

TMP64-Q1 ±1% 47-kΩ Automotive Grade Linear Thermistor with 0402 and 0603 Package Options

1 Features

- Automotive Qualifications
- Temperature Options:
 - AEC-Q100 Grade 1: –40 °C to 125 °C
 - AEC-Q100 Grade 0 (DYA): –40 °C to 150 °C
- Silicon-based thermistor with a positive temperature coefficient (PTC)
- Linear resistance change across temperature
- 47-kΩ nominal resistance at 25 °C (R25)
 - ±1% maximum (0 °C to 70 °C)
- Consistent sensitivity across temperature
 - 6400 ppm/°C TCR (25 °C)
 - 0.2% typical TCR tolerance across temperature range
- Fast thermal response time of 0.6 s (DEC)
- Long lifetime and robust performance
 - Built-in fail-safe in case of short-circuit failures
 - 0.5% typical long term sensor drift

2 Applications

- Thermal compensation
 - Display backlight
 - Battery management systems
- Thermal threshold detection
 - Motor control
 - On-board chargers & DC-DC converters

3 Description

Get started today with the [Thermistor Design Tool](#), offering complete resistance vs temperature table (R-T table) computation, other helpful methods to derive temperature and example C-code.

Linear thermistors offer linearity and consistent sensitivity across temperature to enable simple and accurate methods for temperature conversion. Low power consumption and a small thermal mass minimize the impact of self-heating. With built-in failsafe behavior at high temperatures and powerful immunity to environmental variation, these devices are designed for a long lifetime of high performance. The small size of the TMP6 series also allows for close placement to heat sources and quick response times.

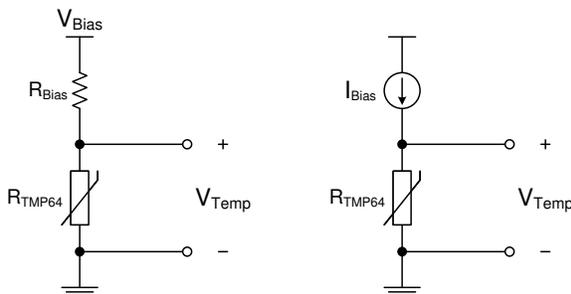

Take advantage of benefits over NTC thermistors such as no extra linearization circuitry, minimized calibration, less resistance tolerance variation, larger sensitivity at high temperatures, and simplified conversion methods to save time and memory in the processor.

The TMP64-Q1 is currently available in a 0402 footprint-compatible X1SON package and a 0603 footprint-compatible SOT-5X3 package.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TMP64-Q1	X1SON	0.60 mm × 1.00 mm
	SOT-5X3	0.60 mm × 1.00 mm

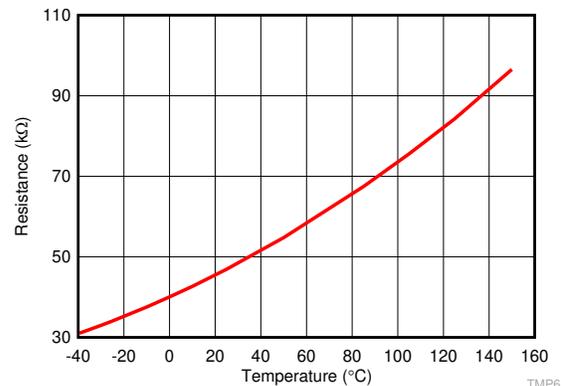

(1) For all available packages, see the orderable addendum at the end of the data sheet.

$$V_{Temp} = \frac{V_{Bias} * R_{TMP64}}{R_{Bias} + R_{TMP64}}$$

$$V_{Temp} = I_{Bias} * R_{TMP64}$$

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (June 2020) to Revision B (November 2020)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Added AEC-Q100 Temperature Grade 0 rating for SOT-5X3/DYA package.....	1
• Moved HBM and CDM ESD classification levels to <i>ESD Ratings</i> table.....	1
• Added DY A (SOT-5X3) package.....	1
• Updated DY A maximum temperature rating to 150 °C in device comparison table.....	3
• Changed Junction temperature from 150 °C to 155 °C in <i>Absolute Maximum Ratings</i> Table.....	5
• Changed Storage temperature from 150 °C to 155 °C in <i>Absolute Maximum Ratings</i> Table.....	5
• Added DY A Ambient Temperature Rating to <i>Recommended Operating Conditions</i> Table.....	5
• Added DY A Long Term Drift specifications.....	6
• Changed <i>Typical Characteristics</i> section.....	7
• Added <i>Application Curve</i> section.....	16

Changes from Revision Original (March 2019) to Revision A (June 2020)	Page
• Changed data sheet status from: Advanced Information to: Production Data.....	1
• Added Device Comparison table.....	3

8 Detailed Description

8.1 Overview

The TMP64-Q1 silicon linear thermistor has a linear positive temperature coefficient (PTC) that results in a uniform and consistent temperature coefficient resistance (TCR) across a wide operating temperature range. TI uses a special silicon process where the the doping level and active region areas devices control the key characteristics (the temperature coefficient resistance (TCR) and nominal resistance (R25)). The device has an active area and a substrate due to the polarized terminals. Connect the positive terminal to the highest voltage potential. Connect the negative terminal to the lowest voltage potential.

Unlike an NTC, which is a purely resistive device, the TMP64-Q1 resistance is affected by the current across the device and the resistance changes when the temperature changes. In a voltage divider circuit, it is recommended to maintain the top resistor value at 47 kΩ. Changing the top resistor value or the V_{BIAS} value changes the resistance vs temperature table (R-T table) of the TMP64-Q1, and subsequently the polynomials as described in [Section 9.2.1.1](#). Consult [Section 8.3.1](#) for more information.

$$TCR \text{ (ppm/}^\circ\text{C)} = (R_{T2} - R_{T1}) / ((T_2 - T_1) \times R_{(T2+T1)/2}) \quad (1)$$

Below are the definitions of the key terms used throughout this document:

- I_{SNS} : Current flowing through the TMP64-Q1.
- V_{SNS} : Voltage across the two TMP64-Q1 terminals.
- I_{BIAS} : Current supplied by the biasing circuit.
- V_{BIAS} : Voltage supplied by the biasing circuit.
- V_{Temp} : Output voltage that corresponds to the measured temperature. Note that this is different from V_{SNS} . In the use case of a voltage divider circuit with the TMP64-Q1 in the high side, V_{Temp} is taken across R_{BIAS} .

8.2 Functional Block Diagram

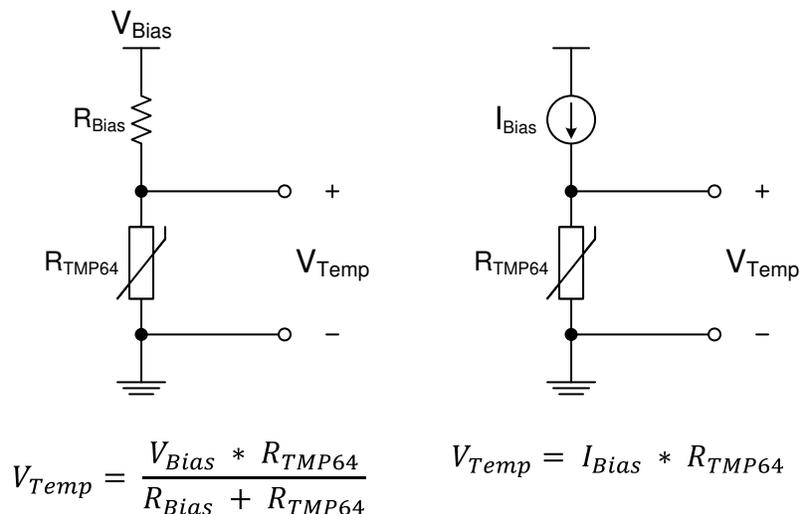

Figure 8-1. Typical Implementation Circuits

8.3 Feature Description

8.3.1 TMP64-Q1 R-T table

The TMP64-Q1 R-T table must be re-calculated for any change in the bias voltage, bias resistor, or bias current. TI provides a [Thermistor Design Tool](#) to calculate the R-T table. The system designer should always validate the calculations provided.

8.3.2 Linear resistance curve

The TMP64-Q1 has good linear behavior across the whole temperature range as shown in [Figure 7-1](#). This range allows a simpler resistance-to-temperature conversion method that reduces look-up table memory requirements. The linearization circuitry or midpoint calibration associated with traditional NTCs is not necessary with the device.

The linear resistance across the entire temperature range allows the device to maintain sensitivity at higher operating temperatures.

8.3.3 Positive Temperature Coefficient (PTC)

The TMP64-Q1 has a positive temperature coefficient. As temperature increases the device resistance increases leading to a reduction in power consumption of the bias circuit. In comparison, a negative coefficient system increases power consumption with temperature as the resistance decreases.

The TMP64-Q1 benefits from the reduced power consumption of the bias circuit with less self-heating than a typical NTC system.

8.3.4 Built-In Fail Safe

The TMP6 family feature a positive temperature coefficient. During a short-to-supply condition, the thermistor will have increased current and power dissipated. Due to the positive temperature slope, the TMP6 will increase resistance and limit self-heating by design.

In contrast, a NTC would continually reduce resistance due to self-heating leading to a positive feedback of increasing power dissipation and decreasing resistance.

8.4 Device Functional Modes

The device has one mode of operation that applies when operated within the [Recommended Operating Conditions](#).

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TMP64-Q1 is a positive temperature coefficient (PTC) linear silicon thermistor. The device behaves like a temperature-dependent resistor, and may be configured in a variety of ways to monitor temperature based on the system-level requirements. The TMP64-Q1 has a nominal resistance at 25 °C (R_{25}) of 47 k Ω , a maximum operating voltage of 5.5 V (V_{Sns}), and maximum supply current of 100 μ A (I_{Sns}). This device may be used in a variety of applications to monitor temperature close to a heat source with the very small DEC package option compatible with the typical 0402 (inch) footprint. Some of the factors that influence the total measurement error include the ADC resolution (if applicable), the tolerance of the bias current or voltage, the tolerance of the bias resistance in the case of a voltage divider configuration, and the location of the sensor with respect to the heat source.

9.2 Typical Application

9.2.1 Thermistor Biasing Circuits

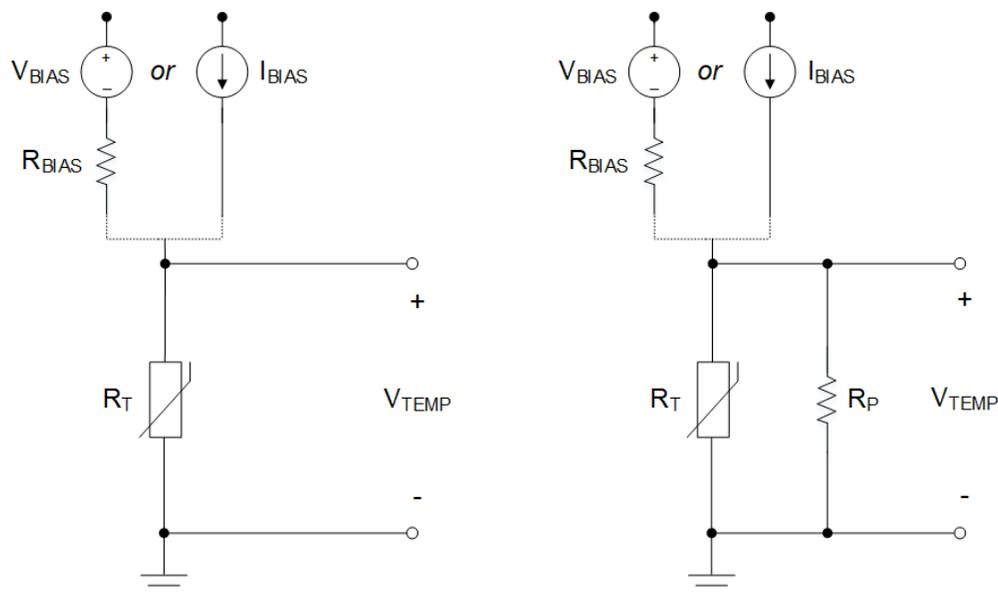

Figure 9-1. Biasing Circuit Implementations With Linear Thermistor (Left) vs. Non-Linear Thermistor (Right)

9.2.1.1 Design Requirements

Existing thermistors, in general, have a non-linear temperature vs. resistance curve. To linearize the thermistor response, the engineer can use a voltage linearization circuit with a voltage divider configuration, or a resistance linearization circuit by adding another resistance in parallel with the thermistor, R_P . Section 9.2.1 highlights the two implementations where R_T is the thermistor resistance. To generate an output voltage across the thermistor, the engineer can use a voltage divider circuit with the thermistor placed at either the high side (close to supply) or low side (close to ground), depending on the desired voltage response (negative or positive). Alternatively, the thermistor can be biased directly using a precision current source (yielding the highest accuracy and voltage gain). It is common to use a voltage divider with thermistors because of its simple implementation and lower cost. The TMP64-Q1, on the other hand, has a linear positive temperature coefficient (PTC) of resistance such

that the voltage measured across it increases linearly with temperature. As such, the need for a linearization circuits is no longer a requirement, and a simple current source or a voltage divider circuit can be used to generate the temperature voltage.

This output voltage can be interpreted using a comparator against a voltage reference to trigger a temperature trip point that is either tied directly to an ADC to monitor temperature across a wider range or used as feedback input for an active feedback control circuit.

The voltage across the TMP64-Q1, as described in [Equation 2](#), can be translated to temperature using either a lookup table method (LUT) or a fitting polynomial, $V(T)$. The [Thermistor Design Tool](#) must be used to translate V_{temp} to Temperature. The temperature voltage must first be digitized using an ADC. The necessary resolution of this ADC is dependent on the biasing method used. Additionally, for best accuracy, the bias voltage (V_{BIAS}) should be tied to the reference voltage of the ADC to create a measurement where the difference in tolerance between the bias voltage and the reference voltage cancels out. The engineer can also implement a low-pass filter to reject system level noise, and the user should place the filter as close to the ADC input as possible.

9.2.1.2 Detailed Design Procedure

The resistive circuit divider method produces an output voltage (V_{TEMP}) scaled according to the bias voltage (V_{BIAS}). When V_{BIAS} is also used as the reference voltage of the ADC, any fluctuations or tolerance error due to the voltage supply is canceled and does not affect the temperature accuracy. This type of configuration is shown in [Figure 9-2](#). [Equation 2](#) describes the output voltage (V_{TEMP}) based on the variable resistance of the TMP64-Q1 ($R_{TMP64-Q1}$) and bias resistor (R_{BIAS}). The ADC code that corresponds to that output voltage, ADC full-scale range, and ADC resolution is given in [Equation 3](#).

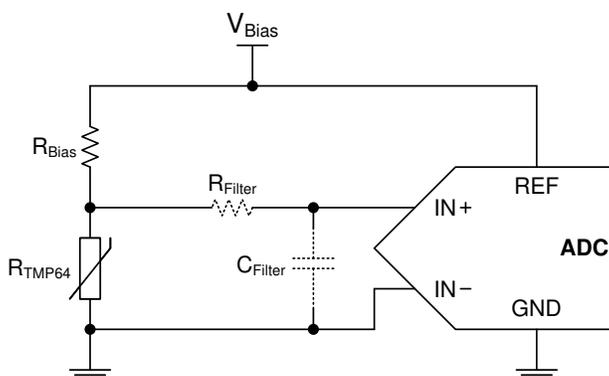

Figure 9-2. TMP64-Q1 Voltage Divider With an ADC

$$V_{TEMP} = V_{BIAS} \times \left(\frac{R_{TMP64}}{R_{BIAS} + R_{TMP64}} \right) \quad (2)$$

$$ADC \text{ Code} = \left(\frac{V_{TEMP}}{FSR} \right) \times 2^n \quad (3)$$

where

- FSR is the full-scale range of the ADC, which is the voltage at REF to GND (V_{REF})
- n is the resolution of the ADC

[Equation 4](#) shows whenever $V_{REF} = V_{BIAS}$, V_{BIAS} cancels out.

$$\text{ADC Code} = \left(\frac{V_{\text{BIAS}} \times \left(\frac{R_{\text{TMP64}}}{R_{\text{BIAS}} + R_{\text{TMP64}}} \right)}{V_{\text{BIAS}}} \right) \times 2^n = \left(\frac{R_{\text{TMP64}}}{R_{\text{BIAS}} + R_{\text{TMP64}}} \right) \times 2^n \quad (4)$$

The engineer can use a polynomial equation or a LUT to extract the temperature reading based on the ADC code read in the microcontroller. The [Thermistor Design Tool](#) should be used to translate the TMP64-Q1 resistance to temperature.

The cancellation of V_{BIAS} is one benefit to using a voltage-divider (ratiometric approach), but the sensitivity of the output voltage of the divider circuit cannot increase much. Therefore, not all of the ADC codes are used due to the small voltage output range compared to the FSR. This application is very common, however, and is simple to implement.

The engineer can use a current source-based circuit, like the one shown in [Figure 9-3](#), to have better control over the sensitivity of the output voltage and achieve higher accuracy. In this case, the output voltage is simply $V = I \times R$. For example, if a current source of 100 μA is used with the TMP64-Q1, the output voltage spans approximately 5.5 V and has a gain up to 40 $\text{mV}/^\circ\text{C}$. Having control over the voltage range and sensitivity allows for full utilization of the ADC codes and full-scale range. Similar to the ratiometric approach above, if the ADC has a built-in current source that shares the same bias as the reference voltage of the ADC, the tolerance of the supply current cancels out. In this case, a precision ADC is not required. This method yields the best accuracy, but can increase the system implementation cost.

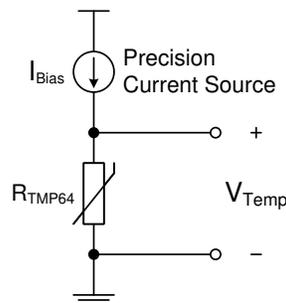

Figure 9-3. TMP64-Q1 Biasing Circuit With Current Source

In comparison to the non-linear NTC thermistor in a voltage divider, the TMP64-Q1 has an enhanced linear output characteristic. The two voltage divider circuits with and without a linearization parallel resistor, R_P , are shown in [Figure 9-4](#). Consider an example where $V_{\text{BIAS}} = 5 \text{ V}$, $R_{\text{BIAS}} = 47 \text{ k}\Omega$, and a parallel resistor (R_P) is used with the NTC thermistor (R_{NTC}) to linearize the output voltage with an additional 47-k Ω resistor. The TMP64-Q1 produces a linear curve across the entire temperature range while the NTC curve is only linear across a small temperature region. When the parallel resistor (R_P) is added to the NTC circuit, the added resistor makes the curve much more linear but greatly affects the output voltage range.

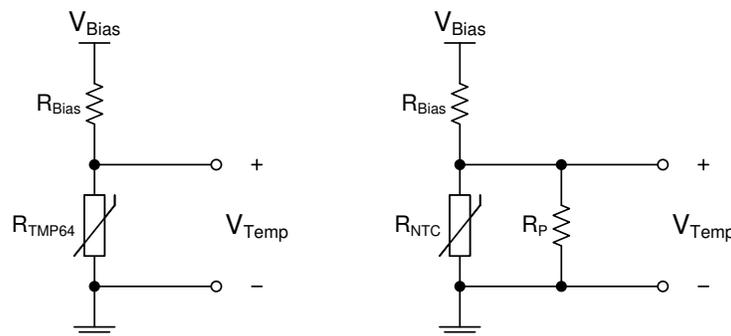

Figure 9-4. TMP64-Q1 vs. NTC With Linearization Resistor (R_P) Voltage Divider Circuits

9.2.1.2.1 Thermal Protection With Comparator

The engineer can use the TMP64-Q1, a voltage reference, and a comparator to program the thermal protection. As shown in [Figure 9-5](#), the output of the comparator remains low until the voltage of the thermistor divider, with R_{BIAS} and $R_{TMP64-Q1}$, rises above the threshold voltage set by R_1 and R_2 . When the output goes high, the comparator signals an overtemperature warning signal. The engineer can also program the hysteresis to prevent the output from continuously toggling around the temperature threshold when the output returns low. Either a comparator with built-in hysteresis or feedback resistors may be used.

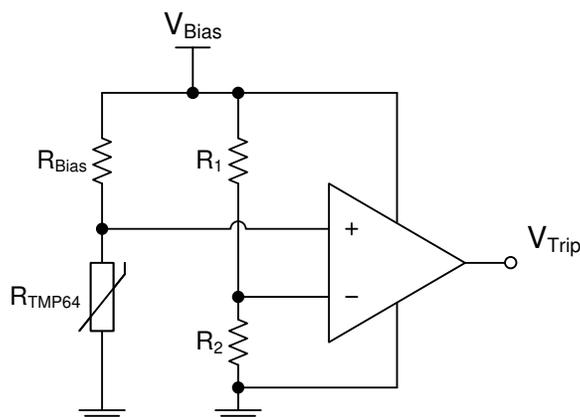

Figure 9-5. Temperature Switch Using TMP64-Q1 Voltage Divider and a Comparator

9.2.1.2.2 Thermal Foldback

One application that uses the output voltage of the TMP64-Q1 in an active control circuit is thermal foldback. This is performed to reduce, or fold back, the current driving a string of LEDs, for example. At high temperatures, the LEDs begin to heat up due to environmental conditions and self heating. Thus, at a certain temperature threshold based on the LED's safe operating area, the driving current must be reduced to cool down the LEDs and prevent thermal runaway. The TMP64-Q1 voltage output increases with temperature when the output is in the lower position of the voltage divider and can provide a response used to fold back the current. Typically, the current is held at a specified level until a high temperature is reached, known as the knee point, where the current must be rapidly reduced. To better control the temperature/voltage sensitivity of the TMP64-Q1, a rail-to-rail operational amplifier is used. In the example shown in [Figure 9-6](#), the temperature “knee” where the foldback begins is set by the reference voltage (2.5 V) at the positive input, and the feedback resistors set the response of the foldback curve. The foldback knee point may be chosen based on the output of the voltage divider and the corresponding temperature from [Equation 5](#) (like 110 °C, for example). A buffer is used in-between the voltage divider with $R_{TMP64-Q1}$ and the input to the op amp to prevent loading and variations in V_{TEMP} .

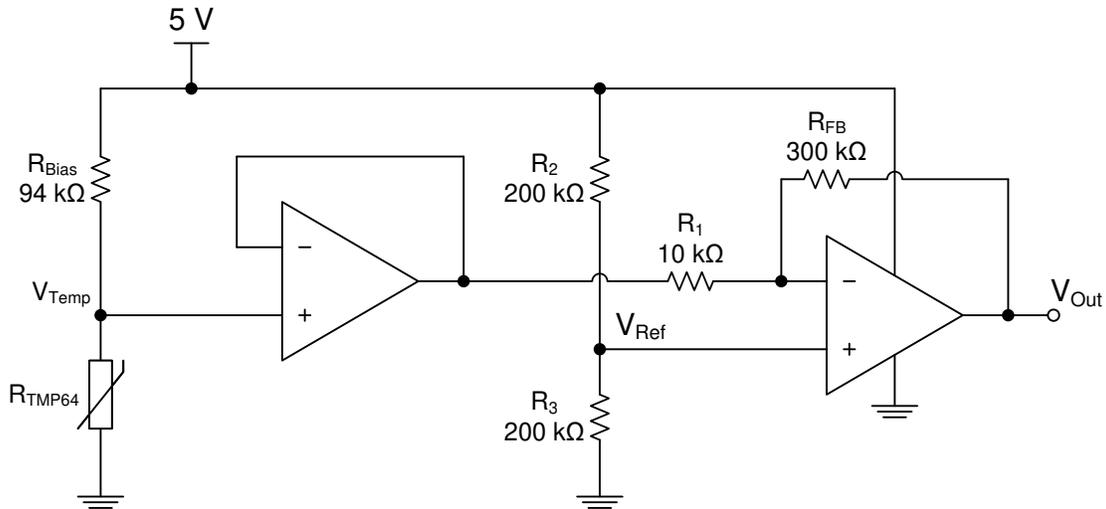

Figure 9-6. Thermal Foldback Using TMP64-Q1 Voltage Divider and a Rail-to-Rail Op Amp

The op amp remains high as long as the voltage output is below V_{Ref} . When the temperature goes above 110 °C, then the output swings low to the 0-V rail of the op amp. The rate at which the foldback occurs is dependent on the feedback network, R_{FB} and R_1 , which varies the gain of the op amp, G , given by Equation 6. This in return controls the voltage/temperature sensitivity of the circuit. This voltage output is fed into a LED driver IC that adjusts output current accordingly. The final output voltage used for thermal foldback is V_{OUT} , and is given in Equation 7. In this example where the knee point is set at 110 °C, the output voltage curve is as shown in Figure 9-7.

$$V_{TEMP} = V_{BIAS} \times \left(\frac{R_{TMP64}}{R_{BIAS} + R_{TMP64}} \right) \quad (5)$$

$$G = \frac{R_{FB}}{R_1} \quad (6)$$

$$V_{OUT} = -G \times V_{TEMP} + (1 + G) \times V_{REF} \quad (7)$$

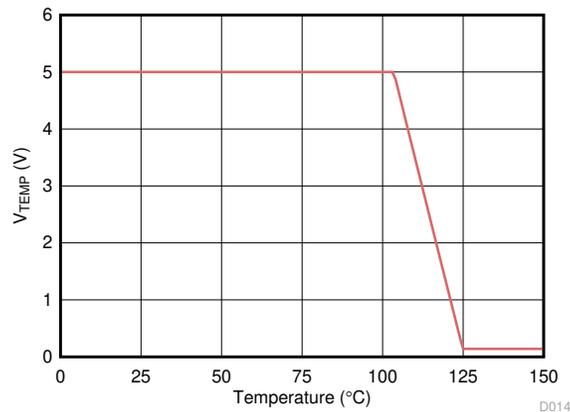

Figure 9-7. Thermal Foldback Voltage Output Curve

9.2.1.3 Application Curve

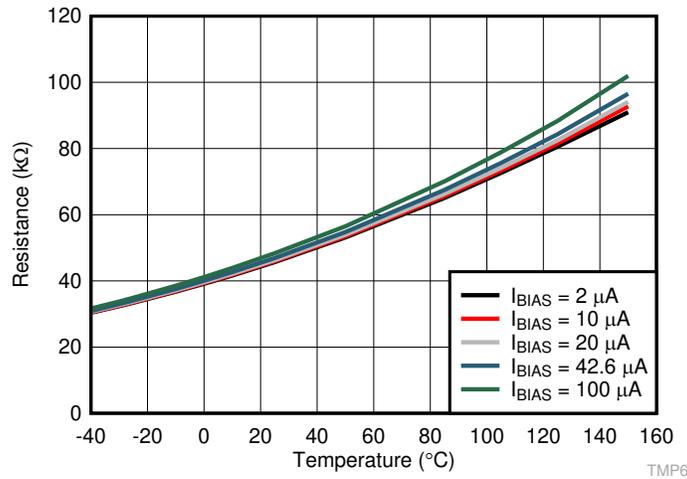

Figure 9-8. TMP64-Q1 Temperature Voltage With Varying Current Sources

10 Power Supply Recommendations

The maximum recommended operating voltage of the TMP64-Q1 is 5.5 V (V_{Sns}), and the maximum current through the device is 100 μA (I_{Sns}).

11 Layout

11.1 Layout Guidelines

The layout of the TMP64-Q1 is similar to that of a passive component. If the device is biased with a current source, the positive pin 2 is connected to the source, while the negative pin 1 is connected to ground. If the circuit is biased with a voltage source, and the device is placed on the lower side of the resistor divider, $V-$ is connected to ground, and $V+$ is connected to the output (V_{TEMP}). If the device is placed on the upper side of the divider, $V+$ is connected to the voltage source and $V-$ is connected to the output voltage (V_{TEMP}). Figure 11-1 shows the device layout.

11.2 Layout Example

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TMP6431QDECRQ1	Active	Production	X1SON (DEC) 2	10000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	HJ
TMP6431QDECRQ1.A	Active	Production	X1SON (DEC) 2	10000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	HJ
TMP6431QDECTQ1	Obsolete	Production	X1SON (DEC) 2	-	-	Call TI	Call TI	-40 to 125	HJ
TMP6431QDYARQ1	Active	Production	SOT-5X3 (DYA) 2	3000 LARGE T&R	Yes	SN	Level-3-260C-168 HR	-40 to 150	1HH
TMP6431QDYARQ1.A	Active	Production	SOT-5X3 (DYA) 2	3000 LARGE T&R	Yes	SN	Level-3-260C-168 HR	-40 to 150	1HH

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

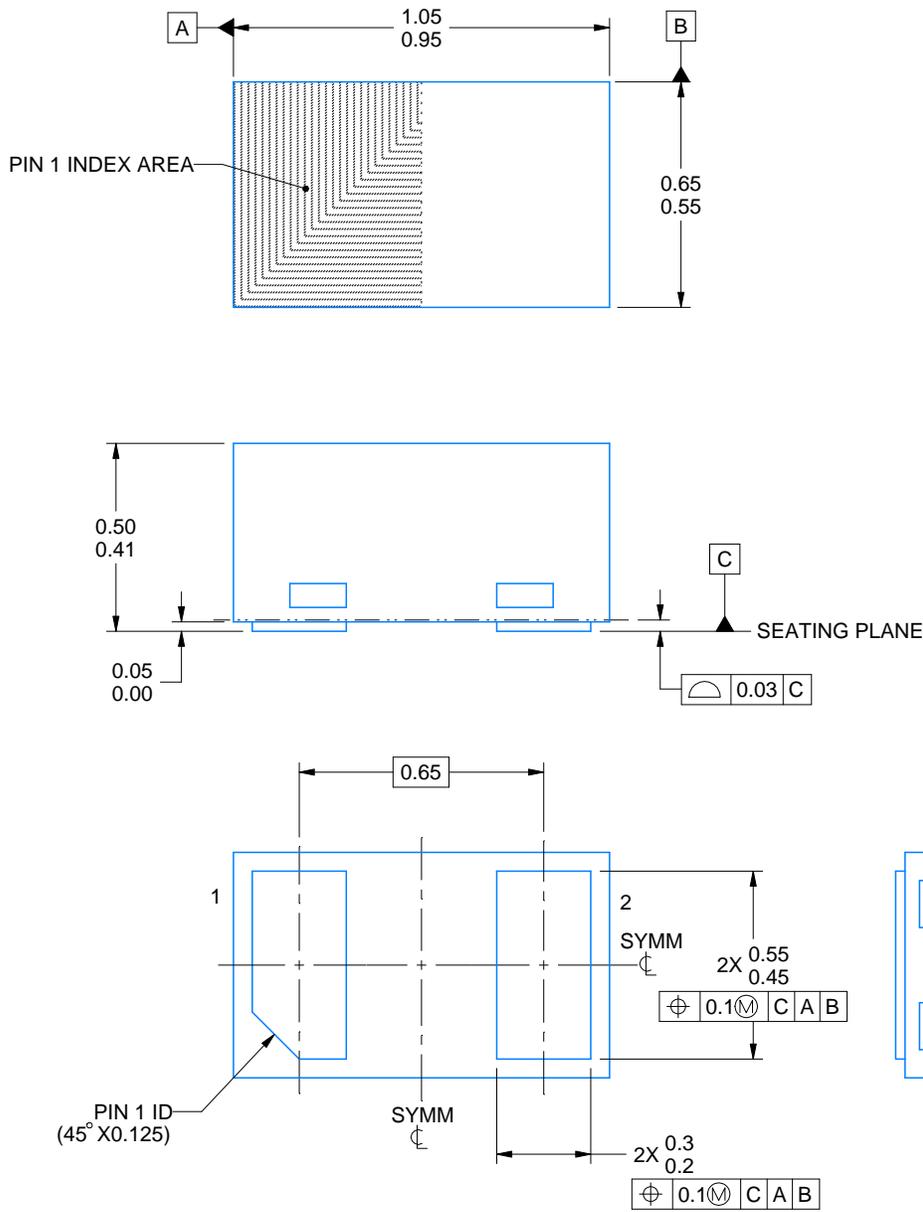

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TMP6431QDECRQ1	X1SON	DEC	2	10000	178.0	8.4	0.7	1.15	0.47	2.0	8.0	Q1
TMP6431QDYARQ1	SOT-5X3	DYA	2	3000	178.0	9.5	0.5	1.94	0.73	2.0	8.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TMP6431QDECRQ1	X1SON	DEC	2	10000	205.0	200.0	33.0
TMP6431QDYARQ1	SOT-5X3	DYA	2	3000	210.0	200.0	42.0

4224506/A 08/2018

NOTES:

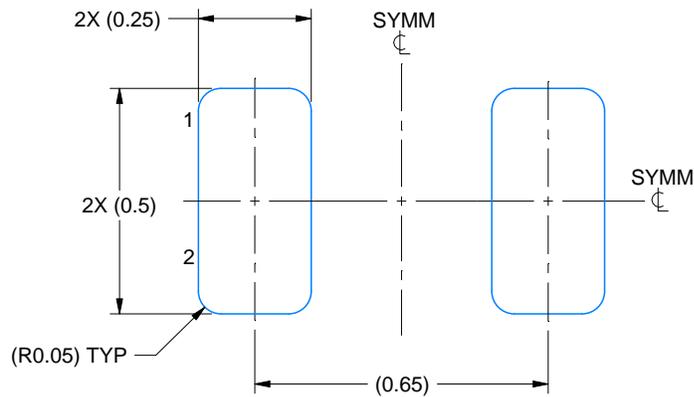

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M
2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT

DEC0002A

X1SON - 0.5 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:60X

SOLDER MASK DETAILS

4224506/A 08/2018

NOTES: (continued)

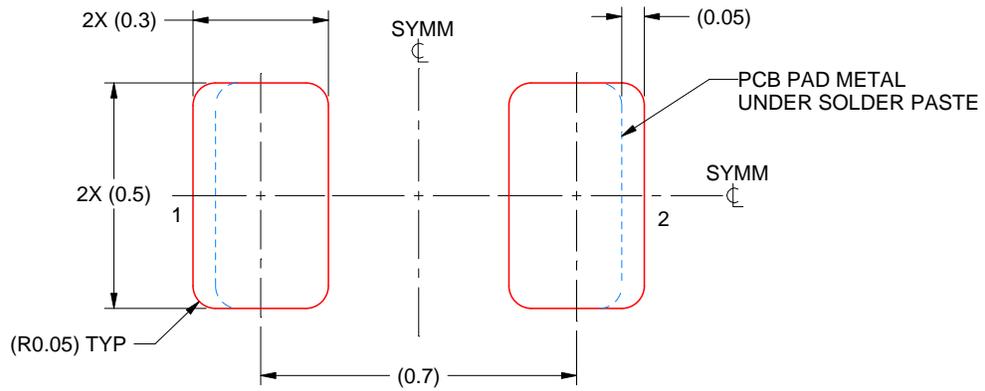

3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slue271).
4. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

DEC0002A

X1SON - 0.5 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE:60X

4224506/A 08/2018

NOTES: (continued)

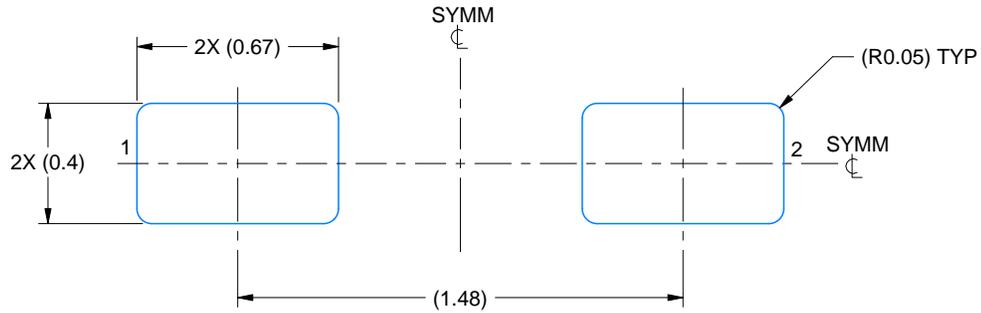

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

EXAMPLE BOARD LAYOUT

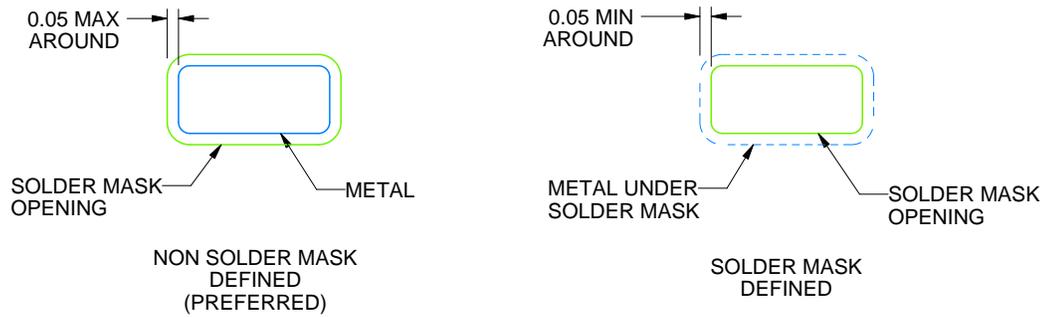

DYA0002A

SOT (SOD-523) - 0.77 mm max height

PLASTIC SMALL OUTLINE

LAND PATTERN EXAMPLE
SCALE:40X

SOLDEMASK DETAILS

4224978/C 11/2024

NOTES: (continued)

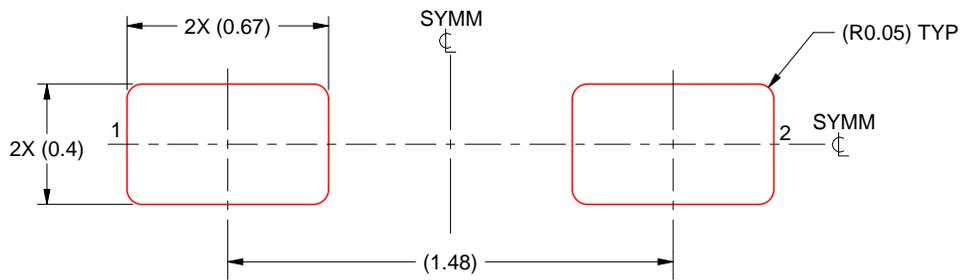

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DYA0002A

SOT (SOD-523) - 0.77 mm max height

PLASTIC SMALL OUTLINE

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE:40X
