

TPS1HB16-Q1 40-V, 16-mΩ Single-Channel Automotive Smart High-Side Switch

1 Features

- AEC-Q100 qualified for automotive applications
 - Temperature grade 1: -40°C to 125°C
 - Device HBM ESD classification level 2
 - Device CDM ESD classification level C4B
 - Withstands 40-V load dump
- **Functional Safety-Capable**
 - Documentation available to aid functional safety system design
- Single-channel smart high-side switch with 16-mΩ R_{ON} ($T_J = 25^{\circ}\text{C}$)
- Improve system level reliability through **adjustable current limiting**
 - Current limit set-point from 4.4 A to 49 A
- Robust integrated output protection:
 - Integrated thermal protection
 - Protection against short to ground and battery
 - Protection against **reverse battery** events including automatic switch on of FET with reverse voltage
 - Automatic shut off on loss of battery and ground
 - Integrated output clamp to demagnetize inductive loads
 - Configurable fault handling
- Analog sense output can be configured to accurately measure:
 - Load current
 - Device temperature
- Provides fault indication through SNS pin
 - Detection of open load and short-to-battery

2 Applications

- **Automotive display module**
- **ADAS modules**
- **Seat comfort module**
- **Transmission control unit**
- **HVAC control module**
- **Body control modules**
- **Incandescent and LED lighting**

3 Description

The TPS1HB16-Q1 device is a smart high-side switch intended for use in 12-V automotive systems. The device integrates robust protection and diagnostic features to ensure output port protection even during harmful events like short circuits in automotive systems. The device protects against faults through a **reliable current limit**, which, depending on device variant, is adjustable from 4.4 A to 49 A. The high current limit range allows for usage in loads that require large transient currents, while the low current limit range provides improved protection for loads that do not require high peak current. The device is capable of reliably driving a wide range of **load profiles**.

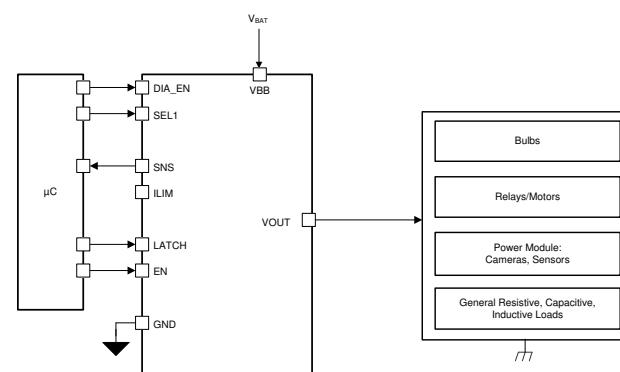

The TPS1HB16-Q1 also provides a high accuracy analog current sense that allows for improved load diagnostics. By reporting load current and device temperature to a system MCU, the device enables predictive maintenance and load diagnostics that improves the system lifetime.

The TPS1HB16-Q1 is available in a HTSSOP package which allows for reduced PCB footprint.

Package Information

| PART NUMBER (1) | PACKAGE | BODY SIZE (NOM) |
|-----------------|-------------|-------------------|
| TPS1HB16-Q1 | HTSSOP (16) | 5.00 mm × 4.40 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision A (April 2020) to Revision B (February 2023) | Page |
|--|-------------|
| • Updated the numbering format for tables, figures and cross-references throughout the document..... | 1 |
| • Addition of V _{SC} parameter to the Specifications section..... | 6 |

| Changes from Revision * (May 2019) to Revision A (April 2020) | Page |
|--|-------------|
| • Changed status from Advance Information to Production Data | 1 |
| • Added device variant F to the data sheet | 3 |

5 Device Comparison Table

Table 5-1. Device Options

| DEVICE VERSION | PART NUMBER | CURRENT LIMIT | CURRENT LIMIT RANGE | OVERCURRENT BEHAVIOR |
|----------------|--------------|-----------------------|---------------------|----------------------------|
| A | TPS1HB16A-Q1 | Resistor Programmable | 4.4 A to 22 A | Disable switch immediately |
| B | TPS1HB16B-Q1 | Resistor Programmable | 9.8 A to 49 A | Disable switch immediately |
| F | TPS1HB16F-Q1 | Internally set | 60 A | Disable switch immediately |

6 Pin Configuration and Functions

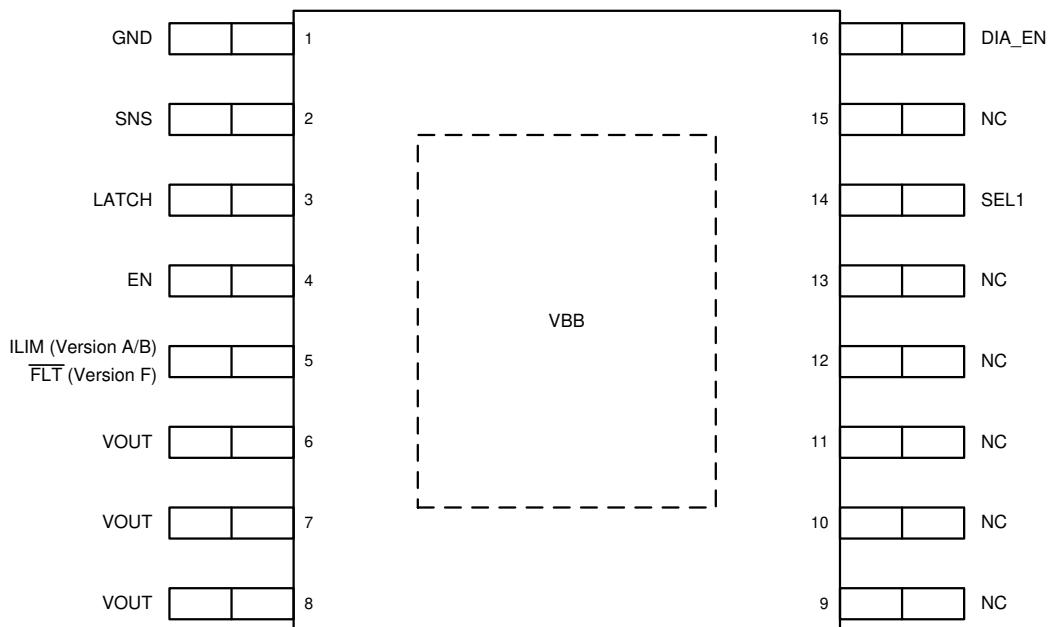

Figure 6-1. PWP Package 16-Pin HTSSOP Top View

Table 6-1. Pin Functions

| PIN | | | I/O | DESCRIPTION |
|--------|-------------|-------------|-----|---|
| NAME | VERSION A/B | VERSION F | | |
| GND | 1 | 1 | — | Device ground |
| SNS | 2 | 2 | O | Sense output |
| LATCH | 3 | 3 | I | Sets fault handling behavior (latched or auto-retry) |
| EN | 4 | 4 | I | Control input, active high |
| ILIM | 5 | - | O | Connect resistor to set current-limit threshold |
| FLT | - | 5 | O | Open drain output with pulldown to signal fault. |
| VOUT | 6 - 8 | 6 - 8 | O | Channel output |
| NC | 9 - 13, 15 | 9 - 13, 15 | I | No Connect, leave floating |
| SEL1 | 14 | 14 | I | Diagnostics select. No functionality on device version F; connect to IC GND through R_{PROT} resistor |
| DIA_EN | 16 | 16 | I | Diagnostic enable, active high |
| VBB | Exposed pad | Exposed pad | I | Power supply input |

6.1 Recommended Connections for Unused Pins

The TPS1HB16-Q1 is designed to provide an enhanced set of diagnostic and protection features. However, if the system design only allows for a limited number of I/O connections, some pins can be considered as optional.

Table 6-2. Connections For Optional Pins

| PIN NAME | CONNECTION IF NOT USED | IMPACT IF NOT USED |
|--------------------|--|---|
| SNS | Ground through 1-k Ω resistor | Analog sense is not available. |
| LATCH | Float or ground through R _{PROT} resistor | With LATCH unused, the device auto-retries after a fault. If latched behavior is desired, but the system describes limited I/O, it is possible to use one microcontroller output to control the latch function of several high-side channels. |
| ILIM (Version A/B) | Float | If the ILIM pin is left floating, the device is set to the default internal current-limit threshold. |
| FAULT (Version F) | Float | Open drain FAULT signal is not able to be used |
| SEL1 | Ground through R _{PROT} | SEL1 selects the TJ sensing feature. With SEL1 unused, only current sensing and open load detection are available. If unused, must be grounded through a resistor to engage FET turn-on during reverse battery. |
| DIA_EN | Float or ground through R _{PROT} resistor | With DIA_EN unused, the analog sense, open-load, and short-to-battery diagnostics are not available. |

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | | MIN | MAX | UNIT |
|---|---|--|-------------------|-----|------|
| Maximum continuous supply voltage, V_{BB} | | | 36 | | V |
| Load dump voltage, V_{LD} | ISO16750-2:2010(E) | | 40 | | V |
| Reverse battery voltage, V_{Rev} , $t \leq 3$ minutes | | | -18 | | V |
| Enable pin voltage, V_{EN} | | | -1 | 7 | V |
| LATCH pin voltage, V_{LATCH} | | | -1 | 7 | V |
| Diagnostic Enable pin voltage, V_{DIA_EN} | | | -1 | 7 | V |
| Sense pin voltage, V_{SNS} | | | -1 | 18 | V |
| Select pin voltage, V_{SEL1} | | | -1 | 7 | V |
| Reverse ground current, I_{GND} | $V_{BB} < 0$ V | | -50 | | mA |
| Energy dissipation during turnoff, E_{TOFF} | Single pulse, $L_{OUT} = 5$ mH, $T_{J,start} = 125^\circ\text{C}$ | | 34 ⁽²⁾ | | mJ |
| Energy dissipation during turnoff, E_{TOFF} | Repetitive pulse, $L_{OUT} = 5$ mH, $T_{J,start} = 125^\circ\text{C}$ | | 14 ⁽²⁾ | | mJ |
| Maximum junction temperature, T_J | | | 150 | | °C |
| Storage temperature, T_{stg} | | | -65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

(2) For further details, see the section regarding switch-off of an inductive load.

7.2 ESD Ratings

| | | | VALUE | UNIT |
|-------------|-------------------------|---|--|------------|
| $V_{(ESD)}$ | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ | All pins except V_{BB} and V_{OUT} | ± 2000 |
| | | | V_{BB} and V_{OUT} | ± 4000 |
| | | Charged-device model (CDM), per AEC Q100-011 | All pins | ± 750 |

(1) AEC-Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specifications.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | | MIN | MAX | UNIT |
|---------------|---|--|-----|-----|------|
| V_{BB} | Nominal supply voltage ⁽¹⁾ | | 6 | 18 | V |
| V_{BB} | Extended lower supply voltage | | 3 | 6 | V |
| V_{BB} | Extended higher supply voltage ⁽²⁾ | | 18 | 28 | V |
| V_{EN} | Enable voltage | | -1 | 5.5 | V |
| V_{LATCH} | LATCH voltage | | -1 | 5.5 | V |
| V_{DIA_EN} | Diagnostic Enable voltage | | -1 | 5.5 | V |
| V_{SEL1} | Select voltage | | -1 | 5.5 | V |
| V_{SNS} | Sense voltage | | -1 | 7 | V |

(1) All operating voltage conditions are measured with respect to device GND

(2) All parameters specified are still valid, short circuit protection valid to value specified by V_{SC} parameter

7.4 Thermal Information

| THERMAL METRIC (1) (2) | | TPS1HB16-Q1 | UNIT |
|-----------------------------|--|--------------|------|
| | | PWP (HTSSOP) | |
| | | 16 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 34.3 | °C/W |
| $R_{\theta JC(\text{top})}$ | Junction-to-case (top) thermal resistance | 31.2 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 10.8 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 2.4 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 10.8 | °C/W |
| $R_{\theta JC(\text{bot})}$ | Junction-to-case (bottom) thermal resistance | 1.6 | °C/W |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

(2) The thermal parameters are based on a 4-layer PCB according to the JESD51-5 and JESD51-7 standards.

7.5 Electrical Characteristics

V_{BB} = 6 V to 18 V, T_J = -40°C to 150°C (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--------------------------------------|---|--|------|------|------------------|
| INPUT VOLTAGE AND CURRENT | | | | | |
| $V_{DSCLAMP}$ | V_{DS} clamp voltage | 40 | 46 | | V |
| $V_{BBCLAMP}$ | V_{BB} clamp voltage | 58 | 76 | | V |
| V_{UVLOF} | V_{BB} undervoltage lockout falling | Measured with respect to the GND pin of the device | 2.0 | 3 | V |
| V_{UVLOR} | V_{BB} undervoltage lockout rising | Measured with respect to the GND pin of the device | 2.2 | 3 | V |
| I_{SB} | Standby current (total device leakage including MOSFET channel) | $V_{BB} = 13.5$ V, $T_J = 25^\circ\text{C}$ $V_{EN} = V_{DIA_EN} = 0$ V, $V_{OUT} = 0$ V | | 0.1 | μA |
| | | $V_{BB} = 13.5$ V, $T_J = 85^\circ\text{C}$, $V_{EN} = V_{DIA_EN} = 0$ V, $V_{OUT} = 0$ V | | 0.5 | μA |
| $I_{L\text{NOM}}$ | Continuous load current | $T_{AMB} = 70^\circ\text{C}$ | 7 | | A |
| $I_{OUT(\text{standby})}$ | Output leakage current | $V_{BB} = 13.5$ V, $T_J = 25^\circ\text{C}$ $V_{EN} = V_{DIA_EN} = 0$ V, $V_{OUT} = 0$ V | | 0.01 | μA |
| | | $V_{BB} = 13.5$ V, $T_J = 125^\circ\text{C}$ $V_{EN} = V_{DIA_EN} = 0$ V, $V_{OUT} = 0$ V | | 1.5 | μA |
| I_{DIA} | Current consumption in diagnostic mode | $V_{BB} = 13.5$ V, $I_{SNS} = 0$ mA $V_{EN} = 0$ V, $V_{DIA_EN} = 5$ V, $V_{OUT} = 0$ V | 3 | 6 | mA |
| I_Q | Quiescent current | $V_{BB} = 13.5$ V $V_{EN} = V_{DIA_EN} = 5$ V, $I_{OUT} = 0$ A | 3 | 6 | mA |
| t_{STBY} | Standby mode delay time | $V_{EN} = V_{DIA_EN} = 0$ V to standby | 12 | 17 | ms |
| RON CHARACTERISTICS | | | | | |
| R_{ON} | On-resistance (Includes MOSFET and package) | $T_J = 25^\circ\text{C}$, 6 V $\leq V_{BB} \leq 28$ V | 16 | | $\text{m}\Omega$ |
| | | $T_J = 150^\circ\text{C}$, 6 V $\leq V_{BB} \leq 28$ V | 32 | | $\text{m}\Omega$ |
| | | $T_J = 25^\circ\text{C}$, 3 V $\leq V_{BB} \leq 6$ V | 30 | | $\text{m}\Omega$ |
| $R_{ON(\text{REV})}$ | On-resistance during reverse polarity | $T_J = 25^\circ\text{C}$, -18 V $\leq V_{BB} \leq -8$ V | 16 | | $\text{m}\Omega$ |
| | | $T_J = 105^\circ\text{C}$, -18 V $\leq V_{BB} \leq -8$ V | 39 | | $\text{m}\Omega$ |
| CURRENT SENSE CHARACTERISTICS | | | | | |
| K_{SNS} | Current sense ratio I_{OUT} / I_{SNS} | $I_{OUT} = 1$ A | 3000 | | |

$V_{BB} = 6 \text{ V to } 18 \text{ V}$, $T_J = -40^\circ\text{C to } 150^\circ\text{C}$ (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT |
|------------|------------------------------------|--|----------------------------|---------|-----|-----|------|
| I_{SNSI} | Current sense current and accuracy | $V_{EN} = V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ | $I_{OUT} = 8 \text{ A}$ | 2.6 | | | mA |
| | | | | -5 | | 5 | % |
| | | | $I_{OUT} = 3 \text{ A}$ | 1.000 | | | mA |
| | | | | -5 | | 5 | % |
| | | | $I_{OUT} = 1 \text{ A}$ | 0.333 | | | mA |
| | | | | -5 | | 5 | % |
| | | | $I_{OUT} = 300 \text{ mA}$ | 0.101 | | | mA |
| | | | | -6 | | 6 | % |
| | | | $I_{OUT} = 100 \text{ mA}$ | 0.03438 | | | mA |
| | | | | -11 | | 11 | % |
| | | | $I_{OUT} = 50 \text{ mA}$ | 0.0174 | | | mA |
| | | | | -18 | | 18 | % |
| | | | $I_{OUT} = 20 \text{ mA}$ | 0.00737 | | | mA |
| | | | | -38 | | 38 | % |

TJ SENSE CHARACTERISTICS

| | | | | | | | |
|----------------|---------------------------|--|---------------------------|------|--------|------|----------------------------|
| I_{SNST} | Temperature sense current | $V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 5 \text{ V}$ | $T_J = -40^\circ\text{C}$ | 0.01 | 0.12 | 0.38 | mA |
| | | | $T_J = 25^\circ\text{C}$ | 0.72 | 0.85 | 0.98 | mA |
| | | | $T_J = 85^\circ\text{C}$ | 1.25 | 1.52 | 1.79 | mA |
| | | | $T_J = 125^\circ\text{C}$ | 1.61 | 1.96 | 2.31 | mA |
| | | | $T_J = 150^\circ\text{C}$ | 1.80 | 2.25 | 2.70 | mA |
| dI_{SNST}/dT | Coefficient | | | | 0.0112 | | $\text{mA}/^\circ\text{C}$ |

SNS CHARACTERISTICS

| | | | | | | |
|---------------|----------------------------|--|---|-----|-----|---------------|
| I_{SNSFH} | I_{SNS} fault high-level | $V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ | 4 | 4.5 | 5.3 | mA |
| $I_{SNSleak}$ | I_{SNS} leakage | $V_{DIA_EN} = 0 \text{ V}$ | | | 1 | μA |

CURRENT LIMIT CHARACTERISTICS

| | | | | | | | |
|----------|--------------------------------------|---|--|-------|------|-------|-----------------------------|
| V_{SC} | Short Circuit Maximum Supply Voltage | Version A | | | 18 | | V |
| | | Version B | | | 18 | | V |
| | | Version F | | | 18 | | V |
| I_{CL} | Current limit threshold | Device Version A, $T_J = -40^\circ\text{C to } 150^\circ\text{C}$ | $R_{ILIM} = \text{GND, open, or out of range}$ | | 28.6 | | A |
| | | | $R_{ILIM} = 5 \text{ k}\Omega$ | 18.16 | 22 | 28 | A |
| | | | $R_{ILIM} = 25 \text{ k}\Omega$ | 2.62 | 4.4 | 5.7 | A |
| | | Device Version B, $T_J = -40^\circ\text{C to } 150^\circ\text{C}$ | $R_{ILIM} = \text{GND, open, or out of range}$ | | 70 | | A |
| | | | $R_{ILIM} = 5 \text{ k}\Omega$ | 40.44 | 49 | 62.4 | A |
| | | | $R_{ILIM} = 25 \text{ k}\Omega$ | 8 | 9.8 | 11.76 | A |
| | | Device Version F | $T_J = 25^\circ\text{C}$ | 53 | 60 | 72 | A |
| | | | $T_J = 150^\circ\text{C}$ | 42 | 47 | 56 | A |
| | | Version A | | | 110 | | $\text{A} * \text{k}\Omega$ |
| | | Version B | | | 245 | | $\text{A} * \text{k}\Omega$ |

FAULT CHARACTERISTICS

| | | | | | | |
|-----------|---|---|-----|-----|-----|---------------|
| V_{OL} | Open-load (OL) detection voltage | $V_{EN} = 0 \text{ V}$, $V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ | 2 | 3 | 4 | V |
| t_{OL1} | OL and STB indication-time from EN falling | $V_{EN} = 5 \text{ V to } 0 \text{ V}$, $V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ $I_{OUT} = 0 \text{ mA}$, $V_{OUT} = 4 \text{ V}$ | 300 | 500 | 700 | μs |
| t_{OL2} | OL and STB indication-time from DIA_EN rising | $V_{EN} = 0 \text{ V}$, $V_{DIA_EN} = 0 \text{ V to } 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ $I_{OUT} = 0 \text{ mA}$, $V_{OUT} = 4 \text{ V}$ | 2 | 20 | 50 | μs |

$V_{BB} = 6 \text{ V to } 18 \text{ V}$, $T_J = -40^\circ\text{C to } 150^\circ\text{C}$ (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------|--|---|-----|-----|-----|------------------|
| t_{OL3} | OL and STB indication-time from V_{OUT} rising | $V_{EN} = 0 \text{ V}$, $V_{DIA_EN} = 5 \text{ V}$, $V_{SEL1} = 0 \text{ V}$ $I_{OUT} = 0 \text{ mA}$, $V_{OUT} = 0 \text{ V to } 4 \text{ V}$ | 2 | 20 | 50 | μs |
| T_{ABS} | Thermal shutdown | | 150 | | | $^\circ\text{C}$ |
| T_{HYS} | Thermal shutdown hysteresis | | 20 | 25 | 30 | $^\circ\text{C}$ |
| t_{FAULT} | Fault shutdown indication-time | $V_{DIA_EN} = 5 \text{ V}$ Time between switch shutdown and I_{SNS} settling at I_{SNSFH} | | | 50 | μs |
| t_{RETRY} | Retry time | Time from fault shutdown until switch re-enable (thermal shutdown or current limit). | 1 | 2 | 3 | ms |

EN PIN CHARACTERISTICS

| | | | | | | |
|----------------|----------------------------|--------------------------|-----|-----|---|------------------|
| $V_{IL, EN}$ | Input voltage low-level | No GND network diode | | 0.8 | | V |
| $V_{IH, EN}$ | Input voltage high-level | No GND network diode | 2.0 | | | V |
| $V_{IHYS, EN}$ | Input voltage hysteresis | | | 350 | | mV |
| R_{EN} | Internal pulldown resistor | | 0.5 | 1 | 2 | $\text{M}\Omega$ |
| $I_{IL, EN}$ | Input current low-level | $V_{EN} = 0.8 \text{ V}$ | | 0.8 | | μA |
| $I_{IH, EN}$ | Input current high-level | $V_{EN} = 5 \text{ V}$ | | 5.0 | | μA |

DIA_EN PIN CHARACTERISTICS

| | | | | | | |
|---------------------|----------------------------|-------------------------------|-----|-----|---|------------------|
| V_{IL, DIA_EN} | Input voltage low-level | No GND network diode | | 0.8 | | V |
| V_{IH, DIA_EN} | Input voltage high-level | No GND network diode | 2.0 | | | V |
| V_{IHYS, DIA_EN} | Input voltage hysteresis | | | 350 | | mV |
| R_{DIA_EN} | Internal pulldown resistor | | 0.5 | 1 | 2 | $\text{M}\Omega$ |
| I_{IL, DIA_EN} | Input current low-level | $V_{DIA_EN} = 0.8 \text{ V}$ | | 0.8 | | μA |
| I_{IH, DIA_EN} | Input current high-level | $V_{DIA_EN} = 5 \text{ V}$ | | 5.0 | | μA |

SEL1 PIN CHARACTERISTICS

| | | | | | | |
|------------------|----------------------------|----------------------------|-----|-----|---|------------------|
| $V_{IL, SEL1}$ | Input voltage low-level | No GND network diode | | 0.8 | | V |
| $V_{IH, SEL1}$ | Input voltage high-level | No GND network diode | 2.0 | | | V |
| $V_{IHYS, SEL1}$ | Input voltage hysteresis | | | 350 | | mV |
| R_{SEL1} | Internal pulldown resistor | | 0.5 | 1 | 2 | $\text{M}\Omega$ |
| $I_{IL, SEL1}$ | Input current low-level | $V_{SEL1} = 0.8 \text{ V}$ | | 0.8 | | μA |
| $I_{IH, SEL1}$ | Input current high-level | $V_{SEL1} = 5 \text{ V}$ | | 5.0 | | μA |

LATCH PIN CHARACTERISTICS

| | | | | | | |
|-------------------|----------------------------|-----------------------------|-----|-----|---|------------------|
| $V_{IL, LATCH}$ | Input voltage low-level | No GND network diode | | 0.8 | | V |
| $V_{IH, LATCH}$ | Input voltage high-level | No GND network diode | 2.0 | | | V |
| $V_{IHYS, LATCH}$ | Input voltage hysteresis | | | 350 | | mV |
| R_{LATCH} | Internal pulldown resistor | | 0.5 | 1 | 2 | $\text{M}\Omega$ |
| $I_{IL, LATCH}$ | Input current low-level | $V_{LATCH} = 0.8 \text{ V}$ | | 0.8 | | μA |
| $I_{IH, LATCH}$ | Input current high-level | $V_{LATCH} = 5 \text{ V}$ | | 5 | | μA |

7.6 SNS Timing Characteristics

$V_{BB} = 6 \text{ V to } 18 \text{ V}$, $T_J = -40^\circ\text{C to } +150^\circ\text{C}$ (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------------------------------|--|---|-----|-----|-----|---------------|
| SNS TIMING - CURRENT SENSE | | | | | | |
| $t_{SNSION1}$ | Settling time from rising edge of DIA_EN | $V_{EN} = 5 \text{ V}$, $V_{DIA_EN} = 0 \text{ V to } 5 \text{ V}$ $R_{SNS} = 1 \text{ k}\Omega$, $R_L \leq 4 \Omega$ | | | 40 | μs |

7.6 SNS Timing Characteristics (continued)

$V_{BB} = 6 \text{ V to } 18 \text{ V}$, $T_J = -40^\circ\text{C}$ to $+150^\circ\text{C}$ (unless otherwise noted)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |

9 Detailed Description

9.1 Overview

The TPS1HB16-Q1 device is a single-channel smart high-side switch intended for use with 12-V automotive batteries. Many protection and diagnostic features are integrated in the device.

Diagnostics features include the analog SNS output that is capable of providing a signal that is proportional to load current or device temperature. The high-accuracy load current sense allows for diagnostics of complex loads.

This device includes protection through thermal shutdown, current limiting, transient withstand, and reverse battery operation. For more details on the protection features, refer to the [Section 9.3](#) and [Section 10.1](#) sections of the document.

The TPS1HB16-Q1 is one device in a family of TI high side switches. For each device, the part number indicates elements of the device behavior. [Figure 9-1](#) gives an example of the device nomenclature.

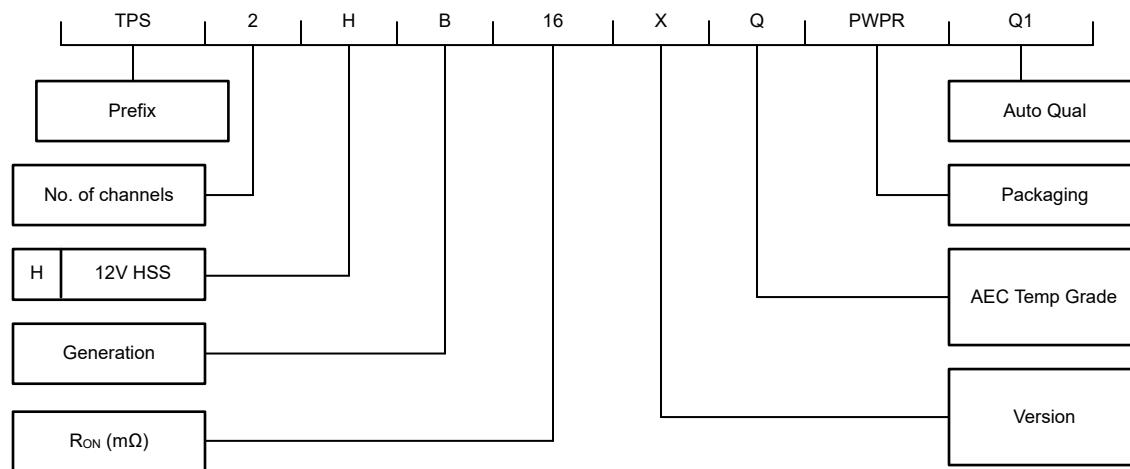

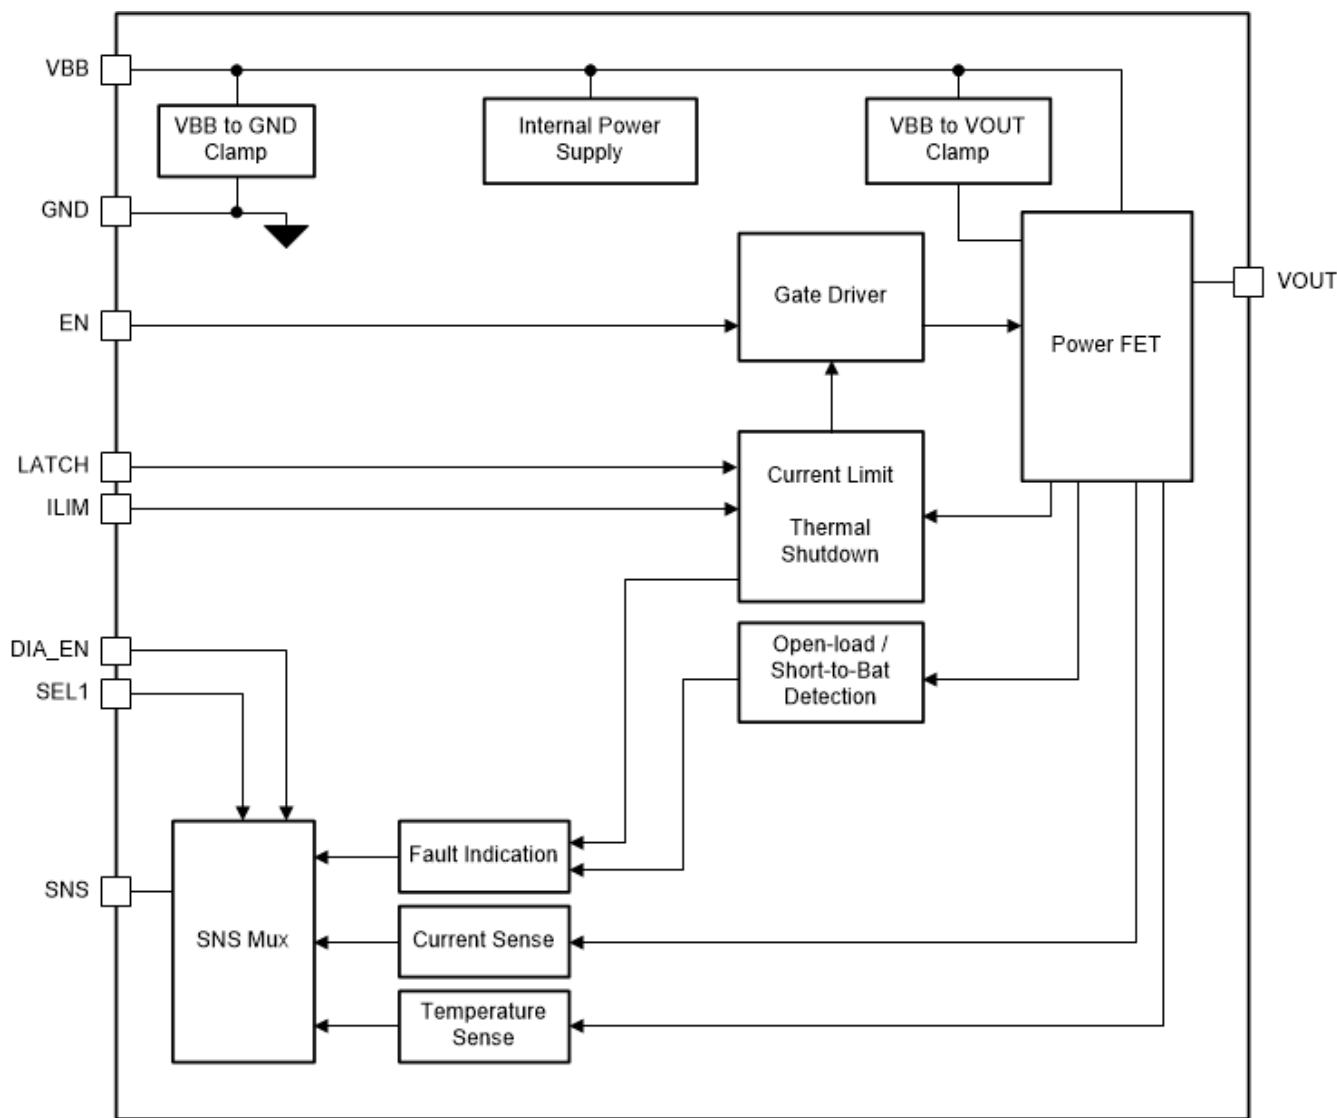

Figure 9-1. Naming Convention

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Protection Mechanisms

The TPS1HB16-Q1 is designed to operate in the automotive environment. The protection mechanisms allow the device to be robust against many system-level events such as load dump, reverse battery, short-to-ground, and more.

There are two protection features which, if triggered, will cause the switch to automatically disable:

- Thermal Shutdown
- Current Limit

When any of these protections are triggered, the device will enter the FAULT state. In the FAULT state, the fault indication will be available on the SNS pin (see the *Diagnostic Mechanisms* section of the data sheet for more details).

The switch is no longer held off and the fault indication is reset when all of the below conditions are met:

- LATCH pin is low
- t_{RETRY} has expired
- All faults are cleared (thermal shutdown, current limit)

9.3.1.1 Thermal Shutdown

The TPS1HB16-Q1 includes a temperature sensor on the power FET and also within the controller portion of the device. There are two cases that the device will consider to be a thermal shutdown fault:

- $T_{J,FET} > T_{ABS}$
- $(T_{J,FET} - T_{J,controller}) > T_{REL}$

After the fault is detected, the switch will turn off. If $T_{J,FET}$ passes T_{ABS} , the fault is cleared when the switch temperature decreases by the hysteresis value, T_{HYS} . If instead the T_{REL} threshold is exceeded, the fault is cleared after T_{RETRY} passes.

9.3.1.2 Current Limit

When I_{OUT} reaches the current limit threshold, I_{CL} , the channel will switch off immediately. The I_{CL} value will vary with slew rate and a fast current increase that occurs during a powered-on short circuit can temporarily go above the specified I_{CL} value. When the switch is in the FAULT state, it will output an output current I_{SNSFH} on the SNS pin.

During a short-circuit event, the device will hit the I_{CL} value that is listed in the Electrical Characteristics table (for the given device version and R_{ILIM}) and then turn the output off to protect the device. The device will register a short-circuit event when the output current exceeds I_{CL} , however, the measured maximum current can exceed the I_{CL} value due to the TPS1HB16-Q1 deglitch filter and turn-off time. This deglitch time is defined at 3 μ s, so use the test setup described in the [AEC-Q100-012 Short Circuit Reliability](#) section, and take 3 μ s before the peak value as the I_{CL} . The device is assured to protect itself during a short-circuit event over the nominal supply voltage range (as defined in the Electrical Characteristics table) at 125°C.

9.3.1.2.1 Current Limit Foldback

Version B of the TPS1HB16-Q1 implements a current limit foldback feature that is designed to protect the device in the case of a long-term fault condition. If the device undergoes fault shutdown events (either of thermal shutdown or current limit) seven consecutive times, the current limit will be reduced to half of the original value. The device will revert back to the original current limit threshold if either of the following occurs:

- The device goes to standby mode.
- The switch turns on and turns off without any fault occurring.

Version A does not implement the current limit foldback due to the lower current limit causing less harm during repetitive long-term faults.

9.3.1.2.2 Programmable Current Limit

All versions of the TPS1HB16-Q1 include an adjustable current limit. Some applications (for example, incandescent bulbs) will require a high current limit while other applications can benefit from a lower current limit threshold. In general, wherever possible a lower current limit is recommended due to allowing system advantages through:

- Reduced size and cost in current carrying components such as PCB traces and module connectors
- Less disturbance at the power supply (V_{BB} pin) during a short-circuit event
- Improved protection of the downstream load

To set the current limit threshold, connect a resistor from I_{LIM} to V_{BB} . The current limit threshold is determined by [Equation 1](#) (R_{ILIM} in k Ω):

$$I_{CL} = K_{CL} / R_{ILIM} \quad (1)$$

The R_{ILIM} range is between 5 k Ω and 25 k Ω . An R_{ILIM} resistor is required, however in the fault case where the pin is floating, grounded, or outside of this range the current limit will default to an internal level that is defined in the [Specifications](#) section of this document. If R_{ILIM} is out of this range, the device cannot assure complete short-circuit protection.

Note

Capacitance on the I_{LIM} pin can cause I_{LIM} to go out of range during short-circuit events. For accurate current limiting, place R_{ILIM} near to the device with short traces to ensure $< 5\text{-pF}$ capacitance to GND on the I_{LIM} pin.

9.3.1.2.3 Undervoltage Lockout (UVLO)

The device monitors the supply voltage V_{BB} to prevent unpredicted behaviors in the event that the supply voltage is too low. When the supply voltage falls down to V_{UVLOF} , the output stage is shut down automatically. When the supply rises up to V_{UVLOR} , the device turns back on.

During an initial ramp of V_{BB} from 0 V at a ramp rate slower than 1 V/ms, V_{EN} pin will have to be held low until V_{BB} is above UVLO threshold (with respect to board ground) and the supply voltage to the device has reliably reached above the UVLO condition. For best operation, ensure that V_{BB} has risen above UVLO before setting the V_{EN} pin to high.

9.3.1.2.4 V_{BB} During Short-to-Ground

When V_{OUT} is shorted to ground, the module power supply (V_{BB}) can have a transient decrease. This decrease is caused by the sudden increase in current flowing through the wiring harness cables. To achieve ideal system behavior, TI recommends that the module maintain $V_{BB} > 3\text{ V}$ (above the maximum V_{UVLOF}) during V_{OUT} short-to-ground. This maintenance is typically accomplished by placing bulk capacitance on the power supply node.

9.3.1.3 Voltage Transients

The TPS1HB16-Q1 device contains two types of voltage clamps which protect the FET against system-level voltage transients. The two different clamps are shown in [Figure 9-2](#).

The clamp from V_{BB} to GND is primarily used to protect the controller from positive transients on the supply line (for example, ISO7637-2). The clamp from V_{BB} to V_{OUT} is primarily used to limit the voltage across the FET when switching off an inductive load. If the voltage potential from V_{BB} to GND exceeds the V_{BB} clamp level, the clamp will allow current to flow through the device from V_{BB} to GND (path 2). If the voltage potential from V_{BB} to V_{OUT} exceeds the clamping voltage, the power FET will allow current to flow from V_{BB} to V_{OUT} (path 3). Additional capacitance from V_{BB} to GND can increase the reliability of the system during ISO 7637 pulse 2-A testing.

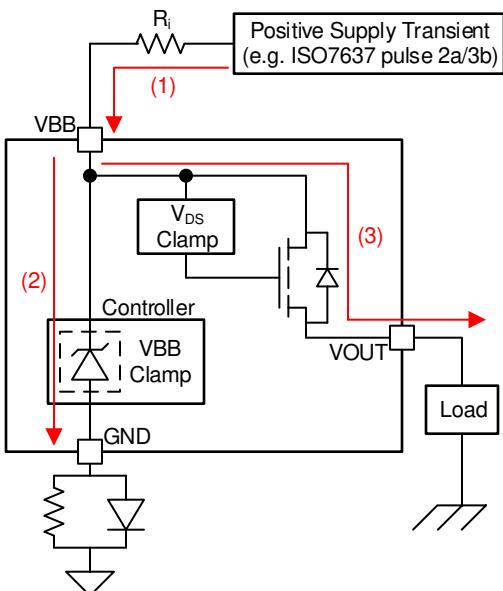

Figure 9-2. Current Path During Supply Voltage Transient

9.3.1.3.1 Load Dump

The TPS1HB16-Q1 device is tested according to ISO 16750-2:2010(E) suppressed load dump pulse. The device supports up to 40-V load dump transient and will maintain normal operation during the load dump pulse. If the switch is enabled, it will stay enabled and if the switch is disabled, it will stay disabled.

9.3.1.3.2 Driving Inductive Loads

When switching off an inductive load, the inductor can impose a negative voltage on the output of the switch. The TPS1HB16-Q1 includes a voltage clamp to limit voltage across the FET. The maximum acceptable load inductance is a function of the device robustness.

Figure 9-3. TPS1HB16-Q1 Inductive Discharge (5 mH)

For more information on driving inductive loads, refer to TI's [How To Drive Inductive, Capacitive, and Lighting Loads With Smart High Side Switches](#) application report.

9.3.1.4 Reverse Battery

In the reverse battery condition, the switch will automatically be enabled regardless of the state of EN to prevent excess power dissipation inside the MOSFET body diode. In many applications (for example, resistive loads), the full load current can be present during reverse battery. In order to activate the automatic switch on feature, SEL must have a path to ground from either from the MCU or it needs to be tied to ground through R_{PROT} if unused.

There are two options for blocking reverse current in the system. The first option is to place a blocking device (FET or diode) in series with the battery supply, blocking all current paths. The second option is to place a blocking diode in series with the GND node of the high-side switch. This method will protect the controller portion of the switch (path 2), but it will not prevent current from flowing through the load (path 3). The diode used for the second option can be shared amongst multiple high-side switches.

Path 1 shown in Figure 9-4 is blocked inside of the device.

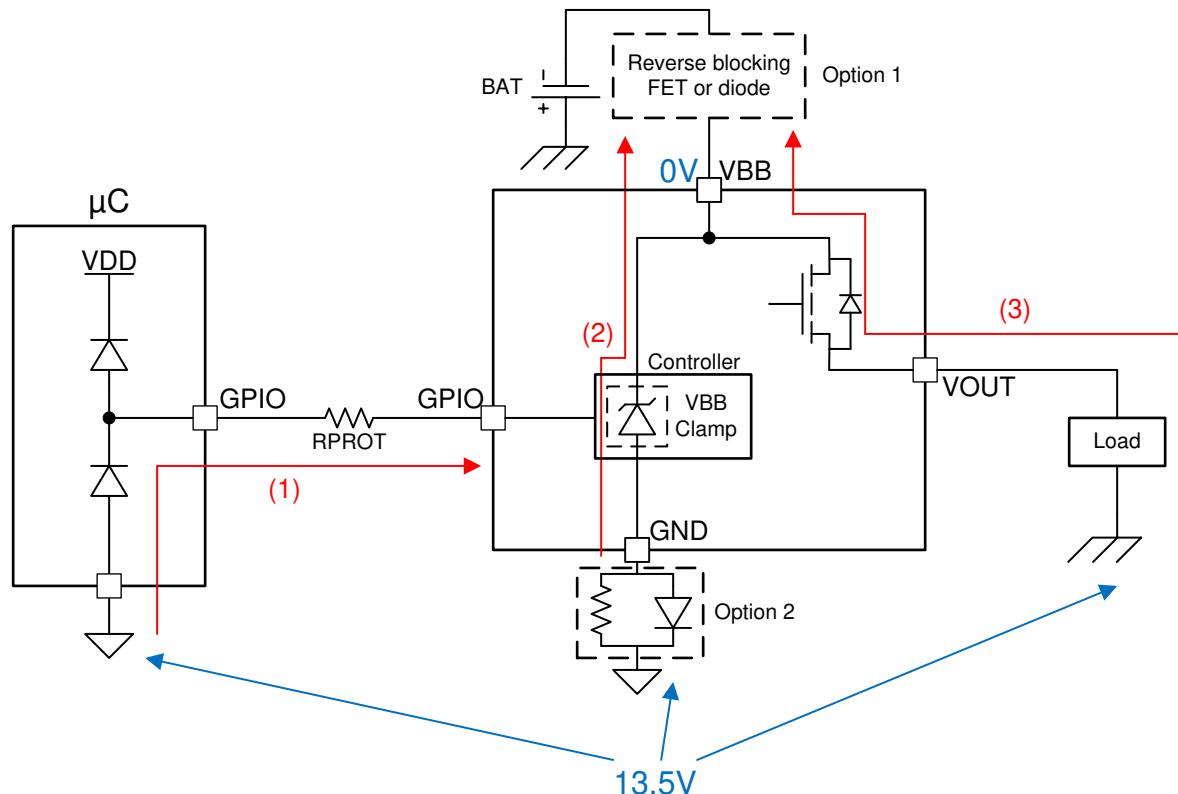

Figure 9-4. Current Path During Reverse Battery

For more information on reverse battery protection, refer to TI's [Reverse Battery Protection for High Side Switches](#) application note.

9.3.1.5 Fault Event – Timing Diagrams

Note

All timing diagrams assume that the SEL1 pin is low.

The LATCH, DIA_EN, and EN pins are controlled by the user. The timing diagrams represent a possible use-case.

Figure 9-5 shows the immediate current limit switch off behavior. The diagram also illustrates the retry behavior. As shown, the switch will remain latched off until the LATCH pin is low.

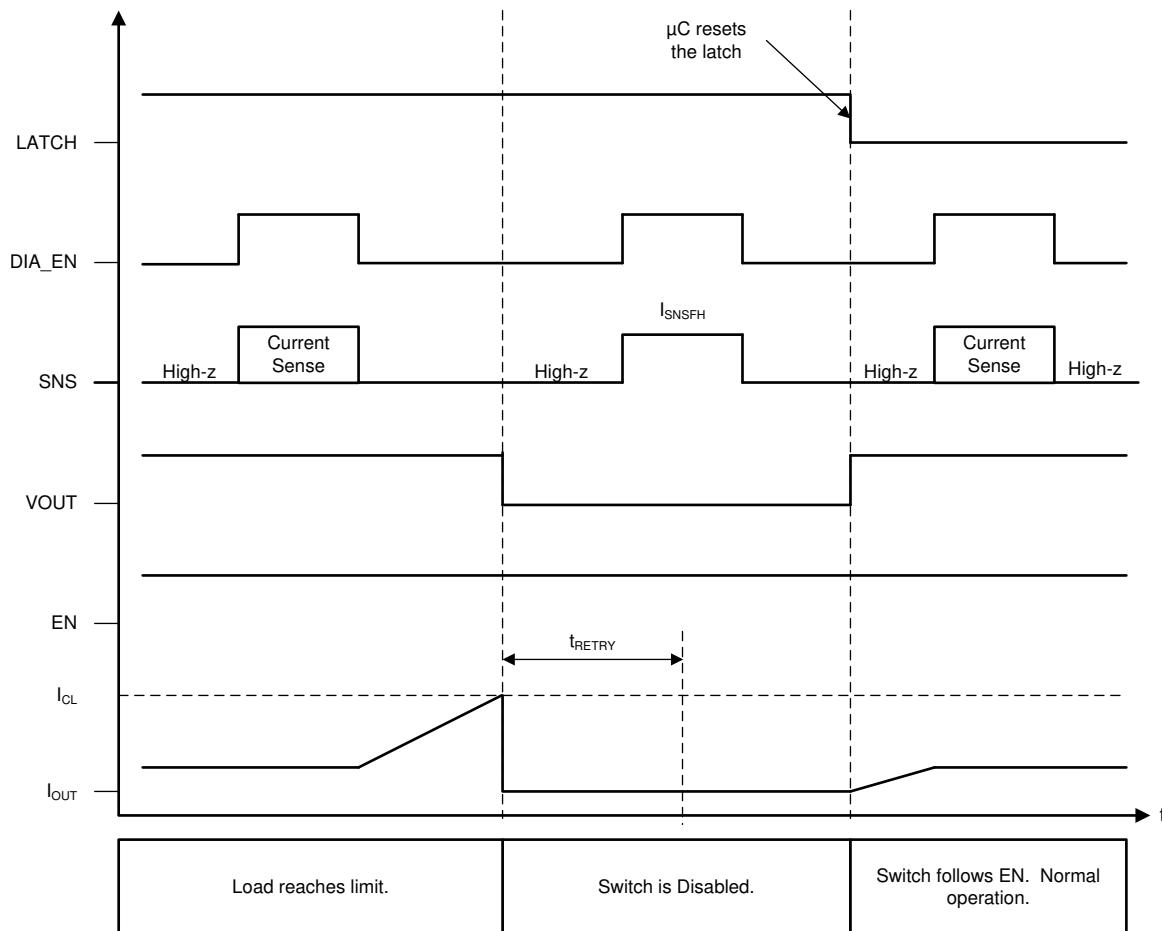

Figure 9-5. Current Limit – Version A and B - Latched Behavior

Figure 9-6 shows the immediate current limit switch off behavior. In this example, LATCH is tied to GND; hence, the switch will retry after the fault is cleared and t_{RETRY} has expired.

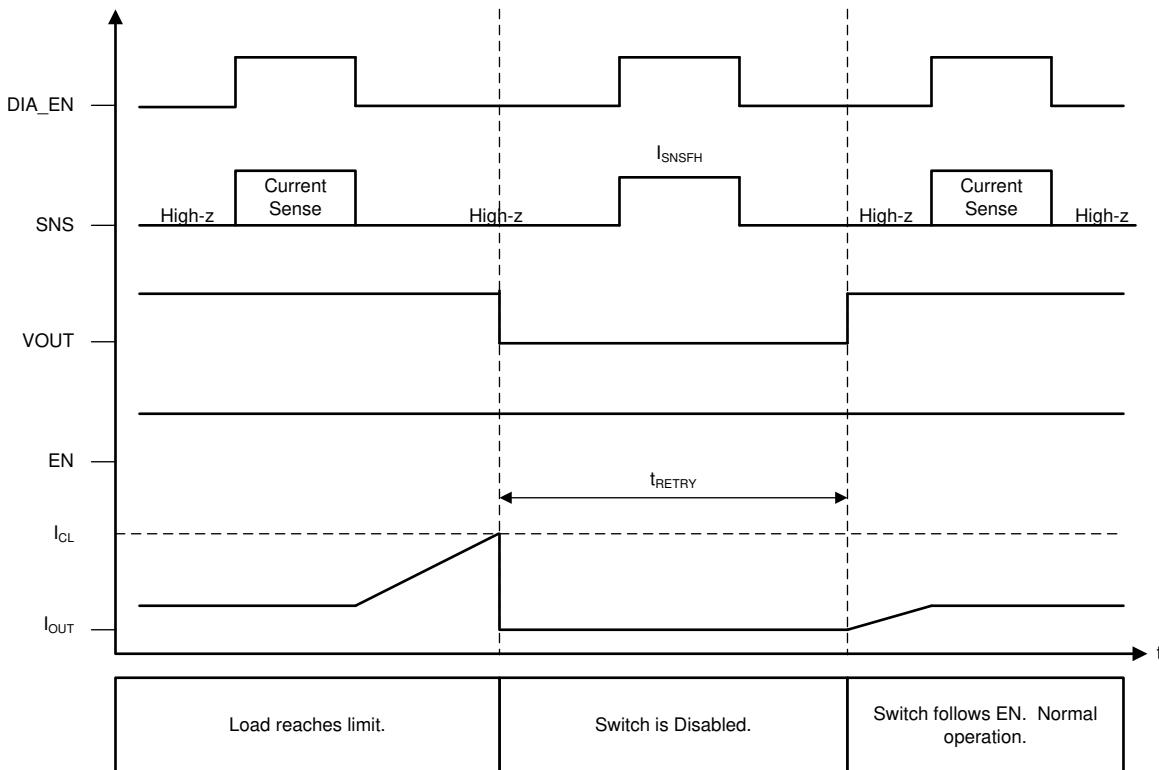

Figure 9-6. Current Limit - Version A and B - LATCH = 0

When the switch retries after a shutdown event, the SNS fault indication will remain until V_{OUT} has risen to $V_{BB} - 1.8$ V. After V_{OUT} has risen, the SNS fault indication is reset and current sensing is available. If there is a short-to-ground and V_{OUT} is not able to rise, the SNS fault indication will remain indefinitely. Figure 9-7 illustrates auto-retry behavior and provides a zoomed-in view of the fault indication during retry.

Note

Figure 9-7 assumes that t_{RETRY} has expired by the time that T_J reaches the hysteresis threshold.

LATCH = 0 V and DIA_EN = 5 V

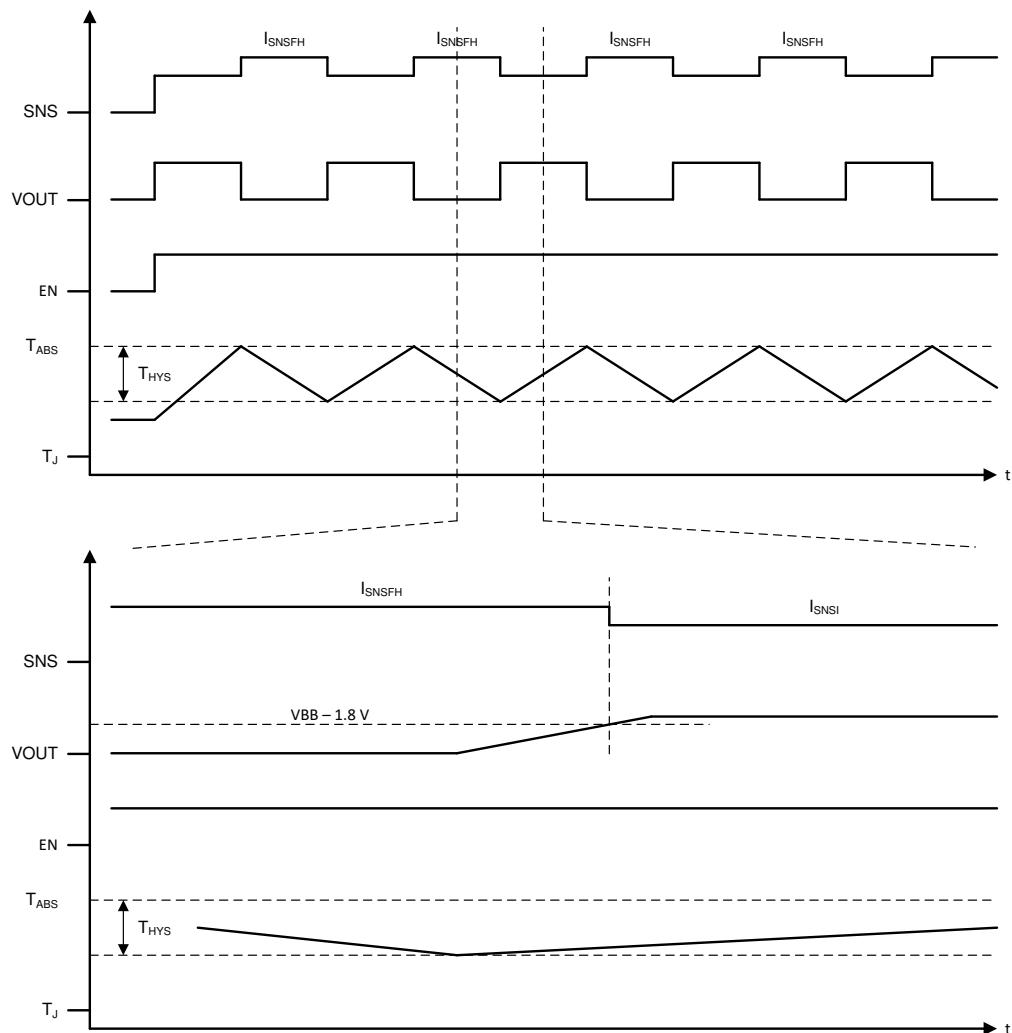

Figure 9-7. Fault Indication During Retry

9.3.2 Diagnostic Mechanisms

9.3.2.1 VOUT Short-to-Battery and Open-Load

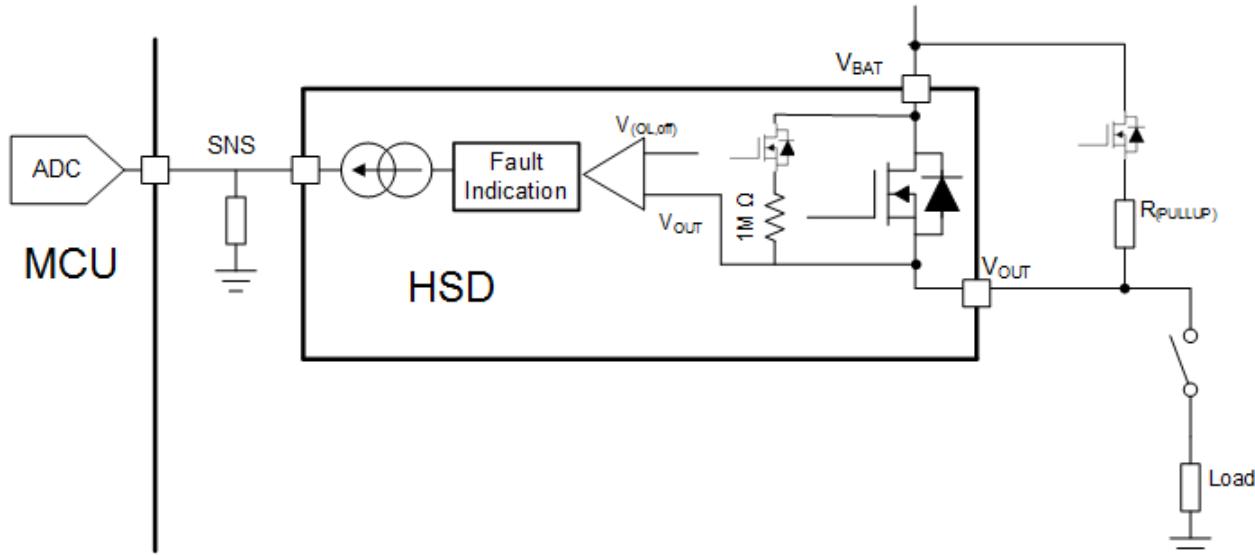

The TPS1HB16-Q1 is capable of detecting short-to-battery and open-load events regardless of whether the switch is turned on or off, however the two conditions use different methods.

9.3.2.1.1 Detection With Switch Enabled

When the switch is enabled, the VOUT short-to-battery and open-load conditions can be detected by the current sense feature. In both cases, the load current will be measured through the SNS pin as below the expected value.

9.3.2.1.2 Detection With Switch Disabled

While the switch is disabled, if DIA_EN is high, an internal comparator will detect the condition of VOUT. If the load is disconnected (open load condition) or there is a short to battery the VOUT voltage will be higher than the open load threshold ($V_{OL,off}$) and a fault is indicated on the SNS pin. An internal pull-up of 1 MΩ is in series with an internal MOSFET switch, so no external component is required if a completely open load must be detected. However, if there is significant leakage or other current draw even when the load is disconnected, a lower value pull-up resistor and switch can be added externally to set the VOUT voltage above the $V_{OL,off}$ during open load conditions.

This figure assumes that the device ground and the load ground are at the same potential. In a real system, there can be a ground shift voltage of 1 V to 2 V.

Figure 9-8. Short to Battery and Open Load Detection

The detection circuitry is only enabled when DIA_EN = HIGH and EN = LOW. If $V_{OUT} > V_{OL}$, the SNS pin will go to the fault level, but if $V_{OUT} < V_{OL}$ there will be no fault indication. The fault indication will only occur if the SEL1 pin is low.

While the switch is disabled and DIA_EN is high, the fault indication mechanisms will continuously represent the present status. For example, if V_{OUT} decreases from greater than V_{OL} to less than V_{OL} , the fault indication is reset. Additionally, the fault indication is reset upon the falling edge of DIA_EN or the rising edge of EN.

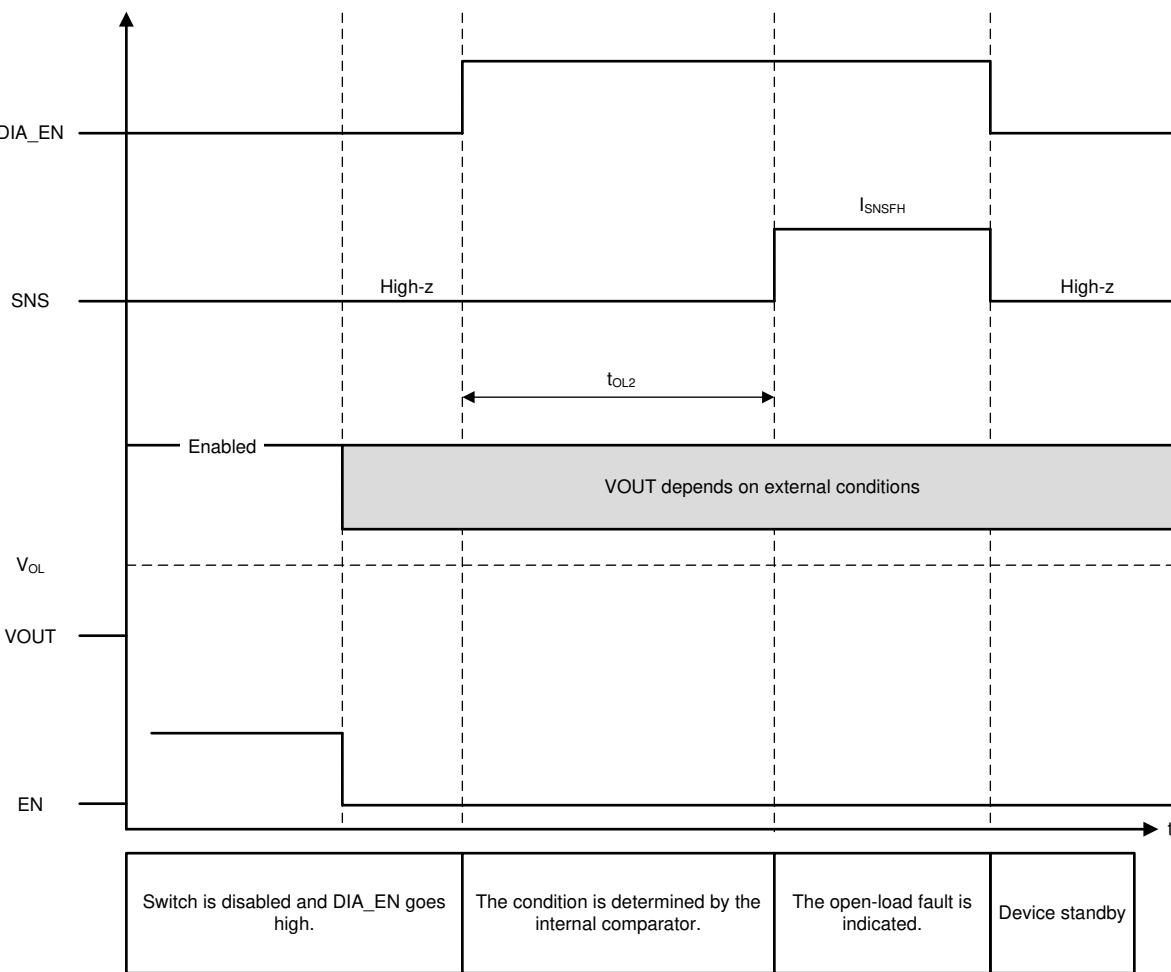

Figure 9-9. Open Load

9.3.2.2 SNS Output

The SNS output can be used to sense the load current if the SEL1 pin is low and there is no fault or device temperature if the SEL1 pin is high and there is no fault. The sense circuit will provide a current that is proportional to the selected parameter. This current will be sourced into an external resistor to create a voltage that is proportional to the selected parameter. This voltage can be measured by an ADC or comparator. In addition, the SNS pin can be used to measure the FET temperature.

To ensure accurate sensing measurement, the sensing resistor must be connected to the same ground potential as the μ C ADC.

Table 9-1. Analog Sense Transfer Function

| PARAMETER | TRANSFER FUNCTION |
|--------------------|--|
| Load current | $I_{SNSI} = I_{OUT} / K_{SNS} = I_{OUT} / 3000$ |
| Device temperature | $I_{SNST} = (T_J - 25^\circ\text{C}) \times dI_{SNST} / dT + 0.85$ |

The SNS output will also be used to indicate system faults. I_{SNS} will go to the predefined level, I_{SNSFH} , when there is a fault. I_{SNSFH} , dI_{SNST}/dT , and K_{SNS} are defined in the [Specifications](#) section.

9.3.2.2.1 R_{SNS} Value

The following factors must be considered when selecting the R_{SNS} value:

- Current sense ratio (K_{SNS})
- Largest and smallest diagnosable load current required for application operation

- Full-scale voltage of the ADC
- Resolution of the ADC

For an example of selecting R_{ISNS} value, reference [R_{LIM} Calculation](#) in the applications section of this data sheet.

9.3.2.2.1.1 High Accuracy Load Current Sense

In many automotive modules, it is required that the high-side switch provide diagnostic information about the downstream load. With more complex loads, high accuracy sensing is required. A few examples follow:

- **LED lighting:** In many architectures, the body control module (BCM) must be compatible with both incandescent bulbs and also LED modules. The bulb can be relatively simple to diagnose. However, the LED module will consume less current and also can include multiple LED strings in parallel. The same BCM is used in both cases, so the high-side switch can accurately diagnose both load types.
- **Solenoid protection:** Often solenoids are precisely controlled by low-side switches. However, in a fault event, the low-side switch cannot disconnect the solenoid from the power supply. A high-side switch can be used to continuously monitor several solenoids. If the system current becomes higher than expected, the high-side switch can disable the module.

9.3.2.2.1.2 SNS Output Filter

To achieve the most accurate current sense value, TI recommends to filter the SNS output. There are two methods of filtering:

- Low-Pass RC filter between the SNS pin and the ADC input. This filter is illustrated in [Figure 10-1](#) with typical values for the resistor and capacitor. The designer must select a C_{SNS} capacitor value based on system requirements. A larger value will provide improved filtering but a smaller value will allow for faster transient response.
- The ADC and microcontroller can also be used for filtering. TI recommends that the ADC collects several measurements of the SNS output. The median value of this data set must be considered as the most accurate result. By performing this median calculation, the microcontroller can filter out any noise or outlier data.

9.3.2.3 Fault Indication and SNS Mux

The following faults will be communicated through the SNS output:

- Switch shutdown, due to:
 - Thermal Shutdown
 - Current limit
- Open-Load and V_{OUT} shorted-to-battery

Open-load and Short-to-battery are not indicated while the switch is enabled, although these conditions can still be detected through the sense current. Hence, if there is a fault indication while the channel is enabled, then it must be either due to an overcurrent or overtemperature event.

The SNS pin will only indicate the fault if the SEL1 pins is low. When the SEL1 pin is high and the device is set to measure temperature, the pin will be measuring the channel FET temperature.

Table 9-2. Device Version A/B SNS Mux

| INPUTS | | | OUTPUTS |
|--------|------|-----------------------------|--------------------|
| DIA_EN | SEL1 | FAULT DETECT ⁽¹⁾ | SNS |
| 0 | X | X | High-z |
| 1 | 0 | 0 | Output current |
| 1 | 1 | 0 | Device temperature |
| 1 | 0 | 1 | I_{SNSFH} |
| 1 | 1 | 1 | Device temperature |

(1) Fault Detect encompasses multiple conditions:

- Switch shutdown and waiting for retry
- Open Load and Short To Battery

For device version F, the SEL1 pin has no functionality so the device cannot output a temperature sense current. In this case, SEL1 must be connected to ground through an R_{PROT} resistor and the SNS behavior will follow the table below.

Table 9-3. Device Version F SNS Mux

| INPUTS | | | OUTPUTS | |
|--------|------|-----------------------------|----------------|--------------------|
| DIA_EN | SEL1 | FAULT DETECT ⁽¹⁾ | SNS | FLT ⁽²⁾ |
| 0 | X | X | High-z | High-z |
| 1 | X | 0 | Output current | High-z |
| 1 | X | 1 | I_{SNSFH} | Open-drain |

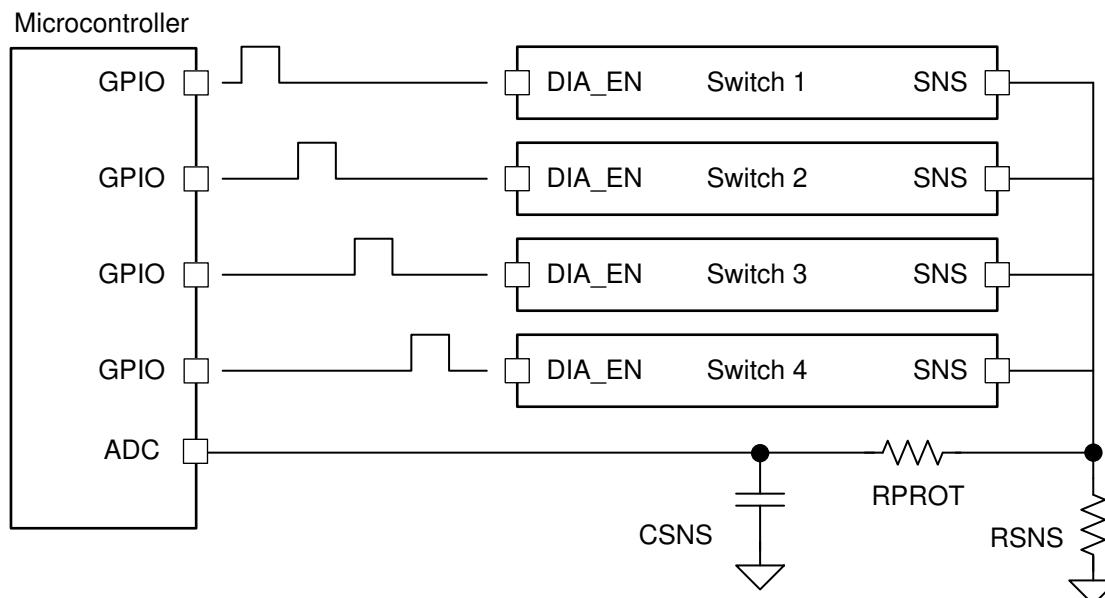

(1) Fault Detect encompasses multiple conditions:

- Switch shutdown and waiting for retry
- Open Load / Short To Battery

(2) Version F Only

9.3.2.4 Resistor Sharing

Multiple high-side devices can use the same SNS resistor as shown in [Figure 9-10](#). This action reduces the total number of passive components in the system and the number of ADC terminals that are required of the microcontroller.

Figure 9-10. Sharing R_{SNS} Among Multiple Devices

9.3.2.5 High-Frequency, Low Duty-Cycle Current Sensing

Some applications will operate with a high-frequency, low duty-cycle PWM or require fast settling of the SNS output. For example, a 250-Hz, 5% duty cycle PWM will have an on-time of only 200 μ s that must be accommodated. The micro-controller ADC can sample the SNS signal after the defined settling time $t_{SNSION3}$.

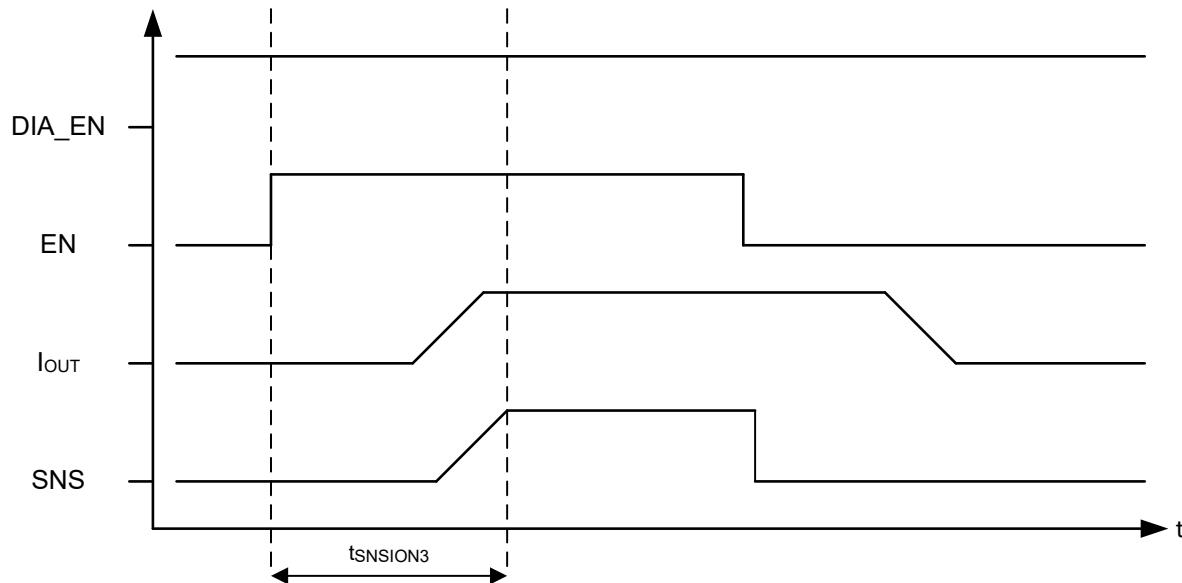

Figure 9-11. Current Sensing in Low-Duty Cycle Applications

9.4 Device Functional Modes

During typical operation, the TPS1HB16-Q1 can operate in a number of states that are described below and shown as a state diagram in [Figure 9-12](#).

9.4.1 Off

Off state occurs when the device is not powered.

9.4.2 Standby

Standby state is a low-power mode used to reduce power consumption to the lowest level. Diagnostic capabilities are not available in Standby mode.

9.4.3 Diagnostic

Diagnostic state can be used to perform diagnostics while the switch is disabled.

9.4.4 Standby Delay

The Standby Delay state is entered when EN and DIA_EN are low. After t_{STBY} , if the EN and DIA_EN pins are still low, the device will go to Standby State.

9.4.5 Active

In Active state, the switch is enabled. The diagnostic functions can be turned on or off during Active state.

9.4.6 Fault

The Fault state is entered if a fault shutdown occurs (thermal shutdown or current limit). After all faults are cleared, the LATCH pin is low, and the retry timer has expired, the device will transition out of Fault state. If the EN pin is high, the switch will re-enable. If the EN pin is low, the switch will remain off.

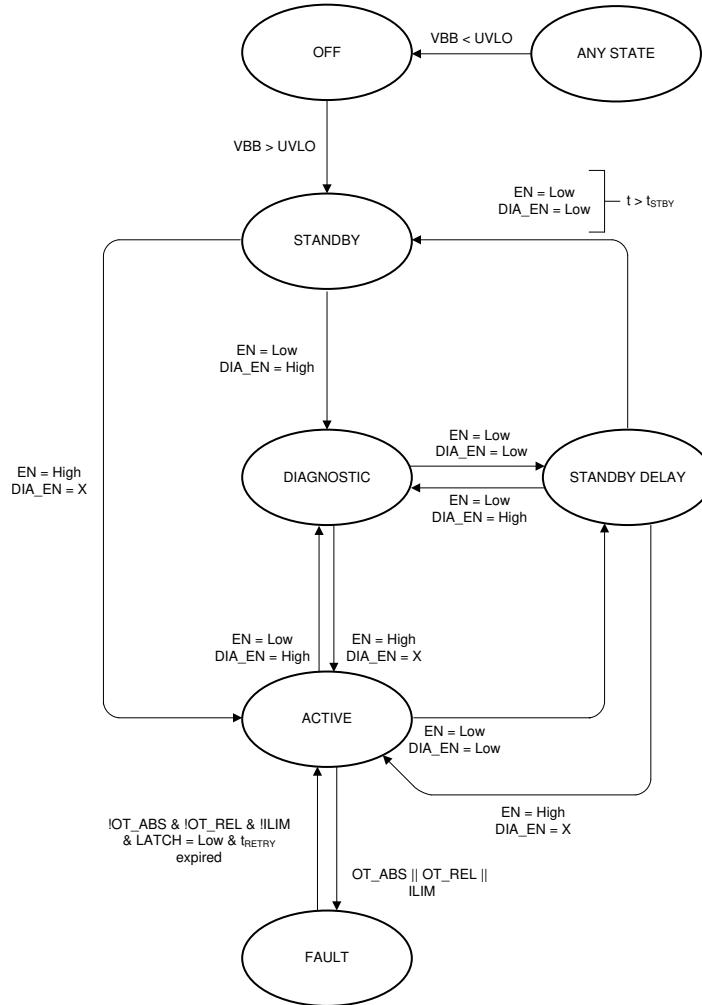

Figure 9-12. State Diagram

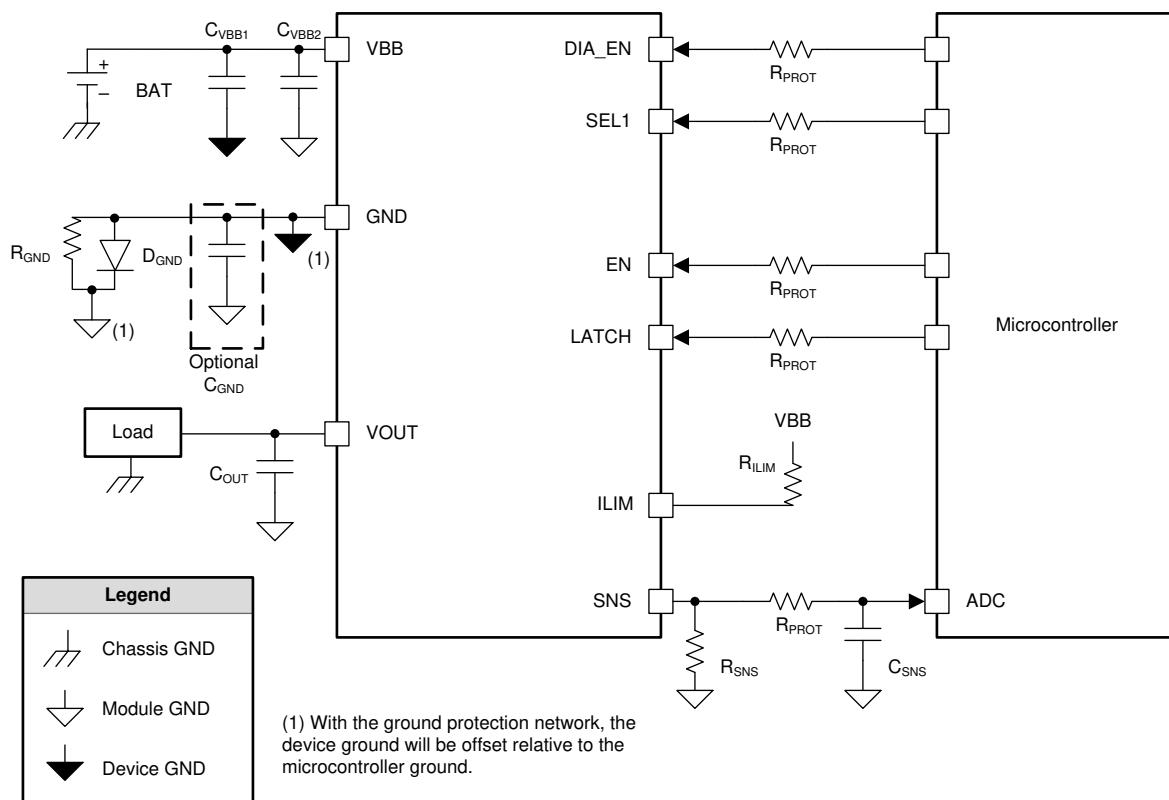

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers must validate and test their design implementation to confirm system functionality.

10.1 Application Information

Figure 10-1 shows the schematic of a typical application for version A or B of the TPS1HB16-Q1. It includes all standard external components. This section of the data sheet discusses the considerations in implementing commonly required application functionality. Version F of the device will replace the ILIM pin with the open drain FLT pin. In this case, the FLT pin must be connected to a 5-V rail through a 10-k Ω pull up resistor.

With the ground protection network, the device ground will be offset relative to the microcontroller ground.

Figure 10-1. System Diagram

Table 10-1. Recommended External Components

| COMPONENT | TYPICAL VALUE | PURPOSE |
|-------------------|------------------------------|---|
| R _{PROT} | 15 k Ω | Protect microcontroller and device I/O pins. |
| R _{SNS} | 1 k Ω | Translate the sense current into sense voltage. |
| C _{SNS} | 100 pF – 10 nF | Low-pass filter for the ADC input. |
| R _{GND} | 4.7 k Ω | Stabilize GND potential during turn-off of inductive load. |
| D _{GND} | BAS21 Diode | Protects device during reverse battery. |
| R _{ILIM} | 5 k Ω – 25 k Ω | Set current limit threshold. |
| C _{VBB1} | 4.7 nF to Device GND | Filtering of voltage transients (for example, ESD, ISO7637-2) and improved emissions. |

Table 10-1. Recommended External Components (continued)

| COMPONENT | TYPICAL VALUE | PURPOSE |
|------------|----------------------|--|
| C_{VBB2} | 220 nF to Module GND | Stabilize the input supply and filter out low frequency noise. |
| C_{OUT} | 220 nF | Filtering of voltage transients (for example, ESD, ISO7637-2). |

10.1.1 Ground Protection Network

As discussed in the [Reverse Battery](#) section, D_{GND} can be used to prevent excessive reverse current from flowing into the device during a reverse battery event. Additionally, R_{GND} is placed in parallel with D_{GND} if the switch is used to drive an inductive load. The ground protection network (D_{GND} and R_{GND}) can be shared amongst multiple high-side switches.

A minimum value for R_{GND} can be calculated by using the absolute maximum rating for I_{GND} . During the reverse battery condition, $I_{GND} = V_{BB} / R_{GND}$:

$$R_{GND} \geq V_{BB} / I_{GND} \quad (2)$$

- Set $V_{BB} = -13.5$ V
- Set $I_{GND} = -50$ mA (absolute maximum rating)

$$R_{GND} \geq -13.5 \text{ V} / -50 \text{ mA} = 270 \Omega$$

In this example, it is found that R_{GND} must be at least 270 Ω . It is also necessary to consider the power dissipation in R_{GND} during the reverse battery event:

$$P_{RGND} = V_{BB}^2 / R_{GND} \quad (3)$$

$$P_{RGND} = (13.5 \text{ V})^2 / 270 \Omega = 0.675 \text{ W}$$

In practice, R_{GND} can not be rated for such a high power. In this case, a larger resistor value must be selected.

10.1.2 Interface With Microcontroller

The ground protection network will cause the device ground to be at a higher potential than the module ground (and microcontroller ground). This offset will impact the interface between the device and the microcontroller.

Logic pin voltage will be offset by the forward voltage of the diode. For input pins (for example, EN), the designer must consider the V_{IH} specification of the switch and the V_{OH} specification of the microcontroller. For a system that *does not* include D_{GND} , it is required that $V_{OH} > V_{IH}$. For a system that *does* include D_{GND} , it is required that $V_{OH} > (V_{IH} + V_F)$. V_F is the forward voltage of D_{GND} .

The sense resistor, R_{SNS} , must be terminated to the microcontroller ground. In this case, the ADC can accurately measure the SNS signal even if there is an offset between the microcontroller ground and the device ground.

10.1.3 I/O Protection

R_{PROT} is used to protect the microcontroller I/O pins during system-level voltage transients such as ISO pulses or reverse battery. The SNS pin voltage can exceed the ADC input pin maximum voltage if the fault or saturation current causes a high enough voltage drop across the sense resistor. If that can occur in the design (for example, by switching to a high value R_{SNS} to improve ADC input level), then an appropriate external clamp has to be designed to prevent a high voltage at the SNS output and the ADC input.

10.1.4 Inverse Current

Inverse current occurs when $0 \text{ V} < V_{BB} < V_{OUT}$. In this case, current can flow from V_{OUT} to V_{BB} . Inverse current cannot be caused by a purely resistive load. However, a capacitive or inductive load can cause inverse current. For example, if there is a significant amount of load capacitance and the V_{BB} node has a transient droop, V_{OUT} can be greater than V_{BB} .

The TPS1HB16-Q1 will not detect inverse current. When the switch is enabled, inverse current will pass through the switch. When the switch is disabled, inverse current can pass through the MOSFET body diode. The device will continue operating in the normal manner during an inverse current event.

10.1.5 Loss of GND

The ground connection can be lost either on the device level or on the module level. If the ground connection is lost, the switch will be disabled. If the switch was already disabled when the ground connection was lost, the switch will remain disabled. When the ground is reconnected, normal operation will resume.

10.1.6 Automotive Standards

The TPS1HB16-Q1 is designed to be protected against all relevant automotive standards to ensure reliable operations when connected to a 12-V automotive battery.

10.1.6.1 ISO7637-2

The TPS1HB16-Q1 is tested according to the ISO7637-2:2011 (E) standard. The test pulses are applied both with the switch enabled and disabled. The test setup includes only the DUT and minimal external components: C_{VBB} , C_{OUT} , D_{GND} , and R_{GND} .

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as: "The function does not perform as designed during the test but returns automatically to normal operation after the test". See [Table 10-2](#) for ISO7637-2:2011 (E) expected results.

Table 10-2. ISO7637-2:2011 (E) Results

| TEST PULSE | TEST PULSE SEVERITY LEVEL WITH STATUS II FUNCTIONAL PERFORMANCE | | MINIMUM NUMBER OF PULSES OR TEST TIME | BURST CYCLE / PULSE REPETITION TIME | |
|-------------------|---|--------|---------------------------------------|-------------------------------------|---------|
| | LEVEL | US | | MINIMUM | MAXIMUM |
| 1 | III | -112 V | 500 pulses | 0.5 s | — |
| 2a ⁽¹⁾ | III | +55 V | 500 pulses | 0.20 | 5 s |
| 2b | IV | +10 V | 10 pulses | 0.5 s | 5 s |
| 3a | IV | -220 V | 1 hour | 90 ms | 100 ms |
| 3b | IV | +150 V | 1 hour | 90 ms | 100 ms |

(1) 1- μ F capacitance on C_{VBB} is required for passing level 3 ISO7637 pulse 2 A.

10.1.6.2 AEC-Q100-012 Short Circuit Reliability

The TPS1HB16-Q1 is tested according to the AEC-Q100-012 Short Circuit Reliability standard. This test is performed to demonstrate the robustness of the device against V_{OUT} short-to-ground events. Test conditions and test procedures are summarized in [Table 10-3](#). For further details, refer to the AEC-Q100-012 standard document.

Test conditions:

- $LATCH = 0$ V
- $R_{ILIM} = 5$ k Ω
- 10 units from 3 separate lots for a total of 30 units.
- $L_{supply} = 5$ μ H, $R_{supply} = 10$ m Ω
- $V_{BB} = 14$ V

Test procedure:

- Parametric data is collected on each unit pre-stress
- Each unit is enabled into a short-circuit with the required short circuit cycles or duration as specified
- Functional testing is performed on each unit post-stress to verify that the part still operates as expected

The cold repetitive test is run at 85°C which is the worst case condition for the device to sustain a short circuit. The cold repetitive test refers to the device being given time to cool down between pulses, rather than being run at a cold temperature. The load short circuit is the worst case situation, since the energy stored in the cable inductance can cause additional harm. The fast response of the device ensures current limiting occurs quickly and at a current close to the load short condition. In addition, the hot repetitive test is performed as well.

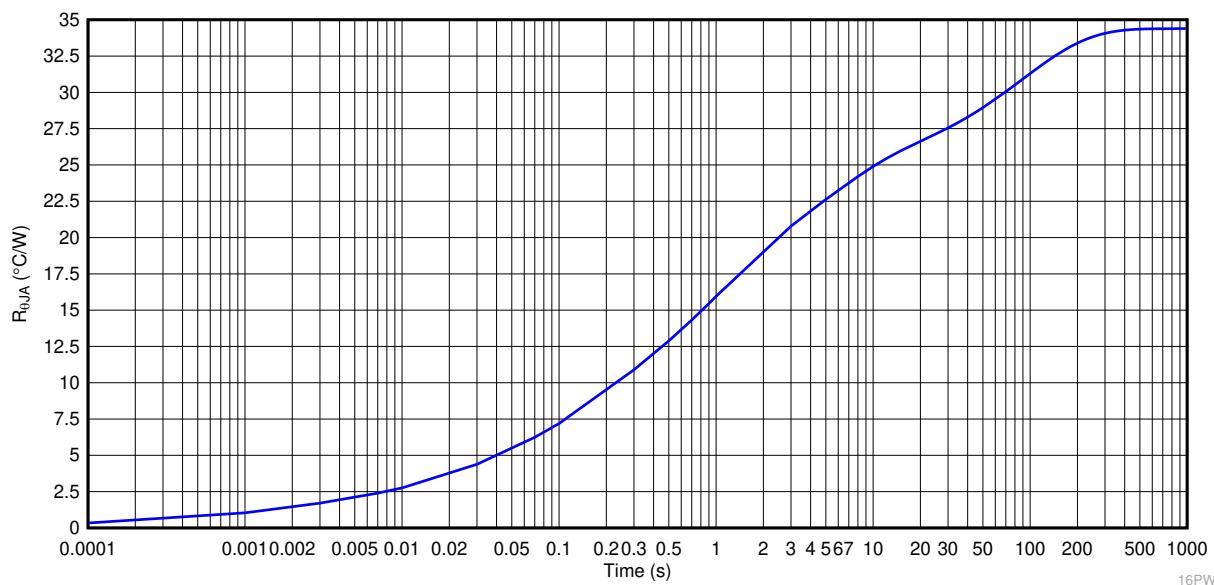

Table 10-3. AEC-Q100-012 Test Results

| TEST | LOCATION OF SHORT | DEVICE VERSION | NO. OF CYCLES / DURATION | NO. OF UNITS | NO. OF FAILS |
|---|--|----------------|--------------------------|--------------|--------------|
| Cold Repetitive - Long Pulse ⁽¹⁾ | Load Short Circuit, $L_{short} = 5 \mu\text{H}$, $R_{short} = 200 \text{ m}\Omega$, $T_A = 85^\circ\text{C}$ | B | 100 k cycles | 30 | 0 |
| Hot Repetitive - Long Pulse | Load Short Circuit, $L_{short} = 5 \mu\text{H}$, $R_{short} = 100 \text{ m}\Omega$, $T_A = 25^\circ\text{C}$ | B | 100 hours | 30 | 0 |

(1) For Cold Repetitive short, 200-mΩ R_{short} is used so that the device is at a higher junction temperature before the short-circuit event, increasing the harshness of the test.

10.1.7 Thermal Information

When outputting current, the TPS1HB16-Q1 will heat up due to the power dissipation. The transient thermal impedance curve can be used to determine the device temperature during a pulse of a given length. This $Z_{\theta JA}$ value corresponds to a JEDEC standard 2s2p thermal test PCB with thermal vias.

Figure 10-2. TPS1HB16-Q1 Transient Thermal Impedance

10.2 Typical Application

This application example demonstrates how the TPS1HB16-Q1 device can be used to power resistive heater loads in automotive seats. In this example, we consider a heater load that is powered by the device. This is just one example of the many applications where this device can fit.

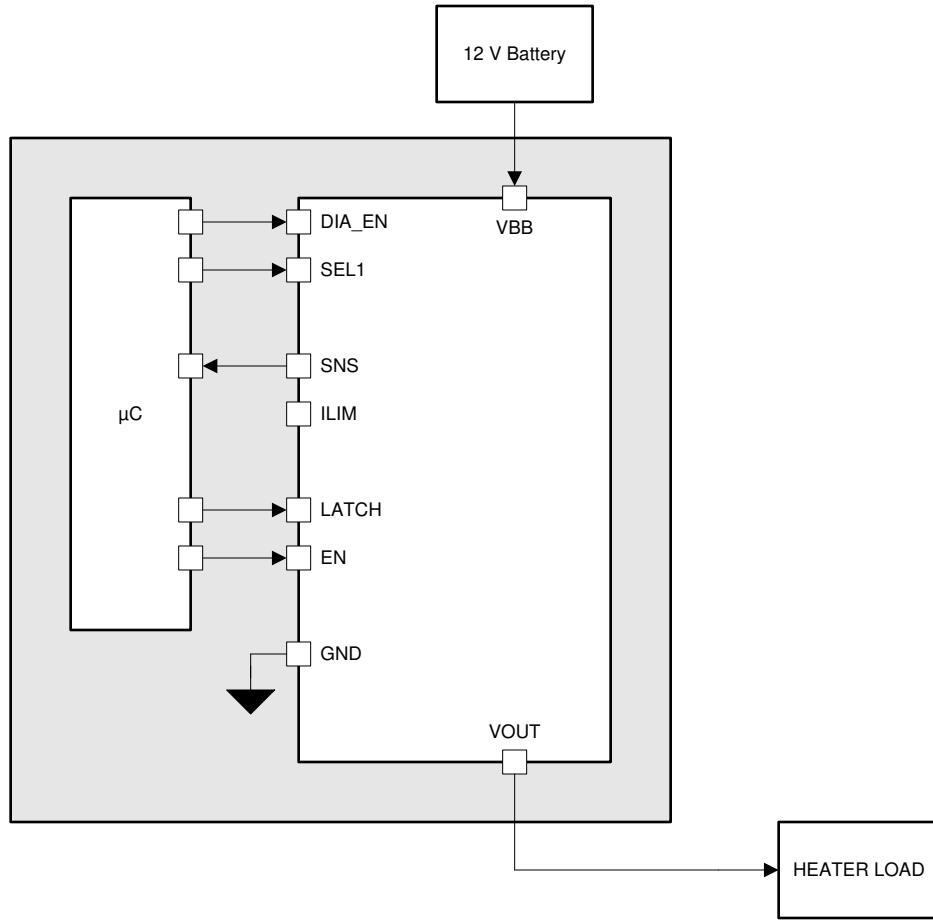

Figure 10-3. Block Diagram for Powering Heater Load

10.2.1 Design Requirements

For this design example, use the input parameters shown in [Table 10-4](#).

Table 10-4. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|---------------------|-----------------------------|
| V_{BB} | 13.5 V |
| Load - Heater | 80-W max |
| Load current sense | 60 mA to 12 A |
| I_{LIM} | 8 A |
| Ambient temperature | 70°C |
| $R_{\theta JA}$ | 34.3°C/W (depending on PCB) |
| Device version | A |

10.2.2 Detailed Design Procedure

10.2.2.1 Thermal Considerations

The 80 W heater load will cause a DC current in the channel under maximum load power condition of around 5.9 A. Therefore, this current at 13.5 V will assume worst case heating.

Power dissipation in the switch is calculated in [Equation 4](#). R_{ON} is assumed to be 32 mΩ because this is the maximum specification at high temperature. In practice, R_{ON} will almost always be lower.

$$P_{FET} = I^2 \times R_{ON} \quad (4)$$

$$P_{FET} = (5.9 \text{ A})^2 \times 32 \text{ m}\Omega = 1.11 \text{ W} \quad (5)$$

This means that the maximum FET power dissipation is 1.11 W. The junction temperature of the device can be calculated using [Equation 6](#) and the $R_{\theta JA}$ value from the [Specifications](#) section.

$$T_J = T_A + R_{\theta JA} \times P_{FET} \quad (6)$$

$$T_J = 70^\circ\text{C} + 34.3^\circ\text{C/W} \times 1.11 \text{ W} = 108.1^\circ\text{C}$$

The maximum junction temperature rating for the TPS1HB16-Q1 is $T_J = 150^\circ\text{C}$. Based on the above example calculation, the device temperature will stay below the maximum rating even at this high level of current.

10.2.2.2 R_{ILIM} Calculation

In this application, the TPS1HB16-Q1 must allow for the maximum DC current with margin but minimize the energy in the switch during a fault condition by minimizing the current limit. For this application, the best I_{ILIM} set point is approximately 8 A. [Equation 7](#) allows you to calculate the R_{ILIM} value that is placed from the I_{ILIM} pins to V_{BB} . R_{ILIM} is calculated in k Ω .

$$R_{ILIM} = K_{CL} / I_{CL} \quad (7)$$

Because this device is version A, the K_{CL} value in the [Specifications](#) section is $110 \text{ A} \times \text{k}\Omega$.

$$R_{ILIM} = 110 \text{ (A} \times \text{k}\Omega\text{)} / 8 \text{ A} = 13.75 \text{ k}\Omega \quad (8)$$

For a I_{ILIM} of 8 A, the R_{ILIM} value must be set at around 13.75 k Ω .

10.2.2.3 Diagnostics

If the resistive heating load is disconnected (heater malfunction), an alert is desired. Open-load detection can be performed in the switch-enabled state with the current sense feature of the TPS1HB16-Q1 device. Under open load condition, the current in the SNS pin will be the fault current and the can be detected from the sense voltage measurement.

10.2.2.3.1 Selecting the R_{ISNS} Value

[Table 10-5](#) shows the requirements for the load current sense in this application. The K_{SNS} value is specified for the device and can be found in the [Specifications](#) section.

Table 10-5. R_{ISNS} Calculation Parameters

| PARAMETER | EXAMPLE VALUE |
|-----------------------------------|---------------|
| Current Sense Ratio (K_{SNS}) | 3000 |
| Largest diagnosable load current | 12 A |
| Smallest diagnosable load current | 60 mA |
| Full-scale ADC voltage | 5 V |
| ADC resolution | 10 bit |

The load current measurement requirements of 12 A ensures that even in the event of a overcurrent surpassing the set current limit, the MCU can register and react by shutting down the TPS1HB16-Q1, while the low level of 60 mA allows for accurate measurement of low load currents.

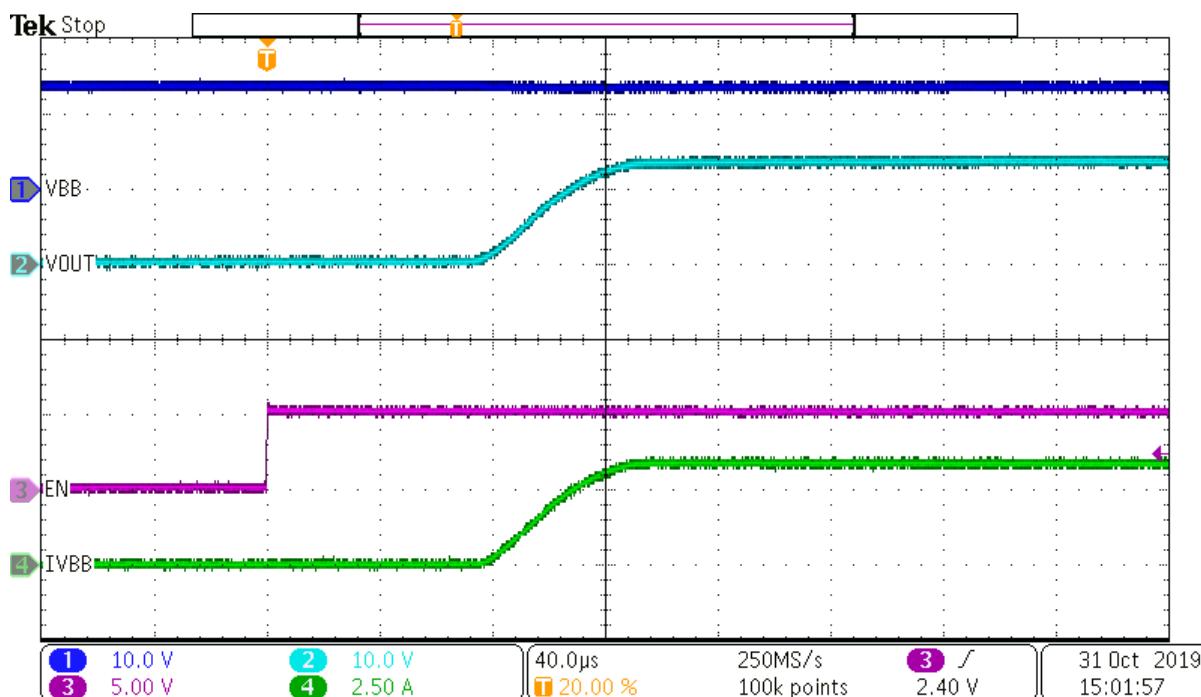

The R_{ISNS} resistor value must be selected such that the largest diagnosable load current puts V_{SNS} at about 95% of the ADC full-scale. With this design, any ADC value above 95% can be considered a fault. Additionally, the R_{ISNS} resistor value must ensure that the smallest diagnosable load current does not cause V_{SNS} to fall below 1 LSB of the ADC. With the given example values, a 1.2-k Ω sense resistor satisfies both requirements shown in [Table 10-6](#).

Table 10-6. V_{SNS} Calculation

| LOAD (A) | SENSE RATIO | I_{SNS} (mA) | R_{SNS} (Ω) | V_{SNS} (V) | % of 5-V ADC |
|----------|-------------|----------------|------------------------|---------------|--------------|
| 0.06 | 3000 | 0.02 | 1200 | 0.024 | 0.5% |
| 12 | 3000 | 4 | 1200 | 4.800 | 96.0% |

10.2.3 Application Curves

When the device receives a rising edge on the EN pulse the output will turn on. After the turn-on delay time, the device V_{OUT} goes to the V_{BB} supply and begins outputting the steady state resistive current.

**Figure 10-4. TPS1HB16-Q1 Turn-On Waveform ($R_{OUT} = 4 \Omega$)**

When the device turns off on a falling edge of EN, the channel I_{OUT} will go to zero and the V_{OUT} will drop to zero as well as shown.

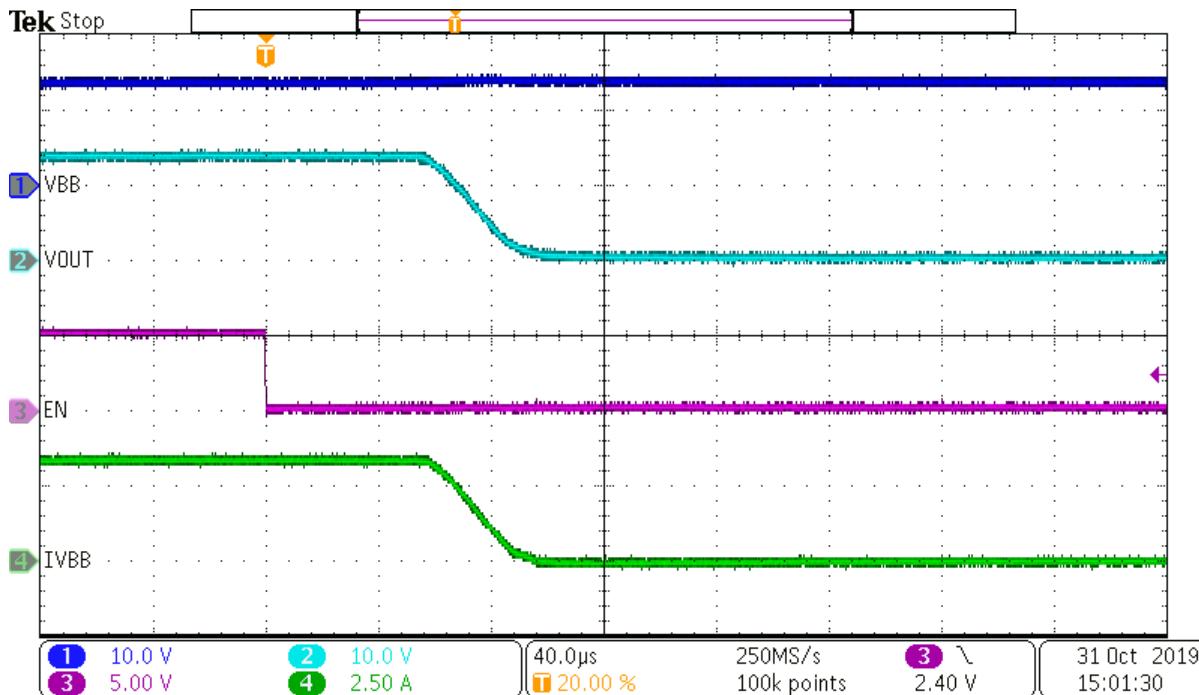

Figure 10-5. TPS1HB16-Q1 Turn-Off Waveform ($R_{OUT} = 4 \Omega$)

When there is a load step, the SNS current output will follow the load current with a slight delay. The image shows the output current temporarily increase from 1 A to 5 A and then return to 1 A. In this situation, the output current is accurately modeled throughout the pulse by the voltage on the SNS pin allowing for accurate diagnostics.

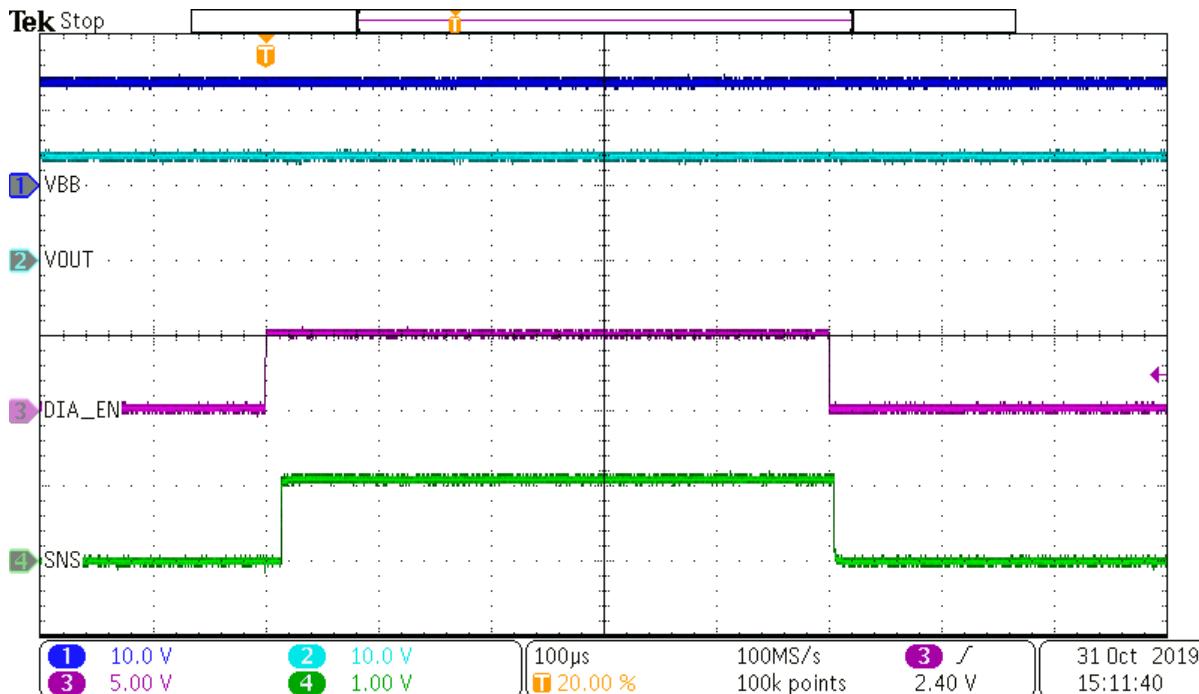

Figure 10-6. TPS1HB16-Q1 SNS Settling Time

If the device has a no-load case due to an open load or cable, the device will register the fault even in an off-state if the DIAG_EN pin is high. Figure 10-7 shows the device behavior when an open load event is registered with EN low and DIAG_EN is raised. Systems can PWM DIAG_EN to lower system power losses while still watching for open load events and the same timing applies.

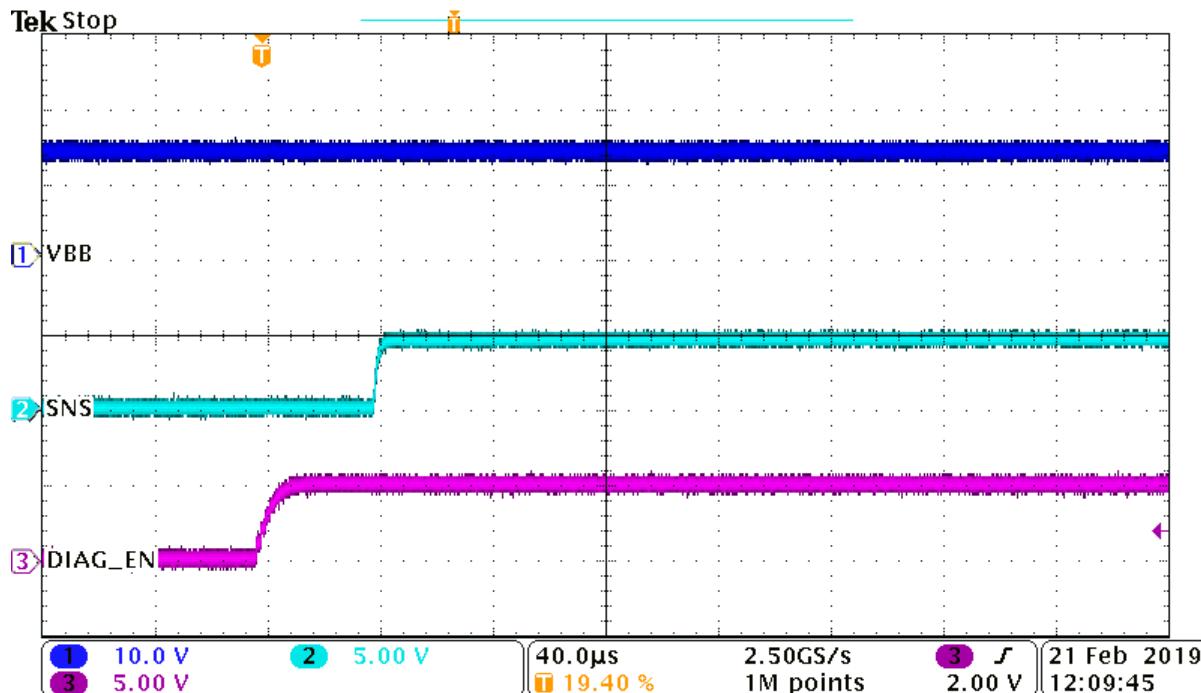

Figure 10-7. Open Load (t_{OL}) Detection Time

If the output of the TPS1HB16-Q1 is short-circuited, the device will protect the system from failure. Depending on the device version and R_{ILIM} , the current limit set-point will vary. The waveforms below show examples of the current limit behavior when the device is enabled into a short circuit with a test setup according to AEC-Q100-012. In each case, the R_{ILIM} pin has a 5 kΩ resistor to set the current limit.

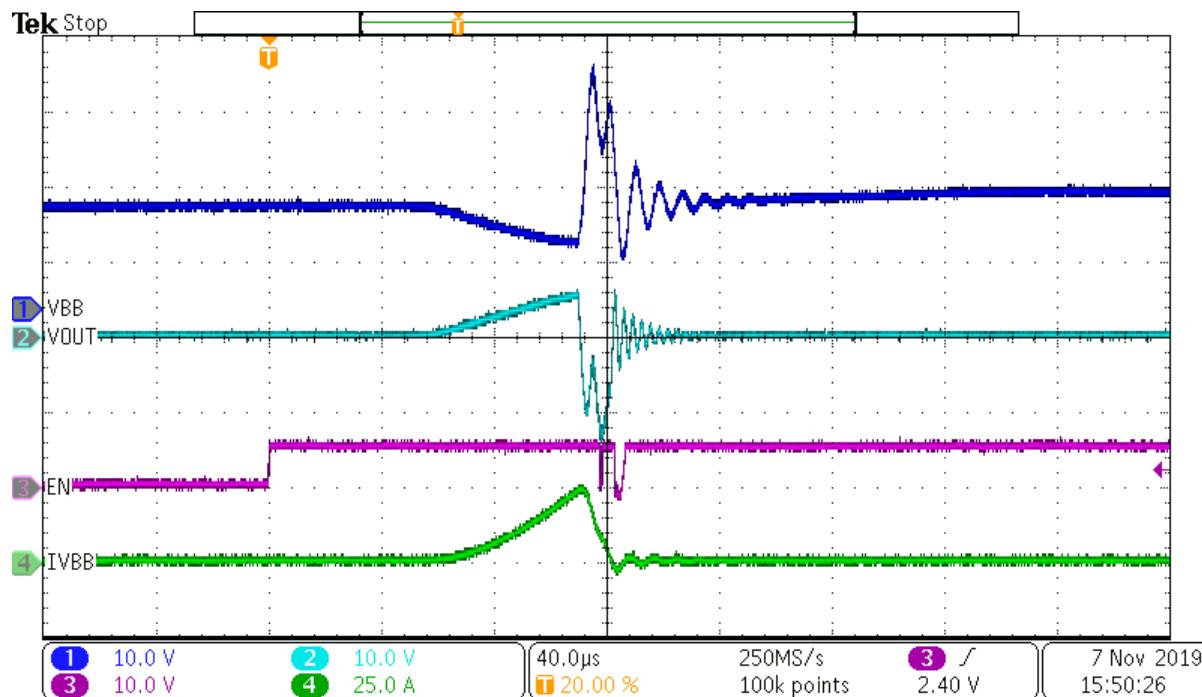

Figure 10-8. TPS1HB16-Q1 Version A Short Circuit Waveform

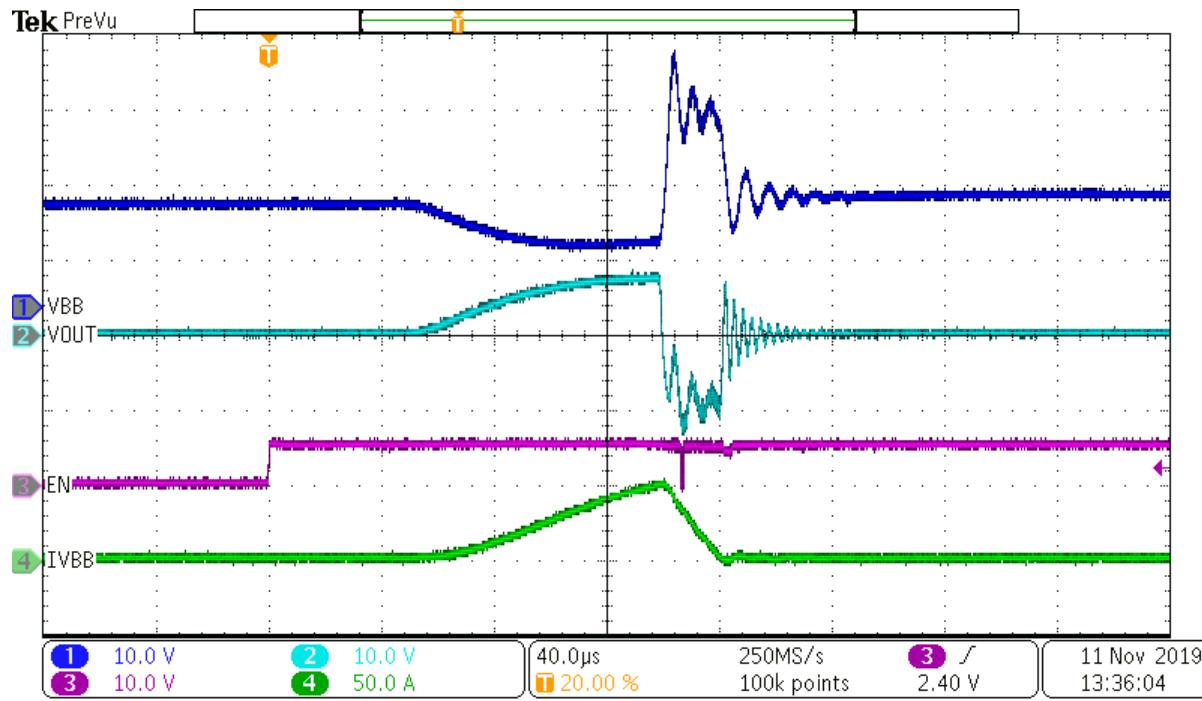

Figure 10-9. TPS1HB16-Q1 Version B Short Circuit Waveform

10.3 Typical Application

This application example demonstrates how the TPS1HB16-Q1 device can be used to power bulb loads in automotive headlights. In this example, we consider a 35 W bulb that is powered by the device. This example is just one example of the many applications where this device can fit.

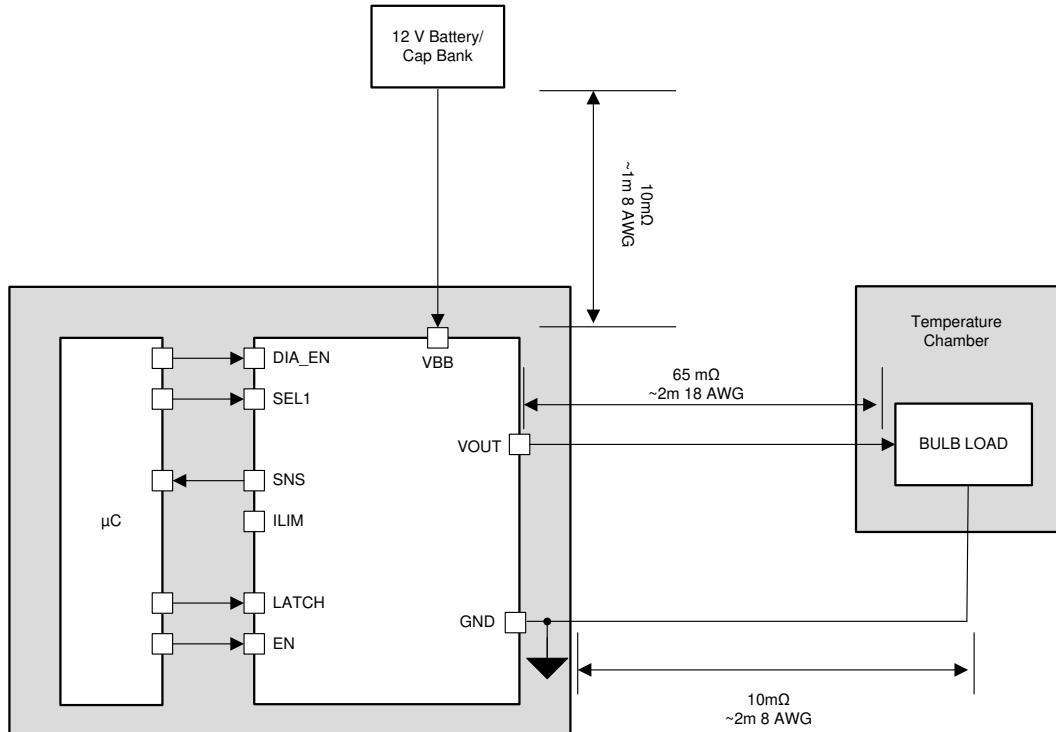

Figure 10-10. Block Diagram for Driving Bulb Load

10.3.1 Design Requirements

For this design example, use the input parameters shown in [Table 10-7](#).

Table 10-7. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |
|-------------------------------------|---------------|
| V_{BB} | 16 V |
| Load - Bulb | 35-W maximum |
| Fixed I_{LIM} | 60 A |
| Ambient temperature | 25°C |
| Bulb temperature in chamber | -40°C |
| Cable impedance from device to bulb | 65 mΩ |
| Device version | F |

10.3.2 Detailed Design Procedure

The typical bulb test setup is where the device is at 25°C and the bulb is in a temperature chamber at -40°C. The bulb needs to be kept at -40°C so that the impedance is very low and the inrush current will be the highest. The impedance of the cables is important because it will change the inrush current of the bulb as well. The F version of the TPS1HB16-Q1 has a very high fixed current limit so that the inrush current of the bulb can be passed without limitation.

10.3.3 Application Curves

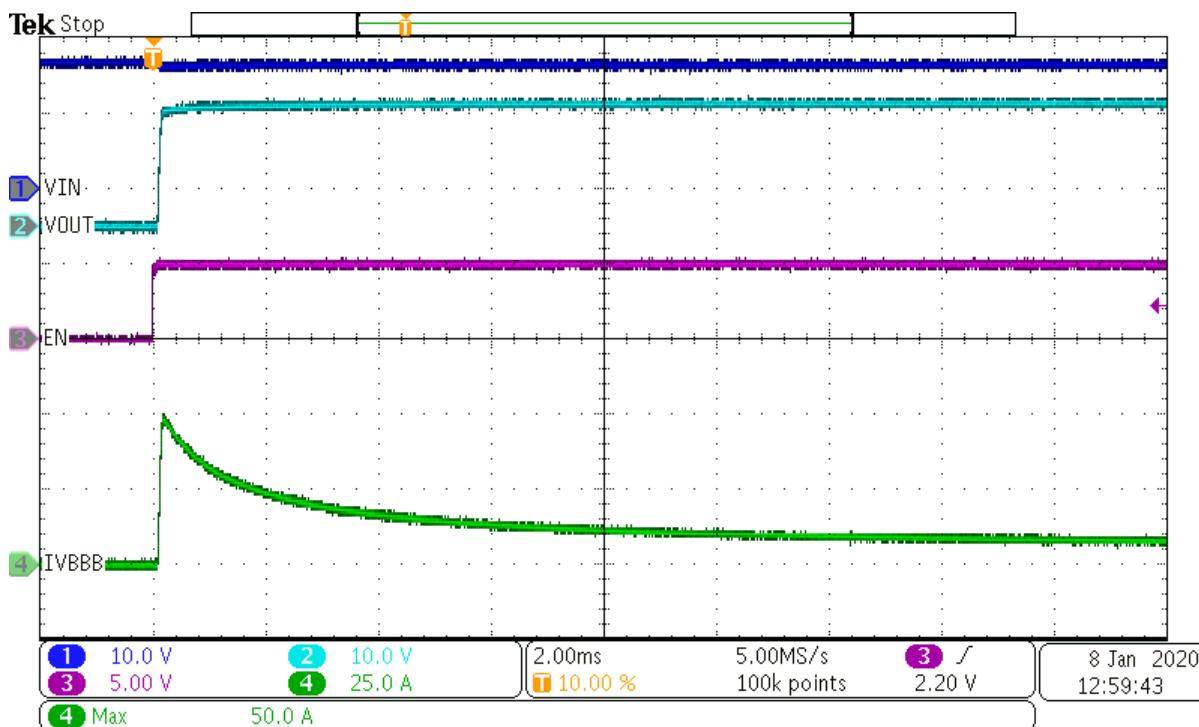

Figure 10-11. TPS1HB16-Q1 Version F 35 W Bulb Inrush Current

10.3.4 Detailed Design Procedure

Another typical bulb test is to have the bulb at room temperature (25°C) and the device heated up to 105°C. This test is designed see if the device can drive the bulb without hitting thermal shutdown due to the current draw of the bulbs. The passing criteria is that the bulb illuminates when the device enables the channel and the device does not go into thermal shutdown. [Figure 10-12](#) shows the current waveform of this test and as it can be seen the bulb comes on and stays on without hitting thermal shutdown. Notice that the current is lower in this condition than the inrush condition. This is due to the bulb's effective capacitance being lower at higher temperatures as expected.

10.3.5 Application Curves

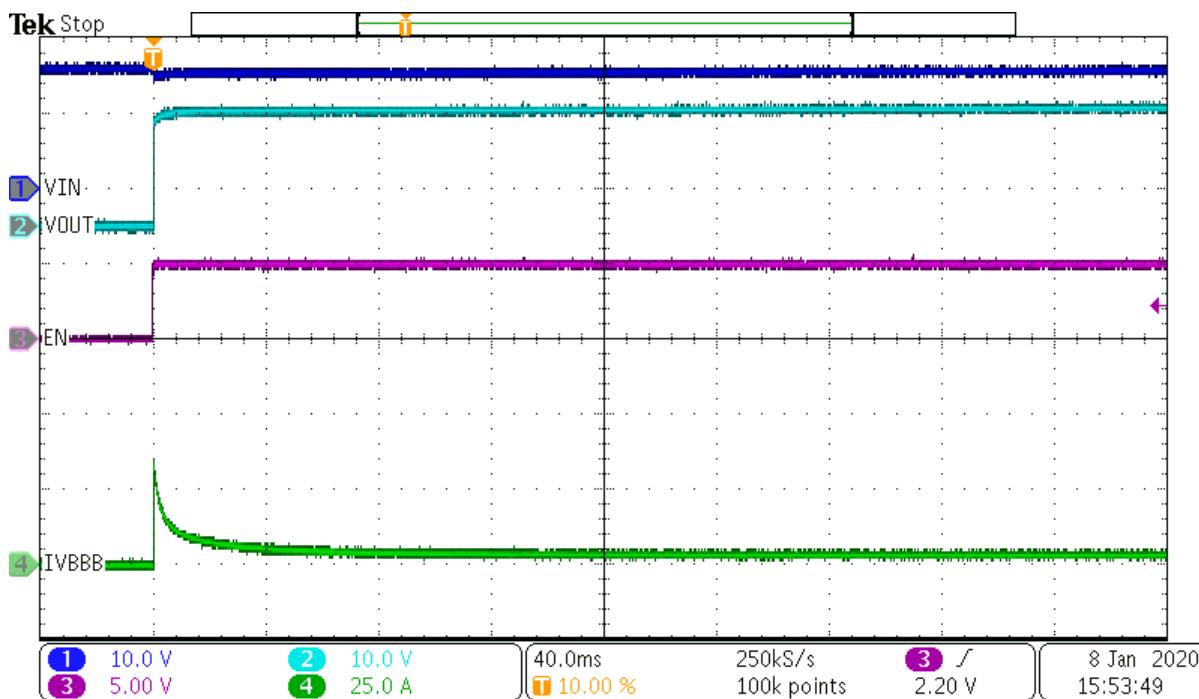

Figure 10-12. TPS1HB16-Q1 Version F 35W Bulb Turn On

10.4 Power Supply Recommendations

The TPS1HB16-Q1 device is designed to operate in a 12-V automotive system. The nominal supply voltage range is 6 V to 18 V as measured at the V_{BB} pin with respect to the GND pin of the device. In this range the device meets full parametric specifications as listed in the *Electrical Characteristics* table. The device is also designed to withstand voltage transients beyond this range. When operating outside of the nominal voltage range but within the operating voltage range, the device will exhibit normal functional behavior. However, parametric specifications can not be specified outside the nominal supply voltage range.

Table 10-8. Operating Voltage Range

| V_{BB} VOLTAGE RANGE | NOTE |
|------------------------|--|
| 3 V to 6 V | Transients such as cold crank and start-stop, functional operation are specified but some parametric specifications can not apply. The device is completely short-circuit protected up to 125°C. |
| 6 V to 18 V | Nominal supply voltage, all parametric specifications apply. The device is completely short-circuit protected up to 125°C. |
| 18 V to 40 V | Transients such as jump-start and load-dump, functional operation specified but some parametric specifications can not apply. |

10.5 Layout

10.5.1 Layout Guidelines

To achieve optimal thermal performance, connect the exposed pad to a large copper pour. On the top PCB layer, the pour can extend beyond the package dimensions as shown in the example below. In addition to this, TI recommends to also have a V_{BB} plane either on one of the internal PCB layers or on the bottom layer.

Vias must connect this plane to the top V_{BB} pour.

Ensure that all external components are placed close to the pins. Device current limiting performance can be harmed if the R_{ILIM} is far from the pins and extra parasitics are introduced.

10.5.2 Layout Example

The layout example is for device versions A/B.

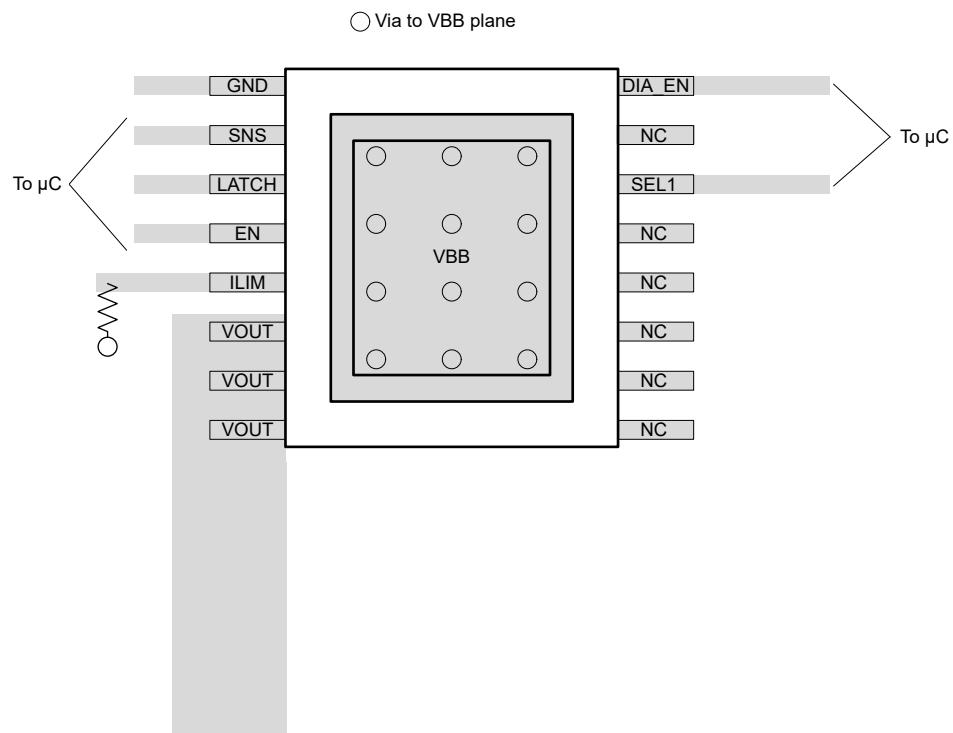

Figure 10-13. 16-PWP Layout Example

11 Device and Documentation Support

11.1 Documentation Support

11.1.1 Related Documentation

11.5 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

 [TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

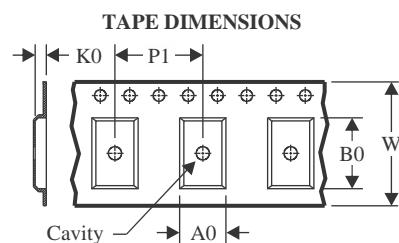

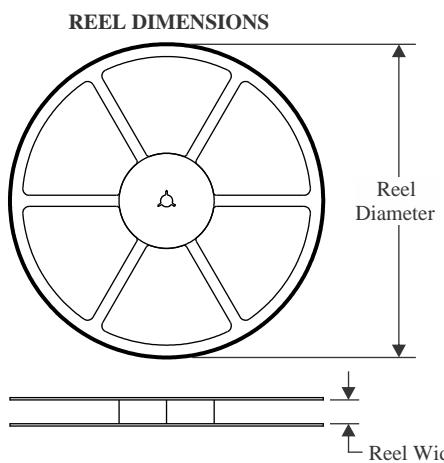

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

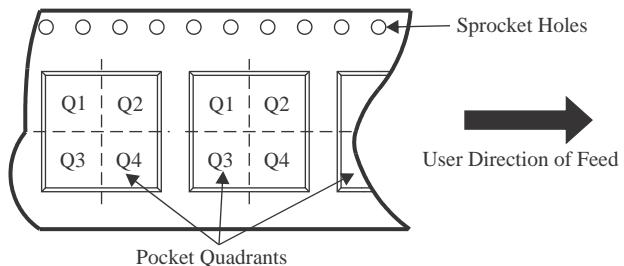

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

| | |
|----|---|
| A0 | Dimension designed to accommodate the component width |
| B0 | Dimension designed to accommodate the component length |
| K0 | Dimension designed to accommodate the component thickness |
| W | Overall width of the carrier tape |
| P1 | Pitch between successive cavity centers |

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|------------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| TPS1HB16AQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 330.0 | 12.4 | 6.9 | 5.6 | 1.6 | 8.0 | 12.0 | Q1 |
| TPS1HB16BQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 330.0 | 12.4 | 6.9 | 5.6 | 1.6 | 8.0 | 12.0 | Q1 |
| TPS1HB16FQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 330.0 | 12.4 | 6.9 | 5.6 | 1.6 | 8.0 | 12.0 | Q1 |

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

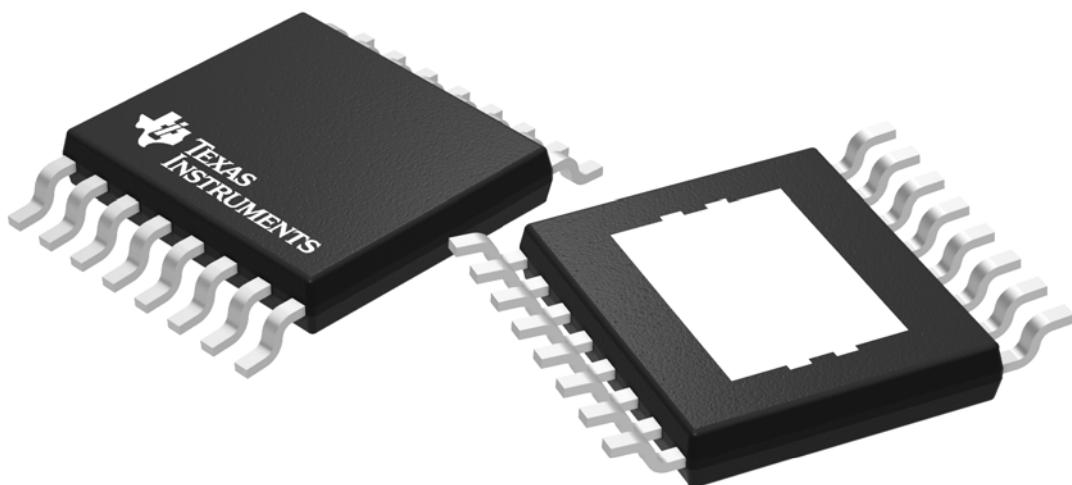

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
|------------------|--------------|-----------------|------|------|-------------|------------|-------------|
| TPS1HB16AQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 350.0 | 350.0 | 43.0 |
| TPS1HB16BQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 350.0 | 350.0 | 43.0 |
| TPS1HB16FQPWPRQ1 | HTSSOP | PWP | 16 | 3000 | 350.0 | 350.0 | 43.0 |

GENERIC PACKAGE VIEW

PWP 16

PowerPAD™ TSSOP - 1.2 mm max height

PLASTIC SMALL OUTLINE

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

PACKAGE OUTLINE

PWP0016M

PowerPAD™ TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

NOTES:

PowerPAD is a trademark of Texas Instruments.

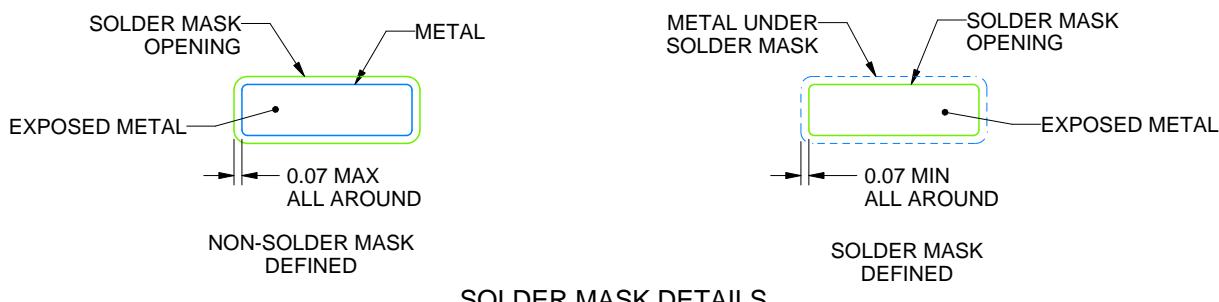

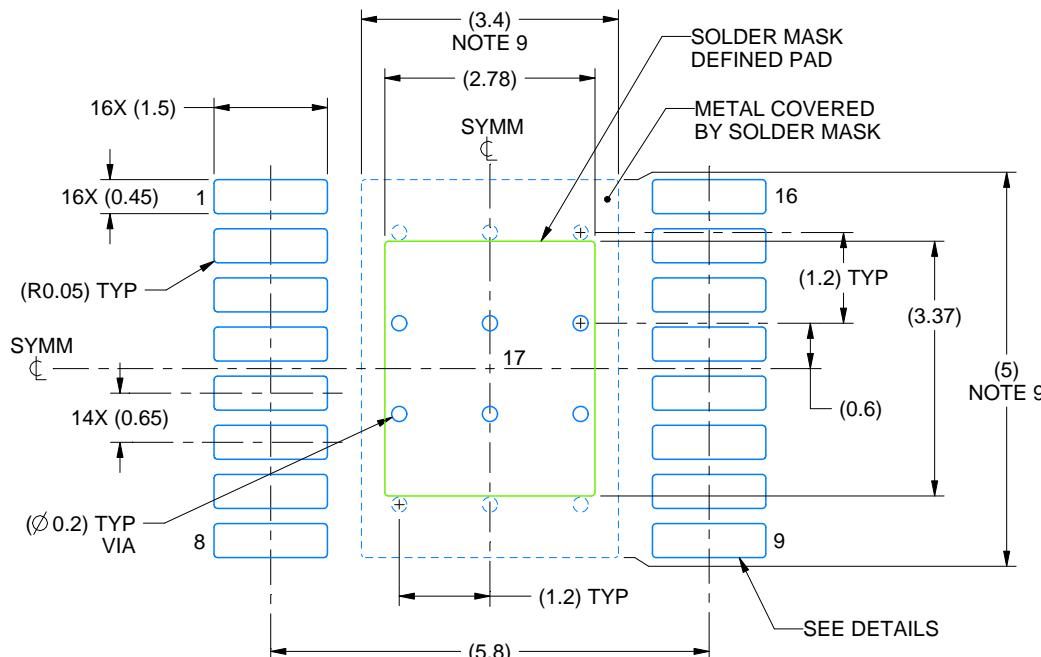

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.

EXAMPLE BOARD LAYOUT

PWP0016M

PowerPAD™ TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

4223886/B 09/2019

NOTES: (continued)

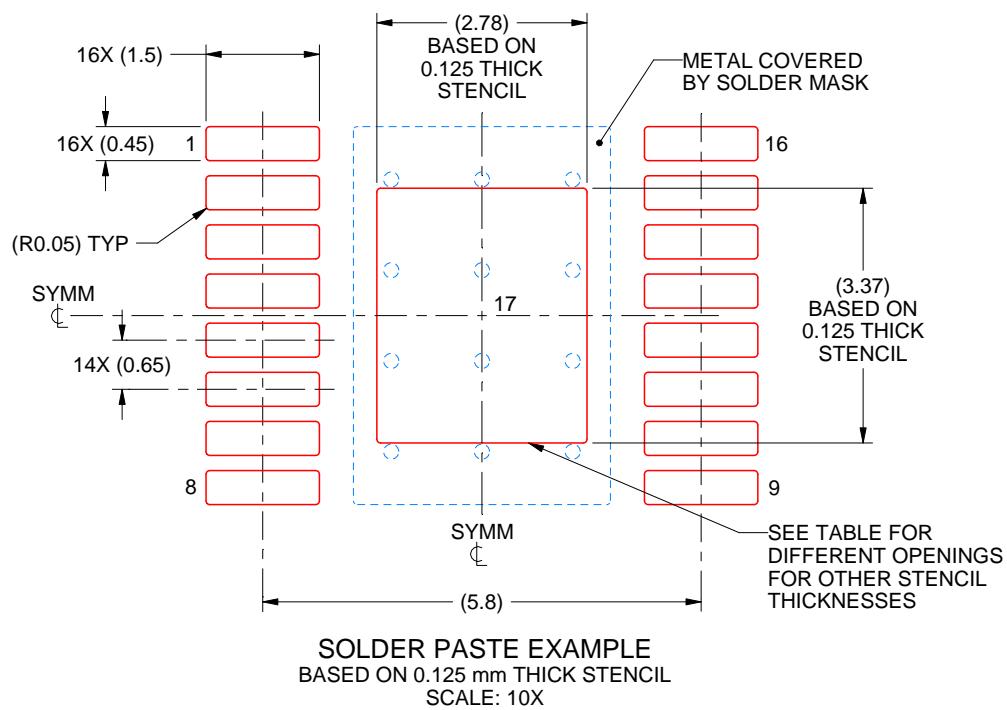

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

PWP0016M

PowerPAD™ TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

| STENCIL THICKNESS | SOLDER STENCIL OPENING |
|-------------------|------------------------|
| 0.1 | 3.11 X 3.77 |
| 0.125 | 2.78 X 3.37 (SHOWN) |
| 0.15 | 2.54 X 3.08 |
| 0.175 | 2.35 X 2.85 |

4223886/B 09/2019

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.
