

TPSM82A823x, TPSM82A824x 3A and 4A, High-Efficiency, Step-Down Converter MicroSiP™ Power Modules With Integrated Inductor

1 Features

- High efficiency
 - > 92% at $V_{IN} = 3.3V$ and $V_{OUT} = 1.2V$
 - > 97% at $V_{IN} = 5V$ and $V_{OUT} = 3.3V$
- 2.5V to 5.5V input voltage range
- 0.6V to V_{IN} adjustable output voltage
- 26 μA operating quiescent current at $V_{IN} = 5V$ (non-switching)
- Forced-PWM (pulse-width modulation) (TPSM82A823A, TPSM82A824A) and PSM (automatic power save mode) versions
- 100% duty cycle enables low-dropout operation ($V_{IN} - V_{OUT}$ minimum drop)
- Output discharge
- Power-good output
- Integrated soft start-up with prebiased output start-up capability
- Overtemperature and hiccup short-circuit protection with automatic recovery
- 2.2MHz fixed switching frequency
- Peak current-mode control
- Pin and footprint-compatible with [TPSM82821](#), [TPSM82822](#), and [TPSM82823](#)
- 2.5mm × 2mm design size, 10-pin μSiP with 1.2mm maximum height

2 Applications

- [Optical modules](#)
- [Machine vision](#)
- [Industrial PCs](#)
- [PLCs](#)
- [Wired networking](#)
- Point-of load (POL) power conversion
- FPGA and DSP core supply
- SSD and storage systems

Application Example TPSM82A823x

3 Description

The TPSM82A823x and TPSM82A824x are 3A and 4A synchronous step-down converter modules in MicroSiP™ package with integrated inductor for compact design. Peak efficiency occurs between 1A and 2A output current.

The integrated inductor simplifies the design, reduces external components, and saves PCB area. The TPSM82A823A and TPSM82A824A operate in PWM; the TPSM82A823 and TPSM82A824 support automatic PSM at light loads. All variants operate at 2.2MHz fixed frequency with peak current-mode control for stable regulation across load and input voltage variations.

EN and PG pins enable flexible sequencing. Integrated soft start-up reduces the inrush current required from the input supply. Overtemperature and overcurrent short-circuit protection deliver a robust and reliable design.

5 Pin Configuration and Functions

Figure 5-1. SIH Package, μ SiP 10-Pin (Top View)

Table 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
VIN	1, 2	PWR	Input voltage pin
EN	3	I	Device enable pin. Drive this pin high to turn the device on. Drive this pin low to turn off the device. Do not leave floating.
PG	4	O	Power-good open-drain output pin with window comparator. The pullup resistor can be connected to voltages up to 5.5V. If unused, connect to GND or leave open.
VOUT	5, 6, 7	PWR	Output voltage pin
FB	8	I	Feedback pin. Connect this pin to the center of the output voltage resistor divider.
GND	9, 10	PWR	Ground pin

(1) I = input, O = output, PWR = power

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Pin voltage ⁽²⁾	VIN, EN, PG	−0.3	6	V
Pin voltage ⁽²⁾	VOUT	−0.3	VIN + 0.3	V
Pin voltage ⁽²⁾	FB	−0.3	3	V
Operating junction temperature	TJ	−40	125	°C
Storage temperature	Tstg	−55	125	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to the network ground terminal.

6.2 ESD Ratings

			VALUE	UNIT
V(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating junction temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
VIN	Input supply voltage range		2.5		5.5	V
VOUT	Output voltage range		0.6		VIN	V
COUT	Effective output capacitance	VOUT < 1.2V		120		μF
COUT	Effective output capacitance	1.2V ≤ VOUT < 1.8V		45		μF
COUT	Effective output capacitance	VOUT ≥ 1.8V		45		μF
IOUT	Output current range	TPSM82A823x	0		3	A
IPG	Power-Good input current capability		0		1	mA
TJ	Operating junction temperature		−40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPSM82A823x, TPSM82A824x		UNIT
		SIH (JEDEC) ⁽²⁾	SIH (EVM)	
		10 PINS	10 PINS

7 Detailed Description

7.1 Overview

The TPSM82A823x and TPSM82A824x devices are high-efficiency, synchronous step-down converter modules with an integrated inductor. The devices use an adaptive off-time, peak current-mode control scheme. The devices operate at a nominal 2.2MHz switching frequency at moderate to heavy load currents. An off-time control circuit adjusts the low-side MOSFET off time based on the V_{IN}/V_{OUT} ratio, keeping the switching frequency stable across varying input voltage, output voltage, and load current conditions.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Power Save Mode

The TPSM82A823A and TPSM82A824A operate in forced PWM mode where the power save mode is permanently deactivated. The device is designed to maintain a constant switching frequency independent of load current, temperature and within limits also input voltage (see graph f_{SW} versus V_{IN}). Unlike the TPSM82A823A and TPSM82A824A, the TPSM82A823 and TPSM82A824 devices automatically enter power save mode (PSM) at light loads when the inductor current becomes discontinuous. In power save mode, the converter reduces the switching frequency and minimizes current consumption. In power save mode, the output voltage rises slightly above the nominal output voltage. This effect is minimized by increasing the output capacitor or adding a feedforward capacitor.

7.3.2 100% Duty Cycle Low Dropout Operation

All device family members offer low input-to-output voltage difference by entering 100% duty cycle mode. In this mode, the high-side MOSFET switch is constantly turned on and the low-side MOSFET is switched off. The minimum input voltage to maintain output regulation, depending on the load current and output voltage, is calculated as:

$$V_{IN(MIN)} = V_{OUT} + I_{OUT} \times R_{DS(ON)} + R_{DCR} \quad (1)$$

where

- $R_{DS(ON)}$ = High-side FET on-resistance
- R_{DCR} = Inductor ohmic resistance (DCR)

7.3.3 Soft Start

After turning the device on, an internal soft start-up circuitry ramps up the output voltage to the set point within the specified time (see [Section 6.5](#)). This action minimizes inrush current and provides a defined V_{OUT} ramp. Soft start-up circuitry also prevents excessive voltage drops of primary cells and rechargeable batteries with high internal impedance.

The TPSM82A823x and TPSM82A824x family supports start-up into a prebiased output capacitor. The converter begins switching from the applied prebias voltage and ramps the output voltage to the nominal set point.

7.3.4 Switch Current Limit and Short-Circuit Protection (HICCUP)

The switch current limit prevents the device from high inductor current and from drawing excessive current from the battery or input voltage rail. Excessive current can occur with a shorted or saturated inductor or an overload or shorted output circuit condition. If the inductor current reaches the threshold I_{LIM} , the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current with an adaptive off time.

When this switch current limit is triggered 32 times, the device reduces the current limit for an additional 32 cycles and then stops switching to protect the output. The device then automatically starts a new start-up ramp after a typical delay time of 150µs has passed. This behavior is called hiccup-mode short-circuit protection. The device repeats this mode until the high load condition disappears. HICCUP protection is also active during the start-up.

7.3.5 Undervoltage Lockout

To avoid misoperation of the device at low input voltages, an undervoltage lockout (UVLO) is implemented, which shuts down the device at voltages lower than V_{UVLO} with a hysteresis of 100mV.

7.3.6 Thermal Shutdown

The device goes into thermal shutdown and stops switching when the junction temperature exceeds $T_{J(SD)}$. When the device temperature falls below the threshold by $T_{J(HYS)}$, the device returns to normal operation automatically.

7.4 Device Functional Modes

7.4.1 Activate and Deactivate

The device is activated by driving the EN input high. Accordingly, a logic low deactivates the device and the device enters the shutdown mode with a supply current reduced to $I_{SD(VIN)}$. If the device is active, the internal power stage starts switching and regulates the output voltage to the set point voltage. The EN input must be terminated and must not be left floating.

7.4.2 Power Good

The TPSM82A823x and TPSM82A824x family has a built-in power-good (PG) feature to indicate whether the output voltage has reached the target and the device is ready. The PG signal can be used for start-up sequencing of multiple rails. The PG pin is an open-drain output that requires a pullup resistor to any voltage up

to the recommended input voltage level. PG is low when the device is turned off due to EN, UVLO (undervoltage lockout), or thermal shutdown. VIN must remain present for the PG pin to stay low.

If the power-good output is not used, tie the PG pin to GND or leave the pin open.

Table 7-1. Power-Good indicator Functional Table

LOGIC SIGNALS				PG STATUS
V _{IN}	EN	THERMAL SHUTDOWN	V _{OUT}	
V _{IN} > UVLO _x	HIGH	NO	V _{OUT} on target	High Impedance
			V _{OUT} < target	LOW
	LOW	x	x	LOW
	x	YES	x	LOW
1.8V < V _{IN} < UVLO	x	x	x	LOW
V _{IN} < 1.8V	x	x	x	Not specified ⁽¹⁾

(1) The 1.8V threshold represents the minimum V_{IN} level at which the PG pin output transistor maintains a defined low-level output. Below this level, PG pin behavior is not specified.

7.4.3 Output Discharge

The purpose of the output discharge function is to ensure a defined down-ramp of the output voltage when the device is turned off and to keep the output voltage close to 0V. The output discharge is active when the EN pin is set to a logic low and during thermal shutdown. The discharge is not active in UVLO.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

8.2 Typical Application

Figure 8-1. TPSM82A823x and TPSM82A824x Typical Application Circuit (With TPSM82A823x as Example)

8.2.1 Design Requirements

For this design example, use the parameters listed in Table 8-1 as the input parameters

Table 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.5V to 5.5V
Output voltage	1.2V
Maximum output current	3.0A

Table 8-2 lists the components used for the example.

Table 8-2. List of Components

REFERENCE	DESCRIPTION	MANUFACTURER ⁽¹⁾
C _{IN}	22μF, Ceramic Capacitor, 10V, X7R, size 0805, GRM21BZ71A226KE15L	Murata
C _{OUT}	3 × 22μF, Ceramic Capacitor, 10V, X7R, size 0805, GRM21BZ71A226KE15L	Murata
R1, R2	Chip resistor, 1%, size 0603	Std.
C _{FF}	Optional, 120pF (R2 = 100kΩ) if needed for transient improvement or for PSM ripple reduction	Std.

(1) See the [Third-Party Products Disclaimer](#).

8.2.2 Detailed Design Procedure

8.2.2.1 Setting the Output Voltage

Select resistors R1 and R2 to set the output voltage within a range of 0.6V to V_{IN} according to [Equation 2](#). To keep the feedback (FB) net robust from noise, set R2 equal to or lower than 100kΩ to have at least 6μA of current in the voltage divider. Lower values of FB resistors achieve better noise immunity, and lower light load efficiency, as explained in the [Design Considerations for a Resistive Feedback Divider in a DC/DC Converter analog design journal](#).

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) = R2 \times \left(\frac{V_{OUT}}{0.6V} - 1 \right) \quad (2)$$

8.2.2.2 Feedforward Capacitor

A feedforward capacitor (C_{FF}) in parallel with R1 improves transient response. In TPSM82A823, a feedforward capacitor also improves the PSM ripple. Use the following equation to calculate the C_{FF} value. For the recommended 100kΩ value for R2, the calculated value for C_{FF} is 120pF.

$$C_{FF} = \frac{12\mu s}{R2} \quad (3)$$

8.2.2.3 Input and Output Capacitor Selection

For the best output and input voltage filtering, ceramic capacitors are required. The input capacitor minimizes input voltage ripple, suppresses input voltage spikes, and provides a stable system rail for the device. The capacitor value must be large enough that the device does not experience input voltage drop below the undervoltage lockout level. A 10μF (5μF effective) input capacitor is a good calculation starting point for 1.5A inductor ripple current and 3.3V input voltage out of 200mΩ source impedance ($V_{OUT} = 1.2V$). The input ripple is approximately 50mV under these conditions. The output capacitor value can range from 44μF up to 100μF. The recommended typical output capacitor value is $2 \times 22\mu F$ or $3 \times 22\mu F$ with an X5R or X7R dielectric. With the devices peak current mode control scheme, output capacitor values over 100μF for ripple-sensitive applications are possible but the designer must perform loop stability analysis (Bode plot). A feedforward capacitor improves transient performance.

Ceramic capacitors have a DC-Bias effect, which has a strong influence on the final effective capacitance. Select the right capacitor carefully in combination with considering the package size and voltage rating. Verify that the effective input capacitance is at least 5μF and the effective output capacitance is at least 28μF.

8.3 Power Supply Recommendations

The devices are designed to operate from an input supply voltage range between 2.5V and 5.5V. Use the following equation to calculate the average input current of the TPSM82A823x and TPSM82A824x:

$$I_{IN} = \frac{1}{\eta} \times \frac{V_{OUT} \times I_{OUT}}{V_{IN}} \quad (4)$$

Verify that the power supply has a sufficient current rating for the application.

8.4 Layout

8.4.1 Layout Guidelines

A proper layout is critical for the operation of any switched mode power supply, especially at high switching frequencies. Therefore, the PCB layout of the TPSM82A823x and TPSM82A824x demands careful attention to make sure of best performance. A poor layout can lead to issues like bad line and load regulation, instability, increased EMI radiation, and noise sensitivity. See also the [Five Steps to a Great PCB Layout for a Step-Down Converter analog design journal](#) for a detailed discussion of general best practices. Specific recommendations for the device are listed below.

- The input capacitor must be placed as close as possible to the VIN and GND pins of the device. This placement is the most critical component placement. Route the input capacitor directly to the VIN and GND pins avoiding vias.
- Place the output capacitor ground close to the VOUT and GND pins and route directly avoiding vias.
- Place the FB resistors, R1 and R2, and the feedforward capacitor C_{FF} close to the FB pin to minimize noise pickup.
- The recommended layout is implemented on the EVM and shown in the [TPSM8282xEVM-080 and TPSM8282xAEVM-127 Evaluation Modules user's guide](#).
- The recommended land pattern for the TPSM82A823x and TPSM82A824x is shown at the end of this datasheet. For best manufacturing results, make sure to create the pads as solder mask defined (SMD), when some pins (such as VIN, VOUT, and GND) are connected to large copper planes. Using SMD pads keeps each pad the same size and avoids solder pulling the device during reflow.

8.4.2 Layout Example

Figure 8-56. TPSM82A823x PCB Layout for the Adjustable Devices (BOM as per List of Components With 2 × 22μF for C2)

This example is preliminary to show the principle. The final layout includes additional 2 × 22μF added to C2.

8.4.2.1 Thermal Consideration

The TPSM82A823x module temperature must be kept below the maximum rating of 125°C. The following are three basic approaches for enhancing thermal performance:

- Improve the power dissipation capability of the PCB design.
- Improve the thermal coupling of the component to the PCB.
- Introduce airflow into the system.

To estimate the approximate module temperature of the TPSM82A823x, apply the typical efficiency stated in this datasheet to the desired application condition to compute the power dissipation of the module. Then, calculate the module temperature rise by multiplying the power dissipation by the thermal resistance. Using this method to compute the maximum device temperature, the Safe Operating Area (SOA) graphs demonstrate the required derating in maximum output current at high ambient temperatures. For more details on how to use the thermal parameters in real applications, see the application notes: [Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs](#) and [Semiconductor and IC Package Thermal Metrics](#).

9 Device and Documentation Support

9.1 Device Support

9.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

9.1.2 Development Support

9.1.2.1 Models and Simulators

PSpice® for TI is a design and simulation environment that helps evaluate performance of analog circuits. Create subsystem designs and prototype designs before committing to layout and fabrication, reducing development cost and time to market.

9.2 Documentation Support

9.2.1 Related Documentation

For related documentation, see the following:

- Texas Instruments, [TPSM82822EVM-080 Evaluation Module EVM user's guide](#)
- Texas Instruments, [Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs](#)

9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.5 Trademarks

MicroSiP™ and TI E2E™ are trademarks of Texas Instruments.

PSpice® is a registered trademark of Cadence Design Systems, Inc..

All trademarks are the property of their respective owners.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

10 Revision History

DATE	REVISION	NOTES
July 2026	*	Initial Release

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPSM82A823ASIHR	Active	Production	uSiP (SIH) 10	3000 LARGE T&R	Yes	Call TI	Level-2-260C-1 YEAR	-	FC A
TPSM82A824ASIHR	Active	Production	uSiP (SIH) 10	3000 LARGE T&R	Yes	Call TI	Level-2-260C-1 YEAR	-	FC C
TPSM82A824SIHR	Active	Production	uSiP (SIH) 10	3000 LARGE T&R	Yes	Call TI	Level-2-260C-1 YEAR	-	FC D

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
