

UCC2822x Interleaved Dual PWM Controller With Programmable Max Duty Cycle

1 Features

- 2-MHz High-Frequency Oscillator With 1-MHz Operation Per Channel
- Matched Internal Slope Compensation Circuits
- Programmable Maximum Duty Cycle Clamp 60% to 90% Per Channel
- Peak Current Mode Control With Cycle-by-Cycle Current Limit
- Current Sense Discharge Transistor for Improved Noise Immunity
- Accurate Line Undervoltage and Overvoltage Sense With Programmable Hysteresis
- Opto-Coupler Interface
- 110-V Internal Start-Up JFET (UCC28221)
- Operates From 12-V Supply (UCC28220)
- Programmable Soft Start

2 Applications

- High Output Current (50-A to 100-A) Converters
- Maximum Power Density Designs
- High-Efficiency 48-V Input With Low Output Ripple Converters
- High-Power Offline, Telecom, and Datacom Power Supplies

3 Description

The UCC28220 and UCC28221 are a family of BiCMOS interleaved dual channel PWM controllers. Peak current mode control is used to ensure current sharing between the two channels. A precise maximum duty cycle clamp can be set to any value between 60% and 90% duty cycle per channel.

The UCC28220 has an UVLO turnon threshold of 10 V for use in 12-V supplies while UCC28221 has a turnon threshold of 13 V for systems needing wider UVLO hysteresis. Both have 8-V turnoff thresholds.

Additional features include a programmable internal slope compensation with a special circuit which is used to ensure exactly the same slope is added to each channel and a high-voltage 110-V internal JFET for easier start-up for the wider hysteresis UCC28221 version.

The UCC28220 is available in both 16-pin SOIC and low-profile TSSOP packages. The UCC28221 also comes in 16-pin SOIC package and a slightly larger 20-pin TSSOP package to allow for high-voltage pin spacing to meet UL1950 creepage clearance safety requirements.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
UCC28220, UCC28221	SOIC (16)	9.00 mm x 3.90 mm
	TSSOP (16)	5.00 mm x 4.40 mm
UCC28221	TSSOP (20)	6.50 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Typical Application

6 Pin Configuration and Functions

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	SOIC, TSSOP (16)	TSSOP (20)		
CHG	10	13	I	Sets oscillator charge current: A resistor from this pin to GND sets up the charging current of the internal C_T capacitor used in the oscillator. This resistor, in conjunction with the resistor on the DISCHG pin is used to set up the operating frequency and maximum duty cycle. Under normal operation the dc voltage on this pin is 2.5 V.
CS1	4	5	I	Channel 1 current sense input: These 2 pins are the current sense inputs to the device. The signals are internally level shifted by 0.5 V before the signal gets to the PWM comparator. Internally the slope compensation ramp is added to this signal. The linear operating range on this input is 0 to 1.5 V. Also, this pin gets pulled to ground each time its respective output goes low (that is: OUT1 and OUT2).
CS2	6	7	I	Channel 2 current sense input: These 2 pins are the current sense inputs to the device. The signals are internally level shifted by 0.5 V before the signal gets to the PWM comparator. Internally the slope compensation ramp is added to this signal. The linear operating range on this input is 0 to 1.5 V. Also, this pin gets pulled to ground each time its respective output goes low (that is: OUT1 and OUT2).
CTRL	8	9	I	Feedback control input:

Pin Functions (continued)

PIN			I/O	DESCRIPTION
NAME	SOIC, TSSOP (16)	TSSOP (20)		
DISCHG	9	12	I	Sets oscillator discharge current: A resistor from this pin to GND sets up the discharge current of the internal C_T capacitor used in the oscillator. This resistor, in conjunction with the resistor on the CHG pin is used to set up the operating frequency and maximum duty cycle. Under normal operation the dc voltage on this pin is 2.5 V.
GND	11	14	—	Device ground
LINEHYS	2	3	I	Sets line comparator hysteresis: This pin is controlled by both the LINEOV and LINEUV pins. It is used to control the hysteresis values for both the over and under voltage line detectors.
LINEOV	1	2	I	Input for line over voltage comparator: This pin is connected to a comparator and used to monitor the line voltage for an over voltage condition. The typical threshold is 1.26 V.
LINEUV	15	18	I	Input for line under voltage comparator: This pin is connected to a comparator and used to monitor the line voltage for an under voltage condition. The typical threshold is 1.26 V.
N/C	16	1, 10, 11, 19	—	No connection
OUT1	13	16	O	PWM output from channel 1: These output buffers are intended to interface with high current MOSFET drivers. The output drive capability is approximately 33 mA and has an output impedance of 100 Ω . The outputs swing between GND and REF.
OUT2	12	15	O	PWM output from channel 2: These output buffers are intended to interface with high current MOSFET drivers. The output drive capability is approximately 33 mA and has an output impedance of 100 Ω . The outputs swing between GND and REF.
REF	14	17	O	Reference voltage output: REF is a 3.3-V output used primarily as a source for the output buffers and other internal circuits. It is protected from accidental shorts to ground. For improved noise immunity, TI recommends the reference pin be bypassed with a minimum of 0.1 μ F of capacitance to GND.
SLOPE	5	6	I	Sets slope compensation: This pin sets up a current used for the slope compensation ramp. A resistor to ground sets up a current, which is internally divided by 25 and then applied to an internal 10-pF capacitor. Under normal operation the dc voltage on this pin is 2.5 V.
SS	7	8	I	Soft-start input: A capacitor to ground sets up the soft-start time for the open loop soft-start function. The source and sink current from this pin is equal to 3/7th of the oscillator charge current set by the resistor on the CHG pin. The soft start capacitor is held low during UVLO and during a Line OV or UV condition. Once an OV or UV fault occurs, the soft-start capacitor is discharged by a current equal to its charging current. The capacitor does NOT quickly discharge during faults. In this way, the controller has the ability to recover quickly from very short line transients. This pin can also be used as an Enable/Disable function.
VDD	3	4	I	Device supply input: This is used to supply power to the device, monitoring this pin is a the UVLO circuit. This is used to insure glitch-free startup operation. Until VDD reaches its UVLO threshold, it remains in a low power mode, drawing approximately 150 μ A of current and forcing pins, SS, CS1, CS2, OUT1, and OUT2 to logic 0 states. If the VDD falls below 8 V after reaching turnon, it goes back into this low power state. In the case of the UCC28221, the UVLO threshold is 13 V. It is 10 V for the UCC28220. Both versions have a turnoff threshold of 8 V.
VIN	—	20	I	High voltage start-up input: This pin has an internal high voltage JFET used for startup. The drain is connected to VIN, while its' source is connected to VDD. During startup, this JFET delivers 12 mA typically with a minimum of 4 mA to VDD, which in turn, charges up the VDD bypass capacitor. When VDD gets to 13 V, the JFET is turned off.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
High-voltage start-up input, V_{IN}		110	V
Supply voltage, V_{DD}		15	V
Output current (OUT1, OUT2) dc, $I_{OUT(dc)}$		±10	mA
OUT1/ OUT2 capacitive load		200	pF
REF output current, I_{REF}		10	mA
Current sense inputs, CS1, CS2	–1	2	V
Analog inputs (CHG, DISCHG, SLOPE, REF, CNTRL)	–0.3	3.6	V
Analog inputs (SS, LINEOV, LINEUV, LINEHYS)	–0.3	7	V
Power dissipation at $T_A = 25^\circ\text{C}$	PW package	400	mW
	D package	650	
Junction operating temperature, T_J	–55	150	°C
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
V_{IN} High-voltage start-up input	36	76	V
V_{DD} Supply voltage	8.4	14.5	V

7.4 Thermal Information

8 Detailed Description

8.1 Overview

The UCC2822x device is comprised of several housekeeping blocks as well as two slope compensated PWM channels that are interleaved. The circuit is intended to run from an external VDD supply voltage between 8 V and 14 V; however, the UCC28221 has the addition of a high-voltage start-up JFET with control circuitry which can be used for system start-up. Other functions contained in the device are supply UVLO, 3.3-V reference, accurate line OV and UV functions, a high-speed programmable oscillator for both frequency and duty cycle, programmable slope compensation, and programmable soft-start functions.

The UCC2822x is a primary side controller for a two-channel interleaved power converter. The device is compatible with forward or flyback converters as long as a duty cycle clamp between 60% and 90% is required. The active clamp forward and flyback converters as well as the RCD and resonant reset forward converters are therefore compatible with this device. To ensure the two channels share the total converter output current, current mode control with internal slope compensation is used. Slope compensation is user programmable through a dedicated pin and can be set over a 50:1 range, ensuring good small-signal stability over a wide range of applications.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

Pinout for 16 pin option shown. See the 20-pin connection to UCC28221-PW in [Pin Configuration and Functions](#).

8.3 Feature Description

8.3.1 VDD

Because the driver output impedance is high, the energy storage requirement on the VDD capacitor is low. For improved noise immunity, TI recommends that the VDD pin is bypassed with a minimum of 0.1- μ F capacitance to GND. In most typical applications, the bias voltage for the MOSFET drivers is also used as the VDD supply voltage for the chip. It is beneficial to add a low valued resistor between the bulk storage capacitor of the driver and the VDD capacitor for the UCC2822x. By adding a resistor in series with the bias supply with the bias supply, any noise that is present on the bias supply is filtered out before getting to the VDD pin of the controller.

8.3.2 Reference

For improved noise immunity, TI recommends that the reference pin, REF, is bypassed with a minimum of 0.1- μ F capacitance to GND.

8.3.3 Oscillator Operation and Maximum Duty Cycle Setpoint

The oscillator uses an internal capacitor to generate the time base for both PWM channels. The oscillator is programmable over a 200-kHz to 2-MHz frequency range with 20% to 80% maximum duty cycle range. Both the dead time and the frequency of the oscillator are divided by 2 to generate the PWM clock and off-time information for each of the outputs. In this way, a 20% oscillator duty cycle corresponds to a 60% maximum duty cycle at each output, where an 80% oscillator duty cycle yields a 90% duty cycle clamp at each output.

The design equations for the oscillator and maximum duty cycle setpoint are given in [Equation 1](#) through [Equation 4](#).

$$F_{OSC} = 2 \times F_{OUT} \quad (1)$$

$$D_{MAX(osc)} = 1 - 2 \times (1 - D_{MAX(out)}) \quad (2)$$

$$R_{CHG} = K_{OSC} \times \frac{D_{MAX(osc)}}{F_{OSC}} \quad (3)$$

$$R_{DISCHG} = K_{OSC} \times \frac{(1 - D_{MAX(osc)})}{F_{OSC}}$$

where

- $K_{OSC} = 2.04 \times 10^{10}$ (Ω/s)
- F_{OUT} = Switching frequency at the outputs of the chip (Hz)
- $D_{MAX(out)}$ = Maximum duty cycle limit at the outputs of the chip
- $D_{MAX(osc)}$ = Maximum duty cycle of the oscillator for the desired maximum duty cycle at the outputs
- F_{OSC} = Oscillator frequency for desired output frequency (Hz)
- R_{CHG} = External oscillator resistor which sets the charge current (Ω)
- R_{DISCHG} = External oscillator resistor which sets the discharge current (Ω)

8.3.4 Soft Start

A current is forced out of the SS pin, equal to 3/7 of the current set by R_{CHG} , to provide a controlled ramp voltage. The current set by the R_{CHG} resistor is equal to 2.5 V divided by R_{CHG} . This ramp voltage overrides the commanded duty cycle on the CTRL pin, allowing a controlled start-up. Assuming the UCC28221 is biased on the primary side, the soft start must be quite quick to allow the secondary bias to be generated and the secondary side control can then take over. Once the soft-start time interval is complete, a closed-loop soft-start on the secondary side can be executed, such as [Equation 5](#).

$$ISS = \frac{3}{7} \times \frac{2.5}{R_{CHG}}$$

where

- ISS = current which is sourced out of the SS pin during the soft-start time (A)

Feature Description (continued)

8.3.5 Current Sense

The current sense signals CS1 and CS2 are level shifted by 0.5 V and have the slope compensation ramps added to them before being compared to the control voltage at the input of the PMW comparators. The amplitude of the current sense signal at full load must be selected such that it is very close to the maximum control voltage to limit the peak output current during short-circuit operation.

8.3.6 Output Drivers

The UCC2822x is intended to interface with the UCC2732x family of MOSFET drivers. As such, the output drive capability is low, effectively 100 Ω, and the driver output swing between GND and REF.

8.4 Device Functional Modes

8.4.1 Line Overvoltage and Undervoltage

Three pins are provided to turn off the output drivers and reset the soft-start capacitor when the converter input voltage is outside a prescribed range. The undervoltage setpoint and undervoltage hysteresis are accurately set through external resistors. The overvoltage set point is also accurately set through a resistor ratio, but the hysteresis is fixed by the same resistor that set the undervoltage hysteresis.

[Figure 17](#) and [Figure 18](#) show the detailed functional diagram and operation of the undervoltage lockout (UVLO) and overvoltage lockout (OVLO) features. [Equation 6](#) through [Equation 9](#) are for setting the thresholds define in [Figure 18](#).

$$V1 = 1.26 \times \frac{R1}{(R2 + R3)} + 1.26 \tag{6}$$

$$V2 = 1.26 \times \frac{(R1 + Rx)}{Rx}, \text{ where } Rx = R4 \parallel (R2 + R3) \tag{7}$$

$$V4 = 1.26 \times \frac{(R1 + R2 + R3)}{R3} \tag{8}$$

$$V3 = V4 - 1.26 \times \left(\frac{R1}{R4} \right) \tag{9}$$

Device Functional Modes (continued)

Figure 17. Line UVLO and OVLO Functional Diagram

Figure 18. Line UVLO and OVLO Operation

The UVLO hysteresis and the OVLO hysteresis can be calculated as $V2 - V1$ and $V4 - V3$, respectively. By examining the design equations, it becomes apparent that the value of $R4$ sets the amount of hysteresis at both thresholds. By realizing this fact, the designer can then set the value of $R4$ based on the most critical hysteresis specification either at high line or at low line. In most designs the value of $R4$ is determined by the desired amount of hysteresis around the UVLO threshold. As an example, consider a telecom power supply with the following input UVLO and OVLO design specifications:

- $V1 = 32\text{ V}$
- $V2 = 34\text{ V}$
- $V3 = 83\text{ V}$
- $V4 = 84.7\text{ V}$

Then,

- $R1 = 976\text{ k}\Omega$
- $R2 = 24.9\text{ k}\Omega$
- $R3 = 15\text{ k}\Omega$
- $R4 = 604\text{ k}\Omega$

Device Functional Modes (continued)

8.4.2 Start-Up JFET Section

A 110-V start-up JFET is included to start the device from a wide range (36 V to 75 V) telecom input source. When VDD is lower than 13 V, the JFET is on, behaving as a current source charging the bias capacitors on VDD and supplying current to the device. In this way, the VDD bypass capacitors are charged to 13 V where the outputs start switching and the JFET is turned off. To enable a constant bias supply to the device during a pulse skipping condition, the JFET is turned back on whenever VDD decreases below 10 V and the outputs are not switching. Thus, the current from the JFET can overcome the internal bias currents, as long as the device is not actively switching the output drivers. See Figure 19 for a representation of the JFET and VDD operation. The UCC28220 does not contain an internal JFET and has a start-up threshold of 10 V which makes it capable of directly operating off a 12-V dc bus.

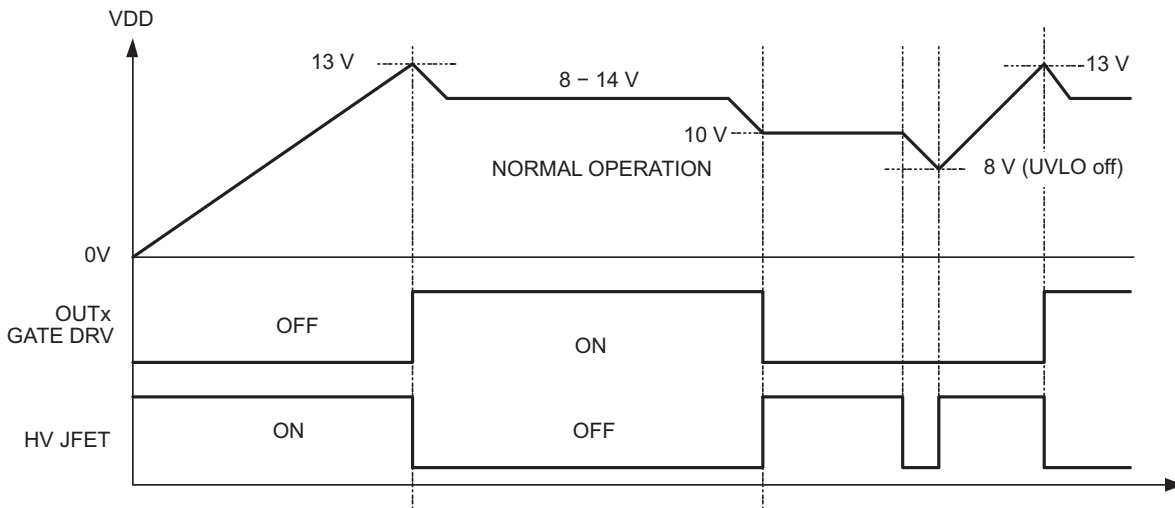

Figure 19. JFET Device Operation With VDD Voltage

8.4.3 Slope Compensation

The slope compensation circuit in the UCC2822x operates on a cycle-by-cycle basis. The two channels have separate slope compensation circuits. These are fabricated in precisely the same way so as current sharing is unaffected by the slope compensation circuit. For each channel, an internal capacitor is reset whenever that channel's output is off. At the beginning of the PWM cycle, a current is mirrored off the SLOPE pin into the capacitor, developing an independent ramp. Because the two channel's ramps start when the channel's output changes from a low to high state, the ramps are thus interleaved. These internal ramps are added to the voltages on the current sense pins, CS1 and CS2, and form an input to the PWM comparators.

Device Functional Modes (continued)

**Figure 20. Slope Compensation Detail for Chanel 1.
Duplicate Matched Circuitry Exists for Channel 2.**

To ensure stability, the slope compensation circuit must add between 1/5 and 1 times the inductor downslope to each of the current sense signals before being applied to the input of the PWM comparator.

Typical Application (continued)

9.2.1 Design Requirements

Table 1 lists the design parameters for the interleaved boost application circuit.

Table 1. Design Parameters

PARAMETER	MIN	TYP	MAX	UNIT
V _{IN}	85	110 or 230	265	V RMS
V _{OUT}	374	390	425	V
V _{RIPPLE}	—	—	30	V
Current THD at 350 W	—	—	10%	
PF at 350 W	0.95	—	—	
Full load efficiency	90%	—	—	
f _S	—	100	—	kHz
Holdup requirements, t _{HOLD}	—	—	20	ms
f _{LINE}	47	50	60	Hz

9.2.2 Detailed Design Procedure

9.2.2.1 Overvoltage Protection and Undervoltage Lockout

The OVP function and undervoltage lockout (UVLO) were handled by the UCC28220. It is a simple comparator that monitors the boost voltage. The OVP for this design was set to 425 V and UVLO was set to 108 V. The preregulator does not start switching until V_{OUT} reaches 108 V.

9.2.2.2 Peak Current Limit

Peak current limit is set by the maximum control voltage (V_C) at the input of the UCC28220's PWM comparator with Equation 10 through Equation 12. Where *a* is the current sense transformer turns ratio of T1 and T2. The peak current limit trip point was set for 130% of the nominal peak current to protect the boost FETs.

$$a = \frac{N_P}{N_S} = \frac{V_P}{V_S} = \frac{I_S}{I_P} = \frac{1}{50} \quad (10)$$

$$I_{PEAK} = \left(\frac{P_{OUT} \times \sqrt{2}}{2 \times V_{in(min)} \times \eta} + \frac{\Delta IL1}{2} \right) \times 1.3 \quad (11)$$

V_C = 1.8, V_{CTRL} was set to a maximum of 3 V to protect the UCC28220 CTRL pin.

$$R_{SENSE} = \frac{V_C - 0.5 \text{ V}}{I_{PEAK} \times a} \quad (12)$$

Equation 12 considers slope compensation that is added later.

The peak current of the FET during power up is 2 times I_{PEAK} under normal operation as calculated with Equation 13. This is due to the excessive slope compensation that is required for stability.

$$I_{PEAK(startup)} = 2 \times I_{PEAK} \quad (13)$$

9.2.2.3 Current Sense Transformer Reset Resistor (T1 and T2)

$$R_{RESET} = \frac{V_C - 0.5 \text{ V}}{I_{PEAK} \times (1 - D_{MIN(LL)}) \times a} \quad (14)$$

9.2.2.4 Oscillator and Maximum Duty Cycle Clamp

The UCC28220's oscillator and maximum duty cycle clamp are setup through resistor R_{CHG} and discharge. The desired duty cycle clamp (D_{MAX}) was set at 0.9 to stop the current sense transformers from saturating.

$$K_{OSC} = (2.04 \times 10^{10}) \frac{\Omega}{S} \tag{15}$$

Equation 15 is UCC28220's oscillator constant.

$$F_{OSC} = 2 \times f_S \tag{16}$$

Equation 16 is UCC28220's internal oscillator frequency.

$$F_{OSC} = 2 \times f_S \tag{17}$$

Equation 17 is the internal duty cycle clamp.

$$D_{MAX(OSC)} = 1 - 2(1 - D_{MAX}) \tag{18}$$

$$R_{DISCHG} = K_{OSC} \frac{(1 - D_{MAX(OSC)})}{F_{OSC}} \tag{19}$$

9.2.3 Application Curves

10 Power Supply Recommendations

The VDD power terminal for the device requires the placement of electrolytic capacitor as energy storage capacitor. And requires the placement of low-ESR noise decoupling capacitance as directly as possible from the VDD terminal to the VSS terminal, ceramic capacitors with stable dielectric characteristics over temperature are recommended, such as X7R or better. TI recommends a 1- μ F, 50-V e-capacitor.

11 Layout

11.1 Layout Guidelines

1. TI recommends placing a 1- μ F ceramic decoupling capacitor as close as possible between the VDD terminal and GND, tracked directly to both terminals.
2. TI recommends placing a small, external filter capacitor on the CS1 and CS2 terminal. Track the filter capacitor as directly as possible from the CS to GND terminal.
3. Reduce the total surface area of traces on the CS net to a minimum.
4. Connect decoupling and noise filter capacitors, as well as sensing resistors directly to the GND terminal in a star-point fashion, ensuring that the current-carrying power tracks (such as the gate drive return) are track separately to avoid noise and ground-drops that could affect the analogue signal integrity.

11.2 Layout Example

12 Device and Documentation Support

12.1 Documentation Support

12.1.1 Related Documentation

An evaluation module and an associated user's guide are available. The UCC28221 is used in a two-channel interleaved Forward design converting from 36-V to 76-V dc input voltage to a regulated 12-V dc output. The power module has two isolated 100 W forward power stages operating at 500 kHz, which are operating 180 degrees out of phase with each other allowing for output current ripple cancellation and smaller magnetic design. This design also takes advantage of the UCC28221's on-board 110-V internal JFET start up circuit that removes the need of an external trickle charge resistor for boot strapping. This circuit turns off after auxiliary power is supplied to the device conserving power.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
