

TPS22971 SLVSDK7C - APRIL 2017-REVISED FEBRUARY 2020

TPS22971 3.6-V, 3-A, 6.7-m Ω On-Resistance Load Switch with Adjustable Fast Turn-ON and Power Good

Features

- Input voltage range (V_{IN}): 0.65 V to 3.6 V
- On-resistance
 - $R_{DS(on)} = 6.7 \text{ m}\Omega$ (typical) at $V_{IN} \ge 1.8 \text{ V}$
 - $R_{DS(on)} = 7.2 \text{ m}\Omega$ (typical) at $V_{IN} = 1.05 \text{ V}$
 - $R_{DS(on)} = 8.9 \text{ m}\Omega$ (typical) at $V_{IN} = 0.65 \text{ V}$
- Maximum continuous switch current (I_{MAX}): 3 A
- ON state (I_{O}): 30 μA (typical) at 3.6 V_{IN}
- OFF state (I_{SD}): 1 μ A (typical) at 3.6 V_{IN}
- Adjustable slew rate through CT pin
 - Fast turn-ON ≤ 65 μs at V_{IN} = 1 V
- Power good (PG) indicator after switch turn ON
- Low threshold enable (ON) of 0.9 V (V_{IH}) supports use of low voltage control logic
- Thermal shutdown (T_{SD})
- Quick output discharge (QOD): $150-\Omega$ (typical)

Applications

- PC & notebooks
- **Tablets**
- Computer on modules
- Optical modules
- Data storage

3 Description

The TPS22971 is a space-saving single-channel load switch with controlled and adjustable turn-on slew rate and an integrated power good indicator. the device contains an n-channel mosfet that can operate over a low input voltage range of 0.65 v to 3.6 V and can support a maximum continuous current of 3 A. A low on-resistance of 6.7-m Ω minimizes the power loss and voltage drop across the load switch. The switch is controlled by an on and off input (ON), which is capable of interfacing directly with lowvoltage control signals.

By default, the TPS22971 has a fast turn-on time to minimize system startup and wait time. The adjustable slew rate can also be reduced to limit inrush current. A power good (PG) signal internally monitors the gate threshold and indicates when the switch is fully on. When the switch is disabled, a 150- Ω on-chip resistor quickly discharges the output to ground and keeps it from floating.

The TPS22971 is available in an ultra-small, space saving 8-pin WCSP package and is characterized for operation over the free-air temperature range of -40°C to 105°C and integrates thermal shutdown to turn off in case of overheating.

4 Revision History

Changes from Revision B (December 2017) to Revision C	Page
 Changed test conditions from "V_{IN} = 1.0 V" to "V_{IN} = 1.05 V" and " 0°C ≤ T_A ≤ 85°C" to "-40°C ≤ T_A ≤ 85°C" for furn-on time specification in <i>Switching Characteristics</i> table. 	
Added load resistance and load capacitance test conditions for fast turn-on time specification in Switching Characteristics table	6
Changes from Original (April 2017) to Revision A	Page
Changed device status from "Advance Information" to " Production Data"	1
Changes from Revision A (July 2017) to Revision B	Page
Deleted YZPT from Part Number in the Device Information table	1
Changed 1.1 μA to 1 μA in the Features section	1
Deleted Duplicate Package Drawing

7 Parameter Measurement Information

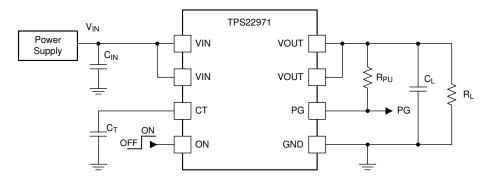

Figure 24. TPS22971 Test Circuit

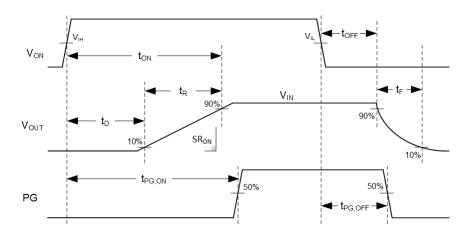

Figure 25. AC Timing Waveforms

8 Detailed Description

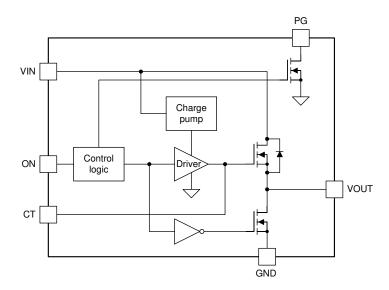

8.1 Overview

The TPS22971 is a single channel, 3-A load switch in a small, space-saving WCSP-8 package. This device implements a low resistance N-channel MOSFET with a controlled rise time for applications that need to limit the inrush current.

The controlled rise time for the device greatly reduces inrush current caused by large bulk load capacitances, thereby reducing or eliminating power supply droop. The adjustable slew rate through CT provides the design flexibility to trade off the inrush current and power up timing requirements. Integrated PG indicator notifies the system about the status of the load switch to facilitate seamless power sequencing.

This device is also designed to have very low leakage current during off state, which prevents downstream circuits from pulling high standby current from the supply. Integrated control logic, driver, power supply, and output discharge FET eliminates the need for additional external components, which reduces solution size and bill of materials (BOM) count.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 On and Off Control

The ON pin controls the state of the switch. Asserting ON high enables the switch. ON has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic. It can be used with any microcontroller with 1.2-V, 1.8-V, 2.5-V or 3.3-V GPIOs. This pin does not have an internal bias and must not be left floating for proper functionality.

8.3.2 Controlled Turn-On

The TPS22971 has controlled Turn-On for inrush current control. A capacitor to GND on the CT pin adjusts the slew rate. For a given input voltage and desired slew rate, Equation 1 can be used to find the required CT value. For calculated CT values less than 220 pF, use 0 pF instead when solving for t_{ON} and t_{PG.ON}.

CT (VIN, SR) =
$$\frac{\left(\frac{VIN}{SR} - (3.1 \times VIN) - 14.2\right) \times 800}{\left((32.5 \times VIN) + 12.5\right)}$$

where

CT is the capacitor on the CT pin (in pF)

Feature Description (continued)

• VIN is the input voltage (in V)

The CT value determined in Equation 1 can be used to find the total Turn-On time, t_{ON} , in Equation 2 or Equation 3 depending on V_{IN} .

$$tON (VIN \ge 0.95 \text{ V, CT}) = \left((15 + (33 \times VIN)) \times \frac{CT}{1000} \right) + \left((3.9 \times VIN) + 35 \right)$$

$$tON (VIN < 0.95 \text{ V, CT}) = \left((45 + (33 \times VIN)) \times \frac{CT}{1000} \right) + \left((3.9 \times VIN) + 55 \right)$$
(2)

where

- tON is the Turn-On time (in μs)
- · CT is the capacitor on the CT pin (in pF)
- VIN is the input voltage (in V)

8.3.3 Power Good (PG)

The TPS22971 has a power good (PG) output signal to indicate the gate of the pass FET is driven high and the switch is fully on (full load ready). The signal is an active high and open drain output which can be connected to a voltage source through an external pull up resistor, R_{PU} . This voltage source can be V_{OUT} from the TPS22971 or another external voltage. Equation 4 and Equation 5 show the approximate equation for the relationship between CT setting, V_{IN} and PG Turn-On time ($t_{PG,ON}$):

$$tPG, ON (VIN \ge 0.95 \text{ V}, CT) = \left((40 + (36 \times VIN)) \times \frac{CT}{1000} \right) + \left((10.7 \times VIN) + 85 \right)$$

$$tPG, ON (VIN < 0.95 \text{ V}, CT) = \left((80 + (36 \times VIN)) \times \frac{CT}{1000} \right) + \left((10.7 \times VIN) + 155 \right)$$

$$(4)$$

where

- t_{PG,ON} is the PG Turn-On time (in μs)
- V_{IN} is the input voltage (in V)
- C_T is the capacitance value on the CT pin (in pF)

 (5)

8.3.4 Quick Output Discharge (QOD)

The TPS22971 includes a QOD feature. When the switch is disabled, a discharge resistor is connected between VOUT and GND. This resistor has a typical value of 150 Ω and prevents the output from floating while the switch is disabled. The QOD pull-down resistance can vary with input voltage and temperature, see Figure 4.

8.4 Device Functional Modes

Table 1 lists the functional modes for the TPS22971.

Table 1. Function Table

TPS22971									
ON-Pin	ON-Pin V _{IN} to V _{OUT} V _{OUT} to GND PG to GND								
Below V _{IL}	OFF	ON	ON						
Above V _{IH}	ON	OFF	OFF						

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Thermal Consideration

It is recommended to limit the junction temperature (T_J) to below 125°C. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use Equation 6 as a guideline:

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{\theta_{JA}}$$

where

- P_{D(max)} is maximum allowable power dissipation
- T_{J(max)} is maximum allowable junction temperature
- T_A is ambient temperature of the device
- Θ_{JA} is junction to air thermal impedance. See the *Thermal Information* section. This parameter is highly dependent upon board layout

9.1.2 PG Pull Up Resistor

The PG output is an open drain signal which connects to a voltage source through a pull up resistor R_{PU}. The PG signal can be used to drive the enable pins of downstream devices, EN. PG is active high, and its voltage is given by Equation 7.

$$V_{PG} = V_{OUT} - (I_{PG,LK} + I_{EN,LK}) \times R_{PU}$$

where

- V_{OUT} is the voltage where PG is tied to
- I_{PG LK} is the leakage current into PG pin
- I_{EN.LK} is the leakage current into the EN pin driven by PG
- R_{PU} is the pull up resistance

 V_{PG} needs to be higher than $V_{IH,MIN}$ of the EN pin to be treated as logic high. The maximum R_{PU} is determined by Equation 8.

$$R_{PU,MAX} = \frac{V_{OUT} - V_{IH,MIN}}{I_{PG,LK} + I_{EN,LK}}$$
(8)

When PG is disabled, with 1 mA current into PG pin (IPG = 1 mA), $V_{PG.OL}$ is less than 0.2 V and treated as logic low as long as $V_{IL,MAX}$ of the EN pin is greater than 0.2 V. The minimum R_{PU} is determined by Equation 9.

$$R_{PU,MIN} = \frac{V_{OUT}}{I_{PG} + I_{EN,LK}}$$
(9)

 R_{PU} can be chosen within the range defined by $R_{PU,MIN}$ and $R_{PU,MAX}$. $R_{PU} = 10 \text{ k}\Omega$ is used for characterization.

9.1.3 Power Sequencing

The TPS22971 has an integrated power good indicator which can be used for power sequencing. As shown in Figure 26, the switch to the second load is controlled by the PG signal from the first switch. This ensures that the power to load 2 is only enabled after the same power to load 1 is enabled after the first switch has turned on.

9.2 Typical Application

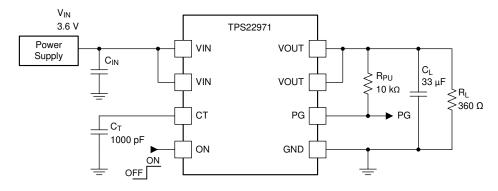

Figure 27. Typical Application

9.2.1 Design Requirements

For this design example, below, use the input parameters shown in Table 2.

 DESIGN PARAMETER
 VALUE

 V_{IN}
 3.6 V

 I_{LOAD}
 10 mA

 Load capacitance (C_L)
 33 μF

 Maximum voltage drop
 1%

 Maximum inrush current
 630 mA

Table 2. Design Parameters

9.2.2 Detailed Design Procedure

9.2.2.1 Maximum Voltage Drop and On-Resistance

At 3.6-V input voltage, with a maximum voltage drop tolerance of 1%, the TPS22971 has a typical R_{ON} of 6.7 $m\Omega$. The rail is supplying 10 mA of current; the voltage drop for a rail is calculated based on Equation 10.

$$V_{DROP} = R_{ON} \times I_{LOAD} \tag{10}$$

$$V_{DROP} = 0.067 \,\mathrm{mV} \tag{11}$$

The maximum voltage drop is 1% which is 36 mV. The voltage drop caused by the load current across the on resistance is 0.067 mV.

9.2.2.2 Managing Inrush Current

When the switch is enabled, the output capacitors must be charged up from 0 V to V_{IN} . This charge arrives in the form of inrush current. Given a load capacitance (C_L) of 33 μ F, an input voltage (V_{IN}) of 3.6V and a maximum inrush (I_{INRUSH}) of 630 mA, use Equation 12 and Equation 13 to solve for Slew Rate (SR).

$$SR = \frac{I_{INRUSH}}{C_L}$$
 (12)

$$SR = 0.0191 \, \text{V} / \mu \text{s}$$
 (13)

Now that the desired slew rate has been calculated, use SR and V_{IN} in in Equation 14 to calculate a CT capacitance value.

$$CT (VIN, SR) = 1007 pF$$
(14)

A capacitance value of 1007pF is a non-standard value therefore a 1000 pF CT capacitance is used moving forward.

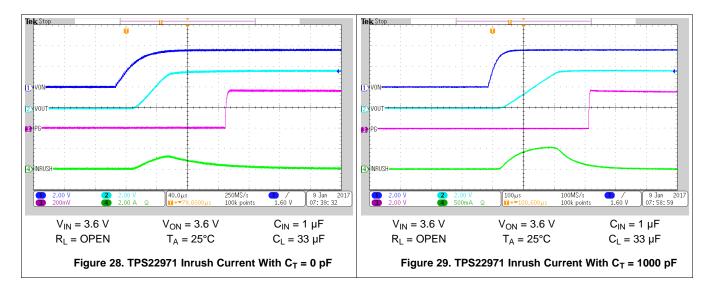

The calculated CT value can be used with Equation 2 and Equation 4 to determine t_{ON} and $t_{PG,ON}$, respectively as shown in Equation 15 and Equation 16.

$$t_{ON} (VIN, CT) = 182.8 \,\mu s$$
 (15)

$$t_{PG, ON} (VIN, CT) = 293.1 \mu s$$
 (16)

9.2.3 Application Curves

10 Power Supply Recommendations

The device is designed to operate from a VIN range of 0.65 V to 3.6 V. The V_{IN} power supply must be well regulated and placed as close to the device terminal as possible. The power supply must be able to withstand all transient load current steps. In most situations, using an input capacitance of 1 μ F is sufficient to prevent the supply voltage from dipping when the switch is turned on. In cases where the power supply is slow to respond to a large transient current or large load current step, additional bulk capacitance may be required on the input.

The requirements for larger input capacitance can be mitigated by adding additional capacitance to the CT pin. This causes the load switch to turn on more slowly. Not only does this reduce transient inrush current, but it also gives the power supply more time to respond to the load current step.

11 Layout

11.1 Layout Guidelines

All traces must be as short as possible for best performance. Using wide traces for V_{IN} , V_{OUT} , and GND helps minimize the parasitic electrical effects along with minimizing the thermal impedance. The CT trace must be as short as possible to reduce parasitic capacitance.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

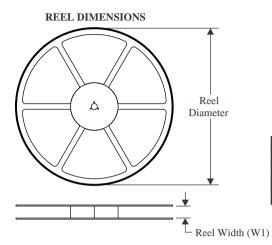

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

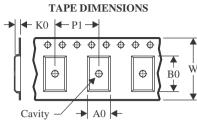

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

PACKAGE MATERIALS INFORMATION

TAPE AND REEL INFORMATION

A0	Dimension designed to accommodate the component width
В0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

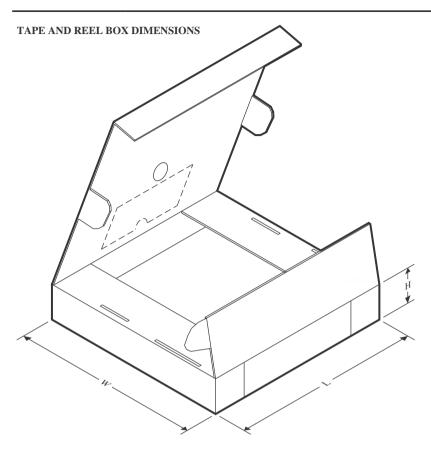

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

DIE SIZE BALL GRID ARRAY

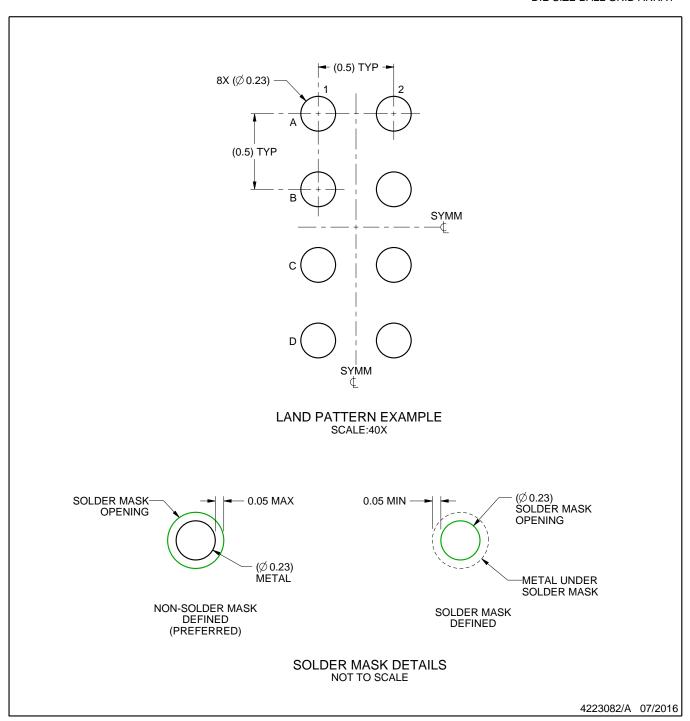

NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.

DIE SIZE BALL GRID ARRAY

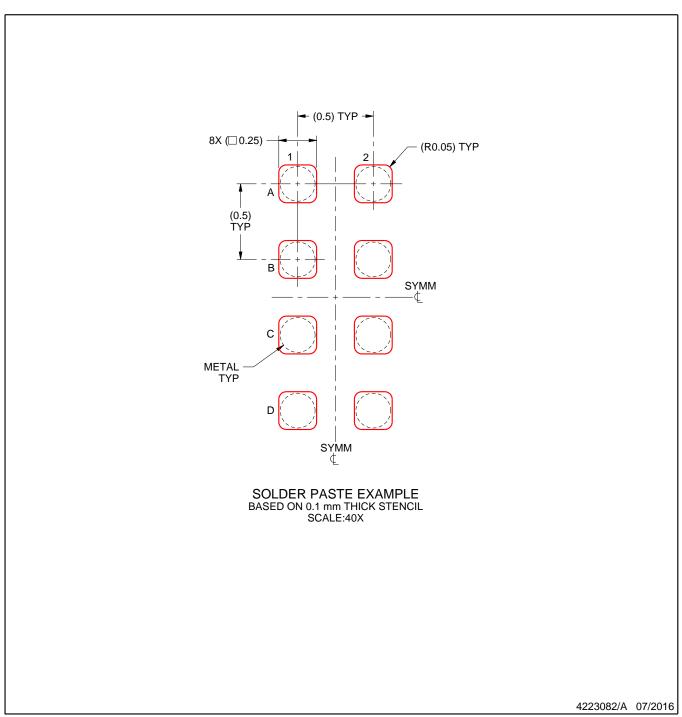

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. For more information, see Texas Instruments literature number SNVA009 (www.ti.com/lit/snva009).

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.
