

450mA 23W Constant Current Buck LED Driver Micro-Module

Check for Samples: [TPS92551](#), [TPS92551EVM](#)

FEATURES

- Integrated All Power Components Including the Power Inductor
- Wide Input Voltage Range : 4.5V - 60V
- Constant Switching Frequency at 800kHz
- High Contrast Ratio (Minimum Dimming Current Pulse width < 16µs)
- Drives up to 16 LEDs in series at 60V input
- ±3.5% Typical LED Current Accuracy
- LED Current Adjustable from 300mA to 450mA
- Up to 95% Efficiency
- TPS92551 Modules can be Connected in Parallel for Higher Current Operation
- Input Under-Voltage Lock-Out (UVLO)
- Compatible with Ceramic and Low ESR Capacitors
- Low Electro Magnetic Interference (EMI) Complies with EN55015 Standard ⁽¹⁾
- LED Open and Short Circuit Protections
- Thermal Shutdown and RoHS Compliant
- -40°C to +125°C Junction Temperature Range

APPLICATIONS

- General Lighting, Desk Lamps
 - Cabinet Lamps
 - Decorative Lamps
 - Street Lamps
- Architecture Lighting, Recess Lights
 - Spot Lights
 - Underwater Lights

PACKAGE HIGHLIGHTS

- 7-Lead Easy-to-Use Package (Similar to TO-263)
- Single Exposed Die Attach Pad for Enhanced Thermal Performance
- 10.2 x 13.8 x 4.6 mm Package

(1) EN55015, refer to [Figure 35](#) and [Figure 36](#)

DESCRIPTION

The TPS92551 Constant Current Buck LED Driver Micro-Module drives maximum 450mA LED current up to 16 LEDs in a single string (maximum 23W). It integrates all the power components including the power inductor. The TPS92551 provides a full turn-key, highly efficient solution for wide range of single string LED lighting applications with up to 95% power efficiency. It accepts an input voltage ranging from 4.5V to 60V and delivers a 350mA LED current as default. The LED current is adjustable from 300mA to 450mA by charging a single external resistor.

The module operates at constant switching frequency (800kHz) with low Electro Magnetic Interference(EMI) complying with EN55015 standard. The module has fast control loop to realize fine LED current pulse yielding 256-step PWM dimming resolution at 240Hz for general lighting. Protection features include thermal shutdown, input under-voltage lockout, LED open-circuit and short-circuit protections. The TPS92551 Micro-Module is available in 7-pin PFM power package.

PIN DESCRIPTIONS

Pin Number	Name	Description	Function
1, 2	LED+	Anode of LED string	Supply input and rail connection to the anode of the LED string.
3	DIM	Dimming signal input	Dimming control signal input. Open to enable or apply logic level PWM signal to control the brightness of the LED string.
4	GND	Ground	Reference point for all stated voltages. Connect to the exposed pad of the package externally.
5	VREF	Voltage reference	Internal voltage reference output.
6	IADJ	LED current adjustment	Fine tuning of the LED current by connecting a resistor between this pin and ground. Connect this pin to ground for factory preset current.
7	LED-	Cathode of LED string	The current return pin of the LED string, connect to the cathode of the LED string.
EP	Exposed Pad	Exposed thermal pad	Used to dissipate heat from the package during operation. Must connect to GND directly.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

	VALUE / UNITS
LED+, LED– to GND	-0.3V to 67V
DIM to GND	-0.3V to 6V
IADJ, VREF to GND	-0.3V to 5V
ESD Susceptibility ⁽²⁾	±2 kV (All Pins Except Pin 6)
Power Dissipation	Internally Limited
Junction Temperature	150°C
Storage Temperature Range	0°C to 150°C
Peak Reflow Case Temperature (30 sec)	245°C

(1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is intended to be functional. For ensured specifications and test conditions, see the Electrical Characteristics.

(2) The human body model is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin. The Pin 6 (IADJ pin) pass ± 1kV. Test method is per JESD22-A114S.

RECOMMENDED OPERATING CONDITIONS ⁽¹⁾

	VALUE / UNITS
LED+, LED-	4.5V to 60V
DIM	0V to 5.5V
IADJ	0V to 0.2V
Junction Temperature (T _J)	-40°C to 125°C

(1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is intended to be functional. For ensured specifications and test conditions, see the Electrical Characteristics.

ELECTRICAL CHARACTERISTICS

Limits in standard type are for $T_J = 25^\circ\text{C}$ unless otherwise stated; limits in **boldface** type apply over the operating junction temperature range T_J of -40°C to 125°C . Minimum and maximum limits are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 48\text{ V}$, $I_{LED} = 350\text{mA}$. V_{IN} is the voltage applied across LED+ and GND. I_{IN} is the input current flowing into the LED+ node. I_{LED} is a LED current flowing into the LED- pin. V_{LED} is the voltage applied across LED+ and LED-. V_{DIM} is the voltage applied across the DIM pin to ground. Resistor R_{IADJ} connect from IADJ pin to ground. Resistor R_{VREF} connect from VREF pin to ground.

BLOCK DIAGRAM

OPERATION DESCRIPTION

The TPS92551 is a high power floating buck LED driver with wide input voltage range. It requires no external current sensing elements and loop compensation network. The integrated power switch enables high output power up to 23W with 450mA LED current.

High speed dimming control input allows precision and high resolution brightness control for applications which require fine brightness adjustment.

APPLICATION INFORMATION

SETTING THE LED CURRENT

The TPS92551 requires no external current sensing resistor for LED current regulation. The average LED current of the TPS92551 is adjustable from 300mA to 450mA by varying the resistance of the resistor according to the following equation and table.

For $R_{VREF} = \text{open}$ and $R_{IADJ} \leq 499\Omega$

$$I_{LED} = \frac{1050}{3k + R_{IADJ}} \quad (1)$$

For $R_{IADJ} = 0$ and $R_{VREF} \geq 10.5k\Omega$

$$I_{LED} = \frac{1050}{3k / R_{VREF}} \quad (2)$$

Table 1. Example for I_{LED} Setting

$R_{IADJ}(\Omega)$	$R_{VREF}(\Omega)$	$I_{LED}(mA)$
499	OPEN	300
SHORT	OPEN	350
SHORT	10.5k	450

Figure 32. TPS92551 Application Schematic for I_{LED} Setting

Minimum Switch On-Time

The on-time of the internal switch should be no shorter than 400ns. The number of LED (typical forward voltage at 3.2V) to input voltage is constrained by that as shown in the following table.

No. of LED	Max. $V_{IN}(V)$
1	10
2	20
3	30
4	40
5	50
6 – 16	60

Peak Switch Current Limit

The TPS92551 features an integrated switch current limiting mechanism to prevent the LEDs from being overdriven. The switch current limiter is triggered when the switch current is three times exceeding the current level set by resistor. Once the current limiter is triggered, the internal power switch turn OFF for $3.6\mu\text{s}$ to discharge the inductor until inductor current reduces back to normal level. The current limiting feature is exceptionally important to avoid permanent damage of the TPS92551 application circuit due to short circuit of LED string.

PWM Dimming Control

The DIM pin of the TPS92551 is an input with internal pull-up that accepts logic signals for average LED current control. Applying a logic high (above 1.3V) signal to the DIM pin or leaving the DIM pin open will enable the device. Applying a logic low signal (below 0.7V) to the DIM pin will disable the switching activity of the device but maintain operation of the VCC regulator active. The TPS92551 operation of high speed dimming and very fine dimming control as shown in [Figure 33](#).

Figure 33. Shortened Current Slew up Time of the TPS92551

To ensure normal operation of the TPS92551, it is recommended to set the dimming frequency not higher than 1/10 of the switching frequency. The dim pulse on time is tested down to $16\mu\text{s}$. In applications that require high dimming contrast ratio, low dimming frequency should be used.

Parallel Operation

When a load current higher than 450mA is required by the application, TPS92551 can be used in parallel to deliver higher current. With common VINs and GNDs, the TPS92551 will operate as independent asynchronous current sinks driving the same LED load. The total DC current of the modules will be additive; however, low frequency sub-harmonic current ripple may be present and its frequency and magnitude will depend upon the phase relationship between the internal clocks as there is no provision for synchronizing driver clocks. It is suggested to have minimum $2.2\mu\text{F}$ C_{OUT} located close to the module to filter out the current ripple, and the resultant LED current will become DC. Current sharing modules should have a local C_{IN} capacitor of minimum $2.2\mu\text{F}$ located as close to V_{IN} and GND as possible. Refer to [Figure 33](#) for the TPS92551 parallel operation circuit schematic. Refer to [Figure 35](#) for the TPS92551 parallel operation results I_{LED} vs V_{IN} .

Figure 34. Parallel Operation Circuit Schematic for $I_{LED} = 900\text{mA}$ Figure 35. Parallel Operation Results for $I_{LED} = 900\text{mA}$, I_{LED} vs V_{IN}

PC Board Layout Considerations

The overall performance of the LED driver is highly depends on the PCB layout. Poor board layout can disrupt the performance of the TPS92551 and surrounding circuitry by contributing to EMI, ground bounce and resistive voltage drop in the traces. These can send erroneous signals to the LED driver resulting in poor regulation and stability. Good layout can be implemented by following a few simple design rules.

1. Place C_{IN} as close as possible to the V_{IN} pin and GND exposed pad (EP).
2. Place C_{OUT} (optional for reduction of LED current ripple and EMI compliance) as close as possible to the V_{LED+} pin and V_{LED-} pin.
3. The exposed pad (EP) must connect to the GND pin directly.

EMI Design Considerations

From an EMI reduction standpoint, it is imperative to minimize the di/dt current paths (refer to Figure 36). Therefore, it is essential to connect an $2.2\mu\text{F}$ capacitor (C_{OUT}) across the V_{LED+} pin and V_{LED-} pin. This will minimize the ripple current so that it can reduce radiated EMI (refer to Figure 37 and Figure 38).

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

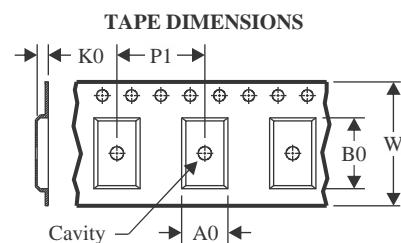

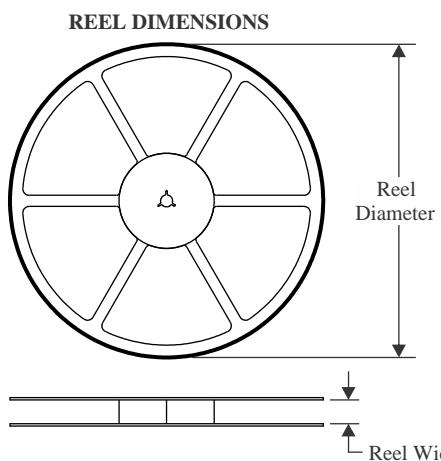

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

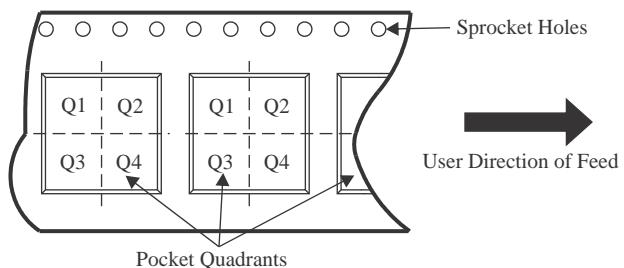

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a " ~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
