

TPS629206-Q1 Buck Converter Evaluation Module User's Guide

ABSTRACT

The TPS629206-Q1EVM is designed to help user easily evaluate the performance of TPS629206-Q1. The user's guide includes the following:

- Performance characteristics
- EVM configuration
- Test setup
- Test result
- PCB layout
- Schematic diagram
- Bill of materials

Table of Contents

1 Introduction

The TPS629206-Q1 is high-efficiency and highly flexible synchronous step-down buck converter in a small 1.6-mm × 2.1-mm SOT583 package. The TPS629206-Q1 can be configured to run 2.5 MHz or 1 MHz in either forced PWM mode or auto PFM/PWM mode. In 2.5-MHz auto PFM/PWM mode, TI AEE mode automatically adjusts the switching frequency based on both input and output voltage to hold a high efficiency through the whole operation range without needing to use different inductors. The device includes a MODE/S-CONF input to select different combinations of following:

- External and internal feedback
- Maximum switching frequency
- Output discharge enable/disable
- Auto PFM/PWM (with AEE) and forced PWM operations

The TPS629206-Q1EVM(BSR131-002) uses a 600-mA TPS629206-Q1 to produce a 3.3-V output from a 12-V input.

2 Performance Specification

[Table 2-1](#) provides a summary of the TPS629206-Q1EVM performance specifications. All the specifications are given at an ambient temperature of 25°C.

Table 2-1. TPS629206-Q1EVM Performance Specification Summary

Specification	Test Conditions	MIN	TYP	MAX	UNIT
Input voltage		5	12	17	V
Output voltage			3.3		V
Output current		0		600	mA
Input current	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 0\text{ A}$, forced PWM, 2.5 MHz, 2.2-μH inductor		6.2		mA
	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, 2.5 MHz, 2.2-μH inductor		0.181		A
Switching frequency	Set by the Mode/S-CONF pin		2.5		MHz
Line regulation	$V_{IN} = 5\text{ V}–17\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 0\text{ A}$ and 600 mA, forced PWM, 2.5 MHz, VSET, 2.2-μH inductor		+0.3%, –0.15%		
Load regulation	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 0\text{ A}–600\text{ mA}$, forced PWM and auto PFM/PWM with AEE, 2.5 MHz, VSET, 2.2-μH inductor		±0.15%		
Output ripple	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, 2.5 MHz, 2.2-μH inductor		10.6		mV
Peak efficiency	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 0\text{ A}–600\text{ mA}$, forced PWM, 2.5 MHz, 2.2-μH inductor		91.3%		
	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 0\text{ A}–600\text{ mA}$, auto PFM/PWM with AEE, 2.5 MHz, 2.2-μH inductor		91.72%		
	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 10\text{ mA}$, auto PFM/PWM with AEE, 2.5 MHz, 2.2-μH inductor		86.2%		
Output rise time	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, 2.5 MHz, 2.2-μH inductor		500		μs
Load transient	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 300\text{ mA}–600\text{ mA}$, slew rate: 1 A/μs, forced PWM, VSET, 2.5 MHz, 2.2-μH inductor		±29		mV
Loop bandwidth	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, VSET, 2.5 MHz, 2.2-μH inductor		153		kHz
Phase margin	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, VSET, 2.5 MHz, 2.2-μH inductor		86.7		deg
IC case temperature	$V_{IN} = 12\text{ V}$, $V_{OUT} = 3.3\text{ V}$, $I_{OUT} = 600\text{ mA}$, forced PWM, 2.5 MHz, 2.2-μH inductor, 10 minutes soaking		30.5		°C

3 EVM Configuration and Modification

The EVM is designed to provide access to features of the TPS629206-Q1. The EVM also provides jumpers for different configurations. Jumper selections must be made prior to enabling the TPS629206-Q1. Additional input and output capacitors can be added. The input voltage at which the IC turns on can be programmed with a voltage divider. The TPS629206-Q1EVM allows multiple MODE/S-CONF pin configurations. The loop response can also be measured.

3.1 Input and Output Capacitors

C2 is provided for additional input capacitance. This capacitor is not required for proper operation but can be used to reduce the input voltage ripple. C6, C7, C8, and C9 are provided for additional output capacitors. These capacitors are not required for proper operation but can be used to reduce the output voltage ripple. The total output capacitance must remain within the recommended range for the TPS629206-Q1.

3.2 Configurable Enable Threshold Voltage

JP1 is provided as option for Enable pin with a precise threshold voltage. R4 and R5 can be adjusted to set a user-selectable input voltage at which the IC turns on. The EVM pre-configures R4 and R5 to have 6.5-V rising and 5.85-V falling threshold voltage.

3.3 MODE/S-CONF Setting

JP2 is used to set different MODE/S-CONF configurations. MODE/S-CONF can be connected to VIN and GND as a traditional HIGH or LOW level. R6 and R7 select the other device configurations including the following:

- Internal and external feedback
- Switching frequency
- Output discharge
- Auto PFM/PWM(with AEE) or forced PWM options

The values of R6 and R7 can be changed per the user's requirement.

- While using the internal feedback (VSET) configuration for the output voltage setting, either float the FB pin by cutting the net tie (NT1) included on the back of the board or remove both R1 and R2 for 3.3-V output voltage. Other output voltages can be programmed by removing R1 and changing the value of R2. Ensure the JP2 jumper is placed correctly for proper operation with internal feedback.

WARNING

Do not to set the MODE/S-CONF pin for external feedback if either the net tie (NT1) is cut or R1 and R2 are removed. This can cause damage to the device due to lack of external feedback control.

- Dynamic mode option is an advanced feature that allows MODE/S-CONF pin to actively switch between forced PWM and auto PFM/PWM during operation, but this is only possible by driving the MODE/S-CONF pin between VIN and GND. This feature provides the user with the option of controlling if and when the device enters power save mode (DCM).

3.4 Power Good

JP3 is provided as an option for power-good test point. If power good is not used, it is recommended to tie to GND or leave open.

3.5 Power-Good Pullup Voltage

JP4 is provided as an option for power-good pullup voltage. Either V_{IN} or V_{OUT} with a 100-k Ω pullup resistor.

3.6 Feedforward Capacitor Option

C10 is provided as an optional of feedforward capacitor (C_{FF}). It helps to improve the loop stability if needed. More detailed discussion on the optimization for stability versus transient response can be found in the [Optimizing Transient Response of Internally Compensated DC-DC Converter With Feedforward Capacitor](#) and [Feedforward Capacitor to Improve Stability and Bandwidth With the TPS621-Family and TPS821-Family](#) application reports.

3.7 Output Voltage Setting

The TPS629206-Q1EVM is configured for external feedback as a default with an output voltage of 3.3 V set by R1 and R2. Additionally, if the internal feedback (VSET) configuration is used, the user can cut the net tie NT1 located on the back of the board (shown in [Figure 3-1](#)). This will float the FB pin resulting in a 3.3-V output voltage using the internal VSET. Resistors R1 and R2 can also be changed to set the output voltage between 0.6 V and 5.5 V. See the TPS629206-Q1 data sheet for recommended values. R2 was populated with 34 k such that if the internal (VSET) is chosen while R1 is removed, the device will regulate to 1.8-V output voltage.

WARNING

If the output voltage is increased, make sure the voltage rating of output capacitor C5 is sized appropriately.

Figure 3-1. Internal Feedback (VSET) Configuration Board Modification

3.8 Loop Response Measurement

The loop response can be measured after simply changing to the board. First, cut the net tie (NT2) and install a 10-Ω 0603 resistor on the bottom of the board (shown in [Figure 3-2](#)). An AC signal (10-mV, peak-to-peak amplitude is recommended) can be injected into the control loop across the added 10-Ω resistor.

Cut Net tie(NT2) to install 10ohm resistor for bode plot measurement

Figure 3-2. Bode Plot Measurement Board Modification

4 EVM Test Setup

This section describes how to properly test the EVM.

4.1 Input and Output Connectors

Table 4-1. Input and Output Connector

Connector	Pins	Description
J1	Pin 1 and Pin 2	V_{IN} positive input for input supply
	Pin 3 and Pin 4	S+ and S– input voltage sense. Input voltage measure points
	Pin 5 and Pin 6	GND return for input supply
J2	Pin 1 and Pin 2	V_{OUT} output voltage connection
	Pin 3 and Pin 4	S+ and S– output voltage sense. Output voltage measure points
	Pin 5 and Pin 6	GND output return connection

4.2 Jumper Configuration

4.2.1 JP1 Enable

Table 4-2. Enable Pin Configuration

Jumper Short Location	Description
Pin 2 and Pin 3	Turn on the device as default.
Pin 3 and Pin 4	Turn off the device.
Pin 1 and Pin 2, Pin 3 and Pin 4	Set programmable Enable threshold voltage with R4 and R5.
Pin 3 and Pin 4	Pin1 can be used for external supply voltage with R4 and R5 resistor divider.

4.2.2 JP2 MODE/S-CONF

Table 4-3. MODE/S-CONF Pin Configuration

Jumper Short Location	Description
Pin 1 and Pin 3	Forced PWM, 2.5 MHz, external FB, output discharge enabled
Pin 3 and Pin 5	Auto PFM/PWM with AEE, 2.5 MHz, external FB, output discharge enabled
Pin 2 and Pin 4	52.3 k to GND, forced PWM, 2.5 MHz, internal FB (VSET), output discharge disabled
Pin 4 and Pin 6	42.2 k to GND, auto PFM/PWM, 2.5 MHz, internal FB (VSET), output discharge disabled

4.2.3 JP3 Power Good

The PGOOD output is on pin 1 of this header with a convenient ground on pin 2. If PG is not used, short pin 1 and pin 2 by a jumper.

4.2.4 JP4 PG Pullup Voltage

Table 4-4. PG Pullup Voltage Option

Jumper Short Location	Description
Pin 1 and Pin 2	PG pulls up to the output voltage.
Pin 2 and Pin 3	PG pulls up to the input voltage.
No jumper	JP4 pin2 can pull up to different external voltage. This external voltage must remain below 18 V.

5 Test Results

This section provides the test results of TPS629206-Q1EVM.
