading and internal package inductances.

8.3.5 Power Supply Mapping

[TPS65917](#) or [TPS659039](#) are the Power Management ICs (PMICs) that should be used for the Device designs. TI requires use of these PMICs for the following reasons:

- TI has validated their use with the Device
- Board level margins including transient response and output accuracy are analyzed and optimized for the entire system
- Support for power sequencing requirements (refer to [Section 5.10 Power Supply Sequences](#))
- Support for Adaptive Voltage Scaling (AVS) Class 0 requirements, including TI provided software

Whenever we allow for combining of rails mapped on any of the SMPSes, the PDN guidelines that are the most stringent of the rails combined should be implemented for the particular supply rail.

It is possible that some voltage domains on the device are unused in some systems. In such cases, to ensure device reliability, it is still required that the supply pins for the specific voltage domains are connected to some core power supply output.

These unused supplies though can be combined with any of the core supplies that are used (active) in the system. For example if IVA and GPU domains are not used, they can be combined with the CORE domain, thereby having a single power supply driving the combined CORE, IVA and GPU domains.

For the combined rail, the following relaxations do apply:

- The AVS voltage of active rail in the combined rail needs to be used to set the power supply
- The decoupling capacitance should be set according to the active rail in the combined rail

[Table 8-4](#) illustrates the approved and validated power supply connections to the Device for the SMPS outputs of the TPS659039 PMIC.

- (1) Power consumption is highly application-specific. Separate analysis must be performed to ensure output current ratings (average and peak) is within the limits of the PMIC for all rails of the device.
- (2) Dual phase (SMPS1/2) can be used as long as the peak power consumption is maintained below the SMPS1/2 capacity
 - a. For the latest rated output current specifications for the [TPS659039](#) device, please refer to the PMIC data manual.
 - b. MPU power consumption is highly system dependent. A detailed power consumption estimate must be performed to confirm compatibility. Example: Single vs Dual MPU, OPP_NOM vs OPP_OD vs OPP_HIGH, TPS659039 configured with $V_I \geq 3V$ vs $V_I < 3V$, etc. Contact your TI representative for details.
- (3) Refer to the PMIC data manual for the latest [TPS659039](#) specifications.
- (4) A product's maximum ambient temperature, thermal system design & heat spreading performance could limit the maximum power dissipation below the full PMIC capacity in order to not exceed recommended SoC max Tj.

- (1) Refer to the [TPS65917 Data Manual](#) for exact current rating limitations, including assumed V_{IN} and other parameters. Values provided in this table are for comparison purposes.
- (2) DSP, EVE, GPU, and IVAHD power consumption is highly application-specific. Separate analysis must be performed to ensure output current ratings (average and peak) is within the limits of the PMIC. VDD only supports OPP_NOM.
- (3) Highly application-specific. Separate analysis must be performed to ensure average and peak power is within the limits of the PMIC.
- (4) Furthermore, if SMPS5 is used for DDR power, both total memory + SoC power must be within the PMIC limits.

8.3.6 DPLL Voltage Requirement

The voltage input to the DPLLs has a low noise requirement. Board designs should supply these voltage inputs with a low noise LDO to ensure they are isolated from any potential digital switching noise. The TPS65917 PMIC LDOLN output is specifically designed to meet this low noise requirement.

NOTE

For more information about Input Voltage Sources, see [Section 6.2 DPLLs, DLLs Specifications](#).

[Table 8-4](#) present the voltage inputs that supply the DPLLs.

8.3.7 Loss of Input Power Event

A few key PDN design items needed to enable a controlled and compliant SoC power down sequence for a “Loss of Input Power” event are:

- “Loss of Input Power” early warning.
 - TI EVM and Reference Design Study SCHs and PDNs achieve this by using the First Stage Converter’s (that is, LM536033-Q1) Power Good status output to enable and disable the Second Stage PMIC devices (that is, TPS65917/919, LP8733, and LP8732). If a different First Stage Converter is used, care must be taken to ensure an adequate “PG_Status” or “Vbatt_Status” signal is provided that can disable Second Stage PMIC to begin a controlled and compliant SoC power down sequence. The total elapsed time from asserting “PG_Status” low until SoC’s PMIC input voltage reaches minimum level of 2.75 V should be minimum of 1.5 ms and 2 ms preferred.
- Maximize discharge time of First Stage Vout (VSYS_3V3 power rail = input voltage to SoC PMIC).
 - TI EVM and Reference Design Study SCHs and PDNs achieve this by opening an in-line load switch immediately upon “PG_Status” low assertion in order to remove the SoC’s 3.3 V IO load current from VSYS_3V3. This will extend the VSYS_3V3 power rail’s discharge time in order to maximize elapsed time for allowing SoC PMIC to execute a controlled and compliant power down sequence. Care should be taken to either disable or isolate any additional peripheral components that may be loading the VSYS_3V3 rail as well.
- Sufficient bulk decoupling capacitance on the First Stage Vout (VSYS_3V3 per PDN) that allows for desired 1.5 – 2 ms elapsed time as described above.
 - TI EVM and Reference Design Study SCHs and PDNs achieve this by using 200 μ F of total capacitance on VSYS_3V3. The First Stage Converter (that is, LM536033-Q1) can typically drive a max of 400 μ F to help extend VSYS_3V3 discharge time for a compliant SoC power down sequence.
- Optimizing the Second Stage SoC PMIC’s OTP settings that determines SoC power up and down sequences and total elapsed time needed for a controlled sequence.
 - TI EVM and Reference Design Study SCHs and PDNs achieve this by using optimized OTPs per the SCH and components used. The definition of these OTPs is captured in the detailed timing diagrams for both power up and down sequences. The PDN diagram typically shows a recommended PMIC OTP ID based upon the SoC and DDR memory types.

8.3.8 Example PCB Design

The following sections describe an example PCB design and its resulting PDN performance for the vdd_mpu key processor power domain.

NOTE

Materials presented in this section are based on generic PDN analysis on PCB boards and are not specific to systems integrating the Device.

8.3.8.1 Example Stack-up

Layer Assignments:

- Layer Top: Signal and Segmented Power Plane
 - Processor and PMIC components placed on Top-side
- Layer 2: Gnd Plane1
- Layer 3: Signals
- Layer n: Power Plane1
- Layer n+1: Power Plane 2
- Layer n+2: Signal
- Layer n+3: Gnd Plane2
- Layer Bottom: Signal and Segmented Power Planes
 - Decoupling caps, etc.

Via Technology: Through-hole

Copper Weight:

- ½ oz for all signal layers.
- 1-2oz for all power plane for improved PCB heat spreading.

8.3.8.2 vdd Example Analysis

Maximum acceptable PCB resistance (R_{eff}) between the PMIC and Processor input power balls should not exceed 10mΩ.

Maximum decoupling capacitance loop inductance (LL) between Processor input power balls and decoupling capacitances should not exceed 2.0nH (ESL NOT included)

Impedance target for key frequency of interest between Processor input power balls and PMIC's SMPS output power balls should not exceed 57mΩ at 20MHz.

Dynamic analysis of this PCB design for the CORE power domain determined the vdd decoupling capacitor loop inductance and impedance vs frequency analysis shown below. As you can see, the loop inductance values ranged from 0.97 –1.75nH and were less than maximum 2.0nH recommended.

NOTE

Comparing loop inductances for capacitors at different distances from the SoC’s input power balls shows an 18% reduction for caps placed closer. This was derived by averaging the inductances for the 3 caps with distances over 800mils (Avg LL = 1.33nH) vs the 3 caps with distances less than 600mils (Avg LL = 1.096nH).

8.4 Single-Ended Interfaces

8.4.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVCMOS interfaces.

- Line spacing:
 - For a line width equal to W , the spacing between two lines must be $2W$, at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the device package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (see [Figure 8-19](#)).

Figure 8-19. Ground Guard Illustration

- Length matching (unless otherwise specified):
 - For bus or traces at frequencies less than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
 - For bus or traces at frequencies greater than 10 MHz, the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.
- Characteristic impedance
 - Unless otherwise specified, the characteristic impedance for single-ended interfaces is recommended to be between 35- Ω and 65- Ω .
- Multiple peripheral support
 - For interfaces where multiple peripherals have to be supported in the star topology, the length of each branch has to be balanced. Before closing the PCB design, it is highly recommended to verify signal integrity based on simulations including actual PCB extraction.

8.4.2 QSPI Board Design and Layout Guidelines

The following section details the routing guidelines that must be observed when routing the QSPI interfaces.

- The `qspi1_sclk` output signal must be looped back into the `qspi1_rtclk` input.
- The signal propagation delay from the `qspi1_sclk` ball to the QSPI device CLK input pin (A to C) must be approximately equal to the signal propagation delay from the QSPI device CLK pin to the `qspi1_rtclk` ball (C to D).
- The signal propagation delay from the QSPI device CLK pin to the `qspi1_rtclk` ball (C to D) must be approximately equal to the signal propagation delay of the control and data signals between the QSPI device and the SoC device (E to F, or F to E).
- The signal propagation delay from the `qspi1_sclk` signal to the series terminators ($R2 = 10 \Omega$) near the QSPI device must be $< 450\text{pS}$ ($\sim 7\text{cm}$ as stripline or $\sim 8\text{cm}$ as microstrip)
- 50 Ω PCB routing is recommended along with series terminations, as shown in [Figure 8-20](#).

- Propagation delays and matching:
 - A to C = C to D = E to F.
 - Matching skew: < 60pS
 - A to B < 450pS
 - B to C = as small as possible (<60pS)

8.5 Differential Interfaces

8.5.1 General Routing Guidelines

To maximize signal integrity, proper routing techniques for differential signals are important for high speed designs. The following general routing guidelines describe the routing guidelines for differential lanes and differential signals.

- As much as possible, no other high-frequency signals must be routed in close proximity to the differential pair.
- Must be routed as differential traces on the same layer. The trace width and spacing must be chosen to yield the differential impedance value recommended.
- Minimize external components on differential lanes (like external ESD, probe points).
- Through-hole pins are not recommended.
- Differential lanes mustn't cross image planes (ground planes).
- No sharp bend on differential lanes.
- Number of vias on the differential pairs must be minimized, and identical on each line of the differential pair. In case of multiple differential lanes in the same interface, all lines should have the same number of vias.

- Shielded routing is to be promoted as much as possible (for instance, signals must be routed on internal layers that are inside power and/or ground planes).

8.5.2 USB 2.0 Board Design and Layout Guidelines

This section discusses schematic guidelines when designing a universal serial bus (USB) system.

8.5.2.1 Background

Clock frequencies generate the main source of energy in a USB design. The USB differential DP/DM pairs operate in high speed mode at 480 Mbps. System clocks can operate at 12 MHz, 48 MHz, and 60 MHz. The USB cable can behave as a monopole antenna; take care to prevent RF currents from coupling onto the cable.

When designing a USB board, the signals of most interest are:

- Device interface signals: Clocks and other signal/data lines that run between devices on the PCB.
- Power going into and out of the cable: The USB connector socket pin 1 (VBUS) may be heavily filtered and need only pass low frequency signals of less than ~100 KHz. The USB socket pin 4 (analog ground) must be able to return the current during data transmission, and must be filtered sparingly.
- Differential twisted pair signals going out on cable, DP and DM: Depending upon the data transfer rate, these device terminals can have signals with fundamental frequencies of 240 MHz (high speed), 6 MHz (full speed), and 750 kHz (low speed).
- External crystal circuit (device terminals XI and X0): 12 MHz, 19.2 MHz, 24 MHz, and 48 MHz fundamental. When using an external crystal as a reference clock, a 24 MHz and higher crystal is highly recommended.

8.5.2.2 USB PHY Layout Guide

The following sections describe in detail the specific guidelines for USB PHY Layout.

8.5.2.2.1 General Routing and Placement

Use the following routing and placement guidelines when laying out a new design for the USB physical layer (PHY). These guidelines help minimize signal quality and electromagnetic interference (EMI) problems on a four-or-more layer evaluation module (EVM).

- Place the USB PHY and major components on the un-routed board first. For more details, see [Section 8.5.2.2.3](#).
- Route the high speed clock and high speed USB differential signals with minimum trace lengths.
- Route the high speed USB signals on the plane closest to the ground plane, whenever possible.
- Route the high speed USB signals using a minimum of vias and corners. This reduces signal reflections and impedance changes.
- When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn. This reduces reflections on the signal traces by minimizing impedance discontinuities.
- Do not route USB traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or IC's that use or duplicate clock signals.
- Avoid stubs on the high speed USB signals because they cause signal reflections. If a stub is unavoidable, then the stub should be less than 200 mils.
- Route all high speed USB signal traces over continuous planes (V_{CC} or GND), with no interruptions. Avoid crossing over anti-etch, commonly found with plane splits.

8.5.2.2.2 Specific Guidelines for USB PHY Layout

The following sections describe in detail the specific guidelines for USB PHY Layout.

8.5.2.2.2.1 Analog, PLL, and Digital Power Supply Filtering

To minimize EMI emissions, add decoupling capacitors with a ferrite bead at power supply terminals for the analog, phase-locked loop (PLL), and digital portions of the chip. Place this array as close to the chip as possible to minimize the inductance of the line and noise contributions to the system. An analog and digital supply example is shown in Figure 8-21. In case of multiple power supply pins with the same function, tie them up to a single low-impedance point in the board and then add the decoupling capacitors, in addition to the ferrite bead. This array of caps and ferrite bead improve EMI and jitter performance. Take both EMI and jitter into account before altering the configuration.

SPRS906_PCB_USB20_01

Figure 8-21. Suggested Array Capacitors and a Ferrite Bead to Minimize EMI

Consider the recommendations listed below to achieve proper ESD/EMI performance:

- Use a 0.01 µF cap on each cable power VBUS line to chassis GND close to the USB connector pin.
- Use a 0.01 µF cap on each cable ground line to chassis GND next to the USB connector pin.
- If voltage regulators are used, place a 0.01 µF cap on both input and output. This is to increase the immunity to ESD and reduce EMI. For other requirements, see the device-specific datasheet.

8.5.2.2.2.2 Analog, Digital, and PLL Partitioning

If separate power planes are used, they must be tied together at one point through a low-impedance bridge or preferably through a ferrite bead. Care must be taken to capacitively decouple each power rail close to the device. The analog ground, digital ground, and PLL ground must be tied together to the low-impedance circuit board ground plane.

8.5.2.2.2.3 Board Stackup

Because of the high frequencies associated with the USB, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown in Figure 8-22.

SPRS906_PCB_USB20_02

Figure 8-22. Four-Layer Board Stack-Up

The majority of signal traces should run on a single layer, preferably SIGNAL1. Immediately next to this layer should be the GND plane, which is solid with no cuts. Avoid running signal traces across a split in the ground or power plane. When running across split planes is unavoidable, sufficient decoupling must be used. Minimizing the number of signal vias reduces EMI by reducing inductance at high frequencies.

8.5.2.2.2.4 Cable Connector Socket

Short the cable connector sockets directly to a small chassis ground plane (GND *strap*) that exists immediately underneath the connector sockets. This shorts EMI (and ESD) directly to the chassis ground before it gets onto the USB cable. This etch plane should be as large as possible, but all the conductors coming off connector pins 1 through 6 must have the board signal GND plane run under. If needed, scoop out the chassis GND strap etch to allow for the signal ground to extend under the connector pins. Note that the etches coming from pins 1 and 4 (VBUS power and GND) should be wide and via-ed to their respective planes as soon as possible, respecting the filtering that may be in place between the connector pin and the plane. See [Figure 8-23](#) for a schematic example.

Place a ferrite in series with the cable shield pins near the USB connector socket to keep EMI from getting onto the cable shield. The ferrite bead between the cable shield and ground may be valued between $10\ \Omega$ and $50\ \Omega$ at 100 MHz; it should be resistive to approximately 1 GHz. To keep EMI from getting onto the cable bus power wire (a very large antenna) a ferrite may be placed in series with cable bus power, VBUS, near the USB connector pin 1. The ferrite bead between connector pin 1 and bus power may be valued between $47\ \Omega$ and approximately $1000\ \Omega$ at 100 MHz. It should continue being resistive out to approximately 1 GHz, as shown in [Figure 8-23](#).

Figure 8-23. USB Connector

8.5.2.2.2.5 Clock Routings

To address the system clock emissions between devices, place a ~ 10 to $130\ \Omega$ resistor in series with the clock signal. Use a trial and error method of looking at the shape of the clock waveform on a high speed oscilloscope and of tuning the value of the resistance to minimize waveform distortion. The value on this resistor should be as small as possible to get the desired effect. Place the resistor close to the device generating the clock signal. If an external crystal is used, follow the guidelines detailed in the [Selection and Specification of Crystals for Texas Instruments USB 2.0 Devices](#).

When routing the clock traces from one device to another, try to use the 3W spacing rule. The distance from the center of the clock trace to the center of any adjacent signal trace should be at least three times the width of the clock trace. Many clocks, including slow frequency clocks, can have fast rise and fall times. Using the 3W rule cuts down on crosstalk between traces. In general, leave space between each of the traces running parallel between the devices. Avoid using right angles when routing traces to minimize the routing distance and impedance discontinuities. For further protection from crosstalk, run guard traces beside the clock signals (GND pin to GND pin), if possible. This lessens clock signal coupling, as shown in Figure 8-24.

SPRS906_PCB_USB20_04

Figure 8-24. 3W Spacing Rule

8.5.2.2.2.6 Crystals/Oscillator

Keep the crystal and its load capacitors close to the USB PHY pins, X1 and X0 (see Figure 8-25). Note that frequencies from power sources or large capacitors can cause modulations within the clock and should not be placed near the crystal. In these instances, errors such as dropped packets occur. A placeholder for a resistor, in parallel with the crystal, can be incorporated in the design to assist oscillator startup.

Power is proportional to the current squared. The current is $I = C \cdot dv/dt$, because dv/dt is a function of the PHY, current is proportional to the capacitive load. Cutting the load to 1/2 decreases the current by 1/2 and the power to 1/4 of the original value. For more details on crystal selection, see the [Selection and Specification of Crystals for Texas Instruments USB 2.0 Devices](#).

SPRS906_PCB_USB20_05

Figure 8-25. Power Supply and Clock Connection to the USB PHY

8.5.2.2.2.7 DP/DM Trace

Place the USB PHY as close as possible to the USB 2.0 connector. The signal swing during high speed operation on the DP/DM lines is relatively small ($400 \text{ mV} \pm 10\%$), so any differential noise picked up on the twisted pair can affect the received signal. When the DP/DM traces do not have any shielding, the traces tend to behave like an antenna and picks up noise generated by the surrounding components in the environment. To minimize the effect of this behavior:

- DP/DM traces should always be matched lengths and must be no more than 4 inches in length; otherwise, the eye opening may be degraded (see Figure 8-26).

- Route DP/DM traces close together for noise rejection on differential signals, parallel to each other and within two mils in length of each other. The measurement for trace length must be started from device's balls.
- A high speed USB connection is made through a shielded, twisted pair cable with a differential characteristic impedance of $90 \Omega \pm 15\%$. In layout, the impedance of DP and DM should each be $45 \Omega \pm 10\%$.
- DP/DM traces should not have any extra components to maintain signal integrity. For example, traces cannot be routed to two USB connectors.

SPRS906_PCB_USB20_06

Figure 8-26. USB PHY Connector and Cable Connector

8.5.2.2.2.8 DP/DM Vias

When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points on twisted pair lines; through-hole pins are not recommended.

8.5.2.2.2.9 Image Planes

An image plane is a layer of copper (voltage plane or ground plane), physically adjacent to a signal routing plane. Use of image planes provides a low impedance, shortest possible return path for RF currents. For a USB board, the best image plane is the ground plane because it can be used for both analog and digital circuits.

- Do not route traces so they cross from one plane to the other. This can cause a broken RF return path resulting in an EMI radiating loop as shown in [Figure 8-27](#). This is important for higher frequency or repetitive signals. Therefore, on a multi-layer board, it is best to run all clock signals on the signal plane above a solid ground plane.
- Avoid crossing the image power or ground plane boundaries with high speed clock signal traces immediately above or below the separated planes. This also holds true for the twisted pair signals (DP, DM). Any unused area of the top and bottom signal layers of the PCB can be filled with copper that is connected to the ground plane through vias.

SPRS906_PCB_USB20_07

Figure 8-27. Do Not Cross Plane Boundaries

- Do not overlap planes that do not reference each other. For example, do not overlap a digital power plane with an analog power plane as this produces a capacitance between the overlapping areas that could pass RF emissions from one plane to the other, as shown in [Figure 8-28](#).

SPRS906_PCB_USB20_08

Figure 8-28. Do Not Overlap Planes

- Avoid image plane violations. Traces that route over a slot in an image plane results in a possible RF return loop, as shown in [Figure 8-29](#).

Figure 8-29. Do Not Violate Image Planes

8.5.2.2.2.10 Power Regulators

Switching power regulators are a source of noise and can cause noise coupling if placed close to sensitive areas on a circuit board. Therefore, the switching power regulator should be kept away from the DP/DM signals, the external clock crystal (or clock oscillator), and the USB PHY.

8.5.3 USB 3.0 Board Design and Layout Guidelines

This section provides the timing specification for the USB3.0 (USB1 in the device) interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. TI has performed the simulation and system design work to ensure the USB3.0 interface requirements are met. The design rules stated within this document are targeted at DEVICE mode electrical compliance. HOST mode and/or systems that do not include the 3m USB cable and far-end 11-inch PCB trace required by DEVICE mode compliance testing may not need the complete list of optimizations shown in this document; however, applying these optimizations to HOST mode systems will lead to optimal DEVICE mode performance.

8.5.3.1 USB 3.0 interface introduction

The USB 3.0 has two unidirectional differential pairs: TXp/TXn pair and RXp/RXn pair. AC coupling caps are needed on the board for TX traces.

NOTE

ESD components should be on a PCB layer next to a system GND plane layer so the inductance of the via to GND will be minimal.

If vias are used, place the vias near the AC Caps or CMFs and under the SoC BGA, if necessary.

8.5.3.2 USB 3.0 General routing rules

Some general routing guidelines regarding USB 3.0:

- Avoid crossing splits reference plane(s).
- Shorter trace length is preferred.
- Minimize the via usage and layer transition
- Keep large spacing between TX and RX pairs.
- Intra-lane delay mismatch between DP and DM less than 1ps. Same for RXp and RXn.
- Distance between common mode filter (CMF) and ESD protection device should be as short as possible
- Distance between ESD protection device and USB connector should be as short as possible.
- Distance between AC capacitors (TX only) and CMF should be as short as possible.
- USB 3.0 signals should always be routed over an adjacent ground plane.

Table 8-10 and Table 8-11 present routing specification and recommendations for USB1 in the device.

8.5.4 HDMI Board Design and Layout Guidelines

This section provides the timing specification for the HDMI interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. TI has performed the simulation and system design work to ensure the HDMI interface requirements are met. The design rules stated within this document are targeted at resolutions less than or equal to 1080p60 with 8-bit color; deep color (10-bit) requires further signal integrity optimization.

8.5.4.1 HDMI Interface Schematic

The HDMI bus is separated into three main sections (HDMI Ethernet and the optional Audio Return Channel are not specifically supported by this Device):

1. Transition Minimized Differential Signaling (TMDS) high speed digital video interface
2. Display Data Channel (I2C bus for configuration and status exchange between two devices)
3. Consumer Electronics Control (optional) for remote control of connected devices.

The DDC and CEC are low speed interfaces, so nothing special is required for PCB layout of these signals.

The TMDS channels are high speed differential pairs and therefore require the most care in layout. Specifications for TMDS layout are below.

Figure 8-33 shows the HDMI interface schematic.

Figure 8-33. HDMI Interface High Level Schematic

Figure 8-34 presents placement diagram for HDMI interface.

| INTERFACE | DEVICE | SUPPLIER | PART NUMBER |
|-----------|--------|----------|---------------|
| HDMI | ESD | TI | TPD1E05U06 |
| | CMF | Murata | DLW21SN900HQ2 |

8.5.4.2 TMDS General Routing Guidelines

The TMDS signals are high speed differential pairs. Care must be taken in the PCB layout of these signals to ensure good signal integrity.

The TMDS differential signal traces must be routed to achieve 100 Ohms (+/- 10%) differential impedance and 60 ohms (+/-10%) single ended impedance. Single ended impedance control is required because differential signals can't be closely coupled on PCBs and therefore single ended impedance becomes important.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 60 ohms impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations don't affect impedance as much, therefore it's easier to maintain accurate impedance over the length of the signal. The wider traces also show reduced skin effect and therefore often result in better signal integrity.

Some general routing guidelines regarding TMDS:

- Avoid crossing splits reference plane(s).
- Shorter trace length is preferred.
- Distance between common mode filter (CMF) and ESD protection device should be as short as possible
- Distance between ESD protection device and HDMI connector should be as short as possible.

Table 8-13 shows the routing specifications for the TMDS signals.

Table 8-13. TMDS Routing Specifications

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|------|------|------|----------|
| Device balls to HDMI header trace length | | | 4000 | Mils |
| Skew within a differential pair | | 3 | 5 | Mils |
| Number of stubs allowed on TMDS traces | | | 0 | stubs |
| TMDS pair differential impedance | 90 | 100 | 110 | Ω |
| TMDS single-ended impedance | 54 | 60 | 66 | Ω |
| Number of vias on each TMDS trace | | | 0 | Vias |
| TMDS differential pair to any other trace spacing ^{(1) (2) (3)} | 2xDS | 3xDS | | Mils |
| Number of ground plane cuts allowed within HDMI routing region (except for specific ground carving as explained in this document) | | | 0 | Cuts |
| Number of layers between HDMI routing region and reference ground plane | | | 0 | Layers |
| PCB trace width | | 4.4 | | Mils |

(1) DS = differential spacing of the traces.

(2) Exceptions may be necessary in the SoC package BGA area.

(3) GND guard-bands may be closer, but should not be allowed to affect the impedance of the differential pair routing. GND guard-bands to isolate HDMI differential pairs from all other signals is recommended.

8.5.4.3 TPD5S115

The TPD5S115 is an integrated HDMI companion chip solution. The device provides a regulated 5 V output (5VOUT) for sourcing the HDMI power line. The TPD5S115 exceeds the IEC61000-4-2 (Level 4) ESD protection level.

8.5.4.4 HDMI ESD Protection Device (Required)

Interfaces that connect to a cable such as HDMI generally require more ESD protection than can be built into the processor’s outputs. Therefore this HDMI interface requires the use of an ESD protection chip to provide adequate ESD.

When selecting an ESD protection chip, choose the lowest capacitance ESD protection available to minimize signal degradation. In no case should be ESD protection circuit capacitance be more than 5pF.

TI manufactures these devices that provide ESD protection for HDMI signals such as the TPDxE05U06. For more information see the ti.com website.

8.5.5 SATA Board Design and Layout Guidelines

The device provides one SATA port. This section provides the timing specification for the SATA interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. TI has performed the simulation and system design work to ensure the SATA interface requirements are met.

8.5.5.4 Routing Specifications

The SATA data signal traces must be routed to achieve 100 Ohms (+/-10%) differential impedance and 60 ohms (+/-10%) single ended impedance. The signal ended impedance is required because differential signals can't be closely coupled on PCBs and therefore single ended impedance becomes important. 60 ohms is chosen for the single ended impedance to minimize problems caused by too low an impedance.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 100 ohms differential and 60 ohms single ended impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

Table 8-19 shows the routing specifications for the SATA data signals.

Table 8-19. SATA Routing Specifications

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|---------------------|-----|---------------------|----------|
| SATA signal trace length (device balls to SATA connector) | | | 3050 ⁽¹⁾ | Mils |
| Differential pair trace skew matching | | | 5 | Mils |
| Number of stubs allowed on SATA traces ⁽²⁾ | | | 0 | stubs |
| TX/RX pair differential impedance | 90 | 100 | 110 | Ω |

8.5.6 PCIe Board Design and Layout Guidelines

The PCIe interface on the device provides support for a 5.0 Gbps lane with polarity inversion.

8.5.6.1 PCIe Connections and Interface Compliance

The PCIe interface on the device is compliant with the PCIe revision 3.0 specification. Please refer to the PCIe specifications for all connections that are described in it. Those recommendations are more descriptive and exhaustive than what is possible here.

The use of PCIe compatible bridges and switches is allowed for interfacing with more than one other processor or PCIe device.

8.5.6.1.1 Coupling Capacitors

AC coupling capacitors are required on the transmit data pair. [Table 8-21](#) shows the requirements for these capacitors.

Table 8-21. PCIe AC Coupling Capacitors Requirements

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|-----|------|------|-----------------------|
| PCIe AC coupling capacitor value | 90 | 100 | 110 | nF |
| PCIe AC coupling capacitor package size | | 0402 | 0603 | EIA ⁽¹⁾⁽²⁾ |

(1) EIA LxW units, that is, a 0402 is a 40x20 mils surface mount capacitor.

(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side by side.

8.5.6.1.2 Polarity Inversion

The PCIe specification requires polarity inversion support. This means for layout purposes, polarity is unimportant because each signal can change its polarity on die inside the chip. This means polarity within a lane is unimportant for layout.

8.5.6.2 Non-standard PCIe connections

The following sections contain suggestions for any PCIe connection that is NOT described in the official PCIe specification, such as an on-board Device to Device or Device to other PCIe compliant processor connection.

8.5.6.2.1 PCB Stackup Specifications

[Table 8-22](#) shows the stackup and feature sizes required for these types of PCIe connections.

Table 8-22. PCIe PCB Stackup Specifications

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|--------|
| Number of ground plane cuts allowed within PCIe routing region | - | - | 0 | Cuts |
| Number of layers between PCIe routing area and reference plane ⁽¹⁾ | - | - | 0 | Layers |
| PCB Routing clearance | | 4 | | Mils |
| PCB Trace width | | 4 | | Mils |

(1) A reference plane may be a ground plane or the power plane referencing the PCIe signals.

8.5.6.2.2 Routing Specifications

8.5.6.2.2.1 Impedance

The PCIe data signal traces must be routed to achieve 100- Ω ($\pm 10\%$) differential impedance and 60- Ω ($\pm 10\%$) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. These requirements are the same as those recommended in the PCIe Motherboard Checklist 1.0 document, available from PCI-SIG (www.pcisig.com).

These impedances are impacted by trace width, trace spacing, distance between signals and referencing planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs result in as close to 100- Ω differential impedance and 60- Ω single-ended impedance as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met. See [Table 8-23](#) below.

8.5.6.2.2.2 Differential Coupling

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production. For PCBs with very tight space limitations (which are usually small) this can work, but for most PCBs, the loosely coupled option is probably best.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier (because each trace is not so fixed in position relative to the other), and trace width variations don't affect impedance as much, therefore it's easier to maintain an accurate impedance over the length of the signal. For longer routes, the wider traces also show reduced skin effect and therefore often result in better signal integrity with a larger eye diagram opening.

[Table 8-23](#) shows the routing specifications for the PCIe data signals.

Table 8-23. PCI-E Routing Specifications

| PARAMETER | MIN | TYP | MAX | UNIT |
|---|---------------------|-----|---------------------|----------|
| PCIe signal trace length (device balls to PCIe connector) | | | 4700 ⁽¹⁾ | Mils |
| Differential pair trace matching | | | 5 ⁽²⁾ | Mils |
| Number of stubs allowed on PCIe traces ⁽³⁾ | | | 0 | stubs |
| TX/RX pair differential impedance | 90 | 100 | 110 | Ω |
| TX/RX single-ended impedance | 54 | 60 | 66 | Ω |
| Pad size of vias on PCIe trace | | | 25 ⁽⁴⁾ | Mils |
| Hole size of vias on PCIe trace | | | 14 | Mils |
| Number of vias on each PCIe trace | | | 0 | Vias |
| PCIe differential pair to any other trace spacing | 2xDS ⁽⁵⁾ | | | |

(1) Beyond this, signal integrity may suffer.

(2) For example, RXP0 within 5 Mils of RXN0.

(3) Inline pads may be used for probing.

(4) 35-Mil antipad maximum recommended.

(5) DS = differential spacing of the PCIe traces.

| Item | Description | Reason |
|-----------------|-------------|--|
| ESD part number | None | ESD suppression generally not used on PCIe |

8.5.6.2.2.3 Pair Length Matching

Each signal in the differential pair should be matched to within 5 mils of its matching differential signal. Length matching should be done as close to the mismatch as possible.

8.5.6.3 LJC_B_REFN/P Connections

A Common Refclk Rx Architecture is required to be used for the device PCIe interface. Specifically, two modes of Common Refclk Rx Architecture are supported:

- **External REFCLK Mode:** An common external 100MHz clock source is distributed to both the Device and the link partner
- **Output REFCLK Mode:** A 100MHz HCSL clock source is output by the device and used by the link partner

In **External REFCLK Mode**, a high-quality, low-jitter, differential HCSL 100MHz clock source compliant to the PCIe REFCLK AC Specifications should be provided on the Device's `ljcb_clkn` / `ljcb_clkp` inputs. Alternatively, an LVDS clock source can be used with the following additional requirements:

- External AC coupling capacitors described in [Table 8-25](#) should be populated at the `ljcb_clkn` / `ljcb_clkp` inputs.
- All termination requirements (ex. parallel 100Ω termination) from the clock source manufacturer should be followed.

In **Output REFCLK Mode**, the 100MHz clock from the Device's `DPLL_PCIE_REF` should be output on the Device's `ljcb_clkn` / `ljcb_clkp` pins and used as the HCSL REFCLK by the link partner. External near-side termination to ground described in [Table 8-26](#) is required on both of the `ljcb_clkn` / `ljcb_clkp` outputs in this mode.

8.5.7 CSI2 Board Design and Routing Guidelines

The MIPI D-PHY signals include the `CSI2_0` and `CSI2_1` camera serial interfaces to or from the Device.

For more information regarding the MIPI-PHY signals and corresponding balls, see [Table 4-7](#), *CSI2 Signal Descriptions*.

For more information, you can also see the MIPI D-PHY specification v1-01-00_r0-03 (specifically the Interconnect and Lane Configuration and Annex B Interconnect Design Guidelines chapters).

In the next section, the PCB guidelines of the following differential interfaces are presented:

- `CSI2_0` and `CSI2_1` MIPI CSI-2 at 1.5 Gbps

[Table 8-27](#) lists the MIPI D-PHY interface signals in the Device.

8.5.7.1 CSI2_0 and CSI2_1 MIPI CSI-2 (1.5 Gbps)

8.5.7.1.1 General Guidelines

The general guidelines for the PCB differential lines are:

- Differential trace impedance $Z_0 = 100 \Omega$ (minimum = 85Ω , maximum = 115Ω)
- Total conductor length from the Device package pins to the peripheral device package pins is 25 to 30 cm with common FR4 PCB and flex materials.

NOTE

Longer interconnect length can be supported at the expense of detailed simulations of the complete link including driver and receiver models.

The general rule of thumb for the space $S = 2 \times W$ is not designated (see [Figure 8-19, Guard Illustration](#)). It is because although the $S = 2 \times W$ rule is a good rule of thumb, it is not always the best solution. The electrical performance will be checked with the frequency-domain specification. Even though the designer does not follow the $S = 2 \times W$ rule, the differential lines are ok if the lines satisfy the frequency-domain specification.

Because the MIPI signals are used for low-power, single-ended signaling in addition to their high speed differential implementation, the pairs must be loosely coupled.

8.5.7.1.2 Length Mismatch Guidelines

8.5.7.1.2.1 CSI2_0 and CSI2_1 MIPI CSI-2 (1.5 Gbps)

The guidelines of the length mismatch for CSI-2 are presented in [Table 8-28](#).

| PARAMETER | TYPICAL VALUE | UNIT |
|--------------------------------|---|------|
| Operating speed | 1500 | Mbps |
| UI (bit time) | 667 | ps |
| Intralane skew | Have to satisfy mode-conversion S parameters ⁽¹⁾ | |
| Interlane skew (UI / 50) | 13.34 | ps |
| PCB lane-to-lane skew (0.1 UI) | 66.7 | ps |

(1) sdc12, sdc21, sdc12, sdc21, sdc11, sdc11, sdc22, and sdc22

8.5.7.1.3 Frequency-domain Specification Guidelines

After the PCB design is finished, the S-parameters of the PCB differential lines will be extracted with a 3D Maxwell Equation Solver such as the high-frequency structure simulator (HFSS) or equivalent, and compared to the frequency-domain specification as defined in the section 7 of the MIPI Alliance Specification for D-PHY Version v1-01-00_r0-03.

If the PCB lines satisfy the frequency-domain specification, the design is finished. Otherwise, the design needs to be improved.

8.6 Clock Routing Guidelines

8.6.1 32-kHz Oscillator Routing

When designing the printed-circuit board:

- Keep the crystal as close as possible to the crystal pins X1 and X2.
- Keep the trace lengths short and small to reduce capacitor loading and prevent unwanted noise pickup.
- Place a guard ring around the crystal and tie the ring to ground to help isolate the crystal from unwanted noise pickup.
- Keep all signals out from beneath the crystal and the X1 and X2 pins to prevent noise coupling.
- Finally, an additional local ground plane on an adjacent PCB layer can be added under the crystal to shield it from unwanted pickup from traces on other layers of the board. This plane must be isolated from the regular PCB ground plane and tied to the GND pin of the RTC. The plane must not be any larger than the perimeter of the guard ring. Make sure that this ground plane does not contribute to significant capacitance (a few pF) between the signal line and ground on the connections that run from X1 and X2 to the crystal.

Figure 8-37. Slow Clock PCB Requirements

8.6.2 Oscillator Ground Connection

Although the impedance of a ground plane is low it is, of course, not zero. Therefore, any noise current in the ground plane causes a voltage drop in the ground. Figure 8-38 shows the grounding scheme for slow (low frequency) clock generated from the internal oscillator.

8.7 DDR3 Board Design and Layout Guidelines

8.7.1 DDR3 General Board Layout Guidelines

To help ensure good signaling performance, consider the following board design guidelines:

- Avoid crossing splits in the power plane.
- Minimize Vref noise.
- Use the widest trace that is practical between decoupling capacitors and memory module.
- Maintain a single reference.
- Minimize ISI by keeping impedances matched.
- Minimize crosstalk by isolating sensitive bits, such as strobes, and avoiding return path discontinuities.
- Use proper low-pass filtering on the Vref pins.
- Keep the stub length as short as possible.
- Add additional spacing for on-clock and strobe nets to eliminate crosstalk.
- Maintain a common ground reference for all bypass and decoupling capacitors.

- Take into account the differences in propagation delays between microstrip and stripline nets when evaluating timing constraints.

8.7.2 DDR3 Board Design and Layout Guidelines

8.7.2.1 Board Designs

TI only supports board designs using DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory controller are shown in [Table 8-29](#) and [Figure 8-40](#).

Table 8-29. Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller

8.7.2.2 DDR3 EMIF

The processor contains one DDR3 EMIF.

8.7.2.3 DDR3 Device Combinations

Because there are several possible combinations of device counts and single- or dual-side mounting, [Table 8-30](#) summarizes the supported device configurations.

Table 8-30. Supported DDR3 Device Combinations

| NUMBER OF DDR3 DEVICES | DDR3 DATA DEVICE WIDTH (BITS) | MIRRORED? | DDR3 EMIF WIDTH (BITS) |
|------------------------|-------------------------------|---------------------|------------------------|
| 1 | 16 | N | 16 |

| 4 | 8 | N | 32 |
| 4 | 8 | Y ⁽²⁾ | 32 |
| 5 | 8 | N ⁽³⁾⁽⁴⁾ | 32 |

- (1) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.
- (2) This is two mirrored pairs of DDR3 devices.
- (3) Three or five DDR3 device combination is not available on this device, but combination types are retained for consistency with the TDA2xx family of devices.
- (4) The DDR memory connected to the DDR ECC bus does NOT need to be the same part number as the DDR memories connected to the DDR data bus. However, some constraints do apply. When selecting a memory for the DDR ECC bus, the following restrictions must be adhered to as compared to the DDR memories on the data bus:
 - Match the same DDR3 speed grade
 - Have an equal number of internal banks
 - Have an equal number of columns
 - Have a greater or equal number of rows

8.7.2.4 DDR3 Interface Schematic

8.7.2.4.1 32-Bit DDR3 Interface

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. [Figure 8-41](#) and [Figure 8-42](#) show the schematic connections for 32-bit interfaces using x16 devices.

8.7.2.4.2 16-Bit DDR3 Interface

Note that the 16-bit wide interface schematic is practically identical to the 32-bit interface (see [Figure 8-41](#) and [Figure 8-42](#)); only the high-word DDR memories are removed and the unused DQS inputs are tied off.

When not using all or part of a DDR interface, the proper method of handling the unused pins is to tie off the `ddr1_dqsi` pins to ground via a 1k- Ω resistor and to tie off the `ddr1_dqsn` pins to the corresponding `vdds_ddrx` supply via a 1k- Ω resistor. This needs to be done for each byte not used. Although these signals have internal pullups and pulldowns, external pullups and pulldowns provide additional protection against external electrical noise causing activity on the signals.

The `vdds_ddrx` and `ddr1_vref0` power supply pins need to be connected to their respective power supplies even if `ddrx` is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32-bits wide, 16-bits wide, or not used.

8.7.2.5 Compatible JEDEC DDR3 Devices

Table 8-31 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1333 devices in the x8 or x16 widths.

| | | 400MHz < DDR clock rate ≤ 533MHz | DDR3-1066 | DDR3-1600 | |
| | | 533MHz < DDR clock rate ≤ 667MHz | DDR3-1333 | DDR3-1600 | |
| 2 | JEDEC DDR3 device bit width | | x8 | x16 | Bits |
| 3 | JEDEC DDR3 device count ⁽²⁾ | | 2 | 4 | Devices |

(1) Refer to Table 8-29 Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller for the range of supported DDR clock rates.

(2) For valid DDR3 device configurations and device counts, see Section 8.7.2.4, Figure 8-41, and Figure 8-42.

8.7.2.6 PCB Stackup

The minimum stackup for routing the DDR3 interface is a six-layer stack up as shown in Table 8-32. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. Complete stackup specifications are provided in Table 8-33.

Table 8-32. Six-Layer PCB Stackup Suggestion

| LAYER | TYPE | DESCRIPTION |
|-------|--------|---------------------------------------|
| 1 | Signal | Top routing mostly vertical |
| 2 | Plane | Ground |
| 3 | Plane | Split power plane |
| 4 | Plane | Split power plane or Internal routing |
| 5 | Plane | Ground |
| 6 | Signal | Bottom routing mostly horizontal |

Table 8-33. PCB Stackup Specifications

| NO. | PARAMETER | MIN | TYP | MAX | UNIT |
|------|---|-----|-----|-----|------|
| PS1 | PCB routing/plane layers | 6 | | | |
| PS2 | Signal routing layers | 3 | | | |
| PS3 | Full ground reference layers under DDR3 routing region ⁽¹⁾ | 1 | | | |
| PS4 | Full 1.5-V power reference layers under the DDR3 routing region ⁽¹⁾ | 1 | | | |
| PS5 | Number of reference plane cuts allowed within DDR routing region ⁽²⁾ | | | 0 | |
| PS6 | Number of layers between DDR3 routing layer and reference plane ⁽³⁾ | | | 0 | |
| PS7 | PCB routing feature size | | 4 | | Mils |
| PS8 | PCB trace width, w | | 4 | | Mils |
| PS9 | Single-ended impedance, Z ₀ | 50 | | 75 | Ω |
| PS10 | Impedance control ⁽⁵⁾ | Z-5 | Z | Z+5 | Ω |

- (1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
- (2) No traces should cross reference plane cuts within the DDR routing region. High speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
- (3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
- (4) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.
- (5) Z is the nominal singled-ended impedance selected for the PCB specified by PS9.

8.7.2.7 Placement

Figure 8-43 shows the required placement for the processor as well as the DDR3 devices. The dimensions for this figure are defined in Table 8-34. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 devices are omitted from the placement.

- (1) DDR3 keepout region to encompass entire DDR3 routing area.
- (2) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.
- (3) If a device has more than one DDR controller, the signals from the other controller(s) are considered non-DDR3 and should be separated by this specification.

8.7.2.8 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in [Figure 8-44](#). The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in [Table 8-34](#). Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that the two signals from the DDR3 controller should be separated from each other by the specification in [Table 8-34](#) (see [KOD37](#)).

SPRS906_PCB_DDR3_05

8.7.2.9 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. [Table 8-35](#) contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

Table 8-35. Bulk Bypass Capacitors

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|--|-----|-----|---------|
| 1 | vdds_ddrx bulk bypass capacitor count ⁽¹⁾ | 1 | | Devices |
| 2 | vdds_ddrx bulk bypass total capacitance | 22 | | μF |

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the High Speed (HS) bypass capacitors and DDR3 signal routing.

8.7.2.10 High Speed Bypass Capacitors

High Speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. [Table 8-36](#) contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limites on via sharing shown in [Table 8-36](#).

(8) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.

- (9) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.
- (10) Up to a total of two pairs of DDR power/ground balls may share a via.
- (11) The capacitor recommendations in this data manual reflect only the needs of this processor. Please see the memory vendor's guidelines for determining the appropriate decoupling capacitor arrangement for the memory device itself.
- (12) For more information, see [Section 8.3, Core Power Domains](#).

8.7.2.10.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Because these are returns for signal current, the signal via size may be used for these capacitors.

8.7.2.11 Net Classes

[Table 8-37](#) lists the clock net classes for the DDR3 interface. [Table 8-38](#) lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

8.7.2.12 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

8.7.2.13 VREF_DDR Routing

ddr1_vref0 (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the processor. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 VDD5 and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1 μ F bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

8.7.2.14 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR_CTRL net class Thevenin terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

8.7.2.15 CK and ADDR_CTRL Topologies and Routing Definition

The CK and ADDR_CTRL net classes are routed in a fly-by topology. They are routed in a similar manner and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR_CTRL. The figures in the following subsections define the terms for the routing specification detailed in [Table 8-39](#). Balanced-T routing is not recommended.

8.7.2.15.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.7.2.15.2 Two DDR3 Devices

Two DDR3 devices are supported on the DDR EMIF consisting of two x8 DDR3 devices arranged as one bank (CS), 16 bits wide, or two x16 DDR3 devices arranged as one bank (CS), 32 bits wide. These two devices may be mounted on a single side of the PCB, or may be mirrored in a pair to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.7.2.16 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or vdds_ddr. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

8.7.2.16.1 DQS and DQ/DM Topologies, Any Number of Allowed DDR3 Devices

DQS lines are point-to-point differential, and DQ/DM lines are point-to-point singled ended. Figure 8-61 and Figure 8-62 show these topologies.

8.7.2.17 Routing Specification

8.7.2.17.1 CK and ADDR_CTRL Routing Specification

Skew within the CK and ADDR_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-65 and Figure 8-66 show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK/ADDR_CTRL net class. For CK and ADDR_CTRL routing, these specifications are contained in Table 8-39.

SPRS906_PCB_DDR3_26

- A. It is very likely that the longest CK/ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR_CTRL skew matching and length control.

The length of shorter CK/ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.

The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

- (1) Max value is based upon conservative signal integrity approach. This value could be extended only if detailed signal integrity analysis of rise time and fall time confirms desired operation.
- (2) The use of vias should be minimized.
- (3) Additional bypass capacitors are required when using the DDR_1V5 plane as the reference plane to allow the return current to jump between the DDR_1V5 plane and the ground plane when the net class switches layers at a via.
- (4) Non-mirrored configuration (all DDR3 memories on same side of PCB).
- (5) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).
- (6) While this length can be increased for convenience, its length should be minimized.
- (7) ADDR_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.
- (8) CK net class only.
- (9) Center-to-center spacing is allowed to fall to minimum 2w for up to 1250 mils of routed length.
- (10) The ADDR_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.
- (11) CK spacing set to ensure proper differential impedance.
- (12) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the single-ended impedance, Zo.
- (13) Source termination (series resistor at driver) is specifically not allowed.
- (14) Termination values should be uniform across the net class.
- (15) Via count difference may increase by 1 only if accurate 3-D modeling of the signal flight times – including accurately modeled signal propagation through vias – has been applied to ensure all segment skew maximums are not exceeded.

8.7.2.17.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0-DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. [Figure 8-67](#) shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in [Table 8-40](#).

DB0 - DB3 represent data bytes 0 - 3.

SPRS906_PCB_DDR3_28

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:

$$\begin{aligned} \text{DQLM0} &= \text{DQLMX0} + \text{DQLMY0} \\ \text{DQLM1} &= \text{DQLMX1} + \text{DQLMY1} \\ \text{DQLM2} &= \text{DQLMX2} + \text{DQLMY2} \\ \text{DQLM3} &= \text{DQLMX3} + \text{DQLMY3} \end{aligned}$$

9 Device and Documentation Support

TI offers an extensive line of development tools, including methods to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules as listed below.

9.1 Device Nomenclature and Orderable Information

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, TDA2Ex). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of TDA2Ex devices in the ABC package type, see the Package Option Addendum of this document, the TI website (ti.com), or contact your TI sales representative.

9.1.1 Standard Package Symbolization

NOTE

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

9.2 Tools and Software

The following products support development for TDA2Ex platforms:

Design Kits and Evaluation Modules

TDA2Ex Evaluation Module TDA2Ex EVM is an evaluation platform designed to speed up development efforts and reduce time to market for ADAS applications. It is based on a TDA2Eco SoC which incorporates a heterogeneous, scalable architecture that includes a mix of TI's fixed and floating-point TMS320C66x Digital Signal Processor (DSP) core, Arm Cortex-A15 MP core, 3D GPU core, H.264 encode/decode acceleration and dual Cortex-M4 processor cores. It also integrates a host of peripherals including multi-camera interfaces (both parallel and serial) for LVDS-based surround view systems, displays, CAN and GigB Ethernet AVB. The main board integrates key peripherals such as Ethernet, FPD-Link and HDMI, while the Vision application board provides interfaces for popular imagers.

Development Tools

Clock Tree Tool for Sitara, Automotive, Vision Analytics, & Digital Signal Processors The Clock Tree Tool (CTT) for Sitara™ Arm®, Automotive, and Digital Signal Processors is an interactive clock tree configuration software that provides information about the clocks and modules in these TI devices. It allows the user to:

- Visualize the device clock tree
- Interact with clock tree elements and view the effect on PRCM registers
- Interact with the PRCM registers and view the effect on the device clock tree
- View a trace of all the device registers affected by the user interaction with clock tree

XDS110 JTAG Debug Probe The Texas Instruments XDS110 is a new class of debug probe (emulator) for TI embedded processors. The XDS110 replaces the XDS100 family while supporting a wider variety of standards (IEEE1149.1, IEEE1149.7, SWD) in a single pod. Also, all XDS debug probes support Core and System Trace in all Arm and DSP processors that feature an Embedded Trace Buffer (ETB). The Texas Instruments XDS110 connects to the target board via a TI 20-pin connector (with multiple adapters for TI 14-pin and, Arm 10-pin and Arm 20-pin) and to the host PC via USB2.0 High Speed (480Mbps). It also features two additional connections: the Auxiliary 14-pin port connector that enables EnergyTrace™, a full duplex UART port and four General-Purpose I/Os, and the Expansion 30-pin connector to connect the XDS110 EnergyTrace HDR add-on.

9.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents describe the TDA2Ex devices.

Technical Reference Manual

TDA2Ex SoC for Advanced Driver Assistance Systems (ADAS) 23mm (ABC) Package (SR2.0, SR1.0) 17mm (CBD) Package (SR2.1, SR2.0) Technical Reference Manual Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the TDA2Ex family of devices.

Errata

TDA2Ex SoC for Advanced Driver Assistance Systems (ADAS) 23mm (ABC) Package (SR2.0, SR1.0) 17mm (CBD) Package (SR2.1, SR2.0) Silicon Errata Describes the known exceptions to the functional specifications for the device.

9.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.5 Trademarks

E2E is a trademark of Texas Instruments.

Arm, Cortex are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

QSPI is a trademark of Cadence Design Systems, Inc.

HDMI is a trademark of HDMI Licensing, LLC.

PowerVR is a registered trademark of Imagination Technologies Limited.

JTAG is a registered trademark of JTAG Technologies, B.V.

MIPI is a registered trademark of MIPI Alliance, Inc.

MMC, eMMC are trademarks of MultiMediaCard Association.

1°C is a trademark of NXP Semiconductors.

PCI-Express, PCIe are registered trademarks of PCI-SIG.
Secure Digital, SD are registered trademarks of SD Card Association.
Vivante is a registered trademark of Vivante Corporation.
All other trademarks are the property of their respective owners.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

10 Mechanical, Packaging, and Orderable Information

10.1 Packaging Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable part number | Status (1) | Material type (2) | Package Pins | Package qty Carrier | RoHS (3) | Lead finish/ Ball material (4) | MSL rating/ Peak reflow (5) | Op temp (°C) | Part marking (6) |

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
