

TLVM13610 High-Density, 3-V to 36-V Input, 1-V to 10-V Output, 8-A (10-A Peak) Synchronous Buck DC/DC Power Module with Enhanced HotRod™ QFN Package

1 Features

- Functional Safety-Capable
 - Documentation available to aid functional safety system design
- Versatile 36-V_{IN}, 8-A_{OUT} synchronous buck module
 - Integrated MOSFETs, inductor, and controller
 - Adjustable output voltage from 1 V to 10 V
 - 6.5-mm × 7.5-mm × 4-mm overmolded package
 - –40°C to 125°C junction temperature range
 - Frequency adjustable from 200 kHz to 2.2 MHz
- Ultra-high efficiency across the full load range
 - 95%+ peak efficiency
 - External bias option for improved efficiency
 - Exposed Pad for low thermal impedance. EVM $\theta_{JA} = 18.2$ °C/W.
 - Shutdown quiescent current of 0.6 μ A (typical)
- Ultra-low conducted and radiated EMI signatures
 - Low-noise package with dual input paths and integrated capacitors reduces switch ringing
 - Resistor-adjustable switch-node slew rate
 - Meets CISPR 11 and 32 Class B emissions
- Inherent protection features for robust design
 - Precision enable input and open-drain PGOOD indicator for sequencing, control, and V_{IN} UVLO
 - Overcurrent and thermal shutdown protections
- Create a custom design using the [WEBENCH® Power Designer](#)

2 Applications

- Test and measurement, aerospace and defense
- Factory automation and control
- Buck and inverting buck-boost power supplies

Typical Schematic

3 Description

The TLVM13610 is a highly integrated 36-V, 8-A DC/DC solution that combines power MOSFETs, a shielded inductor, and passives in an Enhanced HotRod™ QFN package. The module has VIN and VOUT pins located at the corners of the package for optimized input and output capacitor placement. Four larger thermal pads beneath the module enable a simple layout and easy handling in manufacturing.

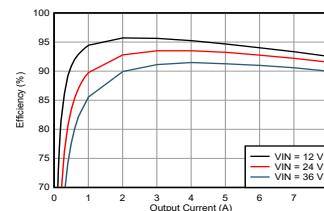

With an output voltage from 1 V to 10 V, the TLVM13610 is designed to quickly and easily implement a low-EMI design in a small PCB footprint. The total solution requires as few as four external components and eliminates the magnetics and compensation part selection from the design process.

Although designed for small size and simplicity in space-constrained applications, the TLVM13610 module offers many features for robust performance: precision enable with hysteresis for adjustable input-voltage UVLO, resistor-programmable switch node slew rate for improved EMI. Along with integrated VCC, bootstrap and input capacitors for increased reliability and higher density. The module automatically transitions between constant switching frequency (FPWM), or variable frequency (PFM) for higher light load efficiency. Including a PGOOD indicator for sequencing, fault protection, and output voltage monitoring.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
TLVM13610	RDF (B3QFN, 22)	6.50 mm × 7.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Efficiency, V_{OUT} = 5 V, F_{SW} = 1 MHz

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

6 Pin Configuration and Functions

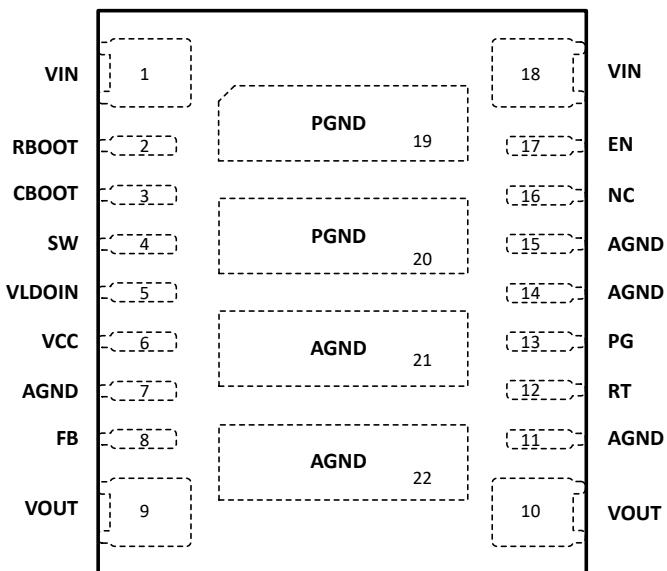

Figure 6-1. 22-Pin B3QFN RDF Package (Top View)

Table 6-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1, 18	VIN1, VIN2	P	Input supply voltage. Connect the input supply to these pins. Connect input capacitors between these pins and PGND in close proximity to the device.
2	RBOOT	I	External bootstrap resistor connection. RBOOT is brought out to use in conjunction with CBOOT to effectively lower the value of the internal series bootstrap resistance to adjust the switch-node slew rate, if necessary. A resistance from 0 to 500 Ω can be connected between RBOOT and CBOOT. A resistance of 0 Ω has the fastest slew rate and highest efficiency. A value of 100 Ω creates a nice balance between efficiency and EMI. Leaving open sets the slew rate to 20 ns and TI does not recommend due to increased self heating.
3	CBOOT	O	Bootstrap pin for the internal high-side gate driver. A 100-nF bootstrap capacitor is internally connected from this pin to SW within the module to provide the bootstrap voltage. CBOOT is brought out to use in conjunction with RBOOT to effectively lower the value of the internal series bootstrap resistance to adjust the switch-node slew rate, if necessary.
4	SW	O	Switch node. Do not place any external component on this pin or connect to any signal. The amount of copper placed on this pin must be kept to a minimum to prevent issues with noise and EMI.
5	VLDOIN	P	Input bias voltage. Input to the internal LDO that supplies the internal control circuits. Connect to an output voltage point to improve efficiency. Connect an optional high-quality 0.1-μF to 1-μF capacitor from this pin to ground for improved noise immunity.
6	VCC	P	Internal LDO output. Used as a supply to the internal control circuits. Do not connect to any external loads. A 1-μF capacitor internally connects from VCC to AGND.
7, 11, 14, 15, 21, 22	AGND	G	Analog ground. Zero-voltage reference for internal references and logic. All electrical parameters are measured with respect to these pins. <i>These pins must be connected to PGND. See Layout Example for a recommended layout.</i>

Table 6-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
8	FB	I	Feedback input. Connect the midpoint of the feedback resistor divider to this pin. Connect the upper resistor (R_{FBT}) of the feedback divider to V_{OUT} at the desired point of regulation. Connect the lower resistor (R_{FBB}) of the feedback divider to AGND. Do not leave open or connect to ground.
9, 10	VOUT1, VOUT2	P	Output voltage. These pins are connected to the internal buck inductor. Connect these pins to the output load and connect external output capacitors between these pins and PGND.
12	RT	I	Frequency setting pin used to set the switching frequency between 200 kHz and 2.2 MHz by placing an external resistor from RT to AGND. Connect to VCC for 400 kHz. Connect to ground for 2.2 MHz. Do not leave open.
13	PG	O	Open-drain power-good monitor output that asserts low if the FB voltage is not within the specified window thresholds. A 10-k Ω to 100-k Ω pullup resistor to a suitable voltage is required. If not used, PG can be left open or connected to GND.
16	NC	—	No connection. Tie to GND or leave open.
17	EN	I	Precision enable input to regulator. High = on, low = off. Can be connected to VIN. Precision enable allows the pin to be used as an adjustable UVLO. Do not float
19, 20	PGND	G	Power ground. This is the return current path for the power stage of the device. Connect these pads to the input supply return, the load return, and the capacitors associated with the VIN and VOUT pins. See Layout Example for a recommended layout.

(1) P = Power, G = Ground, I = Input, O = Output

7 Specifications

7.1 Absolute Maximum Ratings

Over the recommended operating junction temperature range⁽¹⁾

PARAMETER		MIN	MAX	UNIT
Voltages	Transient VIN to AGND, PGND ⁽²⁾	-0.3	42	V
Voltages	Continuous VIN to AGND, PGND ⁽²⁾	-0.3	36	V
Voltages	SW to AGND, PGND	-0.3	$V_{IN} + 0.3$	V
Voltages	RBOOT, CBOOT to SW	-0.3	5.5	V
Voltages	Transient EN to AGND, PGND ⁽²⁾	-0.3	42	V
Voltages	Continuous EN to AGND, PGND ⁽²⁾	-0.3	36	V
Voltages	BIAS to AGND, PGND	-0.3	16	V
Voltages	FB to AGND, PGND: Adjustable Versions	-0.3	5.5	V
Voltages	RESET to AGND, PGND	0	20	V
Current	RESET sink current ⁽⁴⁾	0	10	mA
Voltages	RT to AGND, PGND	-0.3	5.5	V
Voltages	VCC to AGND, PGND	-0.3	5.5	V
Voltages	PGND to AGND ⁽³⁾	-1	2	V
T_{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) A maximum of 42V can be sustained at this pin for duration of $\leq 100\text{ms}$ at a duty cycle of $\leq 0.01\%$. 36 V can be sustained for the life of this device.
- (3) This specification applies to voltage durations of 100 ns or less. The maximum D.C. voltage should not exceed $+\/- 0.3\text{V}$.
- (4) Do not exceed pin 's voltage rating.

7.2 ESD Ratings

		VALUE	UNIT	
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	± 750	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Over the recommended operating junction temperature range of -40°C to 125°C (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	Input Voltage Range ⁽¹⁾	3	36	V
Output voltage	Output Adjustment Range for adjustable output versions ⁽²⁾	1	10	V
Frequency	Frequency adjustment range	200	2200	kHz
Sync Frequency	Synchronization frequency range	200	2200	kHz
Output current	I_{OUT} , TLVM13610	0	8	A
Temperature	Operating junction temperature, T_J	-40	125	°C

(1) 3.7 V is required at VIN for start-up, an extended input voltage range down to 3.0 V is possible after start-up; See [Minimum Input Voltage](#) for start-up conditions.

(2) Under no conditions should the output voltage be allowed to fall below zero volts.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLVM13610	UNIT
		RDF	
		22 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance (TLVM13610EVM) ⁽³⁾	18	°C/W
$R_{\theta JA}$	Junction-to-ambient thermal resistance (JESD 51-7) ⁽²⁾	25	°C/W
$R_{\theta JC(\text{top})}$	Junction-to-case (top) thermal resistance	12.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.4	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.7	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	7.2	°C/W
$R_{\theta JC(\text{bot})}$	Junction-to-case (bottom) thermal resistance	3.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The value of $R_{\theta JA}$ given in this table is only valid for comparison with other packages and can not be used for design purposes. These values were calculated in accordance with JESD 51-7, and simulated on a 4-layer JEDEC board. They do not represent the performance obtained in an actual application. For example, the EVM $R_{\theta JA} = 21.6$ °C/W. For design information please see the [Thermal Design and Layout](#) section.
- (3) Refer to the [EVM User's Guide](#) for board layout and additional information. For thermal design information please see the [Thermal Design and Layout](#) section.

7.5 Electrical Characteristics

Limits apply over the recommended operating junction temperature range of -40°C to +125°C, unless otherwise noted. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 12$. V_{IN1} shorted to $V_{IN2} = V_{IN}$. V_{OUT} is output set point.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY VOLTAGE (VIN PIN)					
V_{IN}	Minimum operating input voltage	Needed to start up		3.7	V
		Once Operating		3	V
ENABLE (EN PIN)					
V_{EN}	Enable input-threshold voltage - rising	V_{EN} rising	1.0	1.263	1.365
V_{EN_HYST}	Enable threshold hysteresis		0.1	0.35	0.5
V_{EN_WAKE}	Enable Wake-up threshold		0.4		V
I_{EN}	Enable pin input current	$V_{IN} = V_{EN} = 12$ V		1.5	50
INTERNAL LDO (VCC PIN)					
V_{CC}	Internal VCC voltage	$V_{BIAS} = 0$ V	3.4		V
		$V_{BIAS} = 3.3$ V, 20 mA	3.2		
V_{CC_UVLO}	V_{IN} voltage at which Internal VCC under voltage lock-out is released	$I_{VCC} = 0$ A		3.75	V
$V_{CC_UVLO_HYST}$	Internal VCC under voltage lock-out hysteresis	Hysteresis below V_{CC_UVLO}		1.2	V
VOLTAGE REFERENCE (FB PIN)					
V_{FB}	Initial reference voltage accuracy for adjustable (1 V FB) versions	$V_{IN} = 3.0$ V to 36 V, FPWM Mode	0.985	1	1.015

7.5 Electrical Characteristics (continued)

Limits apply over the recommended operating junction temperature range of -40°C to $+125^{\circ}\text{C}$, unless otherwise noted. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^{\circ}\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 12$. $VIN1$ shorted to $VIN2 = V_{IN}$. V_{OUT} is output set point.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT		
I_{FB}	Input current from FB to AGND	Adjustable versions only, $V_{FB} = 1$ V			50	nA		
CURRENT LIMITS								
I_{SC}	Short circuit high-side current Limit	Duty cycle approaches 0%	11.5	13.8	15.7	A		
$I_{LS-LIMIT}$	Low-side current limit		8	9.2	10.5	A		
$I_{PEAK-MIN}$	Minimum Peak Inductor Current		1.9			A		
I_{L-NEG}	Negative current limit		-6.4	-5.3	-3.9	A		
I_{L-ZC}	Zero-cross current limit. Positive current direction is out of SW pin.	Auto Mode, static measurement	70		mA			
V_{HICCUP}	Hiccup threshold on FB pin		0.36	0.4	0.44	V		
POWER GOOD (/RESET PIN)								
$V_{RESET-OV}$	RESET upper threshold - Rising	% of FB voltage	109.5	112	114.5	%		
$V_{RESET-UV}$	RESET lower threshold - Falling	% of FB voltage	93	95	97.5	%		
V_{RESET_GUARD}	RESET UV threshold as percentage of steady state output voltage with output voltage and UV threshold, falling, read at the same T_J , and V_{IN} .	Falling	97		%			
$V_{RESET-HYS-FALLING}$	RESET falling threshold hysteresis	% of FB voltage	1.3		%			
$V_{RESET-HYS-RISING}$	RESET rising threshold hysteresis	% of FB voltage	1.3		%			
V_{RESET_VALID}	Minimum input voltage for proper RESET function	Measured when $V_{RESET} < 0.4$ V with 10 kOhm pullup to external 5 V	1.2		V			
V_{OL}	RESET Low-level function output voltage	46.0 μA pull up to RESET pin, $V_{IN} = 1.0$ V, $V_{EN} = 0$ V	0.4		V			
		1 mA pull up to RESET pin, $V_{IN} = 12$ V, $V_{EN} = 0$ V	0.4					
		2 mA pull up to RESET pin, $V_{IN} = 12$ V, $V_{EN} = 3.3$ V	0.4					
R_{RESET}	RESET ON resistance,	$V_{EN} = 5$ V, 1mA pull up current	44	125		Ω		
R_{RESET}	RESET ON resistance,	$V_{EN} = 0$ V, 1mA pull up current	18	40		Ω		
t_{RESET_FILTER}	RESET edge deglitch delay		10	26	45	μs		
t_{RESET_ACT}	RESET active time	Time FB must be valid before RESET is released.	1.2	2.1	3.75	ms		
OSCILLATOR (RT and SYNC PINS)								
f_{osc}	Internal oscillator frequency	RT = GND	1.90	2.2	2.42	MHz		
f_{osc}	Internal oscillator frequency	RT = VCC	320	400	450	kHz		
$f_{FIXED_2.2MHz}$	Oscillator frequency measured using maximum value of RT resistor to select 2.2 MHz	RT = 6.81 k Ω	1.95	2.2	2.42	MHz		
$f_{FIXED_0.4MHz}$	Oscillator frequency measured using minimum value of RT resistor to select 0.4 MHz	RT = 40.2 k Ω	352	400	448	kHz		
f_{ADJ}	Center Trim oscillator frequency	RT = 22.6 k Ω	630	700	770	kHz		
HIGH SIDE DRIVE (CBOOT PIN)								
V_{CBOOT_UVLO}	Voltage on CBOOT pin compared to SW which will turnoff high-side switch		1.9		V			
MOSFETS								

7.5 Electrical Characteristics (continued)

Limits apply over the recommended operating junction temperature range of -40°C to +125°C, unless otherwise noted. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 12$. $VIN1$ shorted to $VIN2 = V_{IN}$. V_{OUT} is output set point.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$R_{DS-ON-HS}$	High-side MOSFET on-resistance	Load = 1 A, $C_{BOOT-SW} = 3.2\text{ V}$		21	39	$\text{m}\Omega$
$R_{DS-ON-LS}$	Low-side MOSFET on-resistance	Load = 1 A, $C_{BOOT-SW} = 3.2\text{ V}$		13	25	$\text{m}\Omega$
PWM LIMITS (SW PIN)						
t_{ON-MIN}	Minimum HS switch on-time	$V_{IN} = 18\text{ V}$, $I_{OUT} = 2\text{ A}$, $R_{BOOT} = 0\text{ }\Omega$		62	81	ns
$t_{OFF-MIN}$	Minimum HS switch off-time	$V_{IN} = 5\text{ V}$		70	103	ns
t_{ON-MAX}	Maximum switch on-time	HS timeout in dropout	6.9	8.9	11	μs
D_{MAX}	Maximum switch duty cycle	While in frequency fold-back	98			%
		$f_{sw} = 1.85\text{ MHz}$		87		
START UP						
t_{EN}	Turn-on delay	$V_{IN} = 12\text{ V}$, $C_{VCC} = 1\text{ }\mu\text{F}$, time from EN high to first SW pulse if output starts at 0 V		0.82	1.2	ms
t_{SS}	Time from first SW pulse to V_{REF} at 90%, of set point.		1.6	2.2	2.7	ms
t_w	Short circuit wait time ("hiccup" time)		40			ms

7.6 System Characteristics

The following specifications apply only to the typical applications circuit, with nominal component values. Specifications in the typical (TYP) column apply to $T_J = 25^\circ\text{C}$ only. These specifications are not ensured by production testing.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY						
I_{IN}	Input supply current when in regulation	$V_{IN} = V_{EN/SYNC} = 24\text{ V}$, $V_{OUT} = V_{VLDOIN} = 3.3\text{ V}$, $V_{MODE} = 0\text{ V}$, $F_{SW} = 1\text{ MHz}$, $I_{OUT} = 0\text{ A}$		8		μA
OUTPUT VOLTAGE						
ΔV_{OUT1}	Load regulation	$V_{OUT} = 3.3\text{ V}$, $V_{IN} = 24\text{ V}$, $I_{OUT} = 0.1\text{ A}$ to 8 A		4		mV
ΔV_{OUT2}	Line regulation	$V_{OUT} = 3.3\text{ V}$, $V_{IN} = 4\text{ V}$ to 36 V , $I_{OUT} = 8\text{ A}$		1		mV
ΔV_{OUT3}	Load transient	$V_{OUT} = 5\text{ V}$, $V_{IN} = 24\text{ V}$, $I_{OUT} = 0\text{ A}$ to 4 A at $1\text{ A}/\mu\text{s}$, $C_{OUT(\text{derated})} = 100\text{ }\mu\text{F}$		150		mV
EFFICIENCY						
η	Efficiency	$V_{IN} = 12\text{ V}$, $V_{OUT} = V_{VLDOIN} = 3.3\text{ V}$, $I_{OUT} = 4\text{ A}$, $F_{SW} = 1\text{ MHz}$		92.1		%
η	Efficiency	$V_{IN} = 24\text{ V}$, $V_{OUT} = V_{VLDOIN} = 3.3\text{ V}$, $I_{OUT} = 4\text{ A}$, $F_{SW} = 1\text{ MHz}$		91		%
η	Efficiency	$V_{IN} = 12\text{ V}$, $V_{OUT} = V_{VLDOIN} = 5\text{ V}$, $I_{OUT} = 4\text{ A}$, $F_{SW} = 1\text{ MHz}$		94.3		%
η	Efficiency	$V_{IN} = 24\text{ V}$, $V_{OUT} = V_{VLDOIN} = 5\text{ V}$, $I_{OUT} = 4\text{ A}$, $F_{SW} = 1\text{ MHz}$		93		%

8 Detailed Description

8.1 Overview

The TLVM13610 is an easy-to-use, synchronous buck DC/DC power module designed for a wide variety of applications where reliability, small solution size, and low EMI signature are of paramount importance. With integrated power MOSFETs, a buck inductor, and PWM controller, the TLVM13610 operates over an input voltage range of 3 V to 36 V with transients as high as 42 V. The module delivers up to 8-A (10-A peak) DC load current with high conversion efficiency and ultra-low input quiescent current in a very small solution footprint. Control loop compensation is not required, reducing design time and external component count.

With a programmable switching frequency from 200 kHz to 2.2 MHz using its RT pin or an external clock signal, the TLVM13610 incorporates specific features to improve EMI performance in noise-sensitive applications:

- An optimized package and pinout design enables a shielded switch-node layout that mitigates radiated EMI
- Parallel input and output paths with symmetrical capacitor layouts minimize parasitic inductance, switch-voltage ringing, and radiated field coupling
- Resistor-programmable switch-node slew rate
- Integrated power MOSFETs with enhanced gate drive control enable low-noise PWM switching

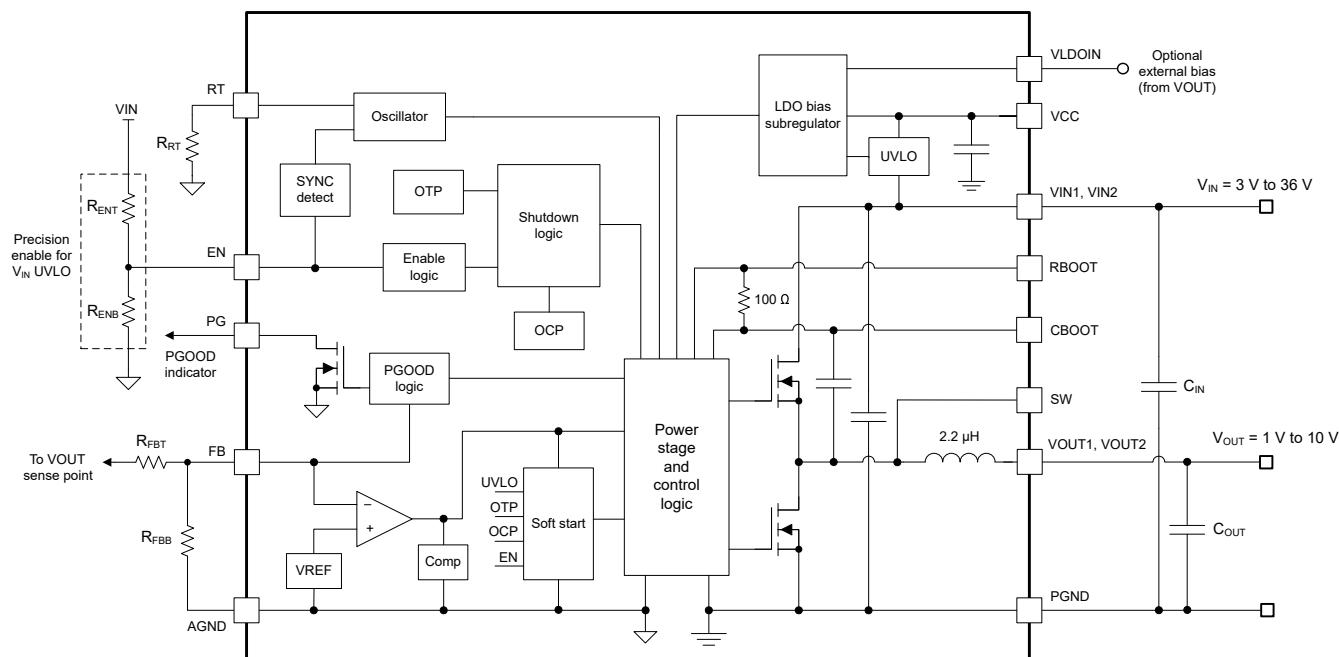

Together, these features significantly reduce EMI filtering requirements, while helping to meet CISPR 11 and CISPR 32 Class B EMI limits for conducted and radiated emissions.

The TLVM13610 module also includes inherent protection features for robust system requirements:

- An open-drain PGOOD indicator for power-rail sequencing and fault reporting
- Precision enable input with hysteresis, providing
 - Programmable line undervoltage lockout (UVLO)
 - Remote ON and OFF capability
- Internally fixed output-voltage soft start with monotonic start-up into prebiased loads
- Hiccup-mode overcurrent protection with cycle-by-cycle peak and valley current limits
- Thermal shutdown with automatic recovery.

Leveraging a pin arrangement designed for simple [layout](#) that requires only a few external components, the TLVM13610 is specified to maximum junction temperatures of 125°C. See [typical performance curves](#) to estimate suitability in a given ambient environment.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Input Voltage Range (VIN1, VIN2)

With a steady-state input voltage range from 3 V to 36 V, the TLVM13610 module is intended for step-down conversions from typical 12-V, 24-V, and 28-V input supply rails. The schematic circuit in [Figure 8-1](#) shows all the necessary components to implement a TLVM13610-based buck regulator using a single input supply.

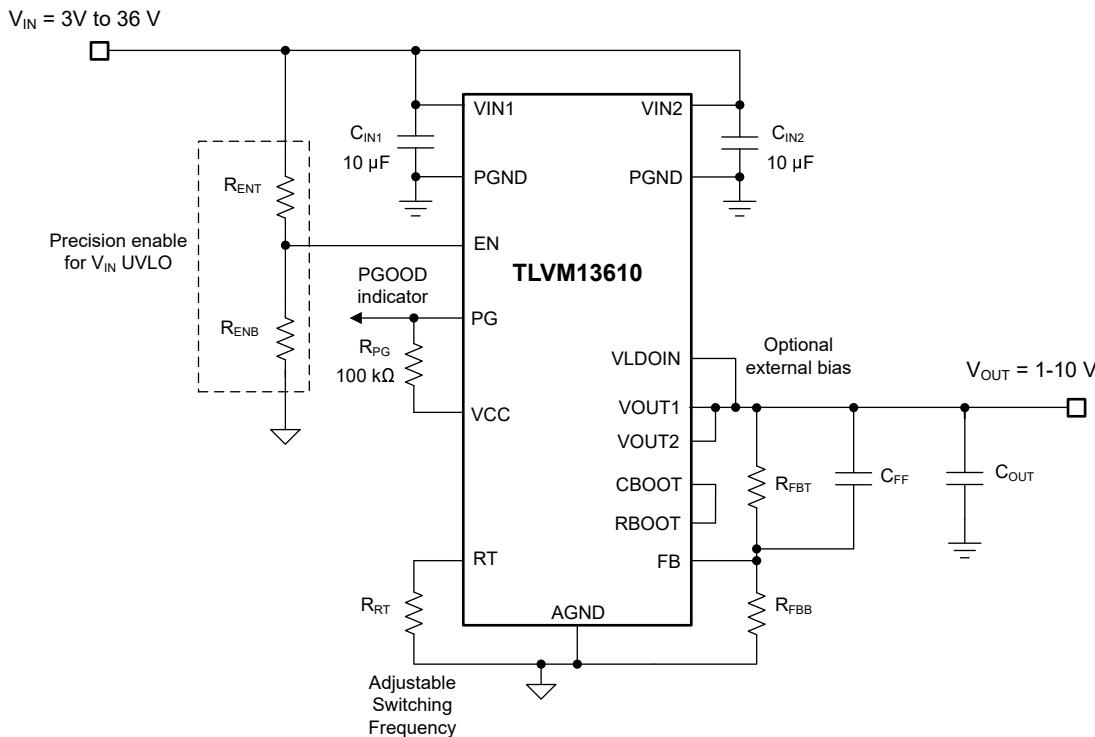

Figure 8-1. TLVM13610 Schematic Diagram with Input Voltage Operating Range of 3 V to 36 V

The minimum input voltage required for start-up is 3.7 V. Take extra care to make sure that the voltage at the VIN pins of the module (VIN1 and VIN2) does not exceed the absolute maximum voltage rating of 42 V during line or load transient events. Voltage ringing at the VIN pins that exceeds the [Section 7.1](#) can damage the IC.

8.3.2 Adjustable Output Voltage (FB)

The TLVM13610 has an adjustable output voltage range from 1 V up to a maximum of 20 V or slightly less than V_{IN}, whichever is lower. Setting the output voltage requires two feedback resistors, designated as R_{FBT} and R_{FBB} in [Figure 8-1](#). The reference voltage at the FB pin is set at 1 V with a feedback system accuracy over the full junction temperature range of $\pm 1\%$. The junction temperature range for the device is -40°C to 125°C .

Calculate the value for R_{FBB} using [Equation 1](#) below based on a recommended value for R_{FBT} of 100 kΩ.

$$R_{FBB}(\text{k}\Omega) = \frac{R_{FBT}(\text{k}\Omega)}{\frac{V_{OUT}}{1} - 1} \quad (1)$$

[Table 8-1](#) lists the standard resistor values for several output voltages and the recommended switching frequency range to maintain reasonable peak-to-peak inductor ripple current. This table also includes the minimum required output capacitance for each output voltage setting to maintain stability. The capacitances as listed represent effective values for ceramic capacitors derated for DC bias voltage and temperature. Furthermore, place a feedforward capacitor, C_{FF}, in parallel with R_{FBT} to increase the phase margin when the output capacitance is close to the minimum recommended value.

Table 8-1. Standard R_{FBT} Values, Recommended F_{SW} Range and Minimum C_{OUT}

V_{OUT} (V)	R_{FBT} (k Ω) ⁽¹⁾	SUGGESTED F_{SW} RANGE (kHz)	$C_{OUT(min)}$ (μ F) (EFFECTIVE)	BOM ⁽²⁾	C_{FF} (μ F)
1	Open	200 to 750	400	$4 \times 100 \mu$ F (6.3 V)	—
1.8	125	300 to 900	350	$4 \times 100 \mu$ F (6.3 V)	100
3.3	43.4	400 to 1100	100	$4 \times 47 \mu$ F (10 V)	47
5	25	500 to 1400	75	$3 \times 47 \mu$ F (10 V)	22
9	12.5	0.75 to 1.5	66	$4 \times 47 \mu$ F (16 V)	—

(1) $R_{FBT} = 100 \text{ k}\Omega$.(2) Refer to [Table 8-3](#) for the output capacitor list.

Note that higher feedback resistances consume less DC current. However, an upper R_{FBT} resistor value higher than 1 M Ω renders the feedback path more susceptible to noise. Higher feedback resistances generally require more careful layout of the feedback path. Make sure to locate the feedback resistors close to the FB and AGND pins, keeping the feedback trace as short as possible (and away from noisy areas of the PCB). See [Section 9.4.2](#) guidelines for more detail.

8.3.3 Input Capacitors

Input capacitors are necessary to limit the input ripple voltage to the module due to switching-frequency AC currents. TI recommends using ceramic capacitors to provide low impedance and high RMS current rating over a wide temperature range. [Equation 2](#) gives the input capacitor RMS current. The highest input capacitor RMS current occurs at $D = 0.5$, at which point the RMS current rating of the capacitors must be greater than half the output current.

$$I_{CIN, rms} = \sqrt{D \times \left(I_{OUT}^2 \times (1 - D) + \frac{\Delta i_L^2}{12} \right)} \quad (2)$$

where

- $D = V_{OUT} / V_{IN}$ is the module duty cycle.

Ideally, the DC and AC components of input current to the buck stage are provided by the input voltage source and the input capacitors, respectively. Neglecting inductor ripple current, the input capacitors source current of amplitude ($I_{OUT} - I_{IN}$) during the D interval and sink I_{IN} during the $1 - D$ interval. Thus, the input capacitors conduct a square-wave current of peak-to-peak amplitude equal to the output current. The resultant capacitive component of AC ripple voltage is a triangular waveform. Together with the ESR-related ripple component, [Equation 3](#) gives the peak-to-peak ripple voltage amplitude:

$$\Delta V_{IN} = \left(\frac{I_{OUT} \times D \times (1 - D)}{F_{SW} \times C_{IN}} + I_{OUT} \times R_{ESR} \right) \quad (3)$$

[Equation 4](#) gives the input capacitance required for a particular load current:

$$C_{IN} \geq \left(\frac{I_{OUT} \times D \times (1 - D)}{F_{SW} \times (\Delta V_{IN} - I_{OUT} \times R_{ESR})} \right) \quad (4)$$

where

- ΔV_{IN} is the input voltage ripple specification.

The TLV13610 requires a minimum of two 10- μ F ceramic input capacitors, preferably with X7R or X7S dielectric and in 1206 or 1210 footprint. Additional capacitance can be required for applications to meet conducted EMI specifications, such as CISPR 11 or CISPR 32.

[Table 8-2](#) includes a preferred list of capacitors by vendor. To minimize the parasitic inductance in the switching loops, position the ceramic input capacitors in a symmetrical layout close to the VIN1 and VIN2 pins and connect the capacitor return terminals to the PGND pins using a copper ground plane under the module.

Table 8-2. Recommended Ceramic Input Capacitors

VENDOR ⁽¹⁾	DIELECTRIC	PART NUMBER	CASE SIZE	CAPACITANCE (μ F) ⁽²⁾	RATED VOLTAGE (V)
TDK	X7R	C3216X7R1H106K160AC	1206	10	50
Murata	X7S	GCM32EC71H106KA03K	1210	10	50
AVX	X7R	12105C106MAT2A	1210	10	50
Murata	X7R	GRM32ER71H106KA12L	1210	10	50

(1) Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table. See the [Third-Party Products Disclaimer](#).

(2) Nameplate capacitance values (the effective values are lower based on the applied DC voltage and temperature).

As discussed in [Power Supply Recommendations](#), an electrolytic bulk capacitance (68 μ F to 100 μ F) provides low-frequency filtering and parallel damping to mitigate the effects of input parasitic inductance resonating with the low-ESR, high-Q ceramic input capacitors.

8.3.4 Output Capacitors

[Table 8-1](#) lists the TLVM13610 minimum amount of required output capacitance. The effects of DC bias and temperature variation must be considered when using ceramic capacitance. For ceramic capacitors in particular, the package size, voltage rating, and dielectric material contribute to differences between the standard rated value and the actual effective value of the capacitance.

When including additional capacitance above $C_{OUT(min)}$, the capacitance can be ceramic type, low-ESR polymer type, or a combination of the two. See [Table 8-3](#) for a preferred list of output capacitors by vendor.

Table 8-3. Recommended Ceramic Output Capacitors

VENDOR ⁽¹⁾	DIELECTRIC	PART NUMBER	CASE SIZE	CAPACITANCE (μ F) ⁽²⁾	VOLTAGE (V)

Murata	X7S	GRM32EC70J107ME15L	1210	100	6.3

(1) Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in the table. See the [Third-Party Products Disclaimer](#).

(2) Nameplate capacitance values (the effective values are lower based on the applied DC voltage and temperature).

8.3.5 Switching Frequency (RT)

Connect a resistor, designated as R_{RT} in [Figure 8-1](#), between RT and AGND to set the switching frequency within the range of 200 kHz to 2.2 MHz. Refer to [Equation 5](#) to calculate R_{RT} for a desired frequency.

$$R_{RT}(\text{k}\Omega) = \frac{16.4}{F_{SW} \text{ [MHz]}} - 0.633 \quad (5)$$

Refer to [Table 8-1](#) or use the simplified expression in [Equation 5](#) to find a switching frequency that sets an inductor ripple current of 25% to 40% of the 8-A module current rating at nominal input voltage.

8.3.6 Precision Enable and Input Voltage UVLO (EN)

The EN pin provides precision ON and OFF control for the TLVM13610. After the EN pin voltage exceeds the rising threshold and V_{IN} is above its minimum turn-on threshold, the device starts operation. The simplest way to enable the TLVM13610 is to connect EN directly to VIN. This action allows the TLVM13610 to start up when V_{IN}

is within its valid operating range. However, many applications benefit from the use of an enable divider network as shown in [Figure 8-1](#), which establishes a precision input undervoltage lockout (UVLO). This can be used for sequencing, to prevent re-triggering the device when used with long input cables, or to reduce the occurrence of deep discharge of a battery power source. An external logic signal can also be used to drive the enable input to toggle the output on and off and for system sequencing or protection.

Calculate R_{ENB} using [Equation 6](#):

$$R_{ENB}[\text{k}\Omega] = R_{ENT}[\text{k}\Omega] \times \left(\frac{V_{EN_RISE}[\text{V}]}{V_{IN(\text{on})}[\text{V}] - V_{EN_RISE}[\text{V}]} \right) \quad (6)$$

where

- A typical value for R_{ENT} is 100 k Ω .
- V_{EN_RISE} is enable rising threshold voltage of 1.263 V (typical).
- $V_{IN(\text{on})}$ is the desired start-up input voltage.

8.3.7 Power-Good Monitor (PG)

The TLVM13610 provides a power-good status signal to indicate when the output voltage is within a regulation window of 94% to 112%. The PG voltage goes low when the feedback (FB) voltage is outside of the specified PGOOD thresholds (see [Figure 7-7](#)). This action can occur during current limit and thermal shutdown, as well as when disabled and during start-up.

PG is an open-drain output, requiring an external pullup resistor to a DC supply, such as VCC or V_{OUT} . To limit current supplied by VCC, the recommended range of pullup resistance is 20 k Ω to 100 k Ω . A 26- μ s deglitch filter prevents false flag operation for short excursions of the output voltage, such as during line and load transients. When EN is pulled low, PG is forced low and remains valid as long as the input voltage is above 1 V (typical). Use the PG signal for start-up sequencing of downstream regulators, as shown in [Figure 8-2](#), or for fault protection and output monitoring.

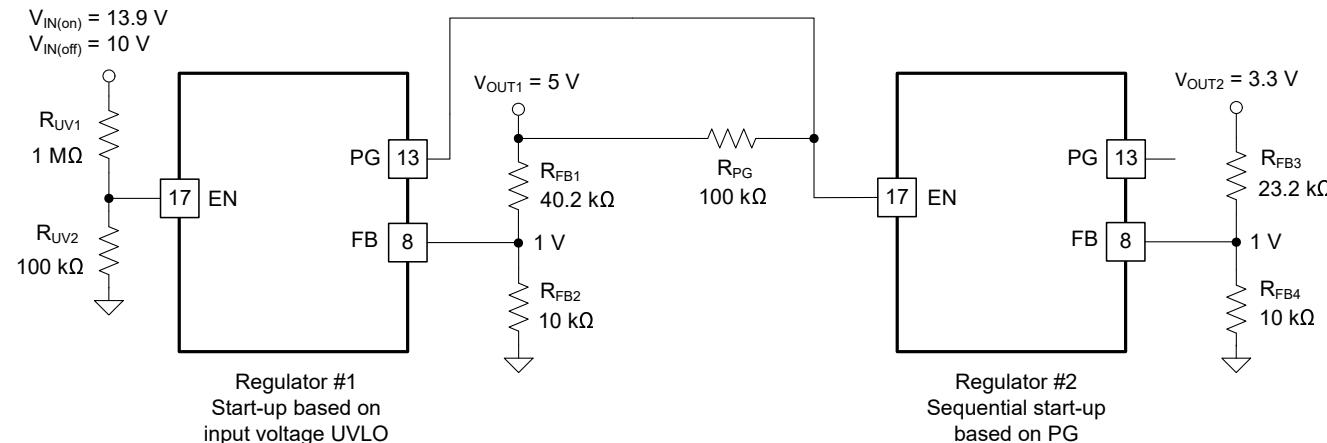

Figure 8-2. TLVM13610 Sequencing Implementation Using PG and EN

8.3.8 Adjustable Switch-Node Slew Rate (RBOOT, CBOOT)

Adjust the switch-node slew rate of the TLVM13610 to slow the switch-node voltage rise time and improve EMI performance at high frequencies. However, slowing the rise time decreases efficiency. Care must be taken to balance the improved EMI versus the decreased efficiency.

Place a resistor from RBOOT and CBOOT to allow adjustment of the internal resistance to balance EMI and efficiency performance. If improved EMI is not required, connect RBOOT to CBOOT to short the internal resistor, thus resulting in highest efficiency. If lower EMI is required, connect a resistor from 100 Ω - 500 Ω to. Floating the RBOOT pin results in 20-ns rise time and is not recommended due to increased power loss for higher load currents.

8.3.9 Bias Supply Regulator (VCC, VLDOIN)

VCC is the output of the internal LDO subregulator used to supply the control circuits of the TLVM13610. The nominal VCC voltage is 3.3 V. The VLDOIN pin is the input to the internal LDO. Connect this input to V_{OUT} to provide the lowest possible input supply current. If the VLDOIN voltage is less than 3.1 V, V_{IN1} and V_{IN2} directly power the internal LDO.

To prevent unsafe operation, VCC has UVLO protection that prevents switching if the internal voltage is too low. See V_{CC_UVLO} and $V_{CC_UVLO_HYS}$ in the [Section 7.5](#).

VCC must not be used to power external circuitry. Do not load VCC or short it to ground. VLDOIN is an optional input to the internal LDO. Connect an optional high quality 0.1- μ F to 1- μ F capacitor from VLDOIN to AGND for improved noise immunity.

The LDO provides the VCC voltage from one of two inputs: V_{IN} or VLDOIN. When VLDOIN is tied to ground or below 3.1 V, the LDO derives power from V_{IN} . The LDO input becomes VLDOIN when VLDOIN is tied to a voltage above 3.1 V. The VLDOIN voltage must not exceed both V_{IN} and 12 V.

[Equation 7](#) specifies the LDO power loss reduction as:

$$P_{LDO-LOSS} = I_{LDO} \times (V_{IN-LDO} - V_{VCC}) \quad (7)$$

The VLDOIN input provides an option to supply the LDO with a lower voltage than V_{IN} , thus minimizing the LDO input voltage relative to VCC and reducing power loss. For example, if the LDO current is 10 mA at 1 MHz with $V_{IN} = 24$ V and $V_{OUT} = 5$ V, the LDO power loss with VLDOIN tied to ground is $10 \text{ mA} \times (24 \text{ V} - 3.3 \text{ V}) = 207 \text{ mW}$, while the loss with VLDOIN tied to V_{OUT} is equal to $10 \text{ mA} \times (5 \text{ V} - 3.3 \text{ V}) = 17 \text{ mW}$ – a reduction of 190 mW.

[Figure 8-3](#) and [Figure 8-4](#) show typical efficiency plots with and without VLDOIN connected to V_{OUT} .

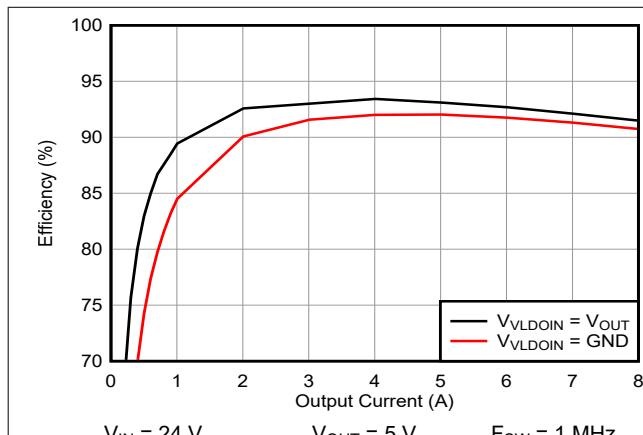

Figure 8-3. Efficiency Increase With External Bias

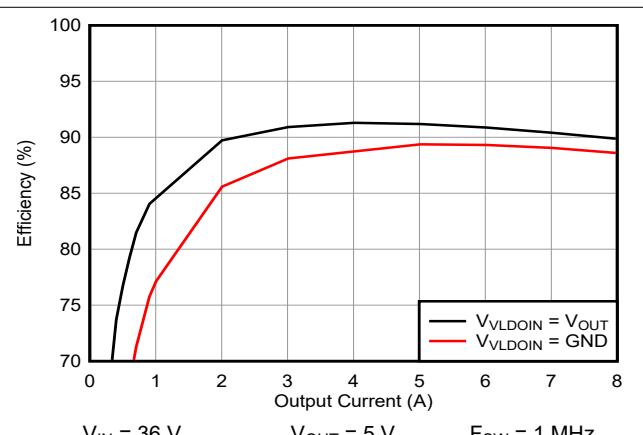

Figure 8-4. Efficiency Increase With External Bias

8.3.10 Overcurrent Protection (OCP)

The TLVM13610 is protected from overcurrent conditions using cycle-by-cycle current limiting of the peak inductor current. The current is compared every switching cycle to the current limit threshold. During an overcurrent condition, the output voltage decreases.

The TLVM13610 employs hiccup overcurrent protection if there is an extreme overload. In hiccup mode, the TLVM13610 module is shut down and kept off for 40 ms (typical) before a restart is attempted. If an overcurrent or short-circuit fault condition still exists, hiccup repeats until the fault condition is removed. Hiccup mode reduces power dissipation under severe overcurrent conditions, thus preventing overheating and potential damage to the device. After the fault is removed, the module automatically recovers and returns to normal operation.

8.3.11 Thermal Shutdown

Thermal shutdown is an integrated self-protection used to limit junction temperature and prevent damage related to overheating. Thermal shutdown turns off the device when the junction temperature exceeds 168°C (typical) to prevent further power dissipation and temperature rise. Junction temperature decreases after shutdown, and the TLVM13610 attempts to restart when the junction temperature falls to 159°C (typical).

8.4 Device Functional Modes

8.4.1 Shutdown Mode

The EN pin provides ON and OFF control for the TLVM13610. When V_{EN} is below approximately 0.4 V, the device is in shutdown mode. Both the internal LDO and the switching regulator are off. The quiescent current in shutdown mode drops to 0.6 μ A (typical). The TLVM13610 also employs internal undervoltage protection. If the input voltage is below its UV threshold, the regulator remains off.

8.4.2 Standby Mode

The internal LDO for the VCC bias supply has a lower enable threshold than the regulator itself. When V_{EN} is above 1.1 V (maximum) and below the precision enable threshold of 1.263 V (typical), the internal LDO is on and regulating. The precision enable circuitry is turned on after the internal V_{CC} is above its UVLO threshold. The switching action and voltage regulation are not enabled until V_{EN} rises above the precision enable threshold.

8.4.3 Active Mode

The TLVM13610 is in active mode when V_{VCC} and V_{EN} are above their relevant thresholds and no fault conditions are present. The simplest way to enable operation is to connect EN to V_{IN} , which allows self start-up when the applied input voltage exceeds the minimum start-up voltage.

9 Applications and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The TLVM13610 synchronous buck module requires only a few external components to convert from a wide range of supply voltages to a fixed output voltage at an output current up to 8 A. To expedite and streamline the process of designing of a TLVM13610-based regulator, a comprehensive TLVM13610 quickstart calculator tool is available by download to assist the system designer with component selection for a given application.

9.2 Typical Applications

For the circuit schematic, bill of materials, PCB layout files, and test results of a TLVM13610-powered implementation, see the TLVM13610EVM.

9.2.1 Design 1 – High-Efficiency 8-A (10-A peak) Synchronous Buck Regulator for Industrial Applications

The following figure shows the schematic diagram of a 5-V, 8-A buck regulator with a switching frequency of 1 MHz. In this example, the target half-load and full-load efficiencies are 93.4% and 91.5%, respectively, based on a nominal input voltage of 24 V that ranges from 9 V to 36 V. A resistor R_{RT} of 15.8 k Ω sets the free-running switching frequency at 1 MHz.

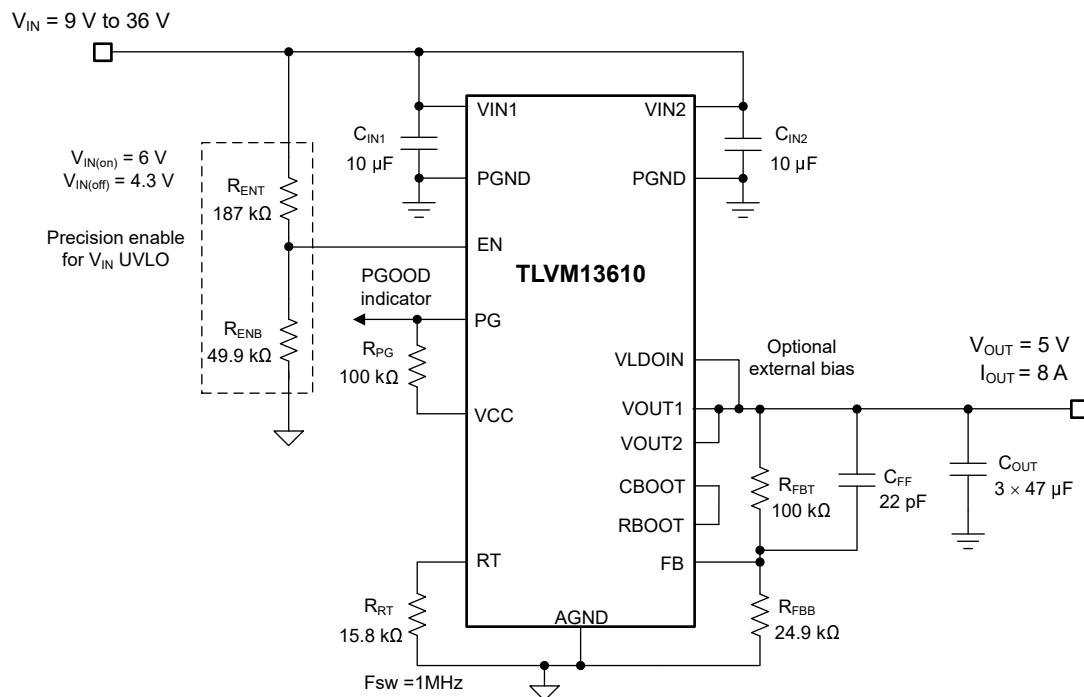

Figure 9-1. Circuit Schematic

9.2.1.1 Design Requirements

Table 9-1 shows the intended input, output, and performance parameters for this application example. Note that if the input voltage decreases below approximately 6 V, the regulator operates in dropout with the output voltage below its 5-V setpoint.

Table 9-1. Design Parameters

DESIGN PARAMETER	VALUE
Input voltage range	9 V to 36 V
Input voltage UVLO turn on, off	6 V, 4.3 V
Output voltage	5 V
Maximum output current	8 A
Switching frequency	1 MHz
Output voltage regulation	$\pm 1\%$
Module shutdown current	< 1 μ A

Table 9-2 gives the selected buck module power-stage components with availability from multiple vendors. This design uses an all-ceramic output capacitor implementation.

Table 9-2. List of Materials for Application Circuit 1

(1) See the [Third-Party Products Disclaimer](#).

More generally, the TLVM13610 module is designed to operate with a wide range of external components and system parameters. However, the integrated loop compensation is optimized for a certain range of output capacitance.

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the TLVM13610 module with WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance.
- Export customized schematic and layout into popular CAD formats.
- Print PDF reports for the design, and share the design with colleagues.

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2.1.2.2 Output Voltage Setpoint

The output voltage of a TLVM13610 module is externally adjustable using a resistor divider. A recommended value for R_{FBT} of 100 k Ω for improved noise immunity compared to 1 M Ω and reduced current consumption compared to lower resistance values. Calculate R_{FBB} using the following equation :

$$R_{FBB} = \frac{R_{FBT} \times V_{REF}}{V_{OUT} - V_{REF}} \quad (8)$$

Choose the closest standard value of 24.9 k Ω for R_{FBB} .

9.2.1.2.3 Switching Frequency Selection

Connect a 15.8-k Ω resistor from RT to AGND to set a switching frequency of 1 MHz, which is designed for an output of 5 V as it establishes an inductor peak-to-peak ripple current in the range of 20% to 40% of the 8-A rated output current at a nominal input voltage of 24 V.

9.2.1.2.4 Input Capacitor Selection

The TLVM13610 requires a minimum input capacitance of $2 \times 10\text{-}\mu\text{F}$ ceramic, preferably with X7R dielectric. The voltage rating of input capacitors must be greater than the maximum input voltage. For this design, select two 10- μF , X7R, 50-V, 1210 case size, ceramic capacitors connected from VIN1 and VIN2 to PGND as close as possible to the module. See [Figure 9-13](#) for recommended layout placement.

9.2.1.2.5 Output Capacitor Selection

From [Table 8-1](#), the TLVM13610 requires a minimum of 25 μF of effective output capacitance for proper operation at an output voltage of 5 V at 2.2 MHz. Use high-quality ceramic type capacitors with sufficient voltage and temperature rating. If needed, connect additional output capacitance to reduce ripple voltage or for applications with specific load transient requirements.

For this design example, use two 47- μF , 6.3-V or 10-V, X7R, 1210, ceramic capacitors connected close to the module from the VOUT1 and VOUT2 pins to PGND. The total effective capacitance at 5 V is approximately 52 μF and 38 μF at 25°C and -40°C, respectively.

9.2.1.2.6 Other Connections

Short RBOOT to CBOOT and connect VLDOIN to the 5-V output for best efficiency. To increase phase margin when using an output capacitance close to the minimum in [Table 8-1](#), a feedforward capacitor, designated as C_{FF} can be placed across the upper feedback resistor. Place the zero created by C_{FF} and R_{FBT} higher than one fifth the switching so that it boosts phase but does not significantly increase the crossover frequency. Because this C_{FF} capacitor can conduct noise from the output of the circuit directly to the FB node of the IC, a 4.99-k Ω resistor, R_{FF} , must be placed in series with C_{FF} . If the ESR zero of the output capacitor is below 200 kHz, do not use CFF.

9.2.1.3 Application Curves

Unless otherwise indicated, $V_{IN} = 24$ V, $V_{OUT} = 5$ V, $I_{OUT} = 8$ A, and $F_{SW} = 1$ MHz.

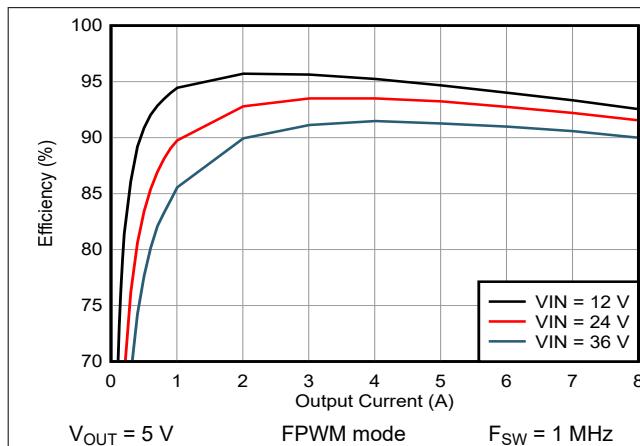

Figure 9-2. Efficiency for $V_{OUT} = 5$ V

9.3 Power Supply Recommendations

The TLVM13610 buck module is designed to operate over a wide input voltage range of 3 V to 36 V. The characteristics of the input supply must be compatible with the *Absolute Maximum Ratings* and *Recommended Operating Conditions* in this data sheet. In addition, the input supply must be capable of delivering the required input current to the loaded regulator circuit. Estimate the average input current with [Equation 9](#).

$$I_{IN} = \left(\frac{V_{OUT} \times I_{OUT}}{V_{IN} \times \eta} \right) \quad (9)$$

where

- η is the efficiency.

If the module is connected to an input supply through long wires or PCB traces with a large impedance, take special care to achieve stable performance. The parasitic inductance and resistance of the input cables can have an adverse affect on module operation. More specifically, the parasitic inductance in combination with the low-ESR ceramic input capacitors form an underdamped resonant circuit, possibly resulting in instability or voltage transients each time the input supply is cycled ON and OFF. The parasitic resistance causes the input voltage to dip during a load transient. If the module is operating close to the minimum input voltage, this dip can cause false UVLO triggering and a system reset.

The best way to solve such issues is to reduce the distance from the input supply to the module and use an electrolytic input capacitor in parallel with the ceramics. The moderate ESR of the electrolytic capacitor helps damp the input resonant circuit and reduce any overshoot or undershoot at the input. A capacitance in the range of 47 μ F to 100 μ F is usually sufficient to provide input parallel damping and helps hold the input voltage steady during large load transients. A typical ESR of 0.1 Ω to 0.4 Ω provides enough damping for most input circuit configurations.

9.4 Layout

Proper PCB design and layout is important in high-current, fast-switching module circuits (with high internal voltage and current slew rates) to achieve reliable device operation and design robustness. Furthermore, the EMI performance of the module depends to a large extent on PCB layout.

9.4.1 Layout Guidelines

The following list summarizes the essential guidelines for PCB layout and component placement to optimize DC/DC module performance, including thermals and EMI signature. [Figure 9-12](#) and [Figure 9-13](#) show a recommended PCB layout for the TLVM13610 with optimized placement and routing of the power-stage and small-signal components.

- *Place input capacitors as close as possible to the VIN pins.* Note the dual and symmetrical arrangement of the input capacitors based on the VIN1 and VIN2 pins located on each side of the module package. The high-frequency currents are split in two and effectively flow in opposing directions such that the related magnetic fields contributions cancel each other, leading to improved EMI performance.
 - Use low-ESR 1206 or 1210 ceramic capacitors with X7R or X7S dielectric. The module has integrated dual 0402 input capacitors for high-frequency bypass.
 - Ground return paths for the input capacitors must consist of localized top-side planes that connect to the PGND pads under the module.
 - Even though the VIN pins are connected internally, use a wide polygon plane on a lower PCB layer to connect these pins together and to the input supply.
- *Place output capacitors as close as possible to the VOUT pins.* A similar dual and symmetrical arrangement of the output capacitors enables magnetic field cancellation and EMI mitigation.
 - Ground return paths for the output capacitors must consist of localized top-side planes that connect to the PGND pads under the module.
 - Even though the VOUT pins are connected internally, use a wide polygon plane on a lower PCB layer to connect these pins together and to the load, thus reducing conduction loss and thermal stress.

- *Keep the FB trace as short as possible by placing the feedback resistors close to the FB pin.* Reduce noise sensitivity of the output voltage feedback path by placing the resistor divider close to the FB pin, rather than close to the load. FB is the input to the voltage-loop error amplifier and represents a high-impedance node sensitive to noise. Route a trace from the upper feedback resistor to the required point of output voltage regulation.
- *Use a solid ground plane on the PCB layer directly below the top layer with the module.* This plane acts as a noise shield by minimizing the magnetic fields associated with the currents in the switching loops. Connect AGND pins 6 and 11 directly to PGND pin 19 under the module.
- *Provide enough PCB area for proper heatsinking.* Use sufficient copper area to achieve a low thermal impedance commensurate with the maximum load current and ambient temperature conditions. Provide adequate heatsinking for the TLVM13610 to keep the junction temperature below 150°C. For operation at full rated load, the top-side ground plane is an important heat-dissipating area. Use an array of heat-sinking vias to connect the exposed pads (PGND) of the package to the PCB ground plane. If the PCB has multiple copper layers, connect these thermal vias to inner-layer ground planes. Make the top and bottom PCB layers preferably with two-ounce copper thickness (and no less than one ounce).

9.4.1.1 Thermal Design and Layout

For a DC/DC module to be useful over a particular temperature range, the package must allow for the efficient removal of the heat produced while keeping the junction temperature within rated limits. The TLVM13610 module is available in a small 6.5-mm × 7.55-mm 22-pin QFN (RDL) package to cover a range of application requirements. The *Thermal Information* table summarizes the thermal metrics of this package with related detail provided by the *Semiconductor and IC Package Thermal Metrics application report*.

The 22-pin QFN package offers a means of removing heat through the exposed thermal pads at the base of the package. This allows a significant improvement in heatsinking, and it becomes imperative that the PCB is designed with thermal lands, thermal vias, and one or more ground planes to complete the heat removal subsystem. The exposed pads of the TLVM13610 are soldered to the ground-connected copper lands on the PCB directly underneath the device package, reducing the thermal resistance to a very low value.

Preferably, use a four-layer board with 2-oz copper thickness for all layers to provide low impedance, proper shielding and lower thermal resistance. Numerous vias with a 0.3-mm diameter connected from the thermal lands to the internal and solder-side ground planes are vital to promote heat transfer. In a multi-layer PCB stack-up, a solid ground plane is typically placed on the PCB layer below the power-stage components. Not only does this provide a plane for the power-stage currents to flow, but it also represents a thermally conductive path away from the heat-generating device.

10 Device and Documentation Support

10.1 Device Support

10.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

10.1.2 Development Support

With an input operating voltage from 3 V to 36 V and rated output current up to 10 A, the TLVM13610 synchronous buck power module provides flexibility, scalability and optimized solution size for a range of applications. These modules enable DC/DC solutions with high density, low EMI and increased flexibility. Available EMI mitigation features include RBOOT-configured switch-node slew rate control, and integrated input bypass capacitors.

Table 10-1. Synchronous Buck DC/DC Power Module Family

DC/DC MODULE	RATED I_{OUT}	PACKAGE	DIMENSIONS	FEATURES	EMI MITIGATION
TLVM13610	8 A	B3QFN (22)	6.5 × 7.5 × 4 mm	RT adjustable F_{SW} , external synchronization, MODE adjustable (PFM/FPWM)	DRSS, RBOOT, integrated input, VCC and BOOT capacitors

10.1.2.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the TLVM13610 module with WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance.
- Run thermal simulations to understand board thermal performance.
- Export customized schematic and layout into popular CAD formats.
- Print PDF reports for the design, and share the design with colleagues.

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](#).

10.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.5 Trademarks

HotRod™ and TI E2E™ are trademarks of Texas Instruments.

WEBENCH® is a registered trademark of Texas Instruments.

All trademarks are the property of their respective owners.

10.6 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this datasheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TLVM13610RDFR	Active	Production	B3QFN (RDF) 22	1000 LARGE T&R	Yes	NIPDAU	Level-3-250C-168 HR	-40 to 125	13610
TLVM13610RDFR.A	Active	Production	B3QFN (RDF) 22	1000 LARGE T&R	Yes	NIPDAU	Level-3-250C-168 HR	-40 to 125	13610

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

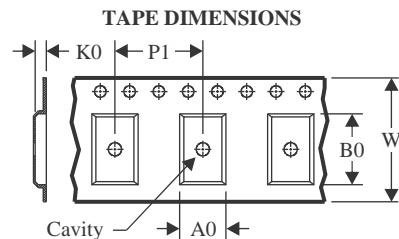

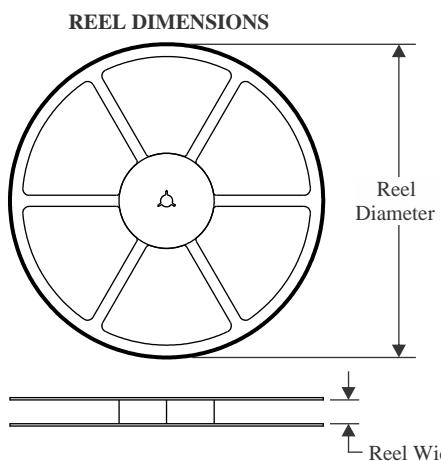

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

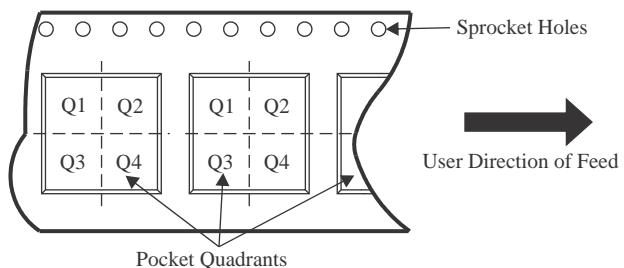

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
