

## 2-W FILTERLESS MONO CLASS-D AUDIO POWER AMPLIFIER

### FEATURES

- Qualified for Automotive Applications
- ESD Protection Exceeds 2000 V Per MIL-STD-883, Method 3015; Exceeds 200 V Using Machine Model (C = 200 pF, R = 0)
- Modulation Scheme Optimized to Operate Without a Filter
- Extremely Efficient Third-Generation 5-V Class-D Technology:
  - Low Supply Current (No Filter) . . . 4 mA
  - Low Supply Current (Filter) . . . 7.5 mA
  - Low Shutdown Current . . . 0.05  $\mu$ A
  - Low-Noise Floor . . . 40  $\mu$ V<sub>RMS</sub> (No-Weighting Filter)
  - Maximum Efficiency Into 8  $\Omega$ , 75 – 85%
  - Four Internal Gain Settings . . . 6 – 23.5 dB
  - PSSR . . . –77 dB
- 4 mm  $\times$  4 mm MicroStar™ Junior BGA and TSSOP Package Options
- 2 W Into a 4- $\Omega$  Speaker (THD+N<1%)
- <0.2% THD+N at 1.5 W, 1 kHz, Into a 4- $\Omega$  Load
- Integrated Depop Circuitry
- Short-Circuit Protection (Short to PV<sub>DD</sub>, Ground, and Load)

### DESCRIPTION/ORDERING INFORMATION

The TPA2000D1 is a 2-W mono bridge-tied-load (BTL) class-D amplifier designed to drive a speaker with at least 4- $\Omega$  impedance. The amplifier uses Texas Instruments third-generation modulation technique, which results in improved efficiency and SNR. It also allows the device to be connected directly to the speaker without the use of the LC output filter commonly associated with class-D amplifiers (this results in EMI which must be shielded at the system level). These features make the device ideal for use in devices where high efficiency is needed to extend battery run time.

The gain of the amplifier is controlled by two input terminals, GAIN1 and GAIN0. This allows the amplifier to be configured for a gain of 6, 12, 18, and 23.5 dB. The differential input terminals are high-impedance CMOS inputs and can be used as summing nodes.

The class-D BTL amplifier includes depop circuitry to reduce the amount of turnon pop at power up and when cycling SHUTDOWN.

The TPA2000D1 is available in the 16-pin TSSOP and MicroStar™ Junior BGA packages and drive 2 W of continuous output power into a 4- $\Omega$  load. The TPA2000D1T operates over an ambient temperature range of –40°C to 105°C.

### TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AGND	15	I	Analog ground
BYPASS	16	I	Connect capacitor to ground for BYPASS voltage filtering.
COSC	14	I	Connect capacitor to ground to set oscillation frequency.
GAIN0	4	I	Bit 0 of gain control (TTL logic level)
GAIN1	5	I	Bit 1 of gain control (TTL logic level)
INN	2	I	Negative differential input
INP	1	I	Positive differential input
OUTN	10	O	Negative BTL output
OUTP	7	O	Positive BTL output
PGND	8, 9	I	High-current grounds
PVDD	6, 11	I	High-current power supplies
ROSC	13	I	Connect resistor to ground to set oscillation frequency.
SHUTDOWN	3	I	Places the amplifier in shutdown mode if a TTL logic low is placed on this terminal, and normal operation if a TTL logic high is placed on this terminal.
V <sub>DD</sub>	12	I	Analog power supply

### Absolute Maximum Ratings<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
V <sub>DD</sub> , PV <sub>DD</sub> Supply voltage range	−0.3	5.5	V
V <sub>I</sub> Input voltage range	−0.3	V <sub>DD</sub> + 0.3	V
Continuous total power dissipation	(see Dissipation Rating Table)		
T <sub>A</sub> Operating free-air temperature range	−40	105	°C
T <sub>J</sub> Operating junction temperature range	−40	115	°C
T <sub>stg</sub> Storage temperature range	−65	150	°C
Lead temperature 1,6 mm (1/16 in) from case for 10 s		260	°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### Dissipation Rating Table

PACKAGE	T <sub>A</sub> ≤ 25°C	DERATING FACTOR	T <sub>A</sub> = 70°C	T <sub>A</sub> = 85°C	T <sub>A</sub> = 105°C
PW	774 mW	6.19 mW/°C	495 mW	402 mW	279 mW

## Recommended Operating Conditions

			MIN	MAX	UNIT
$V_{DD}$ , $PV_{DD}$	Supply voltage		2.7	5.5	V
$V_{IH}$	High-level input voltage	GAIN0, GAIN1, $\overline{\text{SHUTDOWN}}$	2		V
$V_{IL}$	Low-level input voltage	GAIN0, GAIN1, $\overline{\text{SHUTDOWN}}$		0.7	V
$f_S$	Switching frequency		200	300	kHz
$T_A$	Operating free-air temperature		−40	105	°C

## Electrical Characteristics

at specified free-air temperature,  $PV_{DD} = 5\text{ V}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OS} $	Output offset voltage (measured differentially) $V_I = 0\text{ V}$ , $A_V = \text{any gain}$			25	mV
PSRR	Power supply rejection ratio $PV_{DD} = 4.9\text{ V to }5.1\text{ V}$	−77			dB
$ I_{IH} $	High-level input current $PV_{DD} = 5.5$ , $V_I = PV_{DD}$			1	$\mu\text{A}$
$ I_{IL} $	Low-level input current $PV_{DD} = 5.5$ , $V_I = 0\text{ V}$			1	$\mu\text{A}$
$I_{DD}$	Supply current, no filter (with or without speaker load)		4	7	mA
$I_{DD(SD)}$	Supply current, shutdown mode GAIN0, GAIN1, $\overline{\text{SHUTDOWN}} = 0\text{ V}$	0.05		28	$\mu\text{A}$

## Operating Characteristics

$PV_{DD} = 5\text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $R_L = 4\ \Omega$ , gain = 6 dB (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$P_O$	Output power THD = 1%, $f = 1\text{ kHz}$		2		W
THD+N	Total harmonic distortion plus noise $P_O = 1.5\text{ W}$ , $f = 20\text{ Hz to }20\text{ kHz}$		<0.2%		
$k_{SVR}$	Supply ripple rejection ratio $f = 1\text{ kHz}$ , $C_{BYP} = 1\ \mu\text{F}$	−67			dB
SNR	Signal-to-noise ratio		95		dB
$V_n$	Output noise voltage (no-noise weighting filter) $C_{BYP} = 1\ \mu\text{F}$ , $f = <10\text{ Hz to }22\text{ kHz}$		40		$\mu\text{V(rms)}$
$Z_I$	Input impedance		>15		k $\Omega$

## Electrical Characteristics

at specified free-air temperature,  $PV_{DD} = 3.3\text{ V}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OS} $ Output offset voltage (measured differentially)	$V_I = 0\text{ V}$ , $A_V = \text{any gain}$			25	mV
PSRR Power supply rejection ratio	$PV_{DD} = 3.2\text{ V to }3.4\text{ V}$		–61		dB
$ I_{IH} $ High-level input current	$PV_{DD} = 3.3$ , $V_I = PV_{DD}$			1	$\mu\text{A}$
$ I_{IL} $ Low-level input current	$PV_{DD} = 3.3$ , $V_I = 0\text{ V}$			1	$\mu\text{A}$
$I_{DD}$ Supply current, no filter (with or without speaker load)			4	7	mA
$I_{DD(SD)}$ Supply current, shutdown mode			0.05	28	$\mu\text{A}$

## Operating Characteristics

$PV_{DD} = 3.3\text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $R_L = 4\ \Omega$ , gain = 6 dB (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$P_O$ Output power	THD = 1%, $f = 1\text{ kHz}$ ,		850		mW
THD + N Total harmonic distortion plus noise	$P_O = 55\text{ mW}$ , $f = 20\text{ Hz to }20\text{ kHz}$		<0.2%		
$k_{SVR}$ Supply ripple rejection ratio	$f = 1\text{ kHz}$ , $C_{BYP} = 1\ \mu\text{F}$		–61		dB
SNR Signal-to-noise ratio			93		dB
$V_n$ Output noise voltage (no-noise weighting filter)	$C_{BYP} = 1\ \mu\text{F}$ , $f = <10\text{ Hz to }22\text{ kHz}$		40		$\mu\text{V(rms)}$
$Z_I$ Input impedance			>15		k $\Omega$

THD+N	Total harmonic distortion + noise	vs Output power	3, 4, 5
		vs Frequency	6, 7
$k_{SVR}$	Supply ripple rejection ratio	vs Frequency	8

### Test Setup for Graphs

The THD+N measurements shown do not use an LC output filter, but do use a 100- $\Omega$  0.047- $\mu$ F RC low-pass filter with a cutoff frequency of ~30 kHz before the audio analyzer, so the switching frequency does not dominate the measurement. This is done to ensure that the THD+N measured is just the audible THD+N. The THD+N measurements are shown at the highest gain for worst case. The efficiency was measured with no filters and a 3- $\Omega$ , 4- $\Omega$ , or 8- $\Omega$  resistor in series with a 33- $\mu$ H inductor as the load.

## APPLICATION INFORMATION

### Eliminating the Output Filter With the TPA2000D1

This section explains why the user can eliminate the output filter with the TPA2000D1.

#### Effect on Audio

The class-D amplifier outputs a pulse-width modulated (PWM) square wave, which is the sum of the switching waveform and the amplified input audio signal. The human ear acts as a band-pass filter such that only the frequencies between approximately 20 Hz and 20 kHz are passed. The switching frequency components are much greater than 20 kHz, so the only signal heard is the amplified input audio signal.

#### Traditional Class-D Modulation Scheme

The traditional class-D modulation scheme, which is used in the TPA005Dxx family, has a differential output where each output is 180 degrees out of phase and changes from ground to the supply voltage,  $V_{DD}$ . Therefore, the differential pre-filtered output varies between positive and negative  $V_{DD}$ , where filtered 50% duty cycle yields 0 V across the load. The traditional class-D modulation scheme with voltage and current waveforms is shown in Figure 9. Even at an average of 0 V across the load (50% duty cycle), the current to the load is high, causing high loss, thus causing a high supply current.

Figure 9. Traditional Class-D Modulation Scheme's Output Voltage and Current Waveforms Into an Inductive Load With No Input

#### TPA2000D1 Modulation Scheme

The TPA2000D1 uses a modulation scheme that still has each output switching from 0 to the supply voltage. However, OUTP and OUTN are now in phase with each other with no input. The duty cycle of OUTP is greater than 50% and OUTN is less than 50% for positive voltages. The duty cycle of OUTP is less than 50% and OUTN is greater than 50% for negative voltages. The voltage across the load sits at 0 V throughout most of the switching period, greatly reducing the switching current, which reduces any  $I^2R$  losses in the load.

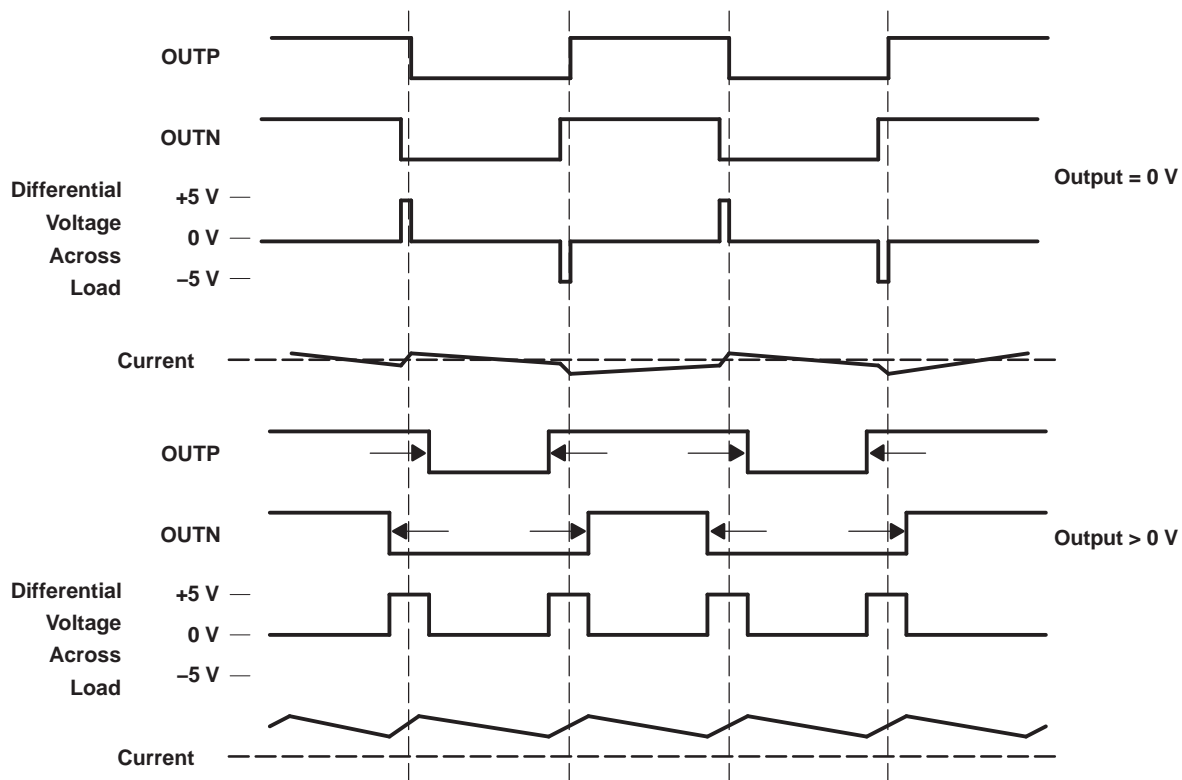

Figure 10. The TPA2000D1 Output Voltage and Current Waveforms Into an Inductive Load

### Efficiency: Why Use a Filter With the Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier needs an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is  $2 \times V_{DD}$ , and the time at each voltage is half the period for the traditional modulation scheme. An ideal LC filter is needed to store the ripple current from each half cycle for the next half cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA2000D1 modulation scheme has little loss in the load without a filter because the pulses are short and the change in voltage is  $V_{DD}$  instead of  $2 \times V_{DD}$ . As the output power increases, the pulses widen making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications, the filter is not needed.

An LC filter with a cut-off frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance than the speaker that results in less power dissipated, which increases efficiency.

### Effects of Applying a Square Wave Into a Speaker

Audio specialists have advised for years not to apply a square wave to speakers. If the amplitude of the waveform is high enough and the frequency of the square wave is within the bandwidth of the speaker, the square wave could cause the voice coil to jump out of the air gap and/or scar the voice coil. A 250-kHz switching frequency, however, is not significant because the speaker cone movement is proportional to  $1/f^2$  for frequencies beyond the audio band. Therefore, the amount of cone movement at the switching frequency is small. However,

damage could occur to the speaker if the voice coil is not designed to handle the additional power. To size the speaker for added power, the ripple current dissipated in the load needs to be calculated by subtracting the theoretical supplied power ( $P_{SUP\ THEORETICAL}$ ) from the actual supply power ( $P_{SUP}$ ) at maximum output power ( $P_{OUT}$ ). The switching power dissipated in the speaker is the inverse of the measured efficiency ( $\eta_{MEASURED}$ ) minus the theoretical efficiency ( $\eta_{THEORETICAL}$ ) all multiplied by  $P_{OUT}$ .

$$P_{SPKR} = P_{SUP} - P_{SUP\ THEORETICAL} \text{ (at max output power)} \quad (1)$$

$$P_{SPKR} = P_{OUT}(P_{SUP}/P_{OUT} - P_{SUP\ THEORETICAL}/P_{OUT}) \text{ (at max output power)} \quad (2)$$

$$P_{SPKR} = P_{OUT}(1/\eta_{THEORETICAL} - 1/\eta_{MEASURED}) \text{ (at max output power)} \quad (3)$$

The maximum efficiency of the TPA2000D1 with an 8-Ω load is 85%. Using [Equation 3](#) with the efficiency at maximum power (78%), we see that there is an additional 106 mW dissipated in the speaker. The added power dissipated in the speaker is not an issue as long as it is taken into account when choosing the speaker.

### When to Use An Output Filter

Design the TPA2000D1 without the filter if the traces from amplifier to speaker are short. The TPA2000D1 passed FCC and CE radiated emissions with no shielding with speaker wires eight inches long or less. Notebook PCs and powered speakers where the speaker is in the same enclosure as the amplifier are good applications for class-D without a filter.

A ferrite bead filter (shown in [Figure 11](#)) often can be used if the design is failing radiated emissions without a filter, and the frequency sensitive circuit is greater than 1 MHz. This is good for circuits that have to pass only FCC and CE because FCC and CE test only radiated emissions greater than 30 MHz. If choosing a ferrite bead, choose one with high impedance at high frequencies, but low impedance at low frequencies.

Use an output filter if the EMI sensitive circuits are low frequency (<1 MHz) and/or the leads from amplifier to speaker are long.

The LC output filter is shown in [Figure 11](#).

- $L1 = L2 = 22\ \mu\text{H}$  (DCR = 110 mΩ, part number = SCD0703T-220 M-S, manufacturer = GCI)
- $C1 = C2 = 1\ \mu\text{F}$

The ferrite filter is shown in [Figure 11](#), where L is a ferrite bead.

- $L1 = L2 = \text{ferrite bead}$  (part number = MPZ1608S221, manufacturer = TDKI)
- $C1 = C2 = 1\ \text{nF}$

**Figure 11. Class-D Output Filter**

### Gain Setting Via GAIN0 and GAIN1 Inputs

The gain of the TPA2000D1 is set by two input terminals, GAIN0 and GAIN1.

The gains listed in [Table 2](#) are realized by changing the taps on the input resistors inside the amplifier. This causes the input impedance ( $Z_i$ ) to be dependent on the gain setting. The actual gain settings are controlled by ratios of resistors, so the actual gain distribution from part-to-part is quite good. However, the input impedance may shift by 30% due to shifts in the actual resistance of the input resistors.

For design purposes, the input network (discussed in the next section) should be designed assuming an input impedance of 20 kΩ, which is the absolute minimum input impedance of the TPA2000D1. At the higher gain settings, the input impedance could increase as high as 115 kΩ.

**Table 2. Gain Settings**

GAIN1	GAIN0	AMPLIFIER GAIN (dB)	INPUT IMPEDANCE (kΩ)
		TYP	TYP
0	0	6	104
0	1	12	74
1	0	18	44
1	1	23.5	24

## Input Resistance

Each gain setting is achieved by varying the input resistance of the amplifier, which can range from its smallest value to over six times that value. As a result, if a single capacitor is used in the input high-pass filter, the –3 dB or cutoff frequency also changes by over six times.

The –3-dB frequency can be calculated using [Equation 4](#).

$$f_{-3\text{ dB}} = \frac{1}{2\pi C_i(Z_i)} \quad (4)$$

## Input Capacitor, $C_i$

In the typical application, an input capacitor ( $C_i$ ) is required to allow the amplifier to bias the input signal to the proper dc level for optimum operation. In this case,  $C_i$  and the input impedance of the amplifier ( $Z_i$ ) form a high-pass filter with the corner frequency determined in [Equation 5](#).

$$f_c = \frac{1}{2\pi Z_i C_i}$$

(5)

The value of  $C_i$  is important, as it directly affects the bass (low frequency) performance of the circuit. Consider the example where  $Z_i$  is 20 k $\Omega$  and the specification calls for a flat bass response down to 80 Hz. Equation 5 is reconfigured as Equation 6.

$$C_i = \frac{1}{2\pi Z_i f_c} \quad (6)$$

In this example,  $C_i$  is 0.1  $\mu$ F, so one would likely choose a value in the range of 0.1  $\mu$ F to 1  $\mu$ F. If the gain is known and will be constant, use  $Z_i$  from Table 1 to calculate  $C_i$ . A further consideration for this capacitor is the leakage path from the input source through the input network ( $C_i$ ) and the feedback network to the load. This leakage current creates a dc offset voltage at the input to the amplifier that reduces useful headroom, especially in high-gain applications. For this reason a low-leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the positive side of the capacitor should face the amplifier input in most applications as the dc level there is held at  $V_{DD}/2$ , which is likely higher than the source dc level. It is important to confirm the capacitor polarity in the application.

### Power Supply Decoupling, $C_s$

The TPA2000D1 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure that the output total harmonic distortion (THD) is as low as possible. Power supply decoupling also prevents oscillations for long lead lengths between the amplifier and the speaker. The optimum decoupling is achieved by using two capacitors of different types that target different types of noise on the power supply leads. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1  $\mu$ F, placed as close as possible to the device  $V_{DD}$  lead works best. For filtering lower-frequency noise signals, a larger aluminum electrolytic capacitor of 10  $\mu$ F or greater placed near the audio power amplifier is recommended.

### Midrail Bypass Capacitor, $C_{BYP}$

The midrail bypass capacitor ( $C_{BYP}$ ) is the most critical capacitor and serves several important functions. During start-up or recovery from shutdown mode,  $C_{BYP}$  determines the rate at which the amplifier starts up. The second function is to reduce noise produced by the power supply caused by coupling into the output drive signal. This noise is from the midrail generation circuit internal to the amplifier, which appears as degraded PSRR and THD+N.

Bypass capacitor ( $C_{BYP}$ ) values of 0.47- $\mu$ F to 1-mF ceramic or tantalum low-ESR capacitors are recommended for the best THD and noise performance.

Increasing the bypass capacitor reduces clicking and popping noise from power on/off and entering and leaving shutdown. To have minimal pop,  $C_{BYP}$  should be 10 times larger than  $C_i$ .

$$C_{BYP} \geq 10 \times C_i$$

### Differential Input

The differential input stage of the amplifier cancels any noise that appears on both input lines of the channel. To use the TPA2000D1 EVM with a differential source, connect the positive lead of the audio source to the INP input and the negative lead from the audio source to the INN input. To use the TPA2000D1 with a single-ended source, ac ground the INN input through a capacitor and apply the audio single to the input. In a single-ended input application, the INN input should be ac-grounded at the audio source instead of at the device input for best noise performance.

### Shutdown Modes

The TPA2000D1 employs a shutdown mode of operation designed to reduce supply current ( $I_{DD}$ ) to the absolute minimum level during periods of nonuse for battery-power conservation. The **SHUTDOWN** input terminal should be held high during normal operation when the amplifier is in use. Pulling **SHUTDOWN** low causes the outputs to mute and the amplifier to enter a low-current state,  $I_{DD(SD)} = 1 \mu$ A. **SHUTDOWN** should never be left unconnected because amplifier operation would be unpredictable.

## Using Low-ESR Capacitors

Low-ESR capacitors are recommended throughout this application section. A real (as opposed to ideal) capacitor can be modeled simply as a resistor in series with an ideal capacitor. The voltage drop across this resistor minimizes the beneficial effects of the capacitor in the circuit. The lower the equivalent value of this resistance the more the real capacitor behaves like an ideal capacitor.

## Switching Frequency

The switching frequency is determined using the values of the components connected to ROSC (pin 13) and COSC (pin 14) and are calculated using Equation 8.

$$f_s = \frac{6.6}{\text{ROSC} \times \text{COSC}} \quad (8)$$

The switching frequency was chosen to be centered on 250 kHz. This frequency represents the optimization of audio fidelity due to oversampling and the maximization of efficiency by minimizing the switching losses of the amplifier.

The recommended values are a resistance of 120 kΩ and a capacitance of 220 pF. Using these components values, the amplifier operates properly by using 5% tolerance resistors and 10% tolerance capacitors. The tolerance of the components can be changed as long as the switching frequency remains between 200 kHz and 300 kHz. Within this range, the internal circuitry of the device provides stable operation.

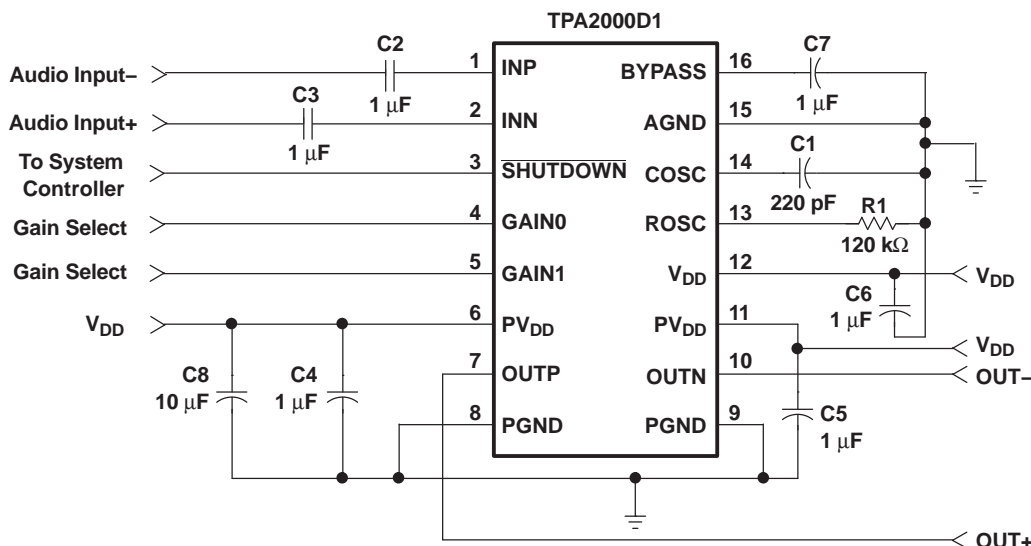

Figure 12. Application Circuit

## Low Supply Voltage Pop

The TPA2000D1 pops when coming out of shutdown at low supply voltage (3.3 V and less) when using the circuit shown in Figure 12. The pops occur because the common-mode input range is worse at the lower supply voltages. At low supply voltages, the inputs are not within the common-mode input range when coming out of shutdown. The outputs develop an offset voltage until the inputs settle within the common-mode input range, which causes a pop. Figure 13 shows 1-M $\Omega$  resistors added to form voltage dividers. The voltage dividers bias the inputs to  $V_{DD}/2$  that keeps the pop low at turnon and when coming out of shutdown. The resistors should be 1% tolerance to ensure the offset voltage is not increased.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPA2000D1TPWRG4Q1	TSSOP	PW	16	2000	330.0	12.4	6.9	5.6	1.6	8.0	12.0	Q1
TPA2000D1TPWRQ1	TSSOP	PW	16	2000	330.0	12.4	6.9	5.6	1.6	8.0	12.0	Q1

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPA2000D1TPWRG4Q1	TSSOP	PW	16	2000	353.0	353.0	32.0
TPA2000D1TPWRQ1	TSSOP	PW	16	2000	353.0	353.0	32.0

4220204/B 12/2023

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

# EXAMPLE BOARD LAYOUT

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 10X

SOLDER MASK DETAILS

4220204/B 12/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

4220204/B 12/2023

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
