TEXAS INSTRUMENTS

TLV700xx-Q1 Automotive, 300mA, Low-I_Q, Low-Dropout Regulator

1 Features

- AEC-Q100 qualified for automotive applications:
  - Device temperature grade 1: –40°C to 125°C ambient operating temperature range
  - Device HBM ESD classification level H2
  - Device CDM ESD classification level C3B
- 2% accuracy
- Low I_Q: 35µA
- Fixed-output voltages: 1.2V and 1.8V
- High PSRR: 68dB at 1kHz
- Stable with effective capacitance of 0.1µF[1]
- Thermal shutdown and overcurrent protection [1]

2 Applications

- Automotive head units
- Camera sensors and modules
- Heads-up displays (HUD)
- Telematics control units
3 Description

The TLV70018-Q1 and TLV70012-Q1 low-dropout (LDO) linear regulators are low quiescent current devices with excellent line and load transient performance. A precision band-gap and error amplifier provides overall 2% accuracy. Low output noise, high power-supply rejection ratio (PSRR), and low-dropout voltage make this series of devices ideal for powering power-sensitive loads. All device versions have thermal shutdown and current limit for detecting fault conditions.

Furthermore, these devices are stable with an effective output capacitance of only 0.1µF. This feature enables the use of cost-effective capacitors that have higher bias voltages and temperature derating. The devices regulate to specified accuracy with no output load.

Package Information

PART NUMBER	PACKAGE[1]	PACKAGE SIZE[2]
TLV70018-Q1	DDC (SOT, 5)	2.9mm × 2.8mm
TLV70012-Q1		

(1) For more information, see the *Mechanical, Packaging, and Orderable Information*.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Typical Application

[1] See the *Input and Output Capacitor Requirements*.

Table of Contents

4 Pin Configuration and Functions

Figure 4-1. DDC Package, 5-Pin SOT (Top View)

Table 4-1. Pin Functions

PIN		DESCRIPTION
NO.	**NAME**	
1	IN	Input pin. A small 1µF ceramic capacitor is recommended from this pin to ground to provide stability and good transient performance.[1]
2	GND	Ground pin
3	EN	Enable pin. Driving EN over 0.9V turns on the regulator. Driving EN below 0.4V puts the regulator into shutdown mode and reduces operating current to 1µA, nominal.
4	NC	No connection. This pin can be tied to ground to improve thermal dissipation.
5	OUT	Regulated output voltage pin. A small 1µF ceramic capacitor is needed from this pin to ground to provide stability.[1]

(1) See the *Input and Output Capacitor Requirements* section for more details.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range, unless otherwise noted[1]

		MIN	MAX	UNIT
Voltage[2]	IN	−0.3	6.0	V
	EN	−0.3	6.0	V
	OUT	−0.3	6.0	V
Current (source)	OUT	Internally limited		
Output short-circuit duration		Indefinite		
Operating virtual junction, T_J		−55	150	°C
Storage temperature, T_{stg}		−55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to network ground terminal.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002[1]	2000	V
		Charged-device model (CDM), per AEC Q100-011	750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range, unless otherwise noted.

			MIN	MAX	UNIT
V_{IN}	Input voltage	IN	2	5.5	V
V_{EN}	Enable voltage	EN	0	5.5	V
V_{OUT}	Output voltage	OUT	0	1.8	V
I_{OUT}	Current output		0	300	mA
T_J	Operating junction temperature		−40	150	°C

5.4 Thermal Information

THERMAL METRIC[1]		TLV70018-Q1, TLV70012-Q1 DDC (SOT) 5 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	262.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	68.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	81.6	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.1	°C/W
ψ_{JB}	Junction-to-board characterization parameter	80.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	NA	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application note.
5.5 Electrical Characteristics

at V_{IN} = $V_{OUT(NOM)}$ + 0.5V or 2V (whichever is greater); I_{OUT} = 10mA, V_{EN} = 0.9V, C_{OUT} = 1.0μF, and T_A = –40°C to 125°C (unless otherwise noted); typical values are at T_A = 25°C (unless otherwise noted)

| PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IN}	Input voltage range		2		5.5	V
V_{OUT}	DC output accuracy	–40°C ≤ T_A ≤ 125°C	–2%	0.5%	2%	
$\Delta V_{OUT}/\Delta V_{IN}$	Line regulation	$V_{OUT(NOM)}$ + 0.5V ≤ V_{IN} ≤ 5.5V, I_{OUT} = 10mA		1	5	mV
$\Delta V_{OUT}/\Delta I_{OUT}$	Load regulation	0mA ≤ I_{OUT} ≤ 300mA, TLV70018-Q1		1	15	mV
		0mA ≤ I_{OUT} ≤ 300mA, TLV70012-Q1		1	20	
I_{CL}	Output current limit	V_{OUT} = 0.9 × $V_{OUT(NOM)}$	320	500	860	mA
I_{GND}	Ground pin current	I_{OUT} = 0mA		35	55	μA
		I_{OUT} = 300mA, V_{IN} = V_{OUT} + 0.5V		370		μA
I_{SHDN}	Ground pin current (shutdown)	V_{EN} ≤ 0.4V, V_{IN} = 2.0V		400		nA
		V_{EN} ≤ 0.4V, 2.0V ≤ V_{IN} ≤ 4.5V, T_A = –40°C to 85°C		1	2	μA
		V_{EN} ≤ 0.4V, 2.0V ≤ V_{IN} ≤ 4.5V, T_A = 85°C to 125°C		1	2.5	μA
PSRR	Power-supply rejection ratio	V_{IN} = 2.3V, V_{OUT} = 1.8V, I_{OUT} = 10mA, f = 1kHz		68		dB
V_n	Output noise voltage	BW = 100Hz to 100kHz, V_{IN} = 2.3V, V_{OUT} = 1.8V, I_{OUT} = 10mA		48		μV$_{RMS}$
t_{STR}	Startup time[1]	C_{OUT} = 1.0μF, I_{OUT} = 300mA		100		μs
$V_{EN(HI)}$	Enable pin high (enabled)		0.9		V_{IN}	V
$V_{EN(LO)}$	Enable pin low (disabled)		0		0.4	V
I_{EN}	Enable pin current	V_{IN} = V_{EN} = 5.5V		0.04		μA
UVLO	Undervoltage lockout	V_{IN} rising		1.9		V
T_{SD}	Thermal shutdown temperature	Shutdown, temperature increasing		165		°C
		Reset, temperature decreasing		145		°C
T_A	Operating temperature		–40		125	°C

(1)   Startup time = time from EN assertion to 0.98 × $V_{OUT(NOM)}$.
5.6 Typical Characteristics

over operating temperature range (T_J = –40°C to 125°C), V_{IN} = $V_{OUT(NOM)}$ + 0.5V or 2V, whichever is greater; I_{OUT} = 10mA, V_{EN} = V_{IN}, C_{OUT} = 1.0μF (unless otherwise noted); typical values are at T_J = 25°C

6 Detailed Description

6.1 Overview

The TLV70018-Q1 and TLV70012-Q1 low-dropout (LDO) linear regulators are low-quiescent-current devices with excellent line and load transient performance. These LDOs are designed for power-sensitive applications. A precision bandgap and error amplifier provides overall 2% accuracy together with low output noise, very high power-supply rejection ratio (PSRR), and low dropout voltage.

6.2 Functional Block Diagram
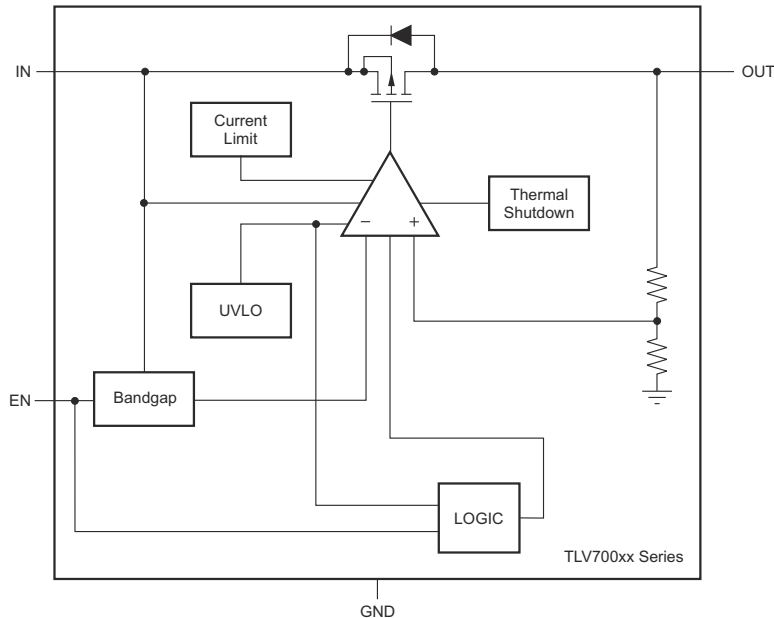

6.3 Feature Description

6.3.1 Internal Current Limit

The TLV70018-Q1 and TLV70012-Q1 internal current limit helps to protect the regulator during fault conditions. During current limit, the output sources a fixed amount of current that is largely independent of the output voltage. In such a case, the output voltage is not regulated, and is $V_{OUT} = I_{LIMIT} \times R_{LOAD}$. The PMOS pass transistor dissipates $(V_{IN} - V_{OUT}) \times I_{LIMIT}$ until thermal shutdown is triggered and the device turns off. As the device cools, it is turned on by the internal thermal shutdown circuit. If the fault condition continues, the device cycles between current limit and thermal shutdown. See the *Thermal Considerations* section for more details.

The PMOS pass transistor in the TLV70018-Q1 and TLV70012-Q1 has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not limited, so if extended reverse voltage operation is anticipated, external limiting to 5% of the rated output current is recommended.

6.3.2 Dropout Voltage

The TLV70018-Q1 and TLV70012-Q1 use a PMOS pass transistor to achieve low dropout. When $(V_{IN} - V_{OUT})$ is less than the dropout voltage (V_{DO}), the PMOS pass transistor is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass transistor. V_{DO} scales approximately with output current because the PMOS transistor behaves as a resistor in dropout.

As with any linear regulator, PSRR and transient response are degraded as $(V_{IN} - V_{OUT})$ approaches dropout. Figure 5-11 illustrates this effect.

6.3.3 Undervoltage Lockout (UVLO)

The TLV70018-Q1 and TLV70012-Q1 use an undervoltage lockout circuit to keep the output shut off until internal circuitry is operating properly.

6.3.4 Thermal Shutdown

Thermal protection disables the output when the junction temperature rises to approximately 165°C, allowing the device to cool. When the junction temperature cools to approximately 145°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least 40°C above the maximum expected ambient condition of the particular application. This configuration produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TLV70018-Q1 and TLV70012-Q1 has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TLV70018-Q1 or TLV70012-Q1 into thermal shutdown degrades device reliability.

6.4 Device Functional Modes

6.4.1 Shutdown

The enable pin (EN) is active high. The device is enabled when voltage at EN pin goes above 0.9V. This relatively lower value of voltage required to turn the LDO on can be exploited to power the LDO with a GPIO of recent processors whose GPIO logic 1 voltage level is lower than traditional microcontrollers. The device is turned off when the EN pin is held at less than 0.4V. When shutdown capability is not required, EN can be connected to the IN pin.

6.4.2 Operation with V_{IN} Less than 2V

The TLV70018-Q1 and TLV70012-Q1 devices operate with input voltages above 2V. The typical UVLO voltage is 1.9V and the device operates at an input voltage above 2V. When input voltage falls below UVLO voltage, the device will shutdown.

6.4.3 Operation with V_{IN} Greater than 2V

When V_{IN} is greater than 2V, if input voltage is higher than desired output voltage plus dropout voltage, the output voltage is equal to the desired value. Otherwise, output voltage will be V_{IN} minus dropout voltage.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The TLV70018-Q1 and TLV70012-Q1 consume low quiescent current and deliver excellent line and load transient performance. These characteristics, combined with low noise and very good PSRR with little (V_{IN} – V_{OUT}) headroom, make this family of devices ideal for portable RF applications. This family of regulators offers current limit and thermal protection, and is specified from –40°C to 125°C.

7.2 Typical Application
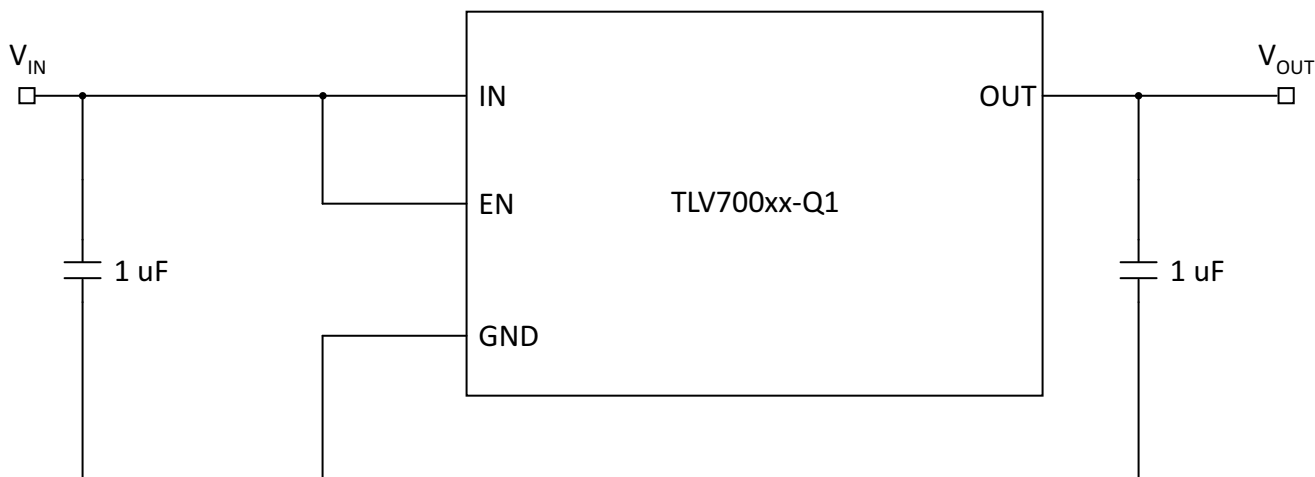

Figure 7-1. Simplified Schematic

7.2.1 Design Requirements

For this design example use, the parameters listed in Table 7-1 as the input parameters.

Table 7-1. Design Parameters

PARAMETER	EXAMPLE VALUE
Input voltage range	2V to 5.5V
Output voltage	1.2V, 1.8V
Output current rating	300mA
Effective output capacitor range	>0.1µF
Maximum output capacitor ESR range	<200mΩ

Product Folder Links: *TLV70018-Q1 TLV70012-Q1*

7.2.2 Detailed Design Procedure

7.2.2.1 Input and Output Capacitor Requirements

1.0µF X5R- and X7R-type ceramic capacitors are recommended because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature.

However, the TLV70018-Q1 and TLV70012-Q1 are designed to be stable with an *effective capacitance* of 0.1µF or larger at the output. Thus, the device is stable with capacitors of other dielectric types as well, as long as the effective capacitance under operating bias voltage and temperature is greater than 0.1µF. This effective capacitance refers to the capacitance that the LDO sees under operating bias voltage and temperature conditions; that is, the capacitance after taking both bias voltage and temperature derating into consideration. In addition to allowing the use of lower-cost dielectrics, this capability of being stable with 0.1µF effective capacitance also enables the use of smaller-footprint capacitors that have higher derating in size- and space-constrained applications.

Note

Using a 0.1µF rated capacitor at the output of the LDO does not provide stability because the effective capacitance under the specified operating conditions would be less than 0.1µF. Maximum ESR should be less than 200mΩ.

Although an input capacitor is not required for stability, good analog design practice is to connect a 0.1µF to 1.0µF, low ESR capacitor across the IN pin and GND pin of the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated, or if the device is not located close to the power source. If source impedance is more than 2Ω, a 0.1µF input capacitor may be necessary to ensure stability.

7.2.2.2 Transient Response

As with any regulator, increasing the size of the output capacitor reduces overshoot or undershoot magnitude but increases the duration of the transient response.

7.2.3 Application Curve

Figure 7-2. Power-Up
7.3 Power Supply Recommendations

The device is designed to operate from an input-voltage supply range between 2V and 5.5V. This input supply must be well regulated. If the input supply is located more than a few inches from the device, TI recommends adding a capacitor with a value of 0.1µF and a ceramic bypass capacitor at the input.

Product Folder Links: *TLV70018-Q1 TLV70012-Q1*

7.4 Layout

7.4.1 Layout Guidelines

Input and output capacitors should be placed as close to the device pins as possible. To improve ac performance such as PSRR, output noise, and transient response, the board is recommended to be designed with separate ground planes for V_{IN} and V_{OUT}, with the ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should be connected directly to the GND pin of the device. High ESR capacitors may degrade PSRR performance.

7.4.1.1 Thermal Considerations

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to 125°C maximum.

To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

7.4.1.2 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air.

Thermal performance data for TLV70018-Q1 and TLV70012-Q1 were gathered using the TLV700 evaluation module (EVM), a 2-layer board with two ounces of copper per side. Corresponding thermal performance data are given in Thermal Information. Note that this board has provision for soldering not only the SOT23-5 package on the bottom layer, but also the SC-70 package on the top layer. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heatsink effectiveness.

Submit Document Feedback   13

Product Folder Links: *TLV70018-Q1 TLV70012-Q1*

7.4.1.2.1 Thermal Calculations

Power dissipation depends on input voltage and load conditions. Power dissipation (P_D) is equal to the product of the output current and the voltage drop across the output pass transistor, as shown in Equation 1.

$$P_D = I_{OUT} \times (V_{IN} - V_{OUT}) + I_Q \times V_{IN}$$

(1)

where

- P_D is continuous power dissipation
- I_{OUT} is output current
- V_{IN} is input voltage
- V_{OUT} is output voltage

Because $I_Q \ll I_{OUT}$, the term $I_Q \times V_{IN}$ is always ignored.

For a device under operation at a given ambient air temperature (T_A), use Equation 2 to calculate the junction temperature (T_J).

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

(2)

where:

- $Z_{\theta JA}$ is the junction-to-ambient air temperature thermal impedance

Use Equation 3 to calculate the rise in junction temperature due to power dissipation.

$$\Delta T = T_J - T_A = (R_{\theta JA} \times P_D)$$

(3)

For a given maximum junction temperature ($T_{J(MAX)}$, use Equation 4 to calculate the maximum ambient air temperature ($T_{A(MAX)}$ at which the device can operate.

$$T_{A max} = T_{J max} - (R_{\theta JA} \times P_D)$$
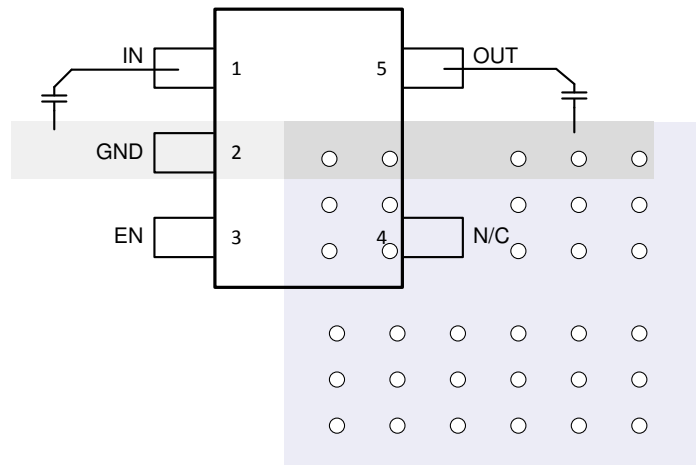

(4)

8.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
   design recommendations.
7. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
