

New Product Update

Opto-emulators, a pin-to-pin upgrade to optocouplers in isolated high-voltage systems

Brittany Parga

Product Marketing Engineer

Agenda

- What are opto-emulators?
- System-level benefits of opto-emulators
- TI's opto-emulator family overview

INT- ISO | Opto-emulators to replace optocouplers

Opto-emulators to replace traditional optos

- **Cost competitive to optocouplers**

- ISOM87xx: High speed digital

- ISOM81xx: Open collector analog

New package development

- **New SO4/SO5** packaging options to be pin-to-pin with existing optocouplers
- Allows for seamless adoption into existing designs

New circuit and process technology

- **Proven analog behavior to look and feel like an optocoupler**
- Current-input diode emulation
- SiO₂ Isolation barrier with strong life-time and HV performance
- Higher CMTI and reliability

TI's SiO₂ Isolation technology

TI's opto-emulator isolators use a diode-input and transistor-output structure separated by a **SiO₂ insulation barrier**

Manufactured and thoroughly tested in a controlled environment to ensure highest quality of isolation products

Silicon dioxide (SiO₂) offers the **highest** dielectric strength in the industry

Insulator Materials	Dielectric Strength
Air	~1 Vrms/ μ m
Epoxies	~20 Vrms/ μ m
Silica filled Mold Compounds	~100 Vrms/ μ m
Polyimide	~300 Vrms/ μ m
SiO ₂	~500 Vrms/ μ m

Unlike polyimide and other polymer based insulators, the reliability of an SiO₂-insulated capacitor does not degrade with exposure to ambient moisture.

Transforming optocoupler designs with TI's SiO₂-based isolation technology

FROM

- LED signal transmission, affected by aging
- Dielectrics based on air, epoxies, or mold compounds
 - Air: 1 V_{RMS}/μm
 - Epoxies: 20 V_{RMS}/μm
 - Mold compounds: 100 V_{RMS}/μm
- Certified to IEC 60747-5-5, lifetime testing not required

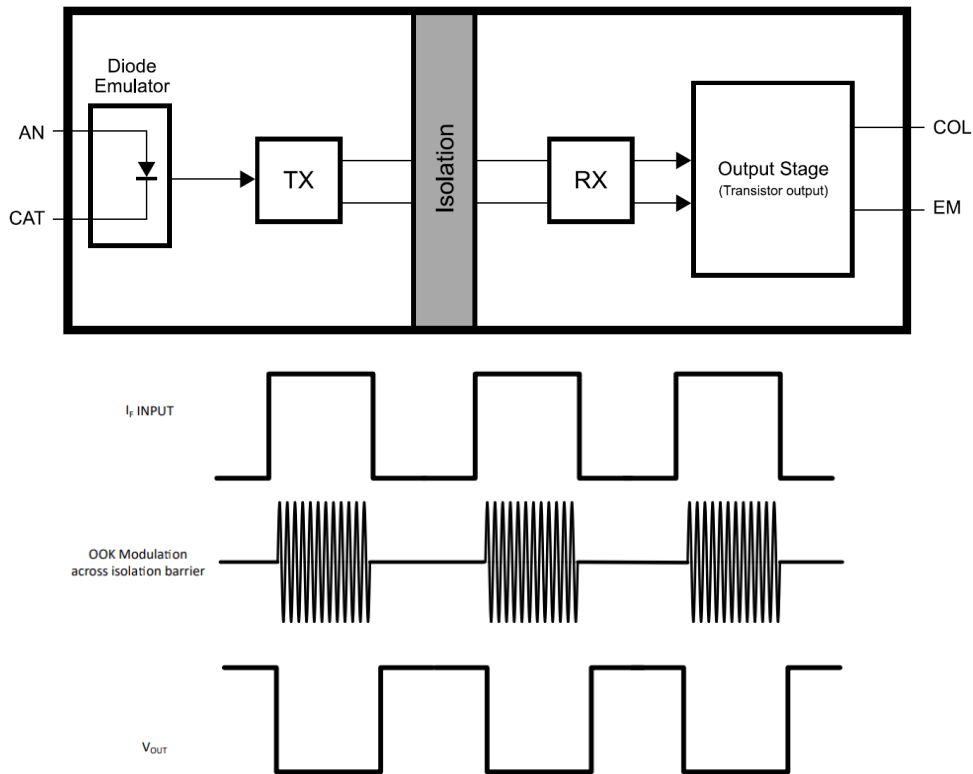

TO

- Diode emulated, no LED required
- Dielectric based on silicon dioxide
 - SiO₂: 500 V_{RMS}/μm
- Certified to IEC 60747-17 with lifetime testing
 - Production high-voltage testing up to >2x higher

Opto-emulator signal chain

- The input signal is transmitted across the isolation barrier using an on-off keying (OOK) modulation scheme
- The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state
- The receiver demodulates the signal after advanced signal conditioning and produces the signal through the output stage
- These devices maximize CMTI performance and minimize radiated emissions

ISOM8xxx: Upgrade optocouplers with TI's new portfolio of opto-emulators

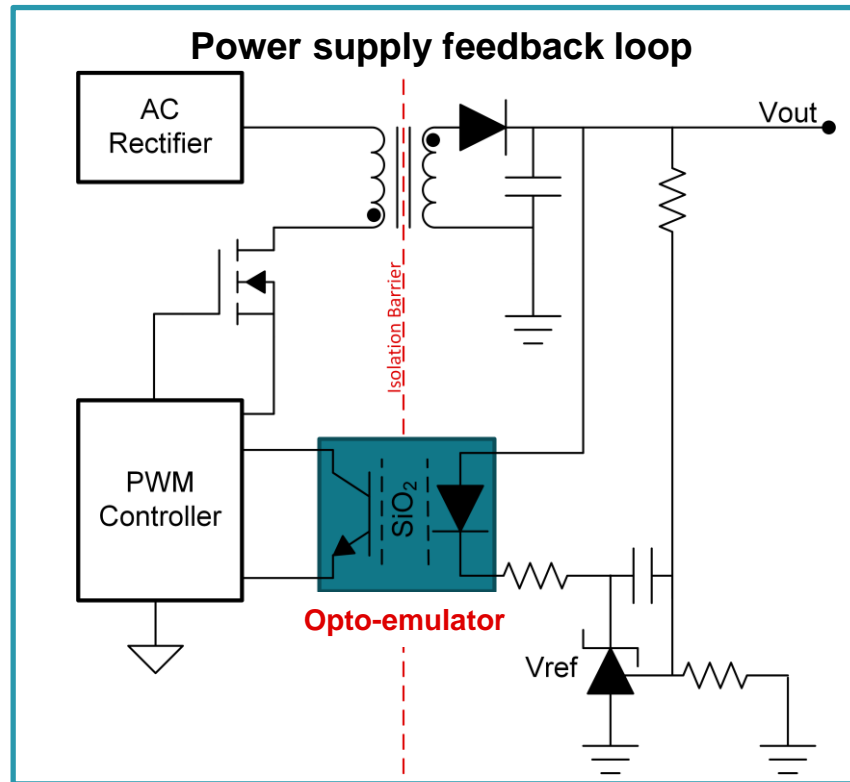

- **Pin-to-pin alternative to optocouplers**
- **Reduces power consumption up to 80%** utilizing a lower I_F threshold and supply current
- **Improved common mode transient immunity (CMTI)** – ISOM8710 features a typical CMTI of 150kV/ μ s
- **High data throughput** with up to 25 Mbps data rates for digital signals (ISOM8710). And high bandwidth of 680 kHz for analog signals (ISOM8110).
- **Stable and tight current transfer ratio (CTR)** over both temperature and lifetime
- **Temperature range** as wide as -55°C to $+125^{\circ}\text{C}$

Reach new levels of system performance over lifetime

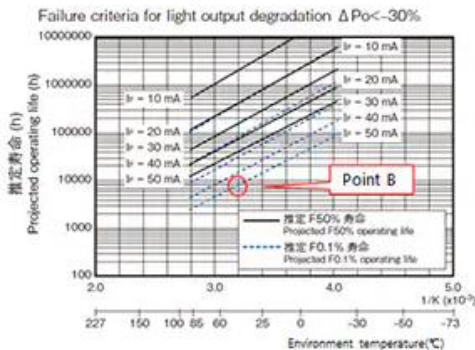

- **Flat CTR over temperature** ensures consistent output regulation in changing environments
- **Reduced part-to-part variation** enables improved designs for optimized efficiency
- **Wide bandwidth** enables improved load transient response and improves system cost by reducing requirements of output capacitor
- **Improved barrier lifetime** with SiO_2 insulation

Optocoupler CTR vs. ISOM8xxx opto-emulator over time

Test conditions: $I_F = 50 \text{ mA}$, $T_a = 40^\circ\text{C}$

LED optocoupler

- Example of aging variation of optical output of GaAs
- The LED in optocouplers dims over time, requiring a higher initial forward current to compensate for long-term aging performance
- As shown above, optocoupler LED degradation can be 30% after **just 1 year** → requiring at least 30% increased current at time 0

SiO2 opto-emulator

- Opto-emulators are based on electrical signals, so there is no LED aging
- Forward current can be set to **minimum current at time 0 for reduced power consumption**

3.75 kV_{RMS} opto-emulator with analog behavior in standard SO4 package

Features

- **Isolation, immunity and certifications**
 - Isolation voltage: 3750 V_{RMS}
 - Working voltage: 707 V_{PK}
 - Creepage: ≥ 5 mm
- **Electrical characteristics**
 - Supports unidirectional and bidirectional DC input types
 - Propagation delay (TON/TOFF): 5 μs (typ)
 - Bandwidth: 680 kHz (max)
 - VCE voltage: 80 V (max)
 - Input current (I_F): 0.5 mA to 20 mA recommended
 - CTR: 100%-155%, 150%-230%, 255%-380%, and 385-570% at I_F = 5 mA
 - V_F range: 1.2 V (typ)
 - Operating temperature range: -55 °C to 125 °C
- **Configuration and package**
 - Open collector output
 - 1 Channel: 1/0
 - Small SO-4 package (4.8 mm width, 2.54 mm & 1.27 mm pitch)

Applications

- PLC and motor drive I/O modules
- Isolated digital inputs
- Switching power supplies
- Building automation
- Automotive audio

Benefits

- Supports low input current (0.5 mA) with CTR 200% (max) for low power applications.
- Eliminate the need to overdesign your system to account for the LED aging effect
- Ease of design for feedback loop compensation with tighter CTR range
- Pin-to-pin drop-in upgrade to traditional optocoupler phototransistor parts

ISOM811x

3.75 kV_{RMS} opto-emulator with analog behavior in standard SO4 package

[Product Folder](#)

Features

- Supports unidirectional and bidirectional DC input types
- Supports 4 different CTR variants
 - Current transfer ratio (CTR) : at $I_F = 5 \text{ mA}$, $V_{CE} = 5 \text{ V}$
 - ISOM8110, ISOM8115 : 100% to 155%
 - ISOM8111, ISOM8116 : 150% to 230%
 - ISOM8112, ISOM8117 : 255% to 380%
 - ISOM8113, ISOM8118 : 375% to 560%

Applications

- PLC and motor drive I/O modules
- Isolated digital inputs
- Switching power supplies
- Building automation
- Automotive audio

Benefits

- Supports low input current (0.5 mA) with CTR 200% (max) for low power applications.
- Eliminate the need to overdesign your system to account for the LED aging effect
- Ease of design for feedback loop compensation with tighter CTR range
- Pin-to-pin drop-in upgrade to traditional optocoupler phototransistor parts

ISOM871x

Single-channel, 25 Mbps, high-speed opto-emulator in SO-5 package

[Product folder](#)

Features

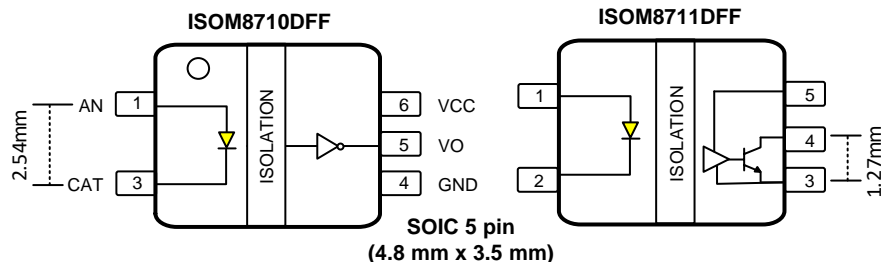

- **Isolation, immunity and certifications**
 - Isolation voltage: 3750 V_{RMS}
 - Working voltage: 707 V_{PK}
 - CMTI: 85 kV/μs (min) 100 kV/μs (typ.)
- **Electrical characteristics**
 - V_{CC} range supports 3.3 V and 5 V
 - Input forward voltage: 1.3 V (min) / 1.8 V (max)
 - Input forward current: 2 mA (min) / 20 mA (max)
 - Reverse input voltage: 5 V (min)
 - 25 Mbps max data rate
 - Prop delay: 47 ns (max)
 - Operating temperature range -40 °C to 125 °C
- **Configuration and package**
 - Two output options:
 - ISOM8710: Inverting, CMOS output
 - ISOM8711: Inverting, open collector output
 - Small SO-5 package (4.8 mm x 3.5 mm)

Applications

- PLC and motor drive I/O modules
- Digital isolation for A/D, D/A conversion
- Microprocessor or FPGA system interface
- Switching power supplies

Benefits

- **Industry-standard packages:** no redesign required
- **Pin-to-pin drop-in upgradable** to existing high-speed optocouplers for superior isolation reliability and lifetime.
- **Consume less system power than optocouplers** since there is no aging effect or temperature variation to compensate for.
- **Achieve enhanced signal integrity in harsh environments** with higher CMTI and wider temperature ratings than optocouplers.

Getting started
