30	RX_REE_PEAK_DIAG_14	R/W	0h	Voter override neg : Writing a 1'b1 in this register bit will force the peaking amp voter function to activate the voter neg signal for a single clock cycle. Note : This bit must be cleared after each time it is enabled, in order to perform follow on voter override functions with this bit. Note : It is not valid to activate both the voter override neg and voter override pos at the same time.
29	RX_REE_PEAK_DIAG_13	R/W	0h	Voter override pos : Writing a 1'b1 in this register bit will force the peaking amp voter function to activate the voter pos signal for a single clock cycle. Note : This bit must be cleared after each time it is enabled, in order to perform follow on voter override functions with this bit. Note : It is not valid to activate both the voter override neg and voter override pos at the same time.

Table 12-766. RX_REE_PEAK_DIAG__RX_REE_PEAK_COVRD1_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	RX_REE_PEAK_DIAG_12	R/W	0h	Voter override enable : Setting this bit to a 1'b1 will allow only the voter override pos and voter override neg bits in this register to control the voter in the peaking amp. Note : This function is intended to be for diagnostic and verification purposes only. Note : Both the voter override neg and voter override pos bits in this register must be set to 1'b0 when this bit is initially set to 1'b1 when enabling this function.
27-24	RX_REE_PEAK_DIAG_11_8	R	0h	Reserved
23-22	RX_REE_PEAK_DIAG_7_6	R	0h	Reserved Note : n = CODE_WIDTH.
21-16	RX_REE_PEAK_DIAG_5_0	R	0h	Current peaking amp integrator accumulator: Current value of the tap integrator accumulator, without the unused sign bit. Note: The reset value for this field is with the transceiver data path power island switched off. In cases where this power island is switched on, the reset value be 6'b100000
15-14	RX_REE_PEAK_COVRD_1_15_14	R	0h	Reserved
13-8	RX_REE_PEAK_COVRD_1_13_8	R/W	0h	Peaking amp code override value mode 3: Value that will override the peaking amp code when in standard mode 3 when the peaking amp code override enable bit in the REE peaking amp diagnostics register on page 264 is active. The value of this override field will ultimately drive the thermometer encoded value on the rxda_dfe_peaking_amp_gain signal driven to the analog.
7-6	RX_REE_PEAK_COVRD_1_7_6	R	0h	Reserved
5-0	RX_REE_PEAK_COVRD_1_5_0	R/W	0h	Peaking amp code override value mode 2: Value that will override the peaking amp code when in standard mode 2 when the peaking amp code override enable bit in the REE peaking amp diagnostics register on page 264 is active. The value of this override field will ultimately drive the thermometer encoded value on the rxda_dfe_peaking_amp_gain signal driven to the analog.

Table 12-823. RX_REE_DIAG_CTRL_RX_REE_FIFO_DIAG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RX_REE_DIAG_CTRL_15_8	R	0h	Reserved
23	RX_REE_DIAG_CTRL_7	R/W	0h	Analog tap disable: When this bit is set to 1'b1, the rxda_dfe_tap_1_coef, rxda_dfe_tap_2_coef, and rxda_dfe_tap_3_coef signals being driven to the analog will be forced to all 0s.
22	RX_REE_DIAG_CTRL_6	R/W	1h	Hold periodic equalization while RX idle: When this bit is set to 1'b1, a detection of electrical idle on the receiver (rx_signal_detect is set to 1'b0), will disable the periodic REE general control state machine, and as a result freeze the current state of the parts of the REE that are controlled by it. When a high speed signal is later detected, the REE general control state machine will be enabled again.

Table 12-823. RX_REE_DIAG_CTRL_RX_REE_FIFO_DIAG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21	RX_REE_DIAG_CTRL_5	R/W	1h	Hold general control state machine 2 equalization while RX idle: When this bit is set to 1'b1, a detection of electrical idle on the receiver (rx_signal_detect is set to 1'b0), will disable the REE general control state machine 2, and as a result freeze the current state of the parts of the REE that are controlled by it. When a high speed signal is later detected, the REE general control state machine will be enabled again.
20	RX_REE_DIAG_CTRL_4	R/W	1h	Hold general control state machine 1 equalization while RX idle: When this bit is set to 1'b1, a detection of electrical idle on the receiver (rx_signal_detect is set to 1'b0), will disable the REE general control state machine 1, and as a result freeze the current state of the parts of the REE that are controlled by it. When a high speed signal is later detected, the REE general control state machine will be enabled again.
19-18	RX_REE_DIAG_CTRL_3_2	R	0h	Reserved
17	RX_REE_DIAG_CTRL_1	R/W	1h	Enable REE control clock on : Enables the REE control clock. 1'b 0: Disabled 1'b 1: Enabled
16	RX_REE_DIAG_CTRL_0	R/W	0h	Force REE function clock on : When active, the REE function clock gate will allow the clock to run. Note that because of how the REE reset functions are implemented, the REE controller clock must be enabled in order for REE function clock to be enabled. Therefore, if all of the REE control state machines are disabled, the Force REE controller lock on bit in this register must also be set, for this bit to take effect.
15	RX_REE_FIFO_DIAG_15	R	0h	FIFO underflow : Indicates when a FIFO underflow condition has occurred.
14	RX_REE_FIFO_DIAG_14	R	1h	FIFO empty :Indicates that the FIFO is empty.
13	RX_REE_FIFO_DIAG_13	R/W	0h	FIFO output dequeue : Writing a 1'b1 to this bit will dequeue the current values from the output of the FIFO. Once this register bit is written to a 1'b1, it must be written to a 1'b0 before it is used again to dequeue data.
12	RX_REE_FIFO_DIAG_12	R/W	0h	FIFO output override enable : Enables the FIFO output override functions. This bit must be set to 1'b1 before enabling the transmitter REE functions. When set, FIFO output dequeues can be performed from this register. When set, the TX equalization evaluator will not be able to dequeue data from the FIFO.
11	RX_REE_FIFO_DIAG_11	R	0h	FIFO output data pre cursor increment : Current value on the pre cursor increment bit on the FIFO output.
10	RX_REE_FIFO_DIAG_10	R	0h	FIFO output data pre cursor decrement : Current value on the pre cursor decrement bit on the FIFO output.
9	RX_REE_FIFO_DIAG_9	R	0h	FIFO output data post cursor increment : Current value on the post cursor increment bit on the FIFO output.
8	RX_REE_FIFO_DIAG_8	R	0h	FIFO output data post cursor decrement : Current value on the post cursor decrement bit on the FIFO output.

Table 12-823. RX_REE_DIAG_CTRL__RX_REE_FIFO_DIAG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	RX_REE_FIFO_DIAG_7	R	0h	FIFO overflow :Indicates when a FIFO overflow condition has occurred.
6	RX_REE_FIFO_DIAG_6	R	0h	FIFO full :Indicates that the FIFO is full.
5	RX_REE_FIFO_DIAG_5	R/W	0h	FIFO input enqueue : Writing a 1'b1 to this bit will enqueue the values of the FIFO input data bits in this register to their respective FIFO bits. Once this register bit is written to a 1'b1, it must be written to a 1'b0 before it is used again to dequeue data.
4	RX_REE_FIFO_DIAG_4	R/W	0h	FIFO input override enable : Enables the FIFO input override functions. This bit must be set to 1'b1 before enabling the transmitter REE functions. When set, FIFO input enqueues can be performed from this register. When set, the TX pre cursor control and TX post cursor control will not be able to enqueue data to the FIFO.
3	RX_REE_FIFO_DIAG_3	R/W	0h	FIFO input data pre cursor increment : Pre cursor increment value that will be enqueued to the FIFO by the FIFO input enqueue bit in this register.
2	RX_REE_FIFO_DIAG_2	R/W	0h	FIFO input data pre cursor decrement : Pre cursor decrement value that will be enqueued to the FIFO by the FIFO input enqueue bit in this register.
1	RX_REE_FIFO_DIAG_1	R/W	0h	FIFO input data post cursor increment : Post cursor increment value that will be enqueued to the FIFO by the FIFO input enqueue bit in this register.
0	RX_REE_FIFO_DIAG_0	R/W	0h	FIFO input data post cursor decrement : Post cursor decrement value that will be enqueued to the FIFO by the FIFO input enqueue bit in this register.

Table 12-886. PHY_PIPE_CMN_CTRL2__PHY_PIPE_CMN_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	PHY_PIPE_CMN_CTRL2_15_12	R/W	Bh	USB SuperSpeed Tx LFPS Stretch : Minimum number of data rate clock cycles in which PMA tx_lfps_en signal is asserted for USB SuperSpeed rate. Number of data rate clock cycles must be X 1 PMA RefClk cycle.
27-24	PHY_PIPE_CMN_CTRL2_11_8	R/W	Dh	USB SuperSpeedPlus Tx LFPS Stretch : Minimum number of data rate clock cycles in which PMA tx_lfps_en signal is asserted for USB SuperSpeedPlus rate. Number of data rate clock cycles must be X 1 PMA RefClk cycle.
23	PHY_PIPE_CMN_CTRL2_7	R	0h	Reserved
22	PHY_PIPE_CMN_CTRL2_6	R/W	1h	PCIe PCS TX electrical idle pre release:When this bit is set, the TX electrical idle release to the PMA is advanced 1 cycle to allow the adjustment of the datapath timing
21	PHY_PIPE_CMN_CTRL2_5	R/W	0h	RX equaliser complete mask: When this bit is cleared, the PHY will return direction change of 0 when PMA indicates evaluation complete. Subsequent evaluation requests would clear the PMA iteration counters. When set high, the PMA equalization complete signal is ignored.

Table 12-886. PHY_PIPE_CMN_CTRL2_PHY_PIPE_CMN_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	PHY_PIPE_CMN_CTRL2_4	R/W	1h	PCIe PCS EIOS cycle error mask: When this bit is enabled and the pipe rx interface is outputting an EIOS symbol, decode errors will be masked out
19	PHY_PIPE_CMN_CTRL2_3	R/W	0h	USB Gen 2 Bit Error Correction Disable: When this bit is high, bit error correction on SKP and SDS symbols is disabled.
18	PHY_PIPE_CMN_CTRL2_2	R/W	0h	USB PIPE3 Compatibility Mode enable : When this bit is set to 1, USB PIPE3 compatibility mode is enabled. In this mode, when operating in nominal empty Elasticity Buffer mode, when the EB buffer goes empty, instead of de-asserting PIPE RxDataValid, a USB SKIP OS is inserted into the data stream. This is the behavior as defined in PIPE version 3. When this bit is low, PIPE RxDataValid is de-asserted when the EB buffer goes empty, as recommended by PIPE version 4.
17	PHY_PIPE_CMN_CTRL2_1	R/W	0h	USB Loopback Slave Error Count disable: When this bit is set to 1, disables the error count for US loopback slave, such that the error count is not inserted into the BCNT OS.
16	PHY_PIPE_CMN_CTRL2_0	R/W	1h	USB Elasticity Buffer Re-align enable: When this bit is set to 1, when Rx for a USB link is initially started, the elasticity buffer is re-aligned to its idle point upon seeing 3 consecutive COMMAs (i.e. from TS1/TS2s) in the same relative bit position. The purpose of this is to re-align the elasticity buffer (i.e. CTC) after receiving the TSEQ data, which contains no SKIP OSs.
15-13	PHY_PIPE_CMN_CTRL1_15_13	R	0h	Reserved
12	PHY_PIPE_CMN_CTRL1_12	RC	0h	PHY APB access timeout: When set, an APB read/write request to PHY registers failed (i.e. timed out). When set, this bit is cleared upon read.
11	PHY_PIPE_CMN_CTRL1_11	R	0h	Reserved
10	PHY_PIPE_CMN_CTRL1_10	R/W	1h	PCIe PCS Comma realign: This field controls the comma alignment state machine to re-align to new bit position without going to loss of sync state. The requirement of the new bit position should meet the number of COMMAs as per Symbol unlock count register definition. When new bit position is identified the comma alignment state machine remains in sync state with the alignment now locked to the new bit position. This field needs to be programmed during the PHY initialization routine before training sequences are received. The effect here is that pipe_rx_valid is not de-asserted upon re-alignment. When this bit is 0, pipe_rx_valid will be de-asserted upon loss of COMMA lock and subsequent re-alignment. Applies for PCIe Gen 1/2 and USB3.1 Gen 1 only.
9	PHY_PIPE_CMN_CTRL1_9	R/W	0h	Block alignment clear on EIOS : When set, upon receiving a PCIe EIOS, 128b/130b block alignment is reset regardless of Rx signal detect from the PMA (applies for PCIe Gen 3 only).
8	PHY_PIPE_CMN_CTRL1_8	R/W	0h	Comma alignment clear on EIOS : When set, upon receiving a PCIe EIOS, Comma Alignment is reset regardless of Rx signal detect from the PMA (applies for PCIe Gen 1/2 only).

Table 12-886. PHY_PIPE_CMN_CTRL2__PHY_PIPE_CMN_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	PHY_PIPE_CMN_CTRL1_7	R/W	0h	Block alignment ignore Rx SigDetect : When set, 128b/13xb block alignment will not be reset due to loss of signal detection from the PMA (applies for PCIe Gen 3 and USB3.1 Gen 2 only).
6	PHY_PIPE_CMN_CTRL1_6	R/W	0h	Comma alignment ignore Rx SigDetect : When set, Comma alignment will not be reset due to loss of signal detection from the PMA (applies for PCIe Gen 1/2 and USB3.1 Gen 1 only).
5-4	PHY_PIPE_CMN_CTRL1_5_4	R/W	0h	Rx signal detect delay : Selects the number of clock cycles of delay to add to the PMA signal detect when the bit alignment blocks should be reset after losing signal.
3-2	PHY_PIPE_CMN_CTRL1_3_2	R	0h	Reserved
1	PHY_PIPE_CMN_CTRL1_1	R/W	0h	RefClk disable override: 1 = overrides turning off reference clock receiver by forcing cmn_refclk_disable PMA input low. 0 = normal control of cmn_refclk_disable PMA input by PHY logic.
0	PHY_PIPE_CMN_CTRL1_0	R/W	0h	PHY RefClk enable input ignore : 0 = ignore phy_en_refclk PHY input (forces low internally). 1 = phy_en_refclk_used as specified for controlling enable/disable of cmn_refclk_Xp/mX.

Table 12-895. PHY_PIPE_RX_ELEC_IDLE_DLY__PHY_PIPE_RCV_DET_INH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	PHY_PIPE_RX_ELEC_IDLE_DLY_15_10	R/W	Fh	PCIe PCS L1.x exit Rx electrical idle force fast count : Counter load value to hold PIPE Rx Electrical Idle high upon exit from L1.x. Counter is loaded and starts counting down after phy_l*_rx_elec_idle_det_en is asserted high. Default is 500 nsec. This counter accounts for time to power on just the analog Rx signal detect block. Based on reference clock cycles (25 MHz default). Minimum value = 6'd0.
25-16	PHY_PIPE_RX_ELEC_IDLE_DLY_9_0	R/W	96h	PCIe PCS L1.x exit Rx electrical idle force full count : Counter load value to hold PIPE Rx Electrical Idle high upon exit from L1.x when the PMA common was powered down. Counter is loaded and starts counting down upon de-assertion of PMA cmn_ref_clk_disable (upon de-assertion of phy_l*_ent_l1_x for first link). Default is 6 usec. This counter accounts for time to power on the bias and decap and only takes effect if the PMA was suspended. Based on reference clock cycles (25 MHz default). Minimum value = 10'd1.

Table 12-904. PHY_AUTO_CFG_SPDUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	PHY_AUTO_CFG_SPDUP_15_4	R	0h	Reserved
19	PHY_AUTO_CFG_SPDUP_3	R	0h	Speedup configuration complete: 1 = PHY speedup configuration is complete, 0 = not complete.
18	PHY_AUTO_CFG_SPDUP_2	R/W	0h	Speedup configuration stall: 1 = upon completion of PHY speedup configuration, do not release reset to PMA until this bit is cleared, 0 = release reset to PMA upon completion of PHY speedup configuration. Do not set high when [1] = 0.
17	PHY_AUTO_CFG_SPDUP_1	R/W	0h	Speedup configuration enable: If set to 1 upon de-assertion (high) of phy_reset_n, the PHY will be configured for simulation speedup. Only for use in RTL or gate-level simulations. Not for use in silicon.
16	PHY_AUTO_CFG_SPDUP_0	R	0h	Reserved
15-2	PHY_PLL_CFG_15_2	R	0h	Reserved
1	PHY_PLL_CFG_1	R/W	0h	PLL configuration: 0 = PHY configured to only use PLL0 / PLL1 disabled. 1 = PHY configured to use both PLL0 and PLL1.

Table 12-904. PHY_AUTO_CFG_SPDUP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	PHY_PLL_CFG_0	R/W	1h	Single link PCIe configuration : 1 = PHY configured such that there is only a single PCIe link (1xN) and all PCIe rates will be driven by PLL0. Any other links are not PCIe and will not use PLL0. 0 = ALL other configurations. This is a static configuration, which can only be changed while phy_reset_n is asserted low.

Table 12-928. PHY_PIPE_ISO_RX_EQ_EVAL__PHY_PCS_ISO_RX_CTRL_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	PHY_PIPE_ISO_RX_EQ_EVAL_15_13	R	0h	Reserved
28	PHY_PIPE_ISO_RX_EQ_EVAL_12	R/W	0h	Drives pipe_invalid_request for the associated lane when in PHY macro and PMA isolation modes.
27	PHY_PIPE_ISO_RX_EQ_EVAL_11	R/W	0h	pipe_link_eval_dir_change[5:4] bit reversal enable. When low, no bit reversal. When high, the bit positions for pipe_link_eval_dir_change[5:4] PHY output for the associated lane are reversed.
26	PHY_PIPE_ISO_RX_EQ_EVAL_10	R/W	0h	pipe_link_eval_dir_change[3:2] bit reversal enable. When low, no bit reversal. When high, the bit positions for pipe_link_eval_dir_change[3:2] PHY output for the associated lane are reversed.

**Table 12-928. PHY_PIPE_ISO_RX_EQ_EVAL__PHY_PCS_ISO_RX_CTRL_j Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
25	PHY_PIPE_ISO_RX_EQ_EVAL_9	R/W	0h	pipe_link_eval_dir_change[1:0] bit reversal enable. When low, no bit reversal. When high, the bit positions for pipe_link_eval_dir_change[1:0] PHY output for the associated lane are reversed.
24	PHY_PIPE_ISO_RX_EQ_EVAL_8	R/W	0h	Drives pipe_rx_eval PHY input for the associated lane when in PHY macro and PMA isolation modes.
23	PHY_PIPE_ISO_RX_EQ_EVAL_7	R	0h	Reserved
22	PHY_PIPE_ISO_RX_EQ_EVAL_6	R	1h	Captures pipe_phy_status for Rx equalization evaluation PHY output for the associated lane (does not include power state change signaling). Set when pipe_phy_status is high and pipe_rx_eq_eval to the PCS is high (i.e. after the isolation MUX). Cleared upon read.
21-16	PHY_PIPE_ISO_RX_EQ_EVAL_5_0	R	0h	pipe_link_eval_dir_change PHY output for the associated lane (prior to bit reversal logic) upon completion of Rx equalization evaluation. Captured upon assertion of Rx equalization eval pipe_phy_status when pipe_rx_eq_eval to the PCS (i.e. after the isolation MUX) is high. Cleared upon read. (Not re-synchronized to apb_pclk)
15-12	PHY_PCS_ISO_RX_CTRL_15_12	R	0h	Current value of pipe_rx_data_k PHY output for the associated lane, when PHY_PCS_ISO_RX_CTRL[5] == 1. Otherwise, 0. (Not re-synchronized to apb_pclk)
11-10	PHY_PCS_ISO_RX_CTRL_11_10	R	0h	Reserved
9	PHY_PCS_ISO_RX_CTRL_9	R/W	0h	Drives pipe_rx_eq_training PHY input for the associated lane when in PHY macro and PMA isolation modes.
8	PHY_PCS_ISO_RX_CTRL_8	R/W	0h	Drives pipe_rx_termination PHY input for the associated lane when in PHY macro and PMA isolation modes.
7	PHY_PCS_ISO_RX_CTRL_7	R/W	0h	Drives pipe_rx_polarity PHY input for the associated lane when in PHY macro and PMA isolation modes.
6	PHY_PCS_ISO_RX_CTRL_6	R	0h	Reserved
5	PHY_PCS_ISO_RX_CTRL_5	R	0h	Current value of pipe_rx_valid PHY output for the associated lane.
4	PHY_PCS_ISO_RX_CTRL_4	R	1h	Current value of pipe_rx_elec_idle PHY output for the associated lane.
3	PHY_PCS_ISO_RX_CTRL_3	R	0h	Current value of pipe_align_detect PHY output for the associated lane.
2-0	PHY_PCS_ISO_RX_CTRL_2_0	R	0h	Current value of pipe_rx_status PHY output for the associated lane. Holds the highest priority pipe_rx_status value seen, since the last register read. Cleared upon read.

Table 12-949. PHY_PMA_PLL_RAW_CTRL__PHY_PMA_SSM_STATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	PHY_PMA_PLL_RAW_CTRL_15_2	R	0h	Reserved
17	PHY_PMA_PLL_RAW_CTRL_1	R/W	1h	Raw SerDes PLL1 control : When set to 1, cmn_pll1_en PMA input is controlled by PHY logic. When set to 0, cmn_pll1_en PMA input is forced low. When PLL1 is driving lanes configured for Raw SerDes operation, this bit allows manual enable/disable of PLL1 to allow reconfiguration of the PLL for a different data rate. The PHY logic drives cmn_pll1_en high unless the PHY is configured to operation on PLL0 only (PHY_PLL_CFG[1] == 0).
16	PHY_PMA_PLL_RAW_CTRL_0	R/W	1h	Raw SerDes PLL0 control : When set to 1, cmn_pll0_en PMA input is controlled by PHY logic. When set to 0, cmn_pll0_en PMA input is forced low. When PLL0 is driving lanes configured for Raw SerDes operation, this bit allows manual enable/disable of PLL0 to allow reconfiguration of the PLL for a different data rate. The PHY logic drives cmn_pll0_en high except when the PHY is configured for single link PCIe mode and is performing a rate change between PCIe Gen 1/2 and PCIe Gen 3 (PHY_PLL_CFG[0] == 1). However, PCIe is only supported for PIPE mode and not applicable when PLL0 is driving lanes configured for Raw SerDes operation.

13.3 MCU_FSS0_EOI Register (Offset = 10h) [reset = 0h]

MCU_FSS0_EOI is shown in [Figure 13-3](#) and described in [Table 13-8](#).

Return to [Summary Table](#).

End Of Interrupt (EOI) MISC Register

The End Of Interrupt (EOI) MISC Register allows the CPU to acknowledge completion of an interrupt by writing to it for misc interrupt sources. An EOI write signal will be generated and another interrupt will be triggered if interrupt sources remain. This register will be reset one cycle after it has been written to.

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 13-7. MCU_FSS0_EOI Instances

1	ECC_ERR_DED	R	0h	ECC Error (DED) When set indicates that there was a double error detected for the block.

Table 13-24. MCU_FSS0_ECC_TYPE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ECC_ERR_SEC	R	0h	ECC Error (SEC) When set indicates that there was a single error detected for the block.

13.12 MCU_FSS0_WRT_TYPE Register (Offset = 78h) [reset = 0h]

MCU_FSS0_WRT_TYPE is shown in [Figure 13-12](#) and described in [Table 13-26](#).

Return to [Summary Table](#).

Error Write Type Register

The Error Write Type Register holds the current top of stack write error info, this is only valid when the MCU_FSS0_WRT_TYPE[31] WRT_ERR_VALID bit is set.

Table 13-25. MCU_FSS0_WRT_TYPE Instances

Table 13-26. MCU_FSS0_WRT_TYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRT_ERR_VALID	R/W1C	0h	Write Error Valid When set indicates that there is valid write error information available. Writing a 1h to this register will pop the top of the stack.
30-14	RESERVED	R	0h	Reserved
13	WRT_ERR_BEN	R	0h	Write Error Non-Contiguous Byte Enables When set indicates that there was a write error due to a non-contiguous byte enables.
12	WRT_ERR_ADR	R	0h	Write Error Address When set indicates that there was a write error due to a non-aligned address.
11-0	WRT_ERR_ROUTEID	R	0h	Write Error Route ID Indicates the Route ID for the Master that caused the write error.

14 OSPI Registers

This section describes OSPI Global Control registers, OSPI Configuration registers, and OSPI_ECC_AGGR registers.

14.1 OSPI Global Control Registers

Table 14-2 lists the memory-mapped registers for the OSPI Global Control Registers. All register offset addresses not listed in Table 14-2 should be considered as reserved locations and the register contents should not be modified.

The Global Control Registers region is accessed by setting the Region Select signal to 0 during the access. The address map for this region is as follows:

Table 14-1. OSPI Global Control Instances

Instance	Base Address
MCU_FSS0_OSPI0_SS_CFG	4704 4000h

Table 14-2. OSPI Global Control Registers

Offset	Acronym	Register Name	MCU_FSS0_OSPI0_SS_CFG Physical Address
0h	OSPI_PID	Revision register	4704 4000h
4h	OSPI_CTRL	Control register	4704 4004h
8h	OSPI_STAT	Status register	4704 4008h
20h	OSPI_EOI	End of interrupt	4704 4020h

14.2 OSPI_PID Register (Offset = 0h) [reset = X]

OSPI_PID is shown in [Figure 14-1](#) and described in [Table 14-4](#).

Return to [Summary Table](#).

The Revision Register contains the major and minor revisions for the module.

Table 14-3. OSPI_PID Instances

14.5 OSPI_EOI Register (Offset = 20h) [reset = 0h]

OSPI_EOI is shown in [Figure 14-4](#) and described in [Table 14-10](#).

Return to [Summary Table](#).

End of Interrupt Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Note

Some of the OSPI features described in this section may not be supported on this family of devices. For more information, see *OSPI Not Supported Features*.

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 14-14. OSPI_CONFIG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE_FLD	R	1h	Serial interface and low level SPI pipeline is IDLE. This is a STATUS read-only bit. Note this is a retimed signal, so there will be some inherent delay on the generation of this status signal.
30	DUAL_BYTE_OPCODE_ENABLE_FLD	R/W	0h	Dual-byte Opcode Mode enable bit. This bit is to be set in case the target Flash Device supports dual byte opcode. It is applicable for Octal I/O Mode or Protocol only so should be set back to low if the device is configured to work in another SPI Mode. If enabled, the supplementing bytes are taken from OSPI_OPCODE_EXT_LOWER_REG and from OSPI_OPCODE_EXT_UPPER_REG.
29	CRC_ENABLE_FLD	R/W	0h	CRC enable bit. This bit is to be set in case the target Flash Device supports CRC. It is applicable for Octal DDR Protocol only so should be set back to low if the device is configured to work in another SPI Mode
28-26	CONFIG_RESV2_FLD	R	0h	Reserved

Table 14-14. OSPI_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	PIPELINE_PHY_FLD	R/W	0h	Pipeline PHY Mode enable. This bit is relevant only for configuration with PHY module. It should be asserted to 1 between consecutive PHY pipeline reads transfers and de-asserted to 0 otherwise.
24	ENABLE_DTR_PROTOCOL_FLD	R/W	0h	Enable DTR Protocol. This bit should be set if device is configured to work in DTR protocol.
23	ENABLE_AHB_DECODER_FLD	R/W	0h	Enable AHB Decoder. 0h = Active slave is selected based on the OSPI_CONFIG_REG[13:10] PERIPH_CS_LINES_FLD. 1h = Active slave is selected based on actual data interface address (the partition is calculated with respect to bits OSPI_DEV_SIZE_CONFIG_REG[28:21]).
22-19	MSTR_BAUD_DIV_FLD	R/W	Fh	Master mode baud rate divisor (2 to 32), OSPI baud rate = (master reference clock) / (baud rate divisor) Where baud rate divisor is: 0h = /2 1h = /4 2h = /6 3h = /8 4h = /10 5h = /12 6h = /14 7h = /16 8h = /18 ... Fh = /32 Set this register up before enabling the OSPI controller.
18	ENTER_XIP_MODE_IMM_FLD	R/W	0h	Enter XIP Mode immediately. 0h = If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction Value= 1h = Operate the device in XIP mode immediately. Use this register when the external device wakes up in XIP mode [as per the contents of its non-volatile configuration register]. The controller will assume the next READ instruction will be passed to the device as an XIP instruction, and therefore will not require the READ opcode to be transferred. Note: To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only after the next READ instruction is executed. Software therefore should ensure that at least one READ instruction is requested after resetting this bit in order to be sure that XIP mode is exited.
17	ENTER_XIP_MODE_FLD	R/W	0h	Enter XIP Mode on next READ. 0h = If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. 1h = If XIP is disabled, then setting to 1 will inform the controller that the device is ready to enter XIP on the next READ instruction. The controller will therefore send the appropriate command sequence, including mode bits to cause the device to enter XIP mode. Use this register after the controller has ensured the FLASH device has been configured to be ready to enter XIP mode. Note: To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only AFTER the next READ instruction is executed. Software should therefore ensure that at least one READ instruction is requested after resetting this bit before it can be sure XIP mode in the device is exited
16	ENB_AHB_ADDR_REMAP_FLD	R/W	0h	Enable Data Interface Address Remapping [Direct Access Mode Only] 1h = the incoming data interface address will be adapted and sent to the FLASH device as [address + N], where N is the value stored in the remap address register

Table 14-14. OSPI_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description												
15	ENB_DMA_IF_FLD	R/W	0h	Enable DMA Peripheral Interface. 0h = disable the DMA handshaking logic. 1h = enable the DMA handshaking logic. When enabled the controller will trigger DMA transfer requests via the DMA peripheral interface. CAUTION: This bit should be left at 0 as feature is not supported.												
14	WR_PROT_FLASH_FLD	R/W	0h	Write Protect Flash Pin. Set to drive the Write Protect pin of the FLASH device. This is resynchronized to the generated memory clock as necessary.												
13-10	PERIPH_CS_LINES_FLD	R/W	0h	Peripheral Chip Select Lines. If OSPI_CONFIG_REG[9] PERIPH_SEL_DEC_FLD = 0, ss[3:0] are output thus: <table><tr><td>ss[3:0]</td><td>N_SS_OUT[3:0]</td></tr><tr><td>xxx0</td><td>1110</td></tr><tr><td>xx01</td><td>1101</td></tr><tr><td>x011</td><td>1011</td></tr><tr><td>0111</td><td>0111</td></tr><tr><td>1111</td><td>1111 [no peripheral selected]</td></tr></table> else ss[3:0] directly drives N_SS_OUT[3:0]	ss[3:0]	N_SS_OUT[3:0]	xxx0	1110	xx01	1101	x011	1011	0111	0111	1111	1111 [no peripheral selected]
ss[3:0]	N_SS_OUT[3:0]															
xxx0	1110															
xx01	1101															
x011	1011															
0111	0111															
1111	1111 [no peripheral selected]															
9	PERIPH_SEL_DEC_FLD	R/W	0h	Peripheral select decode. 0h = only 1 of 4 selects N_SS_OUT[3:0] is active, 1h = allow external 4-to-16 decode [N_SS_OUT = ss]												
8	ENB_LEGACY_IP_MODE_FLD	R/W	0h	Legacy IP Mode Enable. 0h = Use Direct Access Controller/Indirect Access Controller 1h = Legacy Mode is enabled. In this mode, any write to the controller via the data interface is serialized and sent to the FLASH device. Any valid data read will pop the internal RX-FIFO, retrieving data that was forwarded by the external FLASH device on the SPI lines, 4, 2 or 1 byte transfers are permitted and controlled.												
7	ENB_DIR_ACC_CTLR_FLD	R/W	1h	Enable Direct Access Controller. 0h = Disable the Direct Access Controller once current transfer of the data word is complete. 1h = Enable the Direct Access Controller. When the Direct Access Controller and Indirect Access Controller are both disabled, all data requests are completed with an error response.												
6	RESET_CFG_FLD	R/W	0h	RESET pin configuration. 0h = RESET feature on DQ3 pin of the device 1h = RESET feature on dedicated pin of the device [controlling of 5th bit influences on reset_out output].												
5	RESET_PIN_FLD	R/W	0h	Set to drive the RESET pin of the FLASH device and reset for de-activation of the RESET pin feature.												
4	HOLD_PIN_FLD	R/W	0h	Set to drive the HOLD pin of the FLASH device and reset for de-activation of the HOLD pin feature.												
3	PHY_MODE_ENABLE_FLD	R/W	0h	PHY mode enable. When enabled, the controller is informed that PHY Module is to be used for handling SPI transfers. This bit is relevant only for configuration with PHY Module.												
2	SEL_CLK_PHASE_FLD	R/W	0h	Select Clock Phase. Selects whether the clock is in an active or inactive phase outside the SPI word 0h = The SPI clock is active outside the word 1h = The SPI clock is inactive outside the word												
1	SEL_CLK_POL_FLD	R/W	0h	Clock polarity outside SPI word. 0h = The SPI clock is quiescent low 1h = The SPI clock is quiescent high												
0	ENB_SPI_FLD	R/W	1h	OSPI Enable. 0h = Disable the OSPI, once current transfer of the data word is complete. 1h = Enable the OSPI, when this bit is set to 0, all output enables are inactive and all pins are set to input mode.												

14.8 OSPI_DEV_INSTR_RD_CONFIG_REG Register (Offset = 4h) [reset = 3h]

OSPI_DEV_INSTR_RD_CONFIG_REG is shown in [Figure 14-6](#) and described in [Table 14-16](#).

Return to [Summary Table](#).

Device Read Instruction Configuration Register.

This register defines the configuration of Multiple-SPI READ instruction. This register should be setup while the controller is idle.

Table 14-20. OSPI_DEV_DELAY_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	D_NSS_FLD	R/W	0h	Clock Delay for Chip Select Deassert. Delay in master reference clocks for the length that the master mode chip select outputs are de-asserted between transactions The minimum delay is always SCLK period to ensure the chip select is never re-asserted within an SCLK period.
23-16	D_BTWN_FLD	R/W	0h	Clock Delay for Chip Select Deactivation. Delay in master reference clocks between one chip select being de-activated and the activation of another This is used to ensure a quiet period between the selection of two different slaves and requires the transmit FIFO to be empty.
15-8	D_AFTER_FLD	R/W	0h	Clock Delay for Last Transaction Bit. Delay in master reference clocks between last bit of current transaction and deasserting the device chip select [n_ss_out] By default, the chip select will be deasserted on the cycle following the completion of the current transaction.
7-0	D_INIT_FLD	R/W	0h	Clock Delay with N_SS_OUT. Delay in master reference clocks between setting n_ss_out low and first bit transfer.

14.11 OSPI_RD_DATA_CAPTURE_REG Register (Offset = 10h) [reset = 1h]

OSPI_RD_DATA_CAPTURE_REG is shown in [Figure 14-9](#) and described in [Table 14-22](#).

Return to [Summary Table](#).

Read Data Capture Register.

This register is used to adjust SPI transfer conditions in order to fetch and capture data reliably. This register should be setup while the controller is idle.

**Table 14-21. OSPI_RD_DATA_CAPTURE_REG
Instances**

Table 14-22. OSPI_RD_DATA_CAPTURE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RD_DATA_RESV3_FLD	R	0h	Reserved
19-16	DDR_READ_DELAY_FLD	R/W	0h	DDR read delay. Delay the transmitted data by the programmed number of RCLK cycles. This field is only relevant when DDR Read Command is executed. Otherwise can be ignored.
15-9	RD_DATA_RESV2_FLD	R	0h	Reserved
8	DQS_ENABLE_FLD	R/W	0h	DQS enable bit. If enabled, signal from DQS input is driven into RX DLL and is used for data capturing in PHY Mode rather than internally generated gated RCLK.
7-6	RD_DATA_RESV1_FLD	R	0h	Reserved
5	SAMPLE_EDGE_SEL_FLD	R/W	0h	Sample edge selection. Choose edge on which data outputs from flash memory will be sampled. 0h = Data outputs from flash memory are sampled on falling edge of the RCLK. 1h = Data outputs from flash memory are sampled on rising edge of the RCLK.

Table 14-22. OSPI_RD_DATA_CAPTURE_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-1	DELAY_FLD	R/W	0h	Read Delay. Delay the read data capturing logic by the programmed number of RCLK cycles.
0	BYPASS_FLD	R/W	1h	Bypass. Bypass the adapted loopback clock circuit.

14.12 OSPI_DEV_SIZE_CONFIG_REG Register (Offset = 14h) [reset = 00101002h]

OSPI_DEV_SIZE_CONFIG_REG is shown in [Figure 14-10](#) and described in [Table 14-24](#).

Return to [Summary Table](#).

Device Size Configuration Register.

This register allows to define the memory organization of using Flash Devices. This register should be setup while the controller is idle.

**Table 14-23. OSPI_DEV_SIZE_CONFIG_REG
Instances**

Table 14-42. OSPI_WRITE_COMPLETION_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	POLL_REP_DELAY_FLD	R/W	0h	Polling repetition delay. Defines additional delay for maintain Chip Select de-asserted during auto-polling phase.
23-16	POLL_COUNT_FLD	R/W	1h	Polling count. Defines the number of times the controller should expect to see a true result from the polling in successive reads of the device register. The poll_count_fld in Write Completion Control register should always be set with values greater or equal to 3 (>=3).
15	ENABLE_POLLING_EXP_FLD	R/W	0h	Enable polling expiration. 1h = enabling auto-polling expiration in OSPI_NO_OF_POLLS_BEF_EXP_REG.
14	DISABLE_POLLING_FLD	R/W	0h	Disable polling. This switches off the automatic polling function.
13	POLLING_POLARITY_FLD	R/W	0h	Polling polarity. Defines the polling polarity. 0h = The write transfer to the device will be complete if the polled bit is equal to 0. 1h = The write transfer to the device will be complete if the polled bit is equal to 1.
12-11	WR_COMP_CTRL_RESV1_FLD	R	0h	Reserved

Table 14-42. OSPI_WRITE_COMPLETION_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10-8	POLLING_BIT_INDEX_FLD	R/W	0h	<p>Polling bit index.</p> <p>Defines the bit index that should be polled.</p> <p>0h = bit 0 of the returned data will be polled for.</p> <p>1h = bit 1 of the returned data will be polled for.</p> <p>2h = bit 2 of the returned data will be polled for.</p> <p>...</p> <p>7h = bit 7 of the returned data will be polled for.</p>
7-0	OPCODE_FLD	R/W	5h	<p>Polling opcode.</p> <p>Defines the opcode that should be issued by the controller when it is automatically polling for device program completion. This command is issued followed all device write operations. By default, this will poll the standard device STATUS register using opcode 0x05.</p>

14.22 OSPI_NO_OF_POLLS_BEF_EXP_REG Register (Offset = 3Ch) [reset = FFFFFFFFh]

OSPI_NO_OF_POLLS_BEF_EXP_REG is shown in [Figure 14-20](#) and described in [Table 14-44](#).

Return to [Summary Table](#).

Polling Expiration Register.

This register defines maximum number of poll cycles. If the expected value of the bit being polled is not gotten after number defined in this register, the auto-polling is done on the next phase.

Table 14-43. OSPI_NO_OF_POLLS_BEF_EXP_REG Instances

31-0	NO_OF_POLLS_BEF_EXP_FLD	R/W	FFFFFFFh	Defines the numbers of poll cycles after which auto-polling phase terminates and polling expiration interrupt is generated.

14.23 OSPI_IRQ_STATUS_REG Register (Offset = 40h) [reset = 0h]

OSPI_IRQ_STATUS_REG is shown in [Figure 14-21](#) and described in [Table 14-46](#).

Return to [Summary Table](#).

Interrupt Status Register. The status fields in this register are set when the described event occurs and the interrupt is enabled in the mask register. When any of these bit fields are set, the interrupt output is asserted high. The fields are each cleared by writing a 1 to the field. Note that bit fields 6 through 10 are only valid when legacy SPI mode is active.

Table 14-46. OSPI_IRQ_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	IRQ_STAT_RESV_FLD	R	0h	Reserved
19	ECC_FAIL_FLD	R/W1C	0h	ECC failure. This interrupt informs the system that Flash Device reported ECC error.
18	TX_CRC_CHUNK_BRK_FLD	R/W1C	0h	TX CRC chunk was broken. This interrupt informs the system that program page SPI transfer was discontinued somewhere inside the chunk.
17	RX_CRC_DATA_VAL_FLD	R/W1C	0h	RX CRC data valid. New RX CRC data was captured from Flash Device.
16	RX_CRC_DATA_ERR_FLD	R/W1C	0h	RX CRC data error. CRC data from Flash Device does not correspond to the one dynamically calculated by the controller
15	IRQ_STAT_RESV1_FLD	R	0h	Reserved
14	STIG_REQ_INT_FLD	R/W1C	0h	The controller is ready for getting another STIG request.
13	POLL_EXP_INT_FLD	R/W1C	0h	The maximum number of programmed polls cycles is expired.

Table 14-46. OSPI_IRQ_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	INDRD_SRAM_FULL_FLD	R/W1C	0h	Indirect Read Partition overflow. Indirect Read Partition of SRAM is full and unable to immediately complete indirect operation.
11	RX_FIFO_FULL_FLD	R/W1C	0h	Small RX FIFO full. Current FIFO status can be ignored in non-SPI legacy mode. 0h = FIFO is not full 1h = FIFO is full
10	RX_FIFO_NOT_EMPTY_FLD	R/W1C	0h	Small RX FIFO not empty. Current FIFO status can be ignored in non-SPI legacy mode. 0h = FIFO has less than RX THRESHOLD entries. 1h = FIFO has >= THRESHOLD entries.
9	TX_FIFO_FULL_FLD	R/W1C	0h	Small TX FIFO full. Current FIFO status can be ignored in non-SPI legacy mode 0h = FIFO is not full 1h = FIFO is full
8	TX_FIFO_NOT_FULL_FLD	R/W1C	0h	Small TX FIFO not full. Current FIFO status can be ignored in non-SPI legacy mode 0h = FIFO has >= THRESHOLD entries. 1h = FIFO has less than THRESHOLD entries.
7	RECV_OVERFLOW_FLD	R/W1C	0h	Receive Overflow. This should only occur in Legacy SPI mode. Set if an attempt is made to push the RX FIFO when it is full. This bit is reset only by a system reset and cleared only when this register is read. If a new push to the RX FIFO occurs coincident with a register read this flag will remain set. 0h = no overflow has been detected. 1h = an overflow has occurred.
6	INDIRECT_XFER_LEVEL_BREACH_FLD	R/W1C	0h	Indirect Transfer Watermark Level Breached.
5	ILLEGAL_ACCESS_DET_FLD	R/W1C	0h	Illegal AHB access has been detected AHB wrapping bursts and the use of SPLIT/RETRY accesses will cause this error interrupt to trigger.
4	PROT_WR_ATTEMPT_FLD	R/W1C	0h	Write to protected area was attempted and rejected.
3	INDIRECT_READ_REJECT_FLD	R/W1C	0h	Indirect operation was requested but could not be accepted. Two indirect operations already in storage.
2	INDIRECT_OP_DONE_FLD	R/W1C	0h	Indirect Operation Complete: Controller has completed last triggered indirect operation.
1	UNDERFLOW_DET_FLD	R/W1C	0h	Underflow Detected: 0h = no underflow has been detected 1h = underflow is detected and an attempt to transfer data is made when the small TX FIFO is empty. This may occur when AHB write data is being supplied too slowly to keep up with the requested write operation. This bit is reset only by a system reset and cleared only when the register is read.
0	MODE_M_FAIL_FLD	R/W1C	0h	Mode M Failure. Mode M failure indicates the voltage on pin N_SS_IN is inconsistent with the SPI mode. Set =1 if N_SS_IN is low in master mode [multi-master contention]. These conditions will clear the spi_enable bit and disable the SPI. This bit is reset only by a system reset and cleared only when this register is: Read 0h = no mode fault has been detected. Read 1h = a mode fault has occurred.

14.24 OSPI_IRQ_MASK_REG Register (Offset = 44h) [reset = 0h]

OSPI_IRQ_MASK_REG is shown in [Figure 14-22](#) and described in [Table 14-48](#).

Return to [Summary Table](#).

Interrupt Mask Register.

This register allows the user to mask/unmask particular interrupt sources. This register should be setup while the controller is idle.

0h = the interrupt for the corresponding interrupt status register bit is disabled.

1h = the interrupt for the corresponding interrupt status register bit is enabled.

Table 14-56. OSPI_INDIRECT_READ_XFER_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	INDIR_RD_XFER_RESV_FLD	R	0h	Reserved
7-6	NUM_IND_OPS_DONE_FLD	R	0h	This field contains the number of indirect operations which have been completed. This is used in conjunction with the OSPI_INDIRECT_READ_XFER_CTRL_REG[5] IND_OPS_DONE_STATUS_FLD It is incremented by hardware when an indirect operation has completed. Write a 1 to OSPI_INDIRECT_READ_XFER_CTRL_REG[5] IND_OPS_DONE_STATUS_FLD to decrement it.
5	IND_OPS_DONE_STATUS_FLD	R/W1C	0h	Indirect Completion Status. This field is set to 1 when an indirect operation has completed. Write a 1 to this field to clear it.
4	RD_QUEUED_FLD	R	0h	Queued Indirect Read Operations. Two indirect read operations have been queued.
3	SRAM_FULL_FLD	R/W1C	0h	SRAM Full. SRAM full and unable to immediately complete an indirect operation. Write a 1 to this field to clear it indirect operation [status].

Table 14-56. OSPI_INDIRECT_READ_XFER_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	RD_STATUS_FLD	R	0h	Indirect Read Status. Indirect read operation in progress [status].
1	CANCEL_FLD	W	0h	Cancel Indirect Read. Writing a 1 to this bit will cancel all ongoing indirect read operations.
0	START_FLD	W	0h	Start Indirect Read. Writing a 1 to this bit will trigger an indirect read operation. The assumption is that the indirect start address and the indirect number of bytes register is setup before triggering the indirect read operation.

14.29 OSPI_INDIRECT_READ_XFER_WATERMARK_REG Register (Offset = 64h) [reset = 0h]

OSPI_INDIRECT_READ_XFER_WATERMARK_REG is shown in [Figure 14-27](#) and described in [Table 14-58](#).

Return to [Summary Table](#).

Indirect Read Transfer Watermark Register.

This register allows to define watermark level for Indirect read transfers. This register should be setup before an indirect read transfer is triggered.

Note

Some of the OSPI features described in this section may not be supported on this family of devices. For more information, see *OSPI Not Supported Features*.

Bit	Field	Type	Reset	Description
31-0	ADDR_FLD	R/W	0h	Start of Indirect Access. This is the start address from which the indirect access will commence its READ operation.

14.31 OSPI_INDIRECT_READ_XFER_NUM_BYTES_REG Register (Offset = 6Ch) [reset = 0h]

OSPI_INDIRECT_READ_XFER_NUM_BYTES_REG is shown in [Figure 14-29](#) and described in [Table 14-62](#).

Return to [Summary Table](#).

Indirect Read Transfer Number Bytes Register.

This register allows to define number of bytes to be read of indirect read transfer which is about to be triggered. This register should be setup before an indirect read transfer is triggered.

Table 14-64. OSPI_INDIRECT_WRITE_XFER_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	INDIR_WR_XFER_RESV2_FLD	R	0h	Reserved
7-6	NUM_IND_OPS_DONE_FLD	R	0h	This field contains the number of indirect operations which have been completed. This is used in conjunction with the OSPI_INDIRECT_WRITE_XFER_CTRL_REG[5] IND_OPS_DONE_STATUS_FLD. It is incremented by hardware when an indirect operation has completed. Write a 1 to OSPI_INDIRECT_WRITE_XFER_CTRL_REG[5] IND_OPS_DONE_STATUS_FLD of this register to decrement it.
5	IND_OPS_DONE_STATUS_FLD	R/W1C	0h	Indirect Completion Status. This field is set to 1 when an indirect operation has completed. Write a 1 to this field to clear it
4	WR_QUEUED_FLD	R	0h	Two indirect write operations have been queued.
3	INDIR_WR_XFER_RESV1_FLD	R	0h	Reserved
2	WR_STATUS_FLD	R	0h	Indirect Write Status. Indirect write operation in progress [status].

Table 14-64. OSPI_INDIRECT_WRITE_XFER_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CANCEL_FLD	W	0h	Cancel Indirect Write. Writing a 1 to this bit will cancel all ongoing indirect write operations.
0	START_FLD	W	0h	Start Indirect Write. Writing a 1 to this bit will trigger an indirect write operation. The assumption is that the indirect start address and the indirect number of bytes register is setup before triggering the indirect write operation.

14.33 OSPI_INDIRECT_WRITE_XFER_WATERMARK_REG Register (Offset = 74h) [reset = FFFFFFFFh]

OSPI_INDIRECT_WRITE_XFER_WATERMARK_REG is shown in [Figure 14-31](#) and described in [Table 14-66](#).

Return to [Summary Table](#).

Indirect Write Transfer Watermark Register.

This register allows to define watermark level for Indirect write transfers. This register should be setup before an indirect write transfer is triggered.

Note

Some of the OSPI features described in this section may not be supported on this family of devices. For more information, see *OSPI Not Supported Features*.

Bit	Field	Type	Reset	Description
31-0	VALUE_FLD	R/W	0h	Indirect Number of Bytes. This is the number of bytes that the indirect access will consume. This can be bigger than the configured size of SRAM.

14.36 OSPI_INDIRECT_TRIGGER_ADDR_RANGE_REG Register (Offset = 80h) [reset = 4h]

OSPI_INDIRECT_TRIGGER_ADDR_RANGE_REG is shown in [Figure 14-34](#) and described in [Table 14-72](#).

Return to [Summary Table](#).

Indirect Trigger Address Range Register.

This register allows the user to define the indirect trigger address range. If the configured range exceeds number of bytes programmed for particular indirect transfer, there is no need to detect indirect trigger address boundaries by software. This register should be setup before an indirect read transfer is triggered.

Table 14-71.

Table 14-72. OSPI_INDIRECT_TRIGGER_ADDR_RANGE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	IND_RANGE_RESV1_FLD	R	0h	Reserved
3-0	IND_RANGE_WIDTH_FLD	R/W	4h	Indirect Range Width. This is the address offset of the OSPI_IND_AHB_ADDR_TRIGGER_REG. When any valid Indirect Access is triggered and data address fits to the range, the request is forwarded into Indirect Write Controller or Indirect Read Controller depending on which one was requested by valid trigger. The value is given as power of 2. The default one is $2^{**4} = 16$ what allows 16-byte bursts to be performed. This field reflects width of the range so number of locations of valid addresses (single location has 32 bits) ranges from Indirect Trigger Address to Indirect Trigger Address + [Indirect Range Width - 1].

14.37 OSPI_FLASH_COMMAND_CTRL_MEM_REG Register (Offset = 8Ch) [reset = 0h]

OSPI_FLASH_COMMAND_CTRL_MEM_REG is shown in [Figure 14-35](#) and described in [Table 14-74](#).

Return to [Summary Table](#).

Flash Command Control Memory Register.

This register controls the Memory Bank accesses. It also defines the number of bytes intended to get by STIG access configured to use the STIG Memory Bank.

Table 14-73.

Bit	Field	Type	Reset	Description
31-24	CMD_OPCODE_FLD	R/W	0h	<p>Command Opcode.</p> <p>The command opcode field should be setup before triggering the command. For example, 20h maps to SubSector Erase. Writing to the execute OSPI_FLASH_CMD_CTRL_REG[0] CMD_EXEC_FLD register launches the command.</p> <p>NOTE: Using this approach to issue commands to the device will make use of the instruction type of the device instruction configuration register.</p> <p>If this field is set to 0h, then the command opcode, command address, command dummy bytes and command data will all be transferred in a serial fashion.</p> <p>If this field is set to 1h, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0 and DQ1 pins.</p> <p>If this field is set to 2h, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0, DQ1, DQ2 and DQ3 pins.</p>

Table 14-76. OSPI_FLASH_CMD_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	ENB_READ_DATA_FLD	R/W	0h	Read Data Enable. Set to 1 if the command specified in the OSPI_FLASH_CMD_CTRL_REG[31-24] CMD_OPCODE_FLD requires read data bytes to be received from the device.
22-20	NUM_RD_DATA_BYTES_FLD	R/W	0h	Number of Read Data Bytes: Up to 8 data bytes may be read using this command Set to 0 for 1 byte and 7 for 8 bytes
19	ENB_COMD_ADDR_FLD	R/W	0h	Command Address Enable. Set to 1 if the command specified in OSPI_FLASH_CMD_CTRL_REG[31-24] CMD_OPCODE_FLD requires an address This should be setup before triggering the command via writing a 1 to the execute field.
18	ENB_MODE_BIT_FLD	R/W	0h	Mode Bit Enable: Set to 1 to ensure the mode bits as defined in the Mode Bit Configuration register are sent following the address bytes
17-16	NUM_ADDR_BYTES_FLD	R/W	0h	Number of Address Bytes. Set to the number of address bytes required [the address itself is programmed in the OSPI_FLASH_CMD_ADDR_REG. This should be setup before triggering the command via the OSPI_FLASH_CMD_CTRL_REG[0] CMD_EXEC_FLD: 0h = 1 address byte 1h = 2 address bytes 2h = 3 address bytes 3h = 4 address bytes
15	ENB_WRITE_DATA_FLD	R/W	0h	Write Data Enable. Set to 1 if the command specified in the command opcode field requires write data bytes to be sent to the device.
14-12	NUM_WR_DATA_BYTES_FLD	R/W	0h	Number of Write Data Bytes. Up to 8 Data bytes may be written using this command. Set to 0 for 1 byte, 7 for 8 bytes.
11-7	NUM_DUMMY_CYCLES_FLD	R/W	0h	Number of Dummy cycles. Set to the number of dummy cycles required. This should be setup before triggering the command via the OSPI_FLASH_CMD_CTRL_REG[0] CMD_EXEC_FLD.
6-3	FLASH_CMD_CTRL_RESV1_FLD	R	0h	Reserved
2	STIG_MEM_BANK_EN_FLD	R/W	0h	STIG Memory Bank enable bit. This should be setup before triggering the command via the OSPI_FLASH_CMD_CTRL_REG[0] CMD_EXEC_FLD.
1	CMD_EXEC_STATUS_FLD	R	0h	Command execution in progress.
0	CMD_EXEC_FLD	W	0h	Execute the command.

14.39 OSPI_FLASH_CMD_ADDR_REG Register (Offset = 94h) [reset = 0h]

OSPI_FLASH_CMD_ADDR_REG is shown in [Figure 14-37](#) and described in [Table 14-78](#).

Return to [Summary Table](#).

Flash Command Address Register.

This register allows to define the address of the command using by the STIG controller. This register should be setup while the controller is idle.

**Table 14-77. OSPI_FLASH_CMD_ADDR_REG

31-0	DATA_FLD	R/W	0h	Command Write Data Upper Byte. This is the command write data upper byte. This should be setup before triggering the command with the OSPI_FLASH_CMD_CTRL_REG[0] CMD_EXEC_FLD bitr It is the data that is to be written to the flash for any status or configuration write operation carried out by triggering the event in the OSPI_FLASH_CMD_CTRL_REG register.

14.44 OSPI_POLLING_FLASH_STATUS_REG Register (Offset = B0h) [reset = 0h]

OSPI_POLLING_FLASH_STATUS_REG is shown in [Figure 14-42](#) and described in [Table 14-88](#).

Return to [Summary Table](#).

Polling Flash Status Register.

This register provides auto-polling data. It acts as the extension for the OSPI_WRITE_COMPLETION_CTRL_REG register where full status is not available and any action can be taken only relying on the indication of single bit being polled for.

Table 14-87. OSPI_POLLING_FLASH_STATUS_REG Instances

Table 14-90. OSPI_PHY_CONFIGURATION_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PHY_CONFIG_RESYNC_FLD	W	0h	Re-synchronisation DLL. This bit is used for re-synchronisation delay lines to update them with values from TX DLL Delay and RX DLL Delay fields.
30	PHY_CONFIG_RESET_FLD	W	1h	DLL Reset. This bit is used for reset of Delay Lines by software.
29	PHY_CONFIG_RX_DLL_BYPASS_FLD	R/W	0h	RX DLL Bypass. This field determines if RX DLL is bypassed.
28-23	PHY_CONFIG_RESV2_FLD	R	0h	Reserved
22-16	PHY_CONFIG_TX_DLL_DELAY_FLD	R/W	0h	TX DLL Delay. This field determines the number of delay elements to insert on data path between RCLK and SCLK.
15-7	PHY_CONFIG_RESV1_FLD	R	0h	Reserved

Table 14-90. OSPI_PHY_CONFIGURATION_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6-0	PHY_CONFIG_RX_DLL_DELAY_FLD	R/W	0h	RX DLL Delay. This field determines the number of delay elements to insert on data path between RCLK and sampling clock.

14.46 OSPI_PHY_MASTER_CONTROL_REG Register (Offset = B8h) [reset = 00800000h]

OSPI_PHY_MASTER_CONTROL_REG is shown in [Figure 14-44](#) and described in [Table 14-92](#).

Return to [Summary Table](#).

PHY DLL Master Control Register.

This register defines the configuration and control logic of DLL intended to work in DLL Master Mode.

**Table 14-91. OSPI_PHY_MASTER_CONTROL_REG
Instances**

Instance	Physical Address
FSS0_OSPI0_CTRL	00B8h

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 14-92. OSPI_PHY_MASTER_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	PHY_MASTER_CONTROL_RESV3_FLD	R	0h	Reserved
24	PHY_MASTER_LOCK_MODE_FLD	R/W	0h	Determines if the master delay line locks on a full cycle or half cycle of delay. This bit need not be written by software. If DLL does not lock in full cycle, it will automatically try to lock in half cycle mode. 0h = Full cycle of delay 1h = Half cycle of delay

Table 14-92. OSPI_PHY_MASTER_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	PHY_MASTER_BYPASS_MODE_FLD	R/W	1h	Controls the bypass mode of the master and slave DLLs. Controls the bypass mode of the master and slave DLLs. If this bit is set, the bypass mode is intended to be used only for debug. 0h = Master operational mode DLL works in normal mode of operation where the slave delay line settings are used as fractional delay of the master delay line encoder reading of the number of delays in one cycle. 1h = Bypass mode Master DLL is disabled with only 1 delay element in its delay line. The slave delay lines decode delays in absolute delay elements rather than as fractional delays. Delays are defined in OSPI_PHY_CONFIGURATION_REG[22-16] PHY_CONFIG_TX_DLL_DELAY_FLD and OSPI_PHY_CONFIGURATION_REG[6-0] PHY_CONFIG_RX_DLL_DELAY_FLD bit fields.
22-20	PHY_MASTER_PHASE_DETECT_SELECTOR_FLD	R/W	0h	Selects the number of delay elements to be inserted between the phase detect flip-flops. 0h = One delay element 1h = Two delay element 2h = Three delay element 3h = Four delay element 4h = Five delay element 5h = Six delay element 6h = Seven delay element 7h = Eight delay element
19	PHY_MASTER_CONTROL_RESV2_FLD	R	0h	Reserved
18-16	PHY_MASTER_NB_INDICATIONS_FLD	R/W	0h	Holds the number of consecutive increment or decrement indications.
15-7	PHY_MASTER_CONTROL_RESV1_FLD	R	0h	Reserved
6-0	PHY_MASTER_INITIAL_DELAY_FLD	R/W	0h	This value is the initial delay value for the Master DLL.

14.47 OSPI_DLL_OBSERVABLE_LOWER_REG Register (Offset = BCh) [reset = 0h]

OSPI_DLL_OBSERVABLE_LOWER_REG is shown in [Figure 14-45](#) and described in [Table 14-94](#).

Return to [Summary Table](#).

DLL Observable Register Lower.

This register allows to observe and debug DLL status.

Table 14-93.

LEGEND: R = Read Only; -n = value after reset

Table 14-94. OSPI_DLL_OBSERVABLE_LOWER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	DLL_OBSERVABLE_LOWER_DLL_LOCK_INC_FLD	R	0h	Holds the state of the cumulative lock incremental steps when the OSPI_DLL_OBSERVABLE_LOWER_REG[7-3] DLL_OBSERVABLE_LOWER_UNLOCK_COUNTER_FLD of this parameter was triggered to increment or was last saturated at a value of 1Fh.
23-16	DLL_OBSERVABLE_LOWER_DLL_LOCK_DEC_FLD	R	0h	Holds the state of the cumulative lock decremental steps when the OSPI_DLL_OBSERVABLE_LOWER_REG[7-3] DLL_OBSERVABLE_LOWER_UNLOCK_COUNTER_FLD of this parameter was triggered to decrement or was last saturated at a value of 1Fh.
15	DLL_OBSERVABLE_LOWER_LOOPBACK_LOCK_FLD	R	0h	This bit indicates that lock of loopback is done.
14-8	DLL_OBSERVABLE_LOWER_LOCK_VALUE_FLD	R	0h	DLL Lock Value. Reports the DLL encoder value from the master DLL to the slave DLLs.

Table 14-94. OSPI_DLL_OBSERVABLE_LOWER_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-3	DLL_OBSERVABLE_LOWER_UNLOCK_COUNTER_FLD	R	0h	DLL Unlock Counter. Reports the number of increments or decrements required for the master DLL to complete the locking process.
2-1	DLL_OBSERVABLE_LOWER_LOCK_MODE_FLD	R	0h	DLL Locked Mode. Defines the mode in which the DLL has achieved the lock: 0h = Full clock mode. The master delay line was long enough to lock on one full clock cycle of delay. 1h = Reserved. 2h = Half clock mode. The master delay line was not long enough to lock one full cycle of delay but could lock on a half- cycle of delay. 3h = Saturation mode. The master delay line was not long enough to lock on a full or a half clock cycle. In this mode, the encoder value is fixed at the maximum delay line setting and the master DLL will be disabled. The slave delay lines continue to use the fractional delays based upon the fixed saturation value of the delay line.
0	DLL_OBSERVABLE_LOWER_DLL_LOCK_FLD	R	0h	DLL Lock. Indicates status of DLL 0h = DLL has not locked 1h = DLL is locked

14.48 OSPI_DLL_OBSERVABLE_UPPER_REG Register (Offset = C0h) [reset = 0h]

OSPI_DLL_OBSERVABLE_UPPER_REG is shown in [Figure 14-46](#) and described in [Table 14-96](#).

Return to [Summary Table](#).

DLL Observable Register Upper.

This register allows to observe and debug DLL status.

14.57 OSPI_ECC_SEC_EOI_REG Register (Offset = 3Ch) [reset = 0h]

OSPI_ECC_SEC_EOI_REG is shown in [Figure 14-54](#) and described in [Table 14-114](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 15-12. MCU_FSS0_HPB0_MC_CSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	WRSTOERR	R	0h	Write RSTO Error This bit indicates whether HyperBus memory is under reset state in the latest write operation. When this bit is set, HBMC responds by AXI SLVERR. 0h = Normal operation 1h = HyperBus memory is under reset
25	WTRSERR	R	0h	Write Transaction Error This bit indicates whether AXI protocol is acceptable by HBMC in the latest write transaction. When this bit is set, HBMC responds by AXI SLVERR. 0h = Normal operation 1h = This protocol is not supported
24	WDECERR	R	0h	Write Decode Error This bit indicates whether access address is acceptable in the latest write transaction. When this bit is set, HBMC responds by AXI DECERR. 0h = Normal operation 1h = Access address is not reachable
23-17	RESERVED	R	0h	Reserved

Table 15-12. MCU_FSS0_HPBO_MC_CSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	WACT	R	0h	Write Active This bit indicates whether write transaction is in progress or not. When receiving write request on write address channel, this bit becomes 1h. When retrieving response signaling on write response channel, this bit becomes 0h. 0h = Write is idle 1h = Write is active
15-12	RESERVED	R	0h	Reserved
11	RDSSTALL	R	0h	RDS Stall This bit indicates whether read data transfer from HyperBus memory is stalled (RDS Stall remains LOW) in the latest read transaction. When this bit is set, HBMC responds by AXI SLVERR. 0h = Normal operation 1h = RDS is stalled
10	RRSTOERR	R	0h	Read RSTO Error This bit indicates whether HyperBus memory is under reset state in the latest read operation. When this bit is set, HBMC responds by AXI SLVERR. 0h = Normal operation 1h = HyperBus memory is under reset
9	RTRSERR	R	0h	Read Transaction Error This bit indicates whether AXI protocol is acceptable by HBMC in the latest read transaction. When this bit is set, HBMC responds by AXI SLVERR. 0h = Normal operation 1h = This protocol is not supported
8	RDECERR	R	0h	Read Decode Error This bit indicates whether access address is acceptable in the latest read transaction. When this bit is set, HBMC responds by AXI DECERR. 0h = Normal operation 1h = Access address is not reachable
7-1	RESERVED	R	0h	Reserved
0	RACT	R	0h	Read Active This bit indicates whether read transaction is in progress or not. When receiving read request on read address channel, this bit becomes 1h. When retrieving all requested data on read data channel, this bit becomes 0h. 0h = Read is idle 1h = Read is active

15.7 MCU_FSS0_HPBO_MC_IER Register (Offset = 4h) [reset = 0h]

MCU_FSS0_HPBO_MC_IER is shown in [Figure 15-5](#) and described in [Table 15-14](#).

Return to [Summary Table](#).

Interrupt Enable Register

The HBMC outputs optional interrupt signal by condition enabled by the Interrupt Enable Register.

15.19 MCU_FSS0_HPBO_ECC_SEC_EOI_REG Register (Offset = 3Ch) [reset = Fh]

MCU_FSS0_HPBO_ECC_SEC_EOI_REG is shown in [Figure 15-16](#) and described in [Table 15-38](#).

Return to [Summary Table](#).

End Of Interrupt (EOI) Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

16 GPMC Registers

Table 16-2 lists the memory-mapped registers for the GPMC. All register offset addresses not listed in Table 16-2 should be considered as reserved locations and the register contents should not be modified.

Note

All GPMC registers are aligned to 32-bit address boundaries. All register file accesses, except to GPMC_NAND_DATA_i register, are little-endian. If the GPMC_NAND_DATA_i register location is accessed, the endianness is access-dependent.

Table 16-6. GPMC_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0.
4-3	IDLEMODE	R/W	0h	0h = Force-idle. A clock stop request is acknowledged unconditionally. 1h (R/W) = No-idle. A clock stop request is never acknowledged. 2h (R/W) = Smart-idle. Acknowledgment to a clock stop request is given based on the internal activity of the module. 3h (R/W) = Reserved. Do not use.
2	RESERVED	R	0h	Write 0 for future compatibility Read returns 0.
1	RESERVED	R/W	0h	This bit must be kept 0 for normal functioning of the IP. Do not set this bit to 1. 0h = Normal mode 1h = The module is reset
0	AUTOIDLE	R/W	0h	Internal interface clock-gating strategy 0h (R/W) = Interface clock is free-running. 1h (R/W) = Automatic Interface clock gating strategy is applied, based on the interconnect activity.

16.3 GPMC_SYSSTATUS Register (Offset = 14h) [reset = 0000000-h]

GPMC_SYSSTATUS is shown in [Figure 16-3](#) and described in [Table 16-8](#).

This register provides status information about the module, excluding the interrupt status information.

Table 16-7. GPMC_SYSSTATUS Instances

Instance	Physical Address

0	RESETDONE	R	-h	Internal reset monitoring 0h (R) = Internal module reset is ongoing. 1h (R) = Reset is complete.

16.4 GPMC_IRQSTATUS Register (Offset = 18h) [reset = 0h]

GPMC_IRQSTATUS is shown in [Figure 16-4](#) and described in [Table 16-10](#).

This interrupt status register regroups all the status of the module internal events that can generate an interrupt.

Table 16-9. GPMC_IRQSTATUS Instances

8	WAIT0EDGEDETECTIONSTATUS	R/W	0h	Status of the Wait0 Edge Detection interrupt Write: 0h = WAIT0EDGEDETECTIONSTATUS bit is unchanged. 1h = WAIT0EDGEDETECTIONSTATUS bit is reset. Read: 0h = A transition on WAIT0 input pin has not been detected. 1h = A transition on WAIT0 input pin has been detected.
7-2	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0s.
1	TERMINALCOUNTSTATUS	R/W	0h	Status of the TerminalCountEvent interrupt Write: 0h = TERMINALCOUNTSTATUS bit is unchanged. 1h = TERMINALCOUNTSTATUS bit is reset. Read: 0h = Indicates that CountValue is greater than 0. 1h = Indicates that CountValue is equal to 0.

Table 16-10. GPMC_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	FIFOEVENTSTATUS	R/W	0h	<p>Status of the FIFOEvent interrupt</p> <p>Write:</p> <p>0h = FIFOEVENTSTATUS bit is unchanged.</p> <p>1h = FIFOEVENTSTATUS bit is reset.</p> <p>Read:</p> <p>0h = Indicates that less than GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and less than FIFOTHRESHOLD bytes free places are available in write-posting mode.</p> <p>1h = Indicates that at least GPMC_PREFETCH_STATUS[16] FIFOTHRESHOLDSTATUS bytes are available in prefetch mode and at least FIFOTHRESHOLD bytes free places are available in write-posting mode.</p>

16.5 GPMC_IRQENABLE Register (Offset = 1Ch) [reset = 0h]

GPMC_IRQENABLE is shown in [Figure 16-5](#) and described in [Table 16-12](#).

The interrupt enable register allows to mask/unmask the module internal sources of interrupt, on a event-by-event basis.

Table 16-11. GPMC_IRQENABLE Instances

9	WAIT1EDGEDETECTIONENABLE	R/W	0h	Enables the Wait1 Edge Detection interrupt 0h (R/W) = Wait1EdgeDetection interrupt is masked. 1h (R/W) = Wait1EdgeDetection event generates an interrupt if occurs.
8	WAIT0EDGEDETECTIONENABLE	R/W	0h	Enables the Wait0 Edge Detection interrupt 0h (R/W) = Wait0EdgeDetection interrupt is masked. 1h (R/W) = Wait0EdgeDetection event generates an interrupt if occurs.
7-2	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0s.
1	TERMINALCOUNTEVENTENABLE	R/W	0h	Enables TerminalCountEvent interrupt issuing in prefetch or write-posting mode 0h (R/W) = TerminalCountEvent interrupt is masked. 1h (R/W) = TerminalCountEvent interrupt is not masked.
0	FIFOEVENTENABLE	R/W	0h	Enables the FIFOEvent interrupt 0h (R/W) = FIFOEvent interrupt is masked. 1h (R/W) = FIFOEvent interrupt is not masked.

16.6 GPMC_TIMEOUT_CONTROL Register (Offset = 40h) [reset = 1FF0h]

GPMC_TIMEOUT_CONTROL is shown in [Figure 16-6](#) and described in [Table 16-14](#).

The GPMC_TIMEOUT_CONTROL register allows the user to set the start value of the timeout counter.

Table 16-13. GPMC_TIMEOUT_CONTROL Instances

Bit	Field	Type	Reset	Description
31	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0.
30-0	ILLEGALADD	R	0h	Address of illegal access A30: 0 for memory region, 1 for GPMC register region A29-A0: 1GB maximum

16.8 GPMC_ERR_TYPE Register (Offset = 48h) [reset = 0h]

GPMC_ERR_TYPE is shown in [Figure 16-8](#) and described in [Table 16-18](#).

The GPMC_ERR_TYPE register stores the type of error when an error occurs.

Table 16-17. GPMC_ERR_TYPE Instances

31-11	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0s.
10-8	ILLEGALMCMD	R	0h	System command of the transaction that caused the error
7-5	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0s.
4	ERRORNOTSUPPADD	R	0h	Not supported address error 0h (R) = No error occurs. 1h (R) = The error is due to a nonsupported address.
3	ERRORNOTSUPPMCMD	R	0h	Not supported command error 0h (R) = No error occurs. 1h (R) = The error is due to a nonsupported command
2	ERRORTIMEOUT	R	0h	Time-out error 0h (R) = No error occurs. 1h (R) = The error is due to a timeout.
1	RESERVED	R	0h	Write 0s for future compatibility. Read returns 0.
0	ERRORVALID	R/W1C	0h	Error validity status - Must be explicitly cleared with a write 1 transaction 0h (R/W) = All error fields no longer valid 1h (R/W) = Error detected and logged in the other error fields

16.9 GPMC_CONFIG Register (Offset = 50h) [reset = 200h]

GPMC_CONFIG is shown in [Figure 16-9](#) and described in [Table 16-20](#).

The configuration register allows global configuration of the GPMC.

Table 16-19. GPMC_CONFIG Instances

Bit	Field	Type	Reset	Description
31-0	REVISION	R	20h	TI internal data. Identifies revision of peripheral.

17.2 ELM_SYSCONFIG Register (Offset = 10h) [reset = 11h]

ELM_SYSCONFIG is shown in [Figure 17-2](#) and described in [Table 17-6](#).

This register controls ELM local power management and software reset.

Note

Some of the ELM features described in this section may not be supported on this family of devices. For more information, see *ELM Not Supported Features*.

Table 17-6. ELM_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	Reserved
8	CLOCKACTIVITYOCP	R/W	0h	ELM_FICLK activity when module is in IDLE mode 0h (R/W) = ELM_FICLK can be switched off. 1h (R/W) = ELM_FICLK is maintained.
7-5	RESERVED	R	0h	Reserved
4-3	SIDLEMODE	R/W	2h	Slave interface power management (clock stop req/ack control) 0h (R/W) = Force-idle. A clock stop request is acknowledged unconditionally and immediately 1h (R/W) = No-idle. A clock stop request is never acknowledged. 2h (R/W) = Smart-idle. The acknowledgment to a clock stop request is given based on the internal activity. 3h (R/W) = Reserved — do not use
2	RESERVED	R	0h	Reserved
1	SOFTRESET	R/W	0h	Module software reset This bit is automatically reset by hardware (during reads, it always returns 0). It has same effect as ELM_RST. 0h (R/W) = Normal mode 1h (R/W) = Start soft reset sequence.

Table 17-6. ELM_SYSCONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	AUTOGATING	R/W	1h	<p>Internal ELM_FICLK gating strategy (no module visible effect other than saving power)</p> <p>0h (R/W) = ELM_FICLK is free-running.</p> <p>1h (R/W) = Automatic internal ELM_FICLK gating strategy is applied based on the Interconnect interface activity.</p>

17.3 ELM_SYSSTATUS Register (Offset = 14h) [reset = 0h]

ELM_SYSSTATUS is shown in [Figure 17-3](#) and described in [Table 17-8](#).

Internal reset monitoring

Undefined since:

From hardware perspective, the reset state is 0.

From software user perspective, when the accessible module is 1.

25	SUPPORT3P0VOLT	R/W	0h	3.0 V Support Should be set based on whether 3.0 V is supported on the SD Interface.

Table 18-10. MMCSDB_SS_CTL_CFG_2_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	SUPPORT3P3VOLT	R/W	0h	3.3 V Support Suggested Value is 1h as the 3.3 V is the default voltage on the SD Interface.
23	SUSPRESSUPPORT	R/W	1h	Suspend/Resume Support Suggested Value is 1h (The Suspend/Resume is supported by Core). Optionally can be set to 0h if the application doesn't want to support Suspend/Resume Mode.
22	SDMASUPPORT	R/W	1h	SDMA Support Suggested Value is 1h (The SDMA is supported by Core). Optionally can be set to 0h if the application doesn't want to support SDMA Mode.
21	HIGHSPEEDSUPPORT	R/W	1h	High Speed Support Suggested Value is 1h (The High Speed mode is supported by Core).
20	RESERVED	R	0h	Reserved
19	ADMA2SUPPORT	R/W	1h	ADMA2 Support Suggested Value is 1h (The ADMA2 is supported by Core). Optionally can be set to 0h if the application doesn't want to support ADMA2 Mode.
18	SUPPORT8BIT	R/W	1h	8-bit Support for Embedded Device Suggested Value is 1h (The Core supports 8-bit Interface). Optionally can be set to 0h if the application supports only 4-bit SD Interface.
17-16	MAXBLKLENGTH	R/W	0h	Max Block Length Maximum Block Length supported by the Core/Device. 0h: 512 Bytes 1h: 1024 Bytes 2h: 2048 Bytes 3h: Reserved
15-8	BASECLKFREQ	R/W	C8h	Base Clock Frequency for SD Clock This is the frequency of the FCLK.
7	TIMEOUTCLKUNIT	R/W	0h	Timeout Clock Unit Suggested Value is 0h (KHz).
6	RESERVED	R	0h	Reserved
5-0	TIMEOUTCLKFREQ	R/W	1h	Timeout Clock Frequency Suggested Value is 1 KHz. Internally the 1 ms Timer is used for Timeout Detection. The 1 ms Timer is generated from the FCLK.

18.2.1 MMCSD0_SDMA_SYS_ADDR_LO Register (Offset = 0h) [reset = 0h]

MMCSD0_SDMA_SYS_ADDR_LO is shown in [Figure 18-30](#) and described in [Table 18-93](#).

Return to [Summary Table](#).

This register contains the Lower 16-bit of physical system memory address used for DMA transfers or the second argument for the Auto CMD23 in Host version 3.0 and as 32-bit Block Count in Version 4.10.

**Table 18-92. MMCSD0_SDMA_SYS_ADDR_LO
Instances**

Instance	Physical Address
MMCSD0_CTL_CFG	04F8 0000h

SDMA_ADDRESS															
R/W-0h															

LEGEND: R/W = Read/Write; -n = value after reset

Table 18-93. MMCS0_SDMA_SYS_ADDR_LO Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	SDMA_ADDRESS	R/W	0h	<p>32-bit Block Count (SDMA System Address) Low</p> <p>When the MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 0h, DMA uses this register as system address in only 32-bit addressing mode. Auto CMD23 cannot be used with SDMA.</p> <p>When the MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, SDMA uses the MMCS0_ADMA_SYS_ADDRESS register instead of using this register to support both 32-bit and 64-bit addressing. This register is re-assigned to 32-bit Block Count and then SDMA may use Auto CMD23.</p> <p>(1) SDMA System Address (MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 0h)</p> <p>This register contains the system memory address for a SDMA transfer in 32-bit addressing mode. When the Host Controller (HC) stops a SDMA transfer, this register shall point to the system address of the next contiguous data position.</p> <p>It can be accessed only if no transaction is executing (after a transaction has stopped). Reading this register during SDMA transfers may return an invalid value. The Host Driver (HD) shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the MMCS0_BLOCK_SIZE[14-12] SDMA_BUF_SIZE bit field. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (Offset = 3h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by setting the MMCS0_BLOCK_GAP_CONTROL[1] CONTINUE bit, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register (MMCS0_SDMA_SYS_ADDR_LO/ MMCS0_SDMA_SYS_ADDR_HI). ADMA does not use this register.</p> <p>(2) 32-bit Block Count (MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h)</p> <p>Host Controller Version 4.10 re-defines this register as 32-bit Block Count . In version 4.00, this register may be used as 32-bit block count only for Auto CMD23 to set the argument of the CMD23 while executing Auto CMD23.</p> <p>The Host Controller would decrement the block count of this register every block transfer and data transfer stops when the count reaches zero.</p> <p>FFFF FFFFh (4G - 1 Block)</p> <p>....</p> <p>0000 0002h (2 Blocks)</p> <p>0000 0001h (1 Block)</p> <p>0000 0000h (Stop Count)</p> <p>Note: This register should be accessed only when no transaction is executing. Reading this register during data transfers may return invalid value.</p>

18.2.2 MMCSD0_SDMA_SYS_ADDR_HI Register (Offset = 2h) [reset = 0h]

MMCSD0_SDMA_SYS_ADDR_HI is shown in [Figure 18-31](#) and described in [Table 18-95](#).

Return to [Summary Table](#).

This register contains the Upper 16-bit of physical system memory address used for DMA transfers or the second argument for the Auto CMD23 in Host version 3.0 and as 32-bit Block Count in Version 4.10.

**Table 18-94. MMCSD0_SDMA_SYS_ADDR_HI

4	DATA_XFER_DIR	R/W	0h	<p>Data Transfer Direction Select</p> <p>This bit defines the direction of data transfers.</p> <p>0h: Write (Host to Card)</p> <p>1h: Read (Card to Host)</p>

Table 18-105. MMCS0_TRANSFER_MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	AUTO_CMD_ENA	R/W	0h	<p>Auto CMD Enable</p> <p>This field determines use of auto command functions. There are three methods to stop Multiple-block read and write operation by CMD23 or CMD12. In the other operations (for example single read/write operation), this field is set to 0h.</p> <p>(1) Auto CMD12 Enable:</p> <p>Multiple-block read and write commands for memory require CMD12 to stop the operation. When this field is set to 1h, the Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the MMCS0_AUTOCMD_ERR_STS register. The Host Driver shall not set this bit if the command does not require CMD12.</p> <p>When MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 0h, CMD12 is issued when 16-bit Block Count is expired.</p> <p>When MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h, CMD12 is issued when 16-bit Block Count or 32-bit Block Count is expired.</p> <p>(2) Auto CMD23 Enable:</p> <p>When this bit field is set to 2h, the Host Controller issues a CMD23 automatically before issuing a command specified in the MMCS0_COMMAND register. The Host Controller Version 3.00 and later shall support this function.</p> <p>The following conditions are required to use the Auto CMD23:</p> <p>Auto CMD23 Supported (Host Controller Version is 3.00 or later).</p> <p>A memory card that supports CMD23 (SCR[33] = 1h).</p> <p>If DMA is used, it shall be ADMA.</p> <p>Only when CMD18 or CMD25 is issued. Auto CMD23 can be used with or without ADMA. By writing the MMCS0_COMMAND register, the Host Controller issues a CMD23 first and then issues a command specified by the MMCS0_COMMAND[13:8] CMD_INDEX bit field. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the MMCS0_AUTOCMD_ERR_STS register.</p> <p>32-bit block count value for CMD23 is set to 32-bit Block Count (MMCS0_SDMA_SYS_ADDR_LO/MMCS0_SDMA_SYS_ADDR_HI) register.</p> <p>(3) Auto CMD Auto Select (Version 4.10):</p> <p>As CMD23 is optional for SD memory card except UHS 104 card, if card supports CMD23, Auto CMD 23 should be used instead of Auto CMD12. Host Controller Version 4.10 defines this "Auto CMD Auto Select" mode. Selection of Auto CMD depends on setting of the MMCS0_HOST_CONTROL2[11] CMD23_ENA bit which indicates whether card supports CMD23. If MMCS0_HOST_CONTROL2[11] CMD23_ENA = 1h, Auto CMD23 is used and if MMCS0_HOST_CONTROL2[11] CMD23_ENA = 0h, Auto CMD12 is used. In case of Version 4.10 or later, use of Auto CMD Auto Select is recommended rather than use of Auto CMD12 Enable or Auto CMD23 Enable.</p> <p>0h: Auto Command Disabled</p> <p>1h: Auto CMD12 Enable</p> <p>2h: Auto CMD23 Enable</p> <p>3h: Reserved</p>

Table 18-105. MMCS0_TRANSFER_MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	BLK_CNT_ENA	R/W	0h	Block Count Enable This bit is used to enable the MMCS0_BLOCK_COUNT register, which is only relevant for multiple block transfers. When this bit is 0h, the MMCS0_BLOCK_COUNT register is disabled, which is useful in executing an infinite transfer. 0h: Disable 1h: Enable
0	DMA_ENA	R/W	0h	DMA Enable DMA can be enabled only if the MMCS0_CAPABILITIES[22] SDMA_SUPPORT bit is set. If this bit is set to 1h, a DMA operation shall begin when the HD writes to the upper byte of the MMCS0_COMMAND register. 0h: Disable 1h: Enable

This register is used to control the operations of data transfers.

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to MMCS0_COMMAND[5] DATA_PRESENT bit), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the MMCS0_PRESENTSTATE[1] INHIBIT_DAT bit is 1h.

Table 18-106 shows the determination of transfer type.

Table 18-106. Determination of Transfer Type

Multi/Single Block Select	Block Count Enable	Block Count	Function
0	Don't Care	Don't Care	Single Transfer
1	0	Don't Care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

18.2.8 MMCSD0_COMMAND Register (Offset = Eh) [reset = 0h]

MMCSD0_COMMAND is shown in [Figure 18-37](#) and described in [Table 18-108](#).

Return to [Summary Table](#).

This register is used to program the Command for host controller.

Table 18-107. MMCSD0_COMMAND Instances

Table 18-108. MMCSD0_COMMAND Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	RESERVED	R	0h	Reserved
13-8	CMD_INDEX	R/W	0h	Command Index This bit shall be set to the command number (CMD0-63, ACMD0-63).
7-6	CMD_TYPE	R/W	0h	Command Type There are three types of special commands. Suspend, Resume and Abort. These bits shall be set to 0h for all other commands. Suspend Command: If the Suspend command succeeds, the HC shall assume the SD Bus has been released and that it is possible to issue the next command which uses the DAT line. The HC shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The Interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the HC shall maintain its current state, and the HD shall restart the transfer by setting the MMCSD0_BLOCK_GAP_CONTROL[1] CONTINUE bit. Resume Command: The HD re-starts the data transfer by restoring the registers in the range of 04F8 0000h - 04F8 000Dh. The HC shall check for busy before starting write transfers. Abort Command: If this command is set when executing a read transfer, the HC shall stop reads to the buffer. If this command is set when executing a write transfer, the HC shall stop driving the DAT line. After issuing the Abort command, the HD should issue a software reset. 0h: Normal 1h: Suspend 2h: Resume 3h: Abort

Table 18-108. MMCS0_COMMAND Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	DATA_PRESENT	R/W	0h	<p>Data Present Select</p> <p>This bit is set to 1h to indicate that data is present and shall be transferred using the DAT line. If is set to 0h for the following:</p> <ol style="list-style-type: none"> 1. Commands using only CMD line (for example CMD52). 2. Commands with no data transfer but using busy signal on DAT[0]line (R1b or R5b for example CMD38). 3. Resume Command. <p>0h: No Data Present 1h: Data Present</p>
4	CMD_INDEX_CHK_ENA	R/W	0h	<p>Command Index Check Enable</p> <p>If this bit is set to 1h, the HC shall check the index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0h, the Index field is not checked.</p> <p>0h: Disable 1h: Enable</p>
3	CMD_CRC_CHK_ENA	R/W	0h	<p>Command CRC Check Enable</p> <p>If this bit is set to 1h, the HC shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0h, the CRC field is not checked.</p> <p>0h: Disable 1h: Enable</p>
2	SUB_CMD	R/W	0h	<p>Sub Command Flag</p> <p>This bit is added from Version 4.10 to distinguish a main command or sub command. When issuing a main command, this bit is set to 0h and when issuing a sub command, this bit is set to 1h. Setting of this bit is checked by the MMCS0_PRESENTSTATE[28] SUB_COMMAND_STS bit.</p> <p>Host Driver manages whether main or sub command. Host Controller does not refer to this bit to issue a command.</p> <p>0h: Sub Command 1h: Main Command</p>
1-0	RESP_TYPE_SEL	R/W	0h	<p>Response Type Select</p> <p>0h: No Response 1h: Response length 136 2h: Response length 48 3h: Response length 48 check Busy after response</p>

18.2.9 MMCSD0_RESPONSE_0 to MMCSD0_RESPONSE_7 Register (Offset = 10h to 1Eh) [reset = 0h]

MMCSD0_RESPONSE_0 to MMCSD0_RESPONSE_7 is shown in [Figure 18-38](#) and described in [Table 18-110](#).

Return to [Summary Table](#).

This registers is used to store responses from SD Cards.

Table 18-110. Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	CMD_RESP	R	0h	Command Response R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register.

[Table 18-111](#) defines the relation between the parameter and name of response type.

Table 18-111. Relation between Parameters and the Name of Response Type

Response Type	Index Check Enable	CRC Check Enable	Name of Response Type
00	0	0	No Response
01	0	1	R2
10	0	0	R3, R4
10	1	1	R1, R6, R5, R7
11	1	1	R1b, R5b

The following table describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register.

[Table 18-112](#) shows response bit definition for each response type.

Table 18-112. Response Bit Definition for each Response Type

Kind of Response	Meaning of Response	Response Field	Response Register
R1, R1b (normal response)	Card Status	R[39:8]	REP[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	REP[127:96]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	REP [127:96]
R2 (CID, CSD Register)	CID or CSD register include	R[127:8]	REP[119:0]
R3 (OCR Register)	OCR Register for memory	R[39:8]	REP[31:0]
R4 (OCR Register)	OCR Register for I/O etc.	R[39:8]	REP[31:0]
R5, R5b	SDIO Response	R[39:8]	REP[31:0]
R6 (Published RCA response)	New published RCA[31:16] etc.	R[39:8]	REP[31:0]

The Response Field indicates bit positions of "Responses" defined in the Physical Layer Specification. The table shows most responses with a length of 48 (R[47:0]) have 32 bits of the response data (R[39:8]) stored

in the Response register at REP[31:0]. Responses of type R1b (Auto CMD12 responses) and R1 (Auto CMD23 response) have response data bits R[39:8] stored in the Response register at REP[127:96]. Responses with length 136 (R[135:0]) have 120 bits of the response data (R[127:8]) stored in the Response register at REP[119:0].

To read the response status efficiently, the Host Controller only stores part of the response data in the Response register. This enables the Host Driver to read 32 bits of response data efficiently in one read cycle on a 32-bit bus system. Parts of the response, the Index field and the CRC, are checked by the Host Controller (as specified by the MMCSD0_COMMAND[4] CMD_INDEX_CHK_ENA and MMCSD0_COMMAND[3] CMD_CRC_CHK_ENA bits) and generate an error interrupt if an error is detected. The bit range for the CRC check depends on the response length. If the response length is 48, the Host Controller shall check R[47:1], and if the response length is 136 the Host Controller shall check R[119:1].

Since the Host Controller may have a multiple block data DAT line transfer executing concurrently with a CMD_wo_DAT command, the Host Controller stores the Auto CMD12 response in the upper bits (REP[127:96]) of the Response register. The CMD_wo_DAT response is stored in REP[31:0]. This allows the Host Controller to avoid overwriting the Auto CMD12 response with the CMD_wo_DAT and vice versa.

While executing Auto CMD23, the response of CMD23 is saved to REP [127:96] and the response of multiple-block read and write command is save to REP [31:0]. The response error of CMD23 is indicated in the MMCSD0_AUTOCMD_ERR_STS register. When the Host Controller modifies part of the Response register, as shown in the table, it shall preserve the unmodified bits.

18.2.10 MMCSD0_DATA_PORT Register (Offset = 20h) [reset = 0h]

MMCSD0_DATA_PORT is shown in [Figure 18-39](#) and described in [Table 18-114](#).

Return to [Summary Table](#).

This register is used to access internal buffer.

Table 18-116. MMCS0_PRESENTSTATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	UHS2_IF_DETECTION	R	0h	<p>UHS-II IF Detection (UHS-II Only)</p> <p>This status indicates whether a card supports UHS-II IF. This status is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCS0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). UHS-II interface initialization is activated by setting the MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA bit. Host Controller drives STB.L on D0 lane from EIDL state and waits for receiving STB.L on D1 lane. This bit is set to 1h if STB.L is detected on D1 lane. Host Controller shall compensate latency from setting SD Clock Enable to output STB.L on D0 lane when reading this status. This bit may be read any time after setting SD Clock Enable for faster UHS-II IF detection but Host Driver shall check this status at least 200μs period from setting SD Clock Enable (MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA) until detecting UHS-II IF.</p> <p>After UHS-II IF is detected, this bit is cleared by when EIDL is detected on D0 lane, UHS-II Interface Enable is set to 0h (MMCS0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or Host full reset is executed.</p> <p>1h: UHS-II IF is detected 0h: UHS-II IF is not detected</p>

Table 18-116. MMCSD0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	UHS2_IF_LANE_SYNC	R	0h	<p>Lane Synchronization (UHS-II Only)</p> <p>This status indicates whether lane is synchronized in UHS-II mode. This status is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCSD0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). On detecting UHS-II Interface (D31 = 1h), Host Controller provides SYN LSS on D0 lane and waits for receiving SYN LSS on D1 lane. If SYN LSS is detected on D1 lane, Host Controller provides LIDL LSS on D0 lane and waits for receiving LIDL LSS on D1 lane.</p> <p>In case of Version 4.00, this bit indicates completion of Device PHY Initialization by detecting LIDL LSS on D1 lane.</p> <p>From Version 4.10, Host Controller may implement a specific PHY verification method and PHY Initialization Failure can be indicated by keeping this bit to 0h even LIDL LSS is detected on D1 lane. Host Driver detects PHY Initialization Failure by timeout.</p> <p>This bit is cleared by when D0 lane is set to EIDL, UHS-II Interface Enable is set to 0h (MMCSD0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or executes Host full reset.</p> <p>1h: UHS-II PHY is initialized 0h: UHS-II PHY is not initialized</p>
29	UHS2_DORMANT	R	0h	<p>In Dormant State (UHS-II Only)</p> <p>This status indicates whether UHS-II lanes enter Dormant state. This function is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCSD0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). On issuing GO_DORMAT_STATE command, "Go Dormant Command (7h)" is set to Command type in the UHS-II Command register (MMCSD0_UHS2_COMMAND[7:6] CMD_TYPE). This command type acts as a trigger to enter lanes into dormant state. Host Controller provides STB.H and EIDL on D0 lane and waits for receiving STB.H and EIDL on D1 lane. This bit is set to 1h after the time of T_DMT_ENTRY (750 RCLK cycle) or more from detecting EIDL on D1 lane.</p> <p>RCLK may be stopped in dormant state, by setting SD Clock Enable to 0h in the Clock Control register (MMCSD0_CLOCK_CONTROL[2] SD_CLK_ENA = 0h) while In Dormant State bit is set to 1h.</p> <p>On writing Clock Control register with setting SD Clock Enable to 1h (MMCSD0_CLOCK_CONTROL[2] SD_CLK_ENA = 1h), Host Controller wakes lanes to exit Dormant State and In Dormant State is set to 0h.</p> <p>In case of the card enters Hibernate Mode (RCLK is stopped), Host Driver may turn off VDD1 by clearing SD Bus Power for VDD1 bit in the MMCSD0_POWER_CONTROL register. Host Controller shall turn off VDD1 after stopping RCLK. This bit is cleared by when Host Controller drives STB.L on D0 lane, UHS-II Interface Enable is set to 0h (MMCSD0_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or executes Host full reset.</p> <p>1h: In DORMANT state 0h: Not in DORMANT state</p>

Table 18-116. MMCSDB0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SUB_COMMAND_STS	R	0h	<p>Sub Command Status</p> <p>The MMCSDB0_COMMAND register and Response register (MMCSDB0_RESPONSE_0 to MMCSDB0_RESPONSE_7) are commonly used for main command and sub command. This status is used to distinguish which response error statuses, main command or sub command, indicated in the MMCSDB0_ERROR_INTR_STS register or in the MMCSDB0_UHS2_ERR_INTR_STS register. Just before reading of this register, the MMCSDB0_COMMAND[2] SUB_CMD bit or the MMCSDB0_UHS2_COMMAND register is copied to this status. This status is effective not only when Response Error interrupt is generated but also when data error interrupt is generated with Command Not Issued by Error (D27 of this register) or Auto CMD Error interrupt is generated with Command Not Issued by Error by Auto CMD12 in the MMCSDB0_AUTOCMD_ERR_STS register.</p> <p>1h: Sub Command Status 0h: Main Command Status</p>
27	CMD_NOT_ISS_BY_ERR	R	0h	<p>Command Not Issued by Error</p> <p>Setting of this status indicates that a command cannot be issued due to an error except Auto CMD12 error (equivalent error status by Auto CMD12 error is defined as Command Not Issued By Auto CMD12 Error in the MMCSDB0_AUTOCMD_ERR_STS register). This status is set to 1h when Host Controller cannot issue a command after setting MMCSDB0_COMMAND register or MMCSDB0_UHS2_COMMAND register. Sub Command Status (D28) indicates which command is not issued (main or sub).</p> <p>1h: Command cannot be issued 0h: No error for issuing a command</p>
26-25	RESERVED	R	0h	Reserved
24	SDIF_CMDIN	R	1h	<p>CMD Line Signal Level (SD Mode Only)</p> <p>This status is used to check CMD line level to recover from errors, and for debugging.</p>
23	SDIF_DAT3IN	R	1h	<p>DAT[3] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[3].</p> <p>D23 - DAT[3]</p>
22	SDIF_DAT2IN	R	1h	<p>DAT[2] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[2].</p> <p>D22 - DAT[2]</p>
21	SDIF_DAT1IN	R	1h	<p>DAT[1] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[1].</p> <p>D21 - DAT[1]</p>
20	SDIF_DAT0IN	R	1h	<p>DAT[0] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0].</p> <p>D20 - DAT[0]</p>

Table 18-116. MMCSD0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	WRITE_PROTECT	R	0h	Write Protect Switch Pin Level The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP pin. 0h: Write protected (SDWP = 1) 1h: Write enabled (SDWP = 0)
18	CARD_DETECT	R	0h	Card Detect Pin Level This bit reflects the inverse value of the SD_CD# pin. 0h: No Card present (SD_CD# = 1) 1h: Card present (SD_CD# = 0)
17	CARD_STATE_STABLE	R	0h	Card State Stable This bit is used for testing. If it is 0h, the Card Detect Pin Level is not stable. If this bit is set to 1h, it means the Card Detect Pin Level is stable. The MMCSD0_SOFTWARE_RESET[0] SWRST_FOR_ALL bit shall not affect this bit. 0h: Reset of Debouncing 1h: No Card or Inserted
16	CARD_INSERTED	R	0h	Card Inserted This bit indicates whether a card has been inserted. Changing from 0h to 1h generates a Card Insertion interrupt in the MMCSD0_NORMAL_INTR_STS register and changing from 1h to 0h generates a Card Removal Interrupt in the MMCSD0_NORMAL_INTR_STS register. The MMCSD0_SOFTWARE_RESET[0] SWRST_FOR_ALL bit shall not affect this bit. If a Card is removed while its power is on and its clock is oscillating, the HC shall clear the MMCSD0_POWER_CONTROL[0] SD_BUS_POWER bit and the MMCSD0_CLOCK_CONTROL[2] SD_CLK_ENA bit. In addition the HD should clear the HC by the MMCSD0_SOFTWARE_RESET[0] SWRST_FOR_ALL bit. The card detect is active regardless of the SD Bus Power. 0h: Reset or Debouncing or No Card 1h: Card Inserted
15-12	RESERVED	R	0h	Reserved
11	BUF_RD_ENA	R	0h	Buffer Read Enable This status is used for non-DMA read transfers. This read only flag indicates that valid data exists in the host side buffer status. If this bit is 1h, readable data exists in the buffer. A change of this bit from 1h to 0h occurs when all the block data is read from the buffer. A change of this bit from 0h to 1h occurs when all the block data is ready in the buffer and generates the Buffer Read Ready Interrupt. 0h: Read Disable 1h: Read Enable
10	BUF_WR_ENA	R	0h	Buffer Write Enable This status is used for non-DMA write transfers. This read only flag indicates if space is available for write data. If this bit is 1h, data can be written to the buffer. A change of this bit from 1h to 0h occurs when all the block data is written to the buffer. A change of this bit from 0h to 1h occurs when top of block data can be written to the buffer and generates the Buffer Write Ready Interrupt. 0h: Write Disable 1h: Write Enable

Table 18-116. MMCSDB0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	RD_XFER_ACTIVE	R	0h	<p>Read Transfer Active (SD Mode Only)</p> <p>This status is used for detecting completion of a read transfer. This bit is set to 1h for either of the following conditions:</p> <p>After the end bit of the read command.</p> <p>When writing a 1h to continue Request in the MMCSDB0_BLOCK_GAP_CONTROL register to restart a read transfer.</p> <p>This bit is cleared to 0h for either of the following conditions:</p> <p>When the last data block as specified by block length is transferred to the system.</p> <p>When all valid data blocks have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request set to 1h (MMCSDB0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h). A transfer complete interrupt is generated when this bit changes to 0h.</p> <p>1h: Transferring data 0h: No valid data</p>
8	WR_XFER_ACTIVE	R	0h	<p>Write Transfer Active (SD Mode Only)</p> <p>This status indicates a write transfer is active. If this bit is 0h, it means no valid write data exists in the HC. This bit is set in either of the following cases:</p> <p>After the end bit of the write command.</p> <p>When writing a 1h to the MMCSDB0_BLOCK_GAP_CONTROL[1] CONTINUE bit to restart a write transfer.</p> <p>This bit is cleared in either of the following cases:</p> <p>After getting the CRC status of the last data block as specified by the transfer count (Single or Multiple).</p> <p>After getting a CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0h, as a result of the Stop At Block Gap Request being set. This status is useful for the HD in determining when to issue commands during write busy.</p> <p>1h: Transferring data 0h: No valid data</p>
7	SDIF_DAT7IN	R	0h	<p>DAT[7] Line Signal Level (Embedded Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging.</p> <p>D07 - DAT[7]</p>
6	SDIF_DAT6IN	R	0h	<p>DAT[6] Line Signal Level (Embedded Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging.</p> <p>D06 - DAT[6]</p>
5	SDIF_DAT5IN	R	0h	<p>DAT[5] Line Signal Level (Embedded Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging.</p> <p>D05 - DAT[5]</p>

Table 18-116. MMCSD0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SDIF_DAT4IN	R	0h	DAT[4] Line Signal Level (Embedded Only) This status is used to check DAT line level to recover from errors, and for debugging. D04 - DAT[4]
3	RETUNING_REQ	R	0h	Re-Tuning Request (UHS-I Only) Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This bit is cleared when a command is issued with setting the MMCSD0_HOST_CONTROL2[6] EXECUTE_TUNING bit. Changing of this bit from 0h to 1h generates Re-Tuning Event. This bit isn't set to 1h if the MMCSD0_HOST_CONTROL2[7] SAMPLING_CLK_SELECT bit is set to 0h (using fixed sampling clock). 1h: Sampling clock needs re-tuning 0h: Fixed or well tuned sampling clock
2	DATA_LINE_ACTIVE	R	0h	DAT Line Active (SD Mode Only) This bit indicates whether one of the DAT line on SD bus is in use. 1h: DAT line active 0h: DAT line inactive
1	INHIBIT_DAT	R	0h	Command Inhibit (DAT) (SD Mode Only) This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1h. If this bit is 0h, it indicates the HC can issue the next SD command. Commands with busy signal belong to Command Inhibit (DAT) (for example R1b, R5b type). Changing from 1h to 0h generates a Transfer Complete interrupt in the MMCSD0_NORMAL_INTR_STS register. Note: The SD Host Driver can save registers in the range of 04F8 0000h - 04F8 000Dh for a suspend transaction after this bit has changed from 1h to 0h. 1h: Cannot issue command which uses the DAT line 0h: Can issue command which uses the DAT line

Table 18-116. MMCSDB0_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INHIBIT_CMD	R	0h	<p>Command Inhibit (CMD)</p> <p>SD Mode:</p> <p>If this bit is 0h, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line. This bit is set immediately after the MMCSDB0_COMMAND register is written. This bit is cleared when the command response is received. Even if the Command Inhibit (DAT) is set to 1h.</p> <p>Commands using only the CMD line can be issued if this bit is 0h. Changing from 1h to 0h generates a Command complete interrupt in the MMCSDB0_NORMAL_INTR_STS register. If the HC cannot issue the command because of a command conflict error or because of Command Not Issued By Auto CMD12 Error, this bit shall remain 1h and the Command Complete is not set. Status issuing Auto CMD12 is not read from this bit. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by the MMCSDB0_COMMAND register.</p> <p>UHS-II Mode:</p> <p>This bit is 0h means that a command packet can be issued by the Host Controller. While this bit is set to 1h, which means the Host Controller is not ready to issue a next command, Host Driver shall not write the registers from the MMCSDB0_UHS2_BLOCK_SIZE to the MMCSDB0_UHS2_COMMAND. Changing from 1h to 0h generates a Command Complete Interrupt in the MMCSDB0_NORMAL_INTR_STS register.</p> <p>1h: Host Controller is not ready to issue a command 0h: Host Controller is ready to issue a command</p> <p>Version 4.10 adds a new control to prevent error statuses from overwriting by receipt of a next command. This status keeps indicating 1h while any of response error statuses is set to 1h, Command Not Issued by Error in this register is set to 1h or the MMCSDB0_AUTOCMD_ERR_STS[7] CMD_NOT_ISSUED bit is set to 1h. Software Reset For CMD Line is used to clear the error statuses above and this status (MMCSDB0_SOFTWARE_RESET[1] SWRST_FOR_CMD).</p>

Note: DAT line active indicates whether one of the DAT line is on SD bus is in use.

(a) In the case of read transactions

This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1h to 0h generates a Block Gap Event interrupt in the MMCSDB0_NORMAL_INTR_STS register, as the result of the Stop At Block Gap Request being set.

This bit shall be set in either of the following cases:

- (1) After the end bit of the read command.
- (2) When writing a 1h to the MMCSDB0_BLOCK_GAP_CONTROL[1] CONTINUE bit to restart a read transfer.

This bit shall be cleared in either of the following cases:

(1) When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.

(2) When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP).

The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend/resume function.

(b) In the case of write transactions

This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1h to 0h generate a Transfer Complete interrupt in the MMCSD0_NORMAL_INTR_STS register.

This bit shall be set in either of the following cases:

(1) After the end bit of the write command.

(2) When writing to 1h to the MMCSD0_BLOCK_GAP_CONTROL[1] CONTINUE bit to continue a write transfer.

This bit shall be cleared in either of the following cases:

(1) When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive "Not Busy". In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.

(2) When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request (MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP).

(c) Command with busy

This status indicates whether a command indicates busy (for example erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1h to 0h generate a Transfer Complete interrupt in the MMCSD0_NORMAL_INTR_STS register.

Note

The HD can issue cmd0, cmd12, cmd13 (for memory) and cmd52 (for SDIO) when the DAT lines are busy during data transfer. These commands can be issued when Command Inhibit (CMD) is set to zero (MMCSD0_PRESENTSTATE[0] INHIBIT_CMD = 0h). Other commands shall be issued when Command Inhibit (DAT) is set to zero (MMCSD0_PRESENTSTATE[1] INHIBIT_DAT = 0h).

18.2.12 MMCS0_HOST_CONTROL1 Register (Offset = 28h) [reset = 0h]

MMCS0_HOST_CONTROL1 is shown in [Figure 18-41](#) and described in [Table 18-118](#).

Return to [Summary Table](#).

This register is used to program DMA modes, LED control, data transfer width, High Speed enable, card detect test level and signal selection.

Table 18-117. MMCS0_HOST_CONTROL1 Instances

Instance	Physical Address
MMCS0_CTL_CFG	04F8 0028h

LEGEND: R/W = Read/Write; -n = value after reset

Table 18-118. MMCS0_HOST_CONTROL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	CD_SIG_SEL	R/W	0h	Card Detect Signal Detection This bit selects source for card detection. 1h: The card detect test level is selected 0h: SDCD# is selected (for normal use)
6	CD_TEST_LEVEL	R/W	0h	Card Detect Test Level This bit is enabled while the Card Detect Signal Selection is set to 1h and it indicates card inserted or not. Generates (card ins or card removal) interrupt when the normal interrupt status enable bit is set. 1h: Card Inserted 0h: No Card
5	EXT_DATA_WIDTH	R/W	0h	Extended Data Transfer Width (Embedded and SD Mode Only) This bit controls 8-bit bus width mode for embedded device. Support of this function is indicated in 8-bit Support for Embedded Device in the MMCS0_CAPABILITIES register. If a device supports 8-bit bus mode, this bit may be set to 1h. If this bit is 0h, bus width is controlled by the MMCS0_HOST_CONTROL1[1] DATA_WIDTH bit. This bit is not effective when multiple devices are installed on a bus slot (Slot Type is set to 2h in the MMCS0_CAPABILITIES register). In this case, each device bus width is controlled by Bus Width Preset field in the Shared Bus register (MMCS0_SHARED_BUS_CTRL_PTR). 1h: 8-bit Bus Width 0h: Bus Width is Selected by Data Transfer Width

Table 18-118. MMCSD0_HOST_CONTROL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-3	DMA_SELECT	R/W	0h	<p>DMA Select</p> <p>This field is used to select DMA type. The Host Driver shall check support of DMA modes by referring the MMCSD0_CAPABILITIES register. Selected DMA is enabled by the MMCSD0_TRANSFER_MODE[0] DMA_ENA bit in SD mode and the MMCSD0_UHS2_XFER_MODE[0] DMA_ENA bit in UHS-II mode.</p> <p>(1) Up to Version 3.00:</p> <p>When MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 0h, setting of this field is compatible to Host Controller Version 3.00.</p> <p>SDMA is initiated by writing to the MMCSD0_COMMAND register when this field is set to 0h and the SDMA System Address register (32-bit) is used (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI). SDMA does not support 64-bit addressing.</p> <p>ADMA2 is initiated by writing to the MMCSD0_COMMAND register when this field is set to 2h or 3h. Lower 32-bit of the ADMA System Address register (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI) is used when this field is set to 2h and 64-bit of the ADMA System Address register is used when this field is set to 3h. Support of 64-bit System Addressing is indicated by the MMCSD0_CAPABILITIES[28] ADDR_64BIT_SUPPORT_V3 bit. 64-bit ADMA2 uses 96-bit Descriptor.</p> <p>0h: SDMA is selected</p> <p>1h: 32-bit Address ADMA1 is selected</p> <p>2h: 32-bit Address ADMA2 is selected</p> <p>3h: 64-bit Address ADMA2 is selected (Optional)</p> <p>(2) Version 4.00 or later:</p> <p>When the MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, setting of this field is changed as follows.</p> <p>SDMA is initiated by Host Driver writes to the MMCSD0_COMMAND register when this field is set to 0h.</p> <p>ADMA2 is initiated by Host Driver writes to the MMCSD0_COMMAND register when this field is set to 2h or 3h and by ADMA3 sets to the ADMA System Address register (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI) when this field is set to 3h.</p> <p>ADMA3 is initiated by Host Driver writes to the MMCSD0_ADMA3_DESC_ADDRESS register when this field is set to 3h.</p> <p>0h: SDMA is selected</p> <p>1h: Not Used (New assignment is not allowed)</p> <p>2h: ADMA2 is selected (ADMA3 is not supported or disabled)</p> <p>3h: ADMA2 or ADMA3 is selected</p> <p>Support of 64-bit DMA and 128-bit Descriptor is indicated by the MMCSD0_CAPABILITIES[27] ADDR_64BIT_SUPPORT_V4</p>

Table 18-118. MMCS0_HOST_CONTROL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				bit. If the support bit is set to 1h, all supported DMAs (depends on Support, ADMA2 Support and ADMA3 Support) shall support 64-bit addressing. The MMCS0_HOST_CONTROL2[13] BIT64_ADDRESSING bit selects either 32-bit or 64-bit system addressing of DMAs.
2	HIGH_SPEED_ENA	R/W	0h	<p>High Speed Enable (SD Mode Only)</p> <p>This bit is optional. Before setting this bit, the HD shall check the MMCS0_CAPABILITIES[21] HIGH_SPEED_SUPPORT bit. If this bit is set to 0h (default), the HC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz/20 MHz for MMC). If this bit is set to 1h, the HC outputs CMD line and DAT lines at the rising edge of the SD clock (up to 50 MHz for SD/52 MHz for MMC)/208 MHz (for SD3.0).</p> <p>If the MMCS0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to 1h, Host Driver needs to reset SD Clock Enable (MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA) before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. This bit is not effective in UHS-II mode.</p> <p>1h: High Speed Mode 0h: Normal Speed Mode</p>
1	DATA_WIDTH	R/W	0h	<p>Data Transfer Width (SD Mode Only)</p> <p>This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card. This bit is not effective in UHS-II mode.</p> <p>1h: 4 bit mode 0h: 1 bit mode</p>
0	LED_CONTROL	R/W	0h	<p>LED Control</p> <p>This bit is used to caution the user not to remove the card while the SD card is being accessed. If the software is going to issue multiple SD commands, this bit can be set during all transactions. It is not necessary to change for each transaction.</p> <p>1h: LED on 0h: LED off</p>

18.2.13 MMCSD0_POWER_CONTROL Register (Offset = 29h) [reset = 0h]

MMCSD0_POWER_CONTROL is shown in [Figure 18-42](#) and described in [Table 18-120](#).

Return to [Summary Table](#).

This register is used to program the SD Bus power and voltage level.

**Table 18-119. MMCSD0_POWER_CONTROL
Instances**

Instance	Physical Address

Table 18-120. MMCSD0_POWER_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	UHS2_VOLTAGE	R/W	0h	SD Bus Voltage Select for VDD2 (UHS-II Only) This field determines supply voltage range to VDD2. This field can be set to 5h if the MMCSD0_CAPABILITIES[60] VDD2_1P8_SUPPORT bit is set to 1h. 111b: Not used 110b: Not used 101b: 1.8 V 100b: Reserved for 1.2 V 011b – 001b: Reserved 000b: VDD2 Not Supported
4	UHS2_POWER	R/W	0h	SD Bus Power for VDD2 (UHS-II Only) Setting this bit enables providing VDD2. 1h: Power on 0h: Power off
3-1	SD_BUS_VOLTAGE	R/W	0h	SD Bus Voltage Select for VDD1 By setting these bits, the HD selects the voltage level for the SD card. Before setting this register, the HD shall check the voltage support bits in the MMCSD0_CAPABILITIES register. If an unsupported voltage is selected, the Host System shall not supply SD bus voltage. 111b: 3.3 V (Flat-top.) 110b: 3.0 V (Typ.) 101b: 1.8 V (Typ.) for Embedded 100b – 000b: Reserved

Table 18-120. MMCS0_POWER_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SD_BUS_POWER	R/W	0h	<p>SD Bus Power for VDD1</p> <p>Before setting this bit, the SD host driver shall set SD Bus Voltage Select (MMCS0_POWER_CONTROL[3-1] SD_BUS_VOLTAGE). If the HC detects the No Card State, this bit shall be cleared.</p> <p>If this bit is cleared, the Host Controller should immediately stop driving CMD and DAT[3:0] (tri-state), and drive SDCLK to low level. If card is connected to Host Controller, Host Controller shall set these lines to low before stopping to supply VDD1.</p> <p>In UHS-II mode, before clearing this bit, Host Driver shall clear the MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA bit and before stopping to supply VDD1, Host Controller shall set DAT[2] to low if DAT[2] is used as out-of band interrupt.</p> <p>1h: Power on 0h: Power off</p>

18.2.14 MMCSD0_BLOCK_GAP_CONTROL Register (Offset = 2Ah) [reset = 80h]

MMCSD0_BLOCK_GAP_CONTROL is shown in [Figure 18-43](#) and described in [Table 18-122](#).

Return to [Summary Table](#).

This register is used to program the block gap request, read wait control and interrupt at block gap.

**Table 18-121. MMCSD0_BLOCK_GAP_CONTROL
Instances**

Instance	Physical Address
MMCSD0_CTL_CFG	04F8 002Ah

6	ALT_BOOT_MODE	R/W	0h	Alternative Boot Mode To start boot code access in alternative mode. 1h: To start alternate boot mode access 0h: To stop alternate boot mode access
5	BOOT_ENABLE	R/W	0h	Boot Enable To start boot code access. 1h: To start boot code access 0h: To stop boot code access
4	RESERVED	R	0h	Reserved
3	INTRPT_AT_BLK_GAP	R/W	0h	Interrupt At Block Gap (SD Mode Only) This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1h enables interrupt detection at the block gap for a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0h. When the HD detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.

Table 18-122. MMCSDB_BLOCK_GAP_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	RDWAIT_CTRL	R/W	0h	<p>Read Wait Control (SD Mode Only)</p> <p>The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using DAT[2] line. Otherwise the HC has to stop the SD clock to hold read data, which restricts commands generation. When the HD detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1h otherwise DAT line conflict may occur. If this bit is set to 0h, Suspend/Resume cannot be supported.</p> <p>In UHS-II mode, Read Wait is disabled and DAT[2] line is used for Interrupt Signal from UHS-II Card.</p> <p>1h: Enable Read Wait Control 0h: Disable Read Wait Control</p>
1	CONTINUE	R/W	0h	<p>Continue Request</p> <p>This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At block Gap Request to 0h (MMCSDB_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 0h) and set this bit to restart the transfer.</p> <p>The Host Controller automatically clears this bit when the transaction re-starts.</p> <p>If MMCSDB_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h, any write to this bit is ignored.</p> <p>In SD mode, this bit is cleared in either of the following cases:</p> <ol style="list-style-type: none"> 1) In the case of a read transaction, the DAT Line Active changes from 0h to 1h as a read transaction restarts. 2) In the case of a write transaction, the Write transfer active changes from 0h to 1h as the write transaction restarts. <p>Therefore it is not necessary for Host driver to set this bit to 0h. If MMCSDB_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h, any write to this bit is ignored.</p> <p>1h: Restart 0h: Ignored</p>

Table 18-122. MMCSD0_BLOCK_GAP_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	STOP_AT_BLK_GAP	R/W	0h	<p>Stop At Block Gap Request</p> <p>This bit is used to stop executing a transaction at the next block gap for non-DMA, SDMA and ADMA transfers. Until the transfer complete is set to 1h, indicating a transfer completion the HD shall leave this bit set to 1h.</p> <p>Clearing both the MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP and MMCSD0_BLOCK_GAP_CONTROL[1] CONTINUE bits shall not cause the transaction to restart. The MMCSD0_BLOCK_GAP_CONTROL[2] RDWAIT_CTRL bit is used to stop the read transaction at the block gap. The HC shall honour Stop At Block Gap Request for write transfers, but for read transfers it requires that the SD card support Read Wait. Therefore the HD shall not set this bit during read transfers unless the SD card supports Read Wait and has set Read Wait Control to 1h (MMCSD0_BLOCK_GAP_CONTROL[2] RDWAIT_CTRL) = 1h). In case of write transfers in which the HD writes data to the MMCSD0_DATA_PORT register, the HD shall set this bit after all block data is written. If this bit is set to 1h, the HD shall not write data to the MMCSD0_DATA_PORT register. This bit affects Read Transfer Active, Write Transfer Active, DAT line active and Command Inhibit (DAT) in the MMCSD0_PRESENTSTATE register.</p> <p>In case of UHS-II, a transaction can be stopped at the boundary of DATA Burst (Flow Control basis). Host Controller waits for sending Flow Control MSG until the MMCSD0_BLOCK_GAP_CONTROL[1] CONTINUE bit is set to 1h.</p> <p>1h: Stop 0h: Transfer</p>

There are three cases to restart the transfer after stop at the block gap. Which case is appropriate depends on whether the HC issues a Suspend command or the SD card accepts the Suspend command.

1. If the HD does not issue Suspend command, the Continue Request shall be used to restart the transfer.
2. If the HD issues a Suspend command and the SD card accepts it, a Resume Command shall be used to restart the transfer.
3. If the HD issues a Suspend command and the SD card does not accept it, the Continue Request shall be used to restart the transfer.

Any time Stop At Block Gap Request stops the data transfer, the HD shall wait for Transfer Complete (in the MMCSD0_NORMAL_INTR_STS register) before attempting to restart the transfer. When restarting the data transfer by Continue Request, the HD shall clear Stop At Block Gap Request before or simultaneously.

Host Controller should not generate timeout interrupts while Stop At Block Gap is set. Host Driver should ignore timeout interrupts while Stop At Block Gap is set.

18.2.15 MMCS0_WAKEUP_CONTROL Register (Offset = 2Bh) [reset = 0h]

MMCS0_WAKEUP_CONTROL is shown in [Figure 18-44](#) and described in [Table 18-124](#).

Return to [Summary Table](#).

This register is used to program the wakeup functionality.

The MMCS0_WAKEUP_CONTROL register is mandatory for the HC, but wakeup functionality depends on the HC system hardware and software. The HD shall maintain voltage on the SD Bus, by setting the MMCS0_POWER_CONTROL[0] SD_BUS_POWER bit to 1h, when wakeup event via card interrupt is desired.

1	CARD_INSERTION	R/W	0h	Wakeup Event Enable On SD Card Insertion This bit enables wakeup event via Card Insertion assertion in the MMCS0_NORMAL_INTR_STS register. FN_WUS (Wake up Support) in CIS does not affect this bit. 1h: Enable 0h: Disable
0	CARD_INTERRUPT	R/W	0h	Wakeup Event Enable On Card Interrupt This bit enables wakeup event via Card Interrupt assertion in the MMCS0_NORMAL_INTR_STS register. This bit can be set to 1h if FN_WUS (Wake Up Support) in CIS is set to 1h. 1h: Enable 0h: Disable

18.2.16 MMCSD0_CLOCK_CONTROL Register (Offset = 2Ch) [reset = 0h]

MMCSD0_CLOCK_CONTROL is shown in [Figure 18-45](#) and described in [Table 18-126](#).

Return to [Summary Table](#).

This register is used to program the Clock frequency select, Clock generator select, Clock enable, Internal clock state fields.

At the initialization of the HC, the HD shall set the SDCLK Frequency Select (MMCSD0_CLOCK_CONTROL[15-8] SDCLK_FRQSEL) according to the MMCSD0_CAPABILITIES register. This register controls SDCLK in SD Mode and RCLK in UHS-II mode.

Table 18-126. MMCS0_CLOCK_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	SDCLK_FRQSEL	R/W	0h	<p>SDCLK/RCLK Frequency Select</p> <p>This register is used to select the frequency of the SDCLK pin. The frequency is not programmed directly; rather this register holds the divisor of the Base Clock Frequency For SD clock in the Capabilities register (MMCS0_CAPABILITIES[15-8] BASE_CLK_FREQ).</p> <p>Only the following settings are allowed.</p> <p>(1) 8-bit Divided Clock Mode:</p> <p>80h: base clock divided by 256</p> <p>40h: base clock divided by 128</p> <p>20h: base clock divided by 64</p> <p>10h: base clock divided by 32</p> <p>08h: base clock divided by 16</p> <p>04h: base clock divided by 8</p> <p>02h: base clock divided by 4</p> <p>01h: base clock divided by 2</p> <p>00h: base clock (10 MHz - 63 MHz)</p> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor. But multiple bits should not be set. The three default divider values can be calculated by the frequency that is defined by the MMCS0_CAPABILITIES[15-8] BASE_CLK_FREQ bit field.</p> <p>400 KHz divider value</p> <p>25 MHz divider value</p> <p>50 MHz divider value</p> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50 MHz in high speed mode, and shall never exceed this limit.</p> <p>The frequency of SDCLK is set by the following formula:</p> <p>Clock Frequency = (Base Clock) / divisor</p> <p>Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency.</p> <p>For example, if the MMCS0_CAPABILITIES[15-8] BASE_CLK_FREQ bit field has the value 33 MHz, and the target frequency is 25 MHz, then choosing the divisor value of 1h will yield 16.5 MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400 KHz, the divisor value of 40h yields the optimal clock value of 258 KHz.</p> <p>(2) 10-bit Divided Clock Mode:</p> <p>Host Controller Version 3.00 or later supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits and all divider values shall be supported.</p> <p>3FFh: 1/2046 Divided Clock</p> <p>N: 1/2N Divided Clock (Duty 50%)</p> <p>002h: 1/4 Divided Clock</p> <p>001h: 1/2 Divided Clock</p> <p>000h: Base Clock (10 MHz - 254 MHz)</p> <p>(3) Programmable Clock Mode:</p>

Table 18-126. MMCSD0_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				<p>Host Controller Version 3.00 or later supports this mode as optional. A non-zero value set to the MMCSD0_CAPABILITIES[55-48] CLOCK_MULTIPLIER bit field indicates support of this clock mode. The multiplier enables the Host System to select a finer grain SD clock frequency. It is not necessary to support all frequency generation specified by this field because programmable clock generator is vendor specific and dependent on the implementation. Therefore, this mode is used with Preset Value registers (MMCSD0_PRESET_VALUE0 - MMCSD0_PRESET_VALUE10). The Host Controller vendor provides possible settings and the Host System vendor sets appropriate values to the Preset Value registers (MMCSD0_PRESET_VALUE0 - MMCSD0_PRESET_VALUE10).</p> <p>3FFh - Base Clock \times M / 1024</p> <p>.....</p> <p>N-1 - Base Clock \times M / N</p> <p>.....</p> <p>002h - Base Clock \times M / 3</p> <p>001h - Base Clock \times M / 2</p> <p>000h - Base Clock \times M</p> <p>This field depends on setting of the MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit. If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this field is set by Host Driver. If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this field is automatically set to a value specified in one of Preset Value registers (MMCSD0_PRESET_VALUE0 - MMCSD0_PRESET_VALUE10).</p>
7-6	SDCLK_FRQSEL_UPBITS	R/W	0h	<p>Upper Bits of SDCLK/RCLK Frequency Select</p> <p>This bit field is assigned to the MMCSD0_CLOCK_CONTROL[9-8] SDCLK_FRQSEL bit field of clock divider in SDCLK/RCLK Frequency Select.</p>
5	CLKGEN_SEL	R/W	0h	<p>Clock Generator Select</p> <p>This bit is used to select the clock generator mode in SDCLK/RCLK Frequency Select (MMCSD0_CLOCK_CONTROL[15-8] SDCLK_FRQSEL).</p> <p>If the Programmable Clock Mode is supported (non-zero value is set to the MMCSD0_CAPABILITIES[55-48] CLOCK_MULTIPLIER bit field), this bit attribute is R/W, and if not supported, this bit attribute is RO and zero is read.</p> <p>This bit depends on the setting of the MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit. If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this bit is set by Host Driver. If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this bit is automatically set to a value specified in one of Preset Value registers (MMCSD0_PRESET_VALUE0 - MMCSD0_PRESET_VALUE10).</p> <p>1h: Programmable Clock Mode</p> <p>0h: Divided Clock Mode</p>

Table 18-126. MMCS0_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	RESERVED	R	0h	Reserved
3	PLL_ENA	R/W	0h	<p>PLL Enable</p> <p>This bit is added from Version 4.10 for Host Controller using PLL. This feature allows Host Controller to initialize clock generator in two steps: by Internal Clock Enable (MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA) and PLL Enable and to minimize output latency (for example SDCLK/RCLK, D0 lane) from SD Clock Enable (MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA). There are two modes to keep Host Drivers compatibility. In both modes, PLL Locked timing is indicated by Internal Clock Stable (MMCS0_CLOCK_CONTROL[1] INT_CLK_STABLE).</p> <p>(1) When MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 0h (Host Driver Version 3, which does not support this bit) or this bit is not implemented, the MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA bit (or the MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA bit) may activate PLL (exit low power mode and start locking clock).</p> <p>(2) When MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h (Host Driver Version 4), the MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA bit is set before setting this bit and then setting this bit may activate PLL (exit low power mode and start locking clock).</p> <p>1h: PLL is enabled 0h: PLL is in low power mode</p>
2	SD_CLK_ENA	R/W	0h	<p>SD Clock Enable</p> <p>The HC shall stop SDCLK when writing this bit to 0h. The MMCS0_CLOCK_CONTROL[15-8] SDCLK_FRQSEL bit field can be changed when this bit is 0h. Then, the HC shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If the HC detects the No Card state, this bit shall be cleared.</p> <p>1h: Enable providing SDCLK or RCLK 0h: Disable providing SDCLK or RCLK</p>
1	INT_CLK_STABLE	R	0h	<p>Internal Clock Stable</p> <p>This bit is set to 1h when SD clock is stable after writing 1h to MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA bit. The SD Host Driver shall wait to set the MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA bit until this bit is set to 1h.</p> <p>Note: This is useful when using PLL for a clock oscillator that requires setup time.</p> <p>(1) Internal Clock Stable (when MMCS0_CLOCK_CONTROL[3] PLL_ENA = 0h or not supported)</p> <p>This bit is set to 1h when internal clock is stable after writing 1h to MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA bit.</p> <p>(2) PLL Clock Stable (when MMCS0_CLOCK_CONTROL[3] PLL_ENA = 1h)</p> <p>Host Controller which supports PLL Enable sets this status to 0h once when PLL Enable is changed 0h to 1h and then this status is set to 1h when PLL is locked (PLL uses an internal clock in stable as a reference clock which is enabled by the MMCS0_CLOCK_CONTROL[0] INT_CLK_ENA bit). After this bit is set to 1h, Host Driver may set the MMCS0_CLOCK_CONTROL[2] SD_CLK_ENA bit.</p> <p>1h: Ready 0h: Not Ready</p>

Table 18-126. MMCSD0_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INT_CLK_ENA	R/W	0h	<p>Internal Clock Enable</p> <p>This bit is set to 0h when the HD is not using the HC or the HC awaits a wakeup event. The HC should stop its internal clock to go very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1h. When clock oscillation is stable, the HC shall set the MMCSD0_CLOCK_CONTROL[1] INT_CLK_STABLE bit to 1h. This bit shall not affect card detection.</p> <p>1h: Oscillate 0h: Stop</p>

18.2.17 MMCS0_TIMEOUT_CONTROL Register (Offset = 2Eh) [reset = 0h]

MMCS0_TIMEOUT_CONTROL is shown in [Figure 18-46](#) and described in [Table 18-128](#).

Return to [Summary Table](#).

The register sets the data timeout counter value.

At the initialization of the HC, the HD shall set the Data Timeout Counter Value according to the MMCS0_CAPABILITIES register.

**Table 18-127. MMCS0_TIMEOUT_CONTROL

During its initialization, the HD shall set this bit to 1h to reset the HC. The HC shall reset this bit to 0h when Capabilities registers are valid and the HD can read them. Additional use of 'Software Reset For All' may not affect the value of the Capabilities registers. If this bit is set to 1h, the SD card shall reset itself and must be re-initialized by the HD.</p> <p>1h: Reset</p> <p>0h: Work</p>

18.2.19 MMCSD0_NORMAL_INTR_STS Register (Offset = 30h) [reset = 0h]

MMCSD0_NORMAL_INTR_STS is shown in [Figure 18-48](#) and described in [Table 18-132](#).

Return to [Summary Table](#).

This register gives the status of all the interrupts.

The Normal Interrupt Signal Enable (see MMCSD0_NORMAL_INTR_SIG_ENA register) affects read of this register, but Normal Interrupt Signal does not affect these reads. An Interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1h. For all bits except Card Interrupt (MMCSD0_NORMAL_INTR_STS[8] CARD_INTR) and Error Interrupt (MMCSD0_NORMAL_INTR_STS[15] ERROR_INTR), writing 1h to a bit clears it. The MMCSD0_NORMAL_INTR_STS[8] CARD_INTR bit is cleared when the card stops asserting the interrupt: that is when the Card Driver services the Interrupt condition.

Table 18-132. MMCSD0_NORMAL_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
15	ERROR_INTR	R	0h	Error Interrupt If any of the bits in the MMCSD0_ERROR_INTR_STS register are set, then this bit is set. Therefore the HD can test for an error by checking this bit first. In UHS-II mode is enabled, if any of the bits in the MMCSD0_UHS2_ERR_INTR_STS register are set, this bit is also set. 0h: No Error 1h: Error
14	BOOT_COMPLETE	R/W1C	0h	Boot Terminate Interrupt This status is set if the boot operation gets terminated. 0h: Boot operation is not terminated 1h: Boot operation is terminated
13	RCV_BOOT_ACK	R/W1C	0h	Boot Acknowledge Receive This status is set if the boot acknowledge is received from device. 0h: Boot acknowledge is not received 1h: Boot acknowledge is received

Table 18-132. MMCS0_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	RETUNING_EVENT	R	0h	<p>Re-Tuning Event (UHS-I Only)</p> <p>This status is set if the MMCS0_PRESENTSTATE[3] RETUNING_REQ bit changes from 0h to 1h.</p> <p>Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning.</p> <p>In UHS-II mode, this bit is not effective.</p> <p>1h: Re-Tuning should be performed</p> <p>0h: Re-Tuning is not required</p>
11	INTC	R	0h	<p>int_c (Embedded)</p> <p>This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_C interrupt factor.</p>
10	INTB	R	0h	<p>int_b (Embedded)</p> <p>This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_B interrupt factor.</p>
9	INTA	R	0h	<p>int_a (Embedded)</p> <p>This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_A interrupt factor.</p>

Table 18-132. MMCSD0_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	CARD_INTR	R	0h	<p>Card Interrupt</p> <p>When this status has been set and the Host Driver needs to start this interrupt service, the MMCSD0_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit may be set to 0h in order to clear the card interrupt status latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set the MMCSD0_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit to 1h and start sampling the interrupt signal again.</p> <p>Writing this bit to 1h does not clear this bit. It is cleared by resetting the SD card interrupt factor.</p> <p>(1) DAT[1] Interrupt Input in SD Mode</p> <p>In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of UHS-I mode, switching time of Interrupt Period is relaxed for 2 clock cycles. Then Host Controller needs to delay start of interrupt sampling at least 2 clocks and should sample interrupt while Interrupt Period is stable.</p> <p>(2) DAT[2] Interrupt Input in UHS-II Mode</p> <p>When the MMCSD0_PRESENTSTATE[16] CARD_INSERTED and MMCSD0_POWER_CONTROL[0] SD_BUS_POWER bits are set to 1h, Host Controller configures DAT[2] as Interrupt Input and enables pull-up of DAT[2]. DAT[2] interrupt is asynchronous to RCLK, low level sensitive and 3.3 V signal level. DAT[2] interrupt is masked by setting the MMCSD0_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit to 0h. When either the MMCSD0_PRESENTSTATE[16] CARD_INSERTED bit or the MMCSD0_POWER_CONTROL[0] SD_BUS_POWER bit is set to 0h, Host Controller sets DAT[2] to low. Only point to point connection is allowed between Host and Card.</p> <p>(3) INT MSG in UHS-II Mode</p> <p>INT MSG is enabled by setting the MMCSD0_UHS2_DEVICE_SELECT[7] INT_MSG_ENA bit. DAT[2] and INT MSG interrupt sources are ORed and indicated to Card Interrupt. If any bit in the MMCSD0_UHS2_DEVICE_INTR_STATUS register is set to 1h, INT MSG interrupt is generated. INT MSG interrupt is cleared by writing a correspondent bit to 1h in the MMCSD0_UHS2_DEVICE_INTR_STATUS register. Masking DAT[2] interrupt also disables INT MSG interrupt due to the MMCSD0_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit is set to 0h. SDIO Version 4.00 does not support INT MSG.</p> <p>1h: Generate Card Interrupt 0h: No Card Interrupt</p>

Table 18-132. MMCSDB0_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	CARD_REM	R/W1C	0h	<p>Card Removal</p> <p>This status is set if the MMCSDB0_PRESENTSTATE[16] CARD_INSERTED bit changes from 1h to 0h. When the HD writes this bit to 1h to clear this status the status of the MMCSDB0_PRESENTSTATE[16] CARD_INSERTED bit should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated.</p> <p>0h: Card State Stable or Debouncing 1h: Card Removed</p>
6	CARD_INS	R/W1C	0h	<p>Card Insertion</p> <p>This status is set if the MMCSDB0_PRESENTSTATE[16] CARD_INSERTED bit changes from 0h to 1h. When the HD writes this bit to 1h to clear this status the status of the MMCSDB0_PRESENTSTATE[16] CARD_INSERTED bit should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated.</p> <p>0h: Card State Stable or Debouncing 1h: Card Inserted</p>
5	BUF_RD_READY	R/W1C	0h	<p>Buffer Read Ready</p> <p>This status is set if the MMCSDB0_PRESENTSTATE[11] BUF_RD_ENA bit changes from 0h to 1h.</p> <p>The MMCSDB0_PRESENTSTATE[11] BUF_RD_ENA bit is set to 1h for every CMD19 execution in tuning procedure.</p> <p>In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: Not Ready to read Buffer 1h: Ready to read Buffer</p>
4	BUF_WR_READY	R/W1C	0h	<p>Buffer Write Ready</p> <p>This status is set if the MMCSDB0_PRESENTSTATE[10] BUF_WR_ENA bit changes from 0h to 1h.</p> <p>In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: Not Ready to Write Buffer 1h: Ready to Write Buffer</p>
3	DMA_INTERRUPT	R/W1C	0h	<p>DMA Interrupt</p> <p>This status is set if the HC detects the Host DMA Buffer Boundary in the MMCSDB0_BLOCK_SIZE register.</p> <p>0h: No DMA Interrupt 1h: DMA Interrupt is Generated</p>
2	BLK_GAP_EVENT	R/W1C	0h	<p>Block Gap Event</p> <p>If the MMCSDB0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit is set, this bit is set.</p> <p>Read Transaction:</p> <p>This bit is set at the falling edge of the DAT Line Active Status (see MMCSDB0_PRESENTSTATE[2] DATA_LINE_ACTIVE bit). When the transaction is stopped at SD Bus timing. The Read Wait must be supported in order to use this function.</p> <p>Write Transaction:</p> <p>This bit is set at the falling edge of Write Transfer Active Status (see MMCSDB0_PRESENTSTATE[8] WR_XFER_ACTIVE bit). After getting CRC status at SD Bus timing. In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: No Block Gap Event 1h: Transaction stopped at Block Gap</p>

Table 18-132. MMCSD0_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	XFER_COMPLETE	R/W1C	0h	<p>Transfer Complete</p> <p>This bit is set when a read/write transaction is completed.</p> <p>SD Mode</p> <p>Read Transaction:</p> <p>This bit is set at the falling edge of Read Transfer Active Status (MMCSD0_PRESENTSTATE[9] RD_XFER_ACTIVE).</p> <p>There are two cases in which the Interrupt is generated. The first is when a data transfer is completed as specified by data length (after the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit (after valid data has been read to the Host System).</p> <p>Write Transaction:</p> <p>This bit is set at the falling edge of the DAT Line Active Status (see MMCSD0_PRESENTSTATE[2] DATA_LINE_ACTIVE bit). There are two cases in which the Interrupt is generated. The first is when the last data is written to the card as specified by data length and Busy signal is released. The second is when data transfers are stopped at the block gap by setting the MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit and data transfers completed (after valid data is written to the SD card and the busy signal is released).</p> <p>Note: MMCSD0_NORMAL_INTR_STS[1] XFER_COMPLETE bit has higher priority than the MMCSD0_ERROR_INTR_STS[4] DATA_TIMEOUT bit. If both bits are set to 1h, the data transfer can be considered complete.</p> <p>Note: While performing tuning procedure (the MMCSD0_HOST_CONTROL2[6] EXECUTE_TUNING bit is set to 1h), the MMCSD0_NORMAL_INTR_STS[1] XFER_COMPLETE bit is not set to 1h.</p> <p>Command with Busy:</p> <p>This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the MMCSD0_PRESENTSTATE register.</p> <p>UHS-I mode</p> <p>While performing tuning procedure (the MMCSD0_HOST_CONTROL2[6] EXECUTE_TUNING bit is set to 1h), the MMCSD0_NORMAL_INTR_STS[1] XFER_COMPLETE bit is not set to 1h.</p> <p>0h: No Data Transfer Complete 1h: Data Transfer Complete</p> <p>UHS-II Mode</p> <p>This interrupt is generated in following two cases:</p> <p>(a) EBSY Completion (for EBSY supported commands) When the MMCSD0_UHS2_XFER_MODE[14] EBSY_WAIT bit is set to 1h, this bit is set when EBSY packet has been received, and all valid data have been sent to system memory in case of read operation.</p> <p>(b) Stop and Continue during DCMD Data Transfer When the MMCSD0_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit is set to 1h and data transfer is stopped at the Flow Control.</p> <p>Following is for both SD mode and UHS-II mode.</p>

Table 18-132. MMCS0_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				<p>The table below shows that the MMCS0_NORMAL_INTR_STS[1] XFER_COMPLETE bit has higher priority than the MMCS0_ERROR_INTR_STS[4] DATA_TIMEOUT bit. If both bits are set to 1h, execution of a command can be considered to be completed.</p> <p>1h: Command execution is completed 0h: Not complete</p>
0	CMD_COMPLETE	R/W1C	0h	<p>Command Complete</p> <p>SD Mode</p> <p>This bit is set when we get the end bit of the command response (Except Auto CMD12 and Auto CMD23).</p> <p>Note: The MMCS0_ERROR_INTR_STS[0] CMD_TIMEOUT bit has higher priority than the MMCS0_NORMAL_INTR_STS[0] CMD_COMPLETE bit. If both are set to 1h, it can be considered that the response was not received correctly.</p> <p>Version 4.00 defines response check function for R1 and R5. If the MMCS0_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 1h, generation of this interrupt is prohibited regardless of the MMCS0_NORMAL_INTR_SIG_ENA[0] CMD_COMPLETE bit.</p> <p>UHS-II Mode</p> <p>If the MMCS0_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 0h, this interrupt is generated when response packet is received.</p> <p>If the MMCS0_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 1h, generation of this interrupt is prohibited regardless of the MMCS0_NORMAL_INTR_SIG_ENA[0] CMD_COMPLETE bit.</p> <p>0h: No Command Complete 1h: Command Complete</p>

Table 18-133 shows the relation between transfer complete and data timeout error.

Table 18-133. Relation between transfer complete and data timeout error

Transfer Complete	Data Timeout Error	Meaning of the Status
0	0	Interrupted by Another Factor
0	1	Timeout occur during transfer
1	Don't Care	Data Transfer Complete

Table 18-134 shows the relation between command complete and command timeout error.

Table 18-134. Relation between command complete and command timeout error

Command Complete	Command Timeout Error	Meaning of the Status
0	0	Interrupted by Another Factor
Don't Care	1	Response not received within 64 SDCLK cycles
1	0	Response Received

18.2.20 MMCSD0_ERROR_INTR_STS Register (Offset = 32h) [reset = 0h]

MMCSD0_ERROR_INTR_STS is shown in [Figure 18-49](#) and described in [Table 18-136](#).

Return to [Summary Table](#).

This register gives the status of the error interrupts.

Status defined in this register can be enabled by the MMCSD0_ERROR_INTR_STS_ENA register, but not by the MMCSD0_ERROR_INTR_SIG_ENA register. The Interrupt is generated when the MMCSD0_ERROR_INTR_SIG_ENA register is enabled and at least one of the statuses is set to 1h. Writing to 1h clears the bit and writing to 0h keeps the bit unchanged. More than one status can be cleared at the one register write.

Table 18-136. MMCSD0_ERROR_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12	HOST	R/W1C	0h	Target Response Error Occurs when detecting ERROR in m_hresp (DMA transaction) 0h: No error 1h: Error
11	RESP	R/W1C	0h	Response Error (SD Mode Only) Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If the MMCSD0_TRANSFER_MODE[7] RESP_ERR_CHK_ENA bit is set to 1h, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1h. 0h: No error 1h: Error
10	RESERVED	R	0h	Reserved
9	ADMA	R/W1C	0h	ADMA Error This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the MMCSD0_ADMA_ERR_STATUS register. 0h: No error 1h: Error

Table 18-136. MMCS0_ERROR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	AUTO_CMD	R/W1C	0h	<p>Auto CMD Error (SD Mode Only)</p> <p>Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that any of the bits D00 to D05 in the MMCS0_AUTOCMD_ERR_STS register has changed from 0h to 1h. D07 is effective in case of Auto CMD12. The MMCS0_AUTOCMD_ERR_STS register is valid while this bit is set to 1h and may be cleared with clearing of this bit (another implementation is also allowed).</p> <p>0h: No error 1h: Error</p>
7	CURR_LIMIT	R/W1C	0h	<p>Current Limit Error</p> <p>By setting the MMCS0_POWER_CONTROL[0] SD_BUS_POWER bit, the HC is requested to supply power for the SD Bus. If the HC supports the Current Limit Function, it can be protected from an Illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1h means the HC is not supplying power to SD card due to some failure. Reading 0 means that the HC is supplying power and no error has occurred. This bit shall always set to be 0, if the HC does not support this function.</p> <p>0h: No error 1h: Power Fail</p>
6	DATA_ENDBIT	R/W1C	0h	<p>Data End Bit Error (SD Mode Only)</p> <p>Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.</p> <p>0h: No error 1h: Error</p>
5	DATA_CRC	R/W1C	0h	<p>Data CRC Error (SD Mode Only)</p> <p>Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 2h.</p> <p>0h: No error 1h: Error</p>
4	DATA_TIMEOUT	R/W1C	0h	<p>Data Timeout Error (SD Mode Only)</p> <p>Occurs when detecting one of following timeout conditions:</p> <ol style="list-style-type: none"> 1. Busy Timeout for R1b, R5b type 2. Busy Timeout after Write CRC status 3. Write CRC status Timeout 4. Read Data Timeout <p>0h: No error 1h: Timeout</p>
3	CMD_INDEX	R/W1C	0h	<p>Command Index Error (SD Mode Only)</p> <p>Occurs if a Command Index error occurs in the Command Response (MMCS0_RESPONSE_0 to MMCS0_RESPONSE_7).</p> <p>0h: No error 1h: Error</p>
2	CMD_ENDBIT	R/W1C	0h	<p>Command End Bit Error (SD Mode Only)</p> <p>Occurs when detecting that the end bit of a command response is 0h.</p> <p>0h: No error 1h: End Bit Error Generated</p>

Table 18-136. MMCSD0_ERROR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CMD_CRC	R/W1C	0h	<p>Command CRC Error (SD Mode Only)</p> <p>Command CRC Error is generated in two cases.</p> <p>1. If a response is returned and the MMCSD0_ERROR_INTR_STS[0] CMD_TIMEOUT bit is set to 0h, this bit is set to 1h when detecting a CRT error in the command response.</p> <p>2. The HC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the HC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the HC shall abort the command (Stop driving CMD line) and set this bit to 1h. The MMCSD0_ERROR_INTR_STS[0] CMD_TIMEOUT bit shall also be set to 1h to distinguish CMD line conflict.</p> <p>0h: No error 1h: CRC Error Generated</p>
0	CMD_TIMEOUT	R/W1C	0h	<p>Command Timeout Error (SD Mode Only)</p> <p>Occurs only if the no response is returned within 64 SDCLK cycles from the end bit of the command. If the HC detects a CMD line conflict, in which case the MMCSD0_ERROR_INTR_STS[1] CMD_CRC bit shall also be set. This bit shall be set without waiting for 64 SDCLK cycles because the command will be aborted by the HC.</p> <p>0h: No error 1h: Timeout</p>

Table 18-137 shows the relation between command CRC error and command time-out error.

Table 18-137. Relation between command CRC error and command time-out error

Command CRC Error	Command Time-out Error	Kinds of Error
0	0	No Error
0	1	Response Timeout Error
1	0	Response CRC Error
1	1	CMD Line Conflict

18.2.21 MMCS0_NORMAL_INTR_STS_ENA Register (Offset = 34h) [reset = 0h]

MMCS0_NORMAL_INTR_STS_ENA is shown in [Figure 18-50](#) and described in [Table 18-139](#).

Return to [Summary Table](#).

This register is used to enable the MMCS0_NORMAL_INTR_STS register fields.

18.2.25 MMCS0_AUTOCMD_ERR_STS Register (Offset = 3Ch) [reset = 0h]

MMCS0_AUTOCMD_ERR_STS is shown in [Figure 18-54](#) and described in [Table 18-147](#).

Return to [Summary Table](#).

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD23.

The Host driver can determine what kind of Auto CMD12/CMD23 errors occur by this register. Auto CMD23 errors are indicated in bit 04-01. This register is valid only when the Auto CMD Error is set.

**Table 18-146. MMCS0_AUTOCMD_ERR_STS
Instances**

Instance	Physical Address

Table 18-147. MMCS0_AUTOCMD_ERR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7	CMD_NOT_ISSUED	R	0h	Command Not Issued By Auto CMD12 Error Setting this bit to 1h means CMD_wo_DAT is not executed due to an Auto CMD12 error (D04- D01) in this register. This bit is set to 0h when Auto CMD Error is generated by Auto CMD23. 0h: No Error 1h: Not Issued
6-5	RESERVED	R	0h	Reserved
4	INDEX	R	0h	Auto CMD Index Error Occurs if the Command Index error occurs in response to a command. 0h: No Error 1h: Error
3	ENDBIT	R	0h	Auto CMD End Bit Error Occurs when detecting that the end bit of command response is 0h. 0h: No Error 1h: End Bit Error Generated
2	CRC	R	0h	Auto CMD CRC Error Occurs when detecting a CRC error in the command response. 0h: No Error 1h: CRC Error Generated

Table 18-147. MMCSD0_AUTOCMD_ERR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TIMEOUT	R	0h	Auto CMD Timeout Error Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1h, the other error status bits (D04 - D02) are meaningless. 0h: No Error 1h: Timeout
0	ACMD12_NOT_EXEC	R	0h	Auto CMD12 not Executed If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1h means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error. If this bit is set to 1h, other error status bits (D04 - D01) are meaningless. This bit is set to 0h when Auto CMD Error is generated by Auto CMD23. 0h: Executed 1h: Not Executed

Table 18-148 shows the relation between Auto CMD12 CRC error and Auto CMD12 timeout error.

Table 18-148. Relation between Auto CMD12 CRC Error and Auto CMD12 Timeout Error

Auto Cmd12 CRC Error	Auto CMD12 Timeout Error	Kinds of Error
0	0	No Error
0	1	Response Timeout Error
1	0	Response CRC Error
1	1	CMD Line Conflict

The timing of changing Auto CMD12 Error Status can be classified in three scenarios:

1. When the HC is going to issue Auto CMD12:

Set D00 to 1h if Auto CMD12 cannot be issued due to an error in the previous command.

Set D00 to 0h if Auto CMD12 is issued.

2. At the end bit of Auto CMD12 response:

Check received responses by checking the error bits D01, D02, D03, D04.

set to 1h if Error is Detected.

set to 0h if Error is Not Detected.

3. Before reading the Auto CMD12 Error Status bit D07:

Set D07 to 1h if there is a command cannot be issued.

Set D07 to 0h if there is no command to issue.

Timing of generating the Auto CMD12 Error and writing to the MMCSD0_COMMAND register are Asynchronous. Then D07 shall be sampled when driver never writing to the MMCSD0_COMMAND register. So just before reading the MMCSD0_AUTOCMD_ERR_STS register is good timing to set the D07 status bit.

18.2.26 MMCS0_HOST_CONTROL2 Register (Offset = 3Eh) [reset = 0h]

MMCS0_HOST_CONTROL2 is shown in [Figure 18-55](#) and described in [Table 18-150](#).

Return to [Summary Table](#).

This register is used to program UHS Mode Select, Driver Strength Select, Execute Tuning, Sampling Clock Select, Asynchronous Interrupt Enable and Preset Value Enable.

Table 18-150. MMCS0_HOST_CONTROL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	PRESET_VALUE_ENA	R/W	0h	<p>Preset Value Enable</p> <p>Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When the MMCS0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to automatic. This bit enables the functions defined in the Preset Value registers (MMCS0_PRESET_VALUE0 - MMCS0_PRESET_VALUE10).</p> <p>If this bit is set to 0h, SDCLK Frequency Select, Clock Generator Select in the MMCS0_CLOCK_CONTROL register and Driver Strength Select in the MMCS0_HOST_CONTROL2 register are set by Host Driver.</p> <p>If this bit is set to 1h, SDCLK Frequency Select, Clock Generator Select in the MMCS0_CLOCK_CONTROL register and Driver Strength Select in the MMCS0_HOST_CONTROL2 register are set by Host Controller as specified in the Preset Value registers (MMCS0_PRESET_VALUE0 - MMCS0_PRESET_VALUE10).</p> <p>0h: SDCLK and Driver Strength are controlled by Host Driver</p> <p>1h: Automatic Selection by Preset Value are Enabled</p>

Table 18-150. MMCSD0_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	ASYNCH_INTR_ENA	R/W	0h	<p>Asynchronous Interrupt Enable</p> <p>This bit can be set to 1h if a card support asynchronous interrupt and the MMCSD0_CAPABILITIES[29] ASYNCH_INTR_SUPPORT bit is set to 1h. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode . If this bit is set to 1h, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card.</p> <p>0h: Disabled 1h: Enabled</p>
13	BIT64_ADDRESSING	R/W	0h	<p>64-bit Addressing</p> <p>This field is effective when the MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h.</p> <p>Host Controller selects either of 32-bit or 64-bit addressing modes to access system memory. Whether 32-bit or 64-bit is determined by OS installed in a host system. Host Driver sets this bit depends on addressing mode of installed OS. Refer to 64-bit System Address Support in the MMCSD0_CAPABILITIES register.</p> <p>0h: 32-bits Addressing 1h: 64-bits Addressing</p>
12	HOST_VER40_ENA	R/W	0h	<p>Host Version 4 Enable</p> <p>This bit selects either Version 3.00 compatible mode or Version 4.00 mode. In Version 4.00, support of 64-bit System Addressing is modified. All DMAs support 64-bit System Addressing. UHS-II supported Host Driver shall enable this bit.</p> <p>In Version 4.10, supported 32-bit Block Count for all operations. Functions of following fields are modified.</p> <p>SDMA Address SDMA uses the MMCSD0_ADMA_SYS_ADDRESS register instead of SDMA System Address register (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI)</p> <p>ADMA2/ADMA3 Selection ADMA3 is selected by MMCSD0_HOST_CONTROL1[4-3] DMA_SELECT bit.</p> <p>64-bit ADMA Descriptor Size 128-bit descriptor is used instead of 96-bit descriptor when 64-bit Addressing is set to 1h.</p> <p>Selection of 32-bit/64-bit System Addressing Either 32-bit or 64-bit system addressing is selected by 64-bit Addressing bit in this register instead of MMCSD0_HOST_CONTROL1[4-3] DMA_SELECT bit.</p> <p>32-bit Block Count SDMA System Address register (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI) is modified to 32-bit Block Count register.</p> <p>0h: Version 3.00 Compatible Mode 1h: Version 4.0 Mode</p>

Table 18-150. MMCS0_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CMD23_ENA	R/W	0h	<p>CMD23 Enable</p> <p>In memory card initialization, Host Driver Version 4.10 checks whether card supports CMD23 by checking a bit SCR[33]. If the card supports CMD23 (SCR[33] = 1h), this bit is set to 1h. This bit is used to select Auto CMD23 or Auto CMD12 for ADMA3 data transfer. Refer to MMCS0_TRANSFER_MODE[3-2] AUTO_CMD_ENA bit.</p>
10	ADMA2_LEN_MODE	R/W	0h	<p>ADMA2 Length Mode</p> <p>This bit selects one of ADMA2 Length Modes either 16-bit or 26-bit.</p> <p>0h: 16-bit Data Length Mode</p> <p>1h: 26-bit Data Length Mode</p>
9	DRIVER_STRENGTH2	R/W	0h	<p>Driver Strength Select</p> <p>This is the programmed Drive Strength output and Bit[2] of the sdhccore_drivestrength value.</p>
8	UHS2_INTF_ENABLE	R/W	0h	<p>UHS-II Interface Enable</p> <p>This bit is used to enable UHS-II Interface. Before trying to start UHS-II initialization, this bit shall be set to 1h. Before trying to start SD mode initialization, this bit shall be set to 0h.</p> <p>This bit is used to enable UHS-II IF Detection, Lane Synchronization and In Dormant State in the MMCS0_PRESENTSTATE register, and to select clock source of either SD mode or UHS-II mode. Host Controller shall not leave unused SD 4-bit Interface lines (CLK, CMD and DAT[3:2]) floating in UHS-II mode by using pull-up or driving to low. When DAT[2] is used as interrupt input in UHS-II mode, DAT[2] of Host Controller is set to input and then DAT[2] of SDIO card is set to output to avoid conflict.</p> <p>0h: 4-bit SD Interface Enabled</p> <p>1h: UHS-II Interface Enabled</p>
7	SAMPLING_CLK_SELECT	R/W	0h	<p>Sampling Clock Select (UHS-I Only)</p> <p>This bit is set by tuning procedure when the MMCS0_HOST_CONTROL2[6] EXECUTE_TUNING bit is cleared. Writing 1h to this bit is meaningless and ignored. Setting 1h means that tuning is completed successfully and setting 0 means that tuning is failed. Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is cleared by writing 0h. Change of this bit is not allowed while the Host Controller is receiving response or a read data block.</p> <p>0h: Fixed clock is used to sample data</p> <p>1h: Tuned clock is used to sample data</p>
6	EXECUTE_TUNING	R/W	0h	<p>Execute Tuning (UHS-I Only)</p> <p>This bit is set to 1h to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to the MMCS0_HOST_CONTROL2[7] SAMPLING_CLK_SELECT bit. Tuning procedure is aborted by writing 0h for more detail about tuning procedure.</p> <p>0h: Not Tuned or Tuning Completed</p> <p>1h: Execute Tuning</p>

Table 18-150. MMCSD0_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5-4	DRIVER_STRENGTH1	R/W	0h	<p>Driver Strength Select (UHS-I Only)</p> <p>Host Controller output driver in 1.8 V signaling is selected by this bit. In 3.3 V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the MMCSD0_CAPABILITIES register. This bit depends on setting of the MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit.</p> <p>If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this field is set by Host Driver.</p> <p>If MMCSD0_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this field is automatically set by a value specified in the one of Preset Value registers (MMCSD0_PRESET_VALUE0 - MMCSD0_PRESET_VALUE10).</p> <p>0h: Driver Type B is Selected (Default)</p> <p>1h: Driver Type A is Selected</p> <p>2h: Driver Type C is Selected</p> <p>3h: Driver Type D is Selected</p>
3	V1P8_SIGNAL_ENA	R/W	0h	<p>1.8 V Signaling Enable (UHS-I Only)</p> <p>This bit controls voltage regulator for I/O cell. 3.3 V is supplied to the card regardless of signaling voltage.</p> <p>Setting this bit from 0h to 1h starts changing signal voltage from 3.3 V to 1.8 V.</p> <p>1.8 V regulator output shall be stable within 5 ms. Host Controller clears this bit if switching to 1.8 V signaling fails.</p> <p>Clearing this bit from 1h to 0h starts changing signal voltage from 1.8 V to 3.3 V.</p> <p>3.3 V regulator output shall be stable within 5 ms.</p> <p>Host Driver can set this bit to 1h when Host Controller supports 1.8 V signaling (one of support bits is set to 1h: SDR50, SDR104 or DDR50 in the MMCSD0_CAPABILITIES register) and the card or device supports UHS-I.</p> <p>0h: 3.3 V Signaling</p> <p>1h: 1.8 V Signaling</p>

Table 18-150. MMCSDB_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2-0	UHS_MODE_SELECT	R/W	0h	<p>UHS Mode Select (UHS-I Only)</p> <p>This field is used to select one of UHS-I modes or UHS-II mode. In case of UHS-I mode, this field is effective when the MMCSDB_HOST_CONTROL2[3] V1P8_SIGNAL_ENA bit is set to 1h. In case of UHS-II mode, the MMCSDB_HOST_CONTROL2[3] V1P8_SIGNAL_ENA bit shall be set to 0h. Setting of this field is used to select one of preset values in UHS-I or UHS-II mode.</p> <p>If the MMCSDB_HOST_CONTROL2[15] PRESET_VALUE_ENA is set to 1h, Host Controller sets SDCLK/RCLK Frequency Select, Clock Generator Select in the MMCSDB_CLOCK_CONTROL register and Driver Strength Select according to Preset Value registers (MMCSDB_PRESET_VALUE0 - MMCSDB_PRESET_VALUE10). In this case, one of preset value registers is selected by this field.</p> <p>Host Driver needs to reset the MMCSDB_CLOCK_CONTROL[2] SD_CLK_ENA bit before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets the MMCSDB_CLOCK_CONTROL[2] SD_CLK_ENA bit again.</p> <p>0h: SDR12 1h: SDR25 2h: SDR50 3h: SDR104 4h: DDR50 5h: HS400 6h: Reserved 7h: UHS-II</p> <p>When SDR50, SDR104 or DDR50 is selected for SDIO card, interrupt detection at the block gap shall not be used. Read Wait timing is changed for these modes. Refer to the SDIO Specification Version 3.00 for more details.</p>

18.2.27 MMCSO_CAPABILITIES Register (Offset = 40h) [reset = 980004073CECC801h]

MMCSO_CAPABILITIES is shown in [Figure 18-56](#) and described in [Table 18-152](#).

Return to [Summary Table](#).

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

Table 18-152. MMCS0_CAPABILITIES Register Field Descriptions

Bit	Field	Type	Reset	Description
63	HS400_SUPPORT	R	1h	HS400 Support 0h: HS400 is Not Supported 1h: HS400 is Supported Note: HS400 mode is not supported (see <i>MMCS0 Not Supported Features</i>).
62-61	RESERVED	R	0h	Reserved
60	VDD2_1P8_SUPPORT	R	1h	1.8 V VDD2 Support This bit indicates that support of VDD2 on Host system. 0h: 1.8 V VDD2 is not supported 1h: 1.8 V VDD2 is supported
59	ADMA3_SUPPORT	R	1h	ADMA3 Support This bit indicates that support of ADMA3 on Host Controller. 0h: ADMA3 is not supported 1h: ADMA3 is supported
58	RESERVED	R	0h	Reserved
57	SPI_BLK_MODE	R	0h	SPI Block Mode This bit indicates whether SPI Block Mode is supported or not. 0h: Not Supported 1h: Supported
56	SPI_SUPPORT	R	0h	SPI Mode This bit indicates whether SPI Mode is supported or not. 0h: Not Supported 1h: Supported
55-48	CLOCK_MULTIPLIER	R	0h	Clock Multiplier This field indicates clock multiplier value of programmable clock generator. Refer to the MMCS0_CLOCK_CONTROL register. Setting 00h means that Host Controller does not support programmable clock generator. FFh: Clock Multiplier M = 256 ---- 02h: Clock Multiplier M = 3 01h: Clock Multiplier M = 2 00h: Clock Multiplier is Not Supported
47-46	RETUNING_MODES	R	0h	Re-tuning Modes (UHS-I Only) This field defines the re-tuning capability of a Host Controller and how to manage the data transfer length and a Re-Tuning Timer by the Host Driver. 0h: Mode 1 1h: Mode 2 2h: Mode 3 3h: Reserved There are two re-tuning timings: Re-Tuning Request and expiration of a Re-Tuning Timer. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue.
45	TUNING_FOR_SDR50	R	0h	Use Tuning for SDR50 (UHS-I Only) If this bit is set to 1h, this Host Controller requires tuning to operate SDR50 (tuning is always required to operate SDR104). 0h: SDR50 does not require tuning 1h: SDR50 requires tuning Note: Tuning is required for SDR50 to compensate temperature variation.

Table 18-152. MMCS0_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
31-30	SLOT_TYPE	R	0h	<p>Slot Type</p> <p>This field indicates usage of a slot by a specific Host System (a host controller register set is defined per slot). Embedded slot for one device (1h) means that only one non-removable device is connected to a SD bus slot. Shared Bus Slot (2h) can be set if Host Controller supports Shared Bus Control register.</p> <p>The Standard Host Driver controls only a removable card or one embedded device is connected to a SD bus slot. If a slot is configured for shared bus (2h), the Standard Host Driver does not control embedded devices connected to a shared bus. Shared bus slot is controlled by a specific host driver developed by a Host System.</p> <p>0h: Removable Card Slot 1h: Embedded Slot for One Device 2h: Shared Bus Slot (SD Mode) 3h: UHS-II Multiple Embedded Devices</p>
29	ASYNCH_INTR_SUPPORT	R	1h	<p>Asynchronous Interrupt Support (SD Mode Only)</p> <p>Refer to SDIO Specification Version 3.00 about asynchronous interrupt.</p> <p>0h: Asynchronous Interrupt Not Supported 1h: Asynchronous Interrupt Supported</p>
28	ADDR_64BIT_SUPPORT_V3	R	1h	<p>64-bit System Address Support for V3</p> <p>Meaning of this bit is different depends on Versions. Host Controller Version 3.00 and Version 4.10 use this bit as 64-bit System Address support for V3 mode. Host Controller Version 4.00 uses this bit as 64-bit System Address support for both V3 and V4 modes.</p> <p>SDMA cannot be used in 64-bit Addressing in Version 3 mode.</p> <p>If this bit is set to 1h, 64-bit ADMA2 with using 96-bit Descriptor may be enabled as follows:</p> <p>In case of Host Controller Version 3, 64-bit ADMA2 is enabled by MMCS0_HOST_CONTROL1[4-3] DMA_SELECT = 3h. In case of Host Controller Version 4, 64-bit ADMA2 for Version 3 is enabled by setting MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 0h and MMCS0_HOST_CONTROL1[4-3] DMA_SELECT = 3h.</p> <p>0h: 64-bit System Address for V3 is not Supported 1h: 64-bit System Address for V3 is Supported</p>
27	ADDR_64BIT_SUPPORT_V4	R	1h	<p>64-bit System Address Support for V4</p> <p>This bit is added from Version 4.10. Setting 1h to this bit indicates that the Host Controller supports 64-bit System Addressing of Version 4 mode.</p> <p>When this bit is set to 1h, full or a part of 64-bit address should be used to decode Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller Registers is effective regardless of setting to the MMCS0_HOST_CONTROL2[13] BIT64_ADDRESSING bit.</p> <p>If this bit is set to 1h, 64-bit DMA Addressing for Version 4 is enabled by setting MMCS0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h, MMCS0_HOST_CONTROL2[13] BIT64_ADDRESSING = 1h.</p> <p>SDMA can be used and ADMA2 uses 128-bit Descriptor.</p> <p>0h: 64-bit System Address for V4 is not Supported 1h: 64-bit System Address for V4 is Supported</p>

Table 18-152. MMCSD0_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	VOLT_1P8_SUPPORT	R	1h	Voltage Support 1.8 V This bit indicates whether the HC supports 1.8 V. 0h: 1.8 V Not Supported 1h: 1.8 V Supported
25	VOLT_3P0_SUPPORT	R	0h	Voltage Support 3.0 V This bit indicates whether the HC supports 3.0 V. 0h: 3.0 V Not Supported 1h: 3.0 V Supported
24	VOLT_3P3_SUPPORT	R	0h	Voltage Support 3.3 V This bit indicates whether the HC supports 3.3 V. 0h: 3.3 V Not Supported 1h: 3.3 V Supported
23	SUSP_RES_SUPPORT	R	1h	Suspend/Resume Support This bit indicates whether the HC supports Suspend/Resume functionality. If this bit is 0h, the Suspend and Resume mechanism are not supported and the HD shall not issue either Suspend/Resume commands. 0h: Not Supported 1h: Supported
22	SDMA_SUPPORT	R	1h	SDMA Support This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly. Version 4.10 Host Controller shall support SDMA if ADMA2 is supported. 0h: SDMA Not Supported 1h: SDMA Supported
21	HIGH_SPEED_SUPPORT	R	1h	High Speed Support This bit indicates whether the HC and the Host System support High Speed mode and they can supply SD Clock frequency from 25 MHz to 50 MHz (for SD)/20 MHz to 52 MHz (for MMC). 0h: High Speed Not Supported 1h: High Speed Supported
20	RESERVED	R	0h	Reserved
19	ADMA2_SUPPORT	R	1h	ADMA2 Support 0h: ADMA2 Not support 1h: ADMA2 support
18	BUS_8BIT_SUPPORT	R	1h	8-bit Support for Embedded Device (Embedded) This bit indicates whether the Host Controller is capable of using 8-bit bus width mode. This bit is not effective when the MMCSD0_CAPABILITIES[31-30] SLOT_TYPE bit field is set to 2h. 0h: 8-bit Bus Width Not Supported 1h: 8-bit Bus Width Supported
17-16	MAX_BLK_LENGTH	R	0h	Max Block Length This value indicates the maximum block size that the HD can read and write to the buffer in the HC. The buffer shall transfer this block size without wait cycles. Three sizes can be defined as indicated below. 0h: 512 byte 1h: 1024 byte 2h: 2048 byte 3h: 4096 byte

Table 18-152. MMCSDB0_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	BASE_CLK_FREQ	R	C8h	Base Clock Frequency for SD Clock (1) 6-bit Base Clock Frequency: This mode is supported by the Host Controller Version 1.00 and 2.00. Upper 2-bit is not effective and always 0. Unit values are 1 MHz. The supported clock range is 10 MHz to 63 MHz. 11xx xxxxb: Not Supported 0011 1111b: 63 MHz 0000 0010b: 2 MHz 0000 0001b: 1 MHz 0000 0000b: Get Information via another method (2) 8-bit Base Clock Frequency: This mode is supported by the Host Controller Version 3.00. Unit values are 1 MHz. The supported clock range is 10 MHz to 255 MHz. FFh: 255 MHz 02h: 2 MHz 01h: 1 MHz 00h: Get Information via another method If the real frequency is 16.5 MHz, the larger value shall be set 0001 0001b (17 MHz) because the Host Driver use this value to calculate the clock divider value (refer to the MMCSDB0_CLOCK_CONTROL[15-8] SDCLK_FRQSEL bit field) and it shall not exceed upper limit of the SD Clock frequency. If these bits are all 0, the Host System has to get information via another method.
7	TIMEOUT_CLK_UNIT	R	0h	Timeout Clock Unit This bit shows the unit of base clock frequency used to detect Data Timeout Error (MMCSDB0_ERROR_INTR_STS[4] DATA_TIMEOUT). 0h: KHz 1h: MHz
6	RESERVED	R	0h	Reserved
5-0	TIMEOUT_CLK_FREQ	R	1h	Timeout Clock Frequency This bit shows the base clock frequency used to detect Data Timeout Error (MMCSDB0_ERROR_INTR_STS[4] DATA_TIMEOUT). 0h: Get Information via another method Not 0h: 1 KHz to 63 KHz/1 MHz to 63 MHz

Table 18-153 shows the 64-bit System Address Support depends on Versions.

Table 18-153. 64-bit System Address Support depends on Versions

Host Controller	Version 3.00	Version 4.00	Version 4.10
D28 (from Version 2.00)	for V3	for V3 and V4	for V3
D27 (from Version 4.10)	D27 (from Version 4.10)	Not Defined	for V4
Register Decode	32-bit or 64-bit (up to implementation)	32-bit or 64-bit (up to implementation)	If D27 = 1h, 64-bit
SDMA	Not supported	Supported when MMCSDB0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h	Supported when MMCSDB0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h
ADMA2 (96-bit Descriptor)	DMA Select = 3h	Selected by MMCSDB0_HOST_CONTROL2[12] HOST_VER40_ENA = 0h	MMCSDB0_HOST_CONTROL2

Table 18-153. 64-bit System Address Support depends on Versions (continued)

Host Controller	Version 3.00	Version 4.00	Version 4.10
ADMA2 (128-bit Descriptor)	Not Defined	Selected by MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h	Selected by MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA = 1h

As the specification of 64-bit System Address Support has been changed, capabilities of 64-bit functions are different depends on versions.

Definition of D28 is different depends on Versions. 96-bit Descriptor was defined by Version 2 but notation V3 is used including V2. Version 4.10 divides 64-bit System Address Support into V3 mode (D28) and V4 mode (D27) so that V3 mode can be optional. Migrate to V4 is recommended. From Host Controller Version 4.00, either V3 mode or V4 mode is selected by Host Version 4 Enable in the Host Control 2 register. V3 mode can be used if 64-bit System Address Support for V3 is set to 1h. V4 mode can be used if 64-bit System Address Support for V4 is set to 1h.

Prior to Version 4.10, address length of Host Controller registers decoding is not defined and whether 32-bit or 64-bit address is used to decode Host Controller registers is up to implementation. If Host Controller decodes 32-bit system address in default, the Host Controller Registers shall be placed in 32-bit addressing space.

When D27 = 1h, Host Controller Version 4.10 or later should use full or a part of 64-bit address to decode Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller Registers is effective regardless of setting to the MMCSD0_HOST_CONTROL2[13] BIT64_ADDRESSING bit. How to decode register also should follow a system bus specification or a mother board specification.

From Version 4.00, 64-bit System Addressing of DMA is enabled by setting to the MMCSD0_HOST_CONTROL2[13] BIT64_ADDRESSING bit. 64-bit SDMA is not supported in V3 mode and is supported in V4 mode. There are two Descriptor types for ADMA2 96-bit (V3) or 128-bit (V4). Support of 96-bit Descriptor is optional for Host Controller Version 4.10. If D28 = 0h, 96-bit Descriptor is not supported.

Note: The Host System shall support at least one of these voltages above. The HD sets the MMCSD0_POWER_CONTROL[3:1] SD_BUS_VOLTAGE bit field according to these support bits. If multiple voltages are supported, select the usable lower voltage by comparing the OCR value from the card.

These registers indicate maximum current capability for each voltage. The value is meaningful if Voltage Support is set in the MMCSD0_CAPABILITIES register.

Table 18-154 describes the re-tuning modes.

Table 18-154. 64-bit System Address Support depends on Versions

Bit47-46	Re-Tuning Mode	Data length	Timer Modes
0h	Mode1	4 MB (Max.)	Always enabled
1h	Mode2	4 MB (Max.)	Stop during data transfer
2h	Reserved	Reserved	Reserved
3h	Reserved	Reserved	Reserved

There are two re-tuning timings: Re-Tuning Request and expiration of a Re-Tuning Timer. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue.

Data length per a read/write command is restricted by whether Host Controller generates Re-Tuning Request during data transfer so that re-tuning procedures can be inserted during data transfers.

18.2.28 MMCS0_MAX_CURRENT_CAP Register (Offset = 48h) [reset = 0h]

MMCS0_MAX_CURRENT_CAP is shown in [Figure 18-57](#) and described in [Table 18-156](#).

Return to [Summary Table](#).

This register indicates maximum current capability for each voltage.

Table 18-165. MMCSD0_ADMA_SYS_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
63-0	ADMA_ADDR	R/W	Xh	<p>ADMA System Address</p> <p>The 32-bit addressing Host Driver uses lower 32-bit of this register (upper 32-bit should be set to 0h) and shall program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. DMA2/3 ignores lower 2-bit of this register and assumes it to be 0h. DMA in 64-bit addressing. The 64-bit addressing Host Driver uses all bits of this register and shall program Descriptor Table on 64-bit boundary and set 64-bit boundary address to this register. DMA2/3 ignores lower 3-bit of this register and assumes it to be 0h.</p> <p>SDMA</p> <p>If the MMCSD0_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, SDMA use this register to indicate System Address of data location instead of using SDMA System Address register (MMCSD0_SDMA_SYS_ADDR_LO/ MMCSD0_SDMA_SYS_ADDR_HI). SDMA can be used in 32-bit and 64-bit addressing in Version 4.00.</p> <p>ADMA2</p> <p>This register holds byte address of executing command of the Descriptor table. At the start of ADMA2, the Host Driver shall set start address of the Descriptor table. The ADMA increments this register address, which points to next line, when every fetching a Descriptor line. When the ADMA Error Interrupt is generated, this register shall hold the Descriptor address depending on the ADMA state.</p> <p>ADMA3</p> <p>This register is set by ADMA3. Host Driver is not necessary to set this register. The ADMA3 increments address of this register, which points to next line, when every time fetching a Descriptor line. When Error Interrupt is generated, this register shall hold the Descriptor address depending on the ADMA state.</p> <p>Register Value - 00000000_xxxxxxxh Addressing Mode - 32-bit System Address Register Value - xxxxxxxx_xxxxxxxh Addressing Mode - 64-bit System Address</p>

18.2.33 MMCS0_PRESET_VALUE0 Register (Offset = 60h) [reset = 100h]

MMCS0_PRESET_VALUE0 is shown in [Figure 18-62](#) and described in [Table 18-168](#).

Return to [Summary Table](#).

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, Driver Strength Select Value.

When the MMCS0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to 1h, SDCLK/RCLK Frequency Select and Clock Generator Select in the MMCS0_CLOCK_CONTROL register, and Driver Strength Select in the MMCS0_HOST_CONTROL2 register are automatically set based on the Selected Bus Speed Mode (see [Table 18-166](#)). This means the Host Driver needs not set these fields when preset is enabled.

Before starting the initialization sequence, the Host Driver needs to set a clock preset value to SDCLK/RCLK Frequency Select in the MMCS0_CLOCK_CONTROL register. The MMCS0_HOST_CONTROL2[15] PRESET_VALUE_ENA bit can be set after initialization completed.

[Table 18-166](#) shows the conditions to select one of preset value registers.

Table 18-166. Preset Value Register Select Condition

Selected Bus Speed Mode	1.8 V Signaling Enable (Host Control 2)	High Speed Enable (Host Control 1)	UHS-1 Mode Selection (Host Control 2)

18.2.47 MMCS0_UHS2_XFER_MODE Register (Offset = 9Ch) [reset = 0h]

MMCS0_UHS2_XFER_MODE is shown in [Figure 18-76](#) and described in [Table 18-197](#).

Return to [Summary Table](#).

This register is used to control the operations of data transfers.

On issuing a Command Packet, a Command Packet image is set to UHS-II Command Packet register (see MMCS0_UHS2_COMMAND_PKT_0 - MMCS0_UHS2_COMMAND_PKT_19) but Host Controller does not analyze the setting of UHS-II Command Packet register. Instead, Host Controller refers setting of this register to issue a Command Packet to make the control easy. Setting of these registers shall be correspondent.

Bit	Field	Type	Reset	Description
7	INT_MSG_ENA	R/W	0h	<p>INT MSG Enable (Optional)</p> <p>This bit enables receipt of INT MSG. If this bit is set to 1h, receipt of INT MSG is informed by the MMCS0_NORMAL_INTR_STS[8] CARD_INTR bit. If this bit is set to 0h, Host Controller ignores receipt of INT MSG and may not set the MMCS0_UHS2_DEVICE_INT_CODE register.</p> <p>Support of INT MSG Interrupt is optional. If trying to set this bit to 1h but still this bit is read 0, INT MSG Interrupt is not supported by the Host Controller. In this case, the MMCS0_UHS2_DEVICE_INTR_STATUS register always shall be read 0 and the MMCS0_UHS2_DEVICE_INT_CODE register may not be implemented.</p> <p>0h: Disabled 1h: Enabled</p>
6-4	RESERVED	R	0h	Reserved
3-0	DEV_SEL	R/W	0h	<p>UHS-II Device Select</p> <p>Host Controller holds an INT MSG packet per device. One of INT MSGs (up to 15) can be selected by this field and read from the MMCS0_UHS2_DEVICE_INT_CODE. This field is effective when the MMCS0_UHS2_DEVICE_SELECT[7] INT_MSG_ENA bit is set to 1h.</p> <p>The number of devices implemented in the Host Controller is indicated by the MMCS0_UHS2_GEN_CAP[21-18] CORECFG_UHS2_MAX_DEVICES bit field.</p> <p>0h: Unselected (Default) 1h: INT MSG of Device ID 1 is selected 2h: INT MSG of Device ID 2 is selected Fh: INT MSG of Device ID 15 is selected</p>

18.2.54 MMCSD0_UHS2_DEVICE_INT_CODE Register (Offset = BFh) [reset = 0h]

MMCSD0_UHS2_DEVICE_INT_CODE is shown in [Figure 18-83](#) and described in [Table 18-212](#).

Return to [Summary Table](#).

This register is effective when the MMCSD0_UHS2_DEVICE_SELECT[7] INT_MSG_ENA bit is set to 1h.

Bit	Field	Type	Reset	Description
7-0	DEV_INTR	R	0h	UHS II Device Interrupt This register is effective when the MMCSD0_UHS2_DEVICE_SELECT[7] INT_MSG_ENA bit is set to 1h. Host Controller holds an INT MSG packet per device. One of INT MSGs (Code length is 1 byte) up to 15 can be read from this register by selecting UHS-II Device Select (MMCSD0_UHS2_DEVICE_SELECT[3-0] DEV_SEL). The number of the registers to hold INT MSGs is determined by the MMCSD0_UHS2_GEN_CAP[21-18] CORECFG_UHS2_MAX_DEVICES bit field. Device ID is supposed to be assigned from 1 sequentially at the UHS-II Initialization.

18.2.55 MMCS0_UHS2_SOFTWARE_RESET Register (Offset = C0h) [reset = 0h]

MMCS0_UHS2_SOFTWARE_RESET is shown in [Figure 18-84](#) and described in [Table 18-214](#).

Return to [Summary Table](#).

16	TIMEOUT_CMD_RES	W	0h	Force Event for Timeout for CMD_RES Setting this bit forces the Host Controller to set Timeout for CMD_RES in the MMCSD0_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: Timeout for CMD_RES Status is set
15	ADMA	W	0h	Force Event for ADMA Error Setting this bit forces the Host Controller to set ADMA Error in the MMCSD0_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: ADMA Error Status is set

Table 18-254. MMCS0_FORCE_UHS2_ERR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-9	RESERVED	R	0h	Reserved
8	EBSY	W	0h	Force Event for EBSY Error Setting this bit forces the Host Controller to set EBSY Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: EBSY Error Status is set
7	UNRECOVERABLE	W	0h	Force Event for Unrecoverable Error Setting this bit forces the Host Controller to set Unrecoverable Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: Unrecoverable Error Status is set
6	RESERVED	R	0h	Reserved
5	TID	W	0h	Force Event for TID Error Setting this bit forces the Host Controller to set TID Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: TID Error Status is set
4	FRAMING	W	0h	Force Event for Framing Error Setting this bit forces the Host Controller to set Framing Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: Framing Error Status is set
3	CRC	W	0h	Force Event for CRC Error Setting this bit forces the Host Controller to set CRC Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: CRC Error Status is set
2	RETRY_EXPIRED	W	0h	Force Event for Retry Expired Setting this bit forces the Host Controller to set Retry Expired in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: Retry expired error status is set
1	RES_PKT	W	0h	Force Event for RES Packet Error Setting this bit forces the Host Controller to set RES Packet Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: RES packet error status is set
0	HEADER	W	0h	Force Event for Header Error Setting this bit forces the Host Controller to set Header Error in the MMCS0_FORCE_UHS2_ERR_INTR_STS register. 0h: Not affected 1h: Header error status is set

18.2.76 MMCSD0_CQ_VERSION Register (Offset = 200h) [reset = 510h]

MMCSD0_CQ_VERSION is shown in [Figure 18-105](#) and described in [Table 18-256](#).

Return to [Summary Table](#).

This register provides information about the version of the eMMC CQ (Command Queueing) standard which is 285 implemented by the CQE, in BCD format. The current version is rev 5.1.

The following table describes the CQBASE+00h: Command Queueing Version.

Table 18-255. MMCSD0_CQ_VERSION Instances

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-12	CF_MUL	R	3h	Internal Timer Clock Frequency Multiplier (ITCFMUL) ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the SQS polling period. See ITCFVAL definition for details (MMCS0_CQ_CAPABILITIES[9-0] CF_VAL). Field Value Description: 0h: 0.001 MHz 1h: 0.01 MHz 2h: 0.1 MHz 3h: 1 MHz 4h: 10 MHz Other values are reserved
11-10	RESERVED	R	0h	Reserved
9-0	CF_VAL	R	C8h	Internal Timer Clock Frequency Value (ITCFVAL) ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the polling period when using periodic SEND_QUEUE_STATUS (CMD13) polling. The clock frequency is calculated as ITCFVAL × ITCFMUL. For example, to encode 19.2 MHz ITCFVAL shall be C0h (= 192 decimal) and ITCFMUL shall be 2h (0.1 MHz). 192 × 0.1 MHz = 19.2 MHz

18.2.78 MMCSD0_CQ_CONFIG Register (Offset = 208h) [reset = 0h]

MMCSD0_CQ_CONFIG is shown in [Figure 18-107](#) and described in [Table 18-260](#).

Return to [Summary Table](#).

This register controls CQE behavior affecting the general operation of command queueing 290 module or operation of multiple tasks in the same time.

Table 18-264. MMCS0_CQ_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4	TASK_ERROR	R/W1C	0h	Task Error Interrupt (TERR) This bit is asserted when task error is detected due to invalid task descriptor.
3	TASK_CLEARED	R/W1C	0h	Task Cleared (TCL) This status bit is asserted (if MMCS0_CQ_INTR_STS_ENA[3] TASK_CLEARED = 1h) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (MMCS0_CQ_TASK_CLEAR) or clearing of all tasks (MMCS0_CQ_CONTROL).
2	RESP_ERR_DET	R/W1C	0h	Response Error Detected Interrupt (RED) This status bit is asserted (if MMCS0_CQ_INTR_STS_ENA[2] RESP_ERR_DET = 1h) when a response is received with an error bit set in the device status field. Software uses the MMCS0_CQ_RESP_ERR_MASK register to configure which device status bit fields may trigger an interrupt, and which are masked.

Table 18-264. MMCS0_CQ_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TASK_COMPLETE	R/W1C	0h	Task Complete Interrupt (TCC) This status bit is asserted (if MMCS0_CQ_INTR_STS_ENA[1] TASK_COMPLETE = 1h) when at least one of the following two conditions are met: (1) A task is completed and the INT bit is set in its Task Descriptor (2) Interrupt caused by Interrupt Coalescing logic
0	HALT_COMPLETE	R/W1C	0h	Halt Complete Interrupt (HAC) This status bit is asserted (if MMCS0_CQ_INTR_STS_ENA[0] HALT_COMPLETE = 1h) when the MMCS0_CQ_CONTROL[0] HALT_BIT bit transitions from 0h to 1h indicating that host controller has completed its current ongoing task and has entered halt state.

18.2.81 MMCS0_CQ_INTR_STS_ENA Register (Offset = 214h) [reset = 0h]

MMCS0_CQ_INTR_STS_ENA is shown in [Figure 18-110](#) and described in [Table 18-266](#).

Return to [Summary Table](#).

This register enables and disables the reporting of the corresponding interrupt to host software in 299 MMCS0_CQ_INTR_STS register. When a bit is set (1h) and the corresponding interrupt condition is active, then the 300 bit in the MMCS0_CQ_INTR_STS register is asserted. Interrupt sources that are disabled (0h) are not indicated in the MMCS0_CQ_INTR_STS 301 register. This register is bit-index matched to the MMCS0_CQ_INTR_STS register.

Table 18-270. MMCS0_CQ_INTR_COALESCING Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CQINTCOALESC_ENABLE	R/W	0h	Interrupt Coalescing Enable/Disable: When set to 0h by software, command responses are neither counted nor timed. Interrupts are still triggered by completion of tasks with INT = 1 in the Task Descriptor. When set to 1h, the interrupt coalescing mechanism is enabled and coalesced interrupts are generated.
30-21	RESERVED	R	0h	Reserved
20	IC_STATUS	R	0h	Interrupt Coalescing Status Bit (ICSB): This bit indicates to software whether any tasks (with INT = 0) have completed and counted towards interrupt coalescing (ICSB is set if and only if IC counter > 0). Bit Value Description 0h: No task completions have occurred since last counter reset (IC counter = 0) 1h: At least one task completion has been counted (IC counter > 0)
19-13	RESERVED	R	0h	Reserved

Table 18-270. MMCS0_CQ_INTR_COALESCING Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12-8	CTR_THRESHOLD	R/W	0h	<p>Interrupt Coalescing Counter Threshold (ICCTH): Software uses this field to configure the number of task completions (only tasks with INT = 0 in the Task Descriptor) which are required in order to generate an interrupt. Counter Operation: As data transfer tasks with INT = 0 complete, they are counted by CQE. The counter is reset by software during the interrupt service routine. The counter stops counting when it reaches the value configured in ICCTH. The maximum allowed value is 31. Note: When ICCTH is 0h, task completions are not counted, and counting-based interrupts are not generated.</p>
7	RESERVED	R	0h	Reserved
6-0	TIMEOUT_VAL	R/W	0h	<p>Interrupt Coalescing Timeout Value (ICTOVAL): Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt. Timer Operation: The timer is reset by software during the interrupt service routine. It starts running when a data transfer task with INT = 0 is completed, after the timer was reset. When the timer reaches the value configured in ICTOVAL field it generates an interrupt and stops. The timers unit is equal to 1024 clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field in the MMCS0_CQ_CAPABILITIES register. The minimum value is 1h (1024 clock periods) and the maximum value is 7Fh (127 × 1024 clock periods). For example, a MMCS0_CQ_CAPABILITIES field value of 0h indicates a 19.2 MHz clock frequency (period = 52.08 ns). If the setting in ICTOVAL is 10h, the calculated polling period is 16 × 1024 × 52.08 ns = 853.33 μs Note: When ICTOVAL is 0h, the timer is not running, and timer-based interrupts are not generated.</p>

18.2.84 MMCS0_CQ_TDL_BASE_ADDR Register (Offset = 220h) [reset = 0h]

MMCS0_CQ_TDL_BASE_ADDR is shown in [Figure 18-113](#) and described in [Table 18-272](#).

Return to [Summary Table](#).

This register is used for configuring the lower 32 bits of the byte address of the head of the Task 312 Descriptor List in the host memory.

Bit	Field	Type	Reset	Description
31-0	CQ_TDLBA_LO	R/W	0h	Task Descriptor List Base Address (TDLBA) This register stores the LSB bits (bits 31-0) of the byte address of the head of the Task Descriptor List in system memory. The size of the task descriptor list is $32 \times (\text{Task Descriptor size} + \text{Transfer Descriptor size})$ as configured by Host driver. This address shall be set on Byte1 KByte boundary. The lower 10 bits of this register shall be set to 0h by software and shall be ignored by CQE.

18.2.85 MMCSO_CQ_TDL_BASE_ADDR_UPBITS Register (Offset = 224h) [reset = 0h]

MMCSO_CQ_TDL_BASE_ADDR_UPBITS is shown in [Figure 18-114](#) and described in [Table 18-274](#).

Return to [Summary Table](#).

This register is used for configuring the upper 32 bits of the byte address of the head of the Task 316 Descriptor List in the host memory.

Bit	Field	Type	Reset	Description
31-0	CQDP_TSKS	R	0h	<p>Device Pending Tasks</p> <p>Bit n of this register is set if and only if QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) were sent for this specific task and if this task hasnt been executed yet.</p> <p>CQE shall set this bit after receiving a successful response for CMD45. CQE shall clear this bit after the task has completed execution.</p> <p>Software needs to read this register in the task-discard procedure, when the controller is halted, to determine if the task is queued in the device. If the task is queued, the driver sends a CMDQ_TASK_MGMT (CMD48) to the device ordering it to discard the task. Then software clears the task in the CQE.</p> <p>Only then the software orders CQE to resume its operation using MMCSD0_CQ_CONTROL register.</p>

18.2.90 MMCS0_CQ_TASK_CLEAR Register (Offset = 238h) [reset = 0h]

MMCS0_CQ_TASK_CLEAR is shown in [Figure 18-119](#) and described in [Table 18-284](#).

Return to [Summary Table](#).

This register is used for removing an outstanding task in the CQE 327. The register should be used only when CQE is in Halt state.

Table 18-283. MMCS0_CQ_TASK_CLEAR Instances

Table 18-284. MMCS0_CQ_TASK_CLEAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CQTCLR	R/W	0h	<p>Command Queueing Task Clear</p> <p>Writing 1h to bit n of this register orders CQE to clear a task which software has previously issued.</p> <p>This bit can only be written when CQE is in Halt state as indicated in the MMCS0_CQ_CONFIG register Halt bit.</p> <p>When software writes 1h to a bit in this register, CQE updates the value to 1h, and starts clearing the data structures related to the task. CQE clears the bit fields (sets a value of 0h) in the MMCS0_CQ_TASK_CLEAR and in MMCS0_CQ_TASK_DOOR_BELL registers once clear operation is complete.</p> <p>Software should poll on the MMCS0_CQ_TASK_CLEAR register until it is cleared to verify clear operation was complete.</p> <p>Writing to this register only clears the task in the CQE and does not have impact on the device. In order to discard the task in the device, host software shall send CMDQ_TASK_MGMT while CQE is still in Halt state.</p> <p>Host driver is not allowed to use this register to clear multiple tasks at the same time. Clearing multiple tasks can be done using MMCS0_CQ_CONTROL register.</p> <p>Writing 0h to a register bit shall have no impact.</p>

18.2.91 MMCS0_CQ_SEND_STS_CONFIG1 Register (Offset = 240h) [reset = 11000h]

MMCS0_CQ_SEND_STS_CONFIG1 is shown in [Figure 18-120](#) and described in [Table 18-286](#).

Return to [Summary Table](#).

The register controls when the SEND_QUEUE_STATUS commands are sent.

Table 18-286. MMCS0_CQ_SEND_STS_CONFIG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19-16	CMD_BLK_CNTR	R/W	1h	Send Status Command Block Counter This field indicates to CQE when to send SEND_QUEUE_STATUS (CMD13) command to inquire the status of the devices task queue. A value of n means CQE shall send status command on the CMD line, during the transfer of data block BLOCK_CNT-n , on the data lines, where BLOCK_CNT is the number of blocks in the current transaction. A value of 0h means that SEND_QUEUE_STATUS (CMD13) command shall not be sent during the transaction. Instead it will be sent only when the data lines are idle. A value of 1 means that STATUS command is to be sent during the last block of the transaction.
15-0	CMD_IDLE_TIMER	R/W	1000h	Send Status Command Idle Timer This field indicates to CQE the polling period to use when using periodic SEND_QUEUE_STATUS (CMD13) polling. Periodic polling is used when tasks are pending in the device, but no data transfer is in progress. When a SEND_QUEUE_STATUS response indicating that no task is ready for execution, CQE counts the configured time until it issues the next SEND_QUEUE_STATUS. Timer units are clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field in the MMCS0_CQ_CAPABILITIES register. The minimum value is 1h (1 clock period) and the maximum value is FFFFh (65535 clock periods). Default interval is: 4096 clock periods. For example, a MMCS0_CQ_CAPABILITIES field value of 0h indicates a 19.2 MHz clock frequency (period = 52.08 ns).

18.2.92 MMCS0_CQ_SEND_STS_CONFIG2 Register (Offset = 244h) [reset = 0h]

MMCS0_CQ_SEND_STS_CONFIG2 is shown in [Figure 18-121](#) and described in [Table 18-288](#).

Return to [Summary Table](#).

This register is used for 333 configuring RCA field in SEND_QUEUE_STATUS command argument.

18.2.95 MMCSD0_CQ_TASK_ERR_INFO Register (Offset = 254h) [reset = 0h]

MMCSD0_CQ_TASK_ERR_INFO is shown in [Figure 18-124](#) and described in [Table 18-294](#).

Return to [Summary Table](#).

This register is updated by CQE when an error occurs on data or command related to a task activity. When such error is detected by CQE or indicated by the eMMC controller CQE stores in the MMCSD0_CQ_TASK_ERR_INFO register the task IDs and the command indices of the commands which were executed on the 343 command line and data lines when the error occurred.

Software is expected to use this information in the error recovery procedure.

MMCS0_RXECC_SEC_EOI_REG is shown in Figure 18-131 and described in Table 18-313.

Return to [Summary Table](#).

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 18-469. MMCS12_SDMA_SYS_ADDR_LO Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	SDMA_ADDRESS	R/W	0h	<p>32-bit Block Count (SDMA System Address) Low</p> <p>When the MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 0h, DMA uses this register as system address in only 32-bit addressing mode. Auto CMD23 cannot be used with SDMA. When the MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, SDMA uses the MMCS12_ADMA_SYS_ADDRESS register instead of using this register to support both 32-bit and 64-bit addressing. This register is re-assigned to 32-bit Block Count and then SDMA may use Auto CMD23.</p> <p>(1) SDMA System Address (MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h)</p> <p>This register contains the system memory address for a SDMA transfer in 32-bit addressing mode. When the Host Controller (HC) stops a SDMA transfer, this register shall point to the system address of the next contiguous data position.</p> <p>It can be accessed only if no transaction is executing (after a transaction has stopped). Reading this register during SDMA transfers may return an invalid value. The Host Driver (HD) shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the MMCS12_BLOCK_SIZE[14-12] SDMA_BUF_SIZE bit field. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register (Offset = 3h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by setting the MMCS12_BLOCK_GAP_CONTROL[1] CONTINUE bit, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register (MMCS12_SDMA_SYS_ADDR_LO/MMCS12_SDMA_SYS_ADDR_HI). ADMA does not use this register.</p> <p>(2) 32-bit Block Count (MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h)</p> <p>Host Controller Version 4.10 re-defines this register as 32-bit Block Count. In version 4.00, this register may be used as 32-bit block count only for Auto CMD23 to set the argument of the CMD23 while executing Auto CMD23.</p> <p>The Host Controller would decrement the block count of this register every block transfer and data transfer stops when the count reaches zero.</p> <p>FFFF FFFFh (4G - 1 Block)</p> <p>....</p> <p>0000 0002h (2 Blocks)</p> <p>0000 0001h (1 Block)</p> <p>0000 0000h (Stop Count)</p> <p>Note: This register should be accessed only when no transaction is executing. Reading this register during data transfers may return invalid value.</p>

18.6.2 MMCSDB12_SDMA_SYS_ADDR_HI Register (Offset = 2h) [reset = 0h]

MMCSDB12_SDMA_SYS_ADDR_HI is shown in [Figure 18-182](#) and described in [Table 18-471](#).

Return to [Summary Table](#).

This register contains the Upper 16-bit of physical system memory address used for DMA transfers or the second argument for the Auto CMD23 in Host version 3.0 and as 32-bit Block Count in Version 4.10.

7	RESP_ERR_CHK_ENA	R/W	0h	<p>Response Error Check Enable</p> <p>Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver. Only R1 or R5 can be checked.</p> <p>If Host Driver checks response error, this bit is set to 0h and the MMCSD12_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 0h. If Host Controller checks response error, sets this bit to 1h and sets the Response Interrupt Disable bit to 1h (MMCSD12_TRANSFER_MODE[8] RESP_INTR_DIS = 1h). The MMCSD12_TRANSFER_MODE[6] RESP_TYPE bit selects either R1 or R5 response type. If an error is detected, Response Error Interrupt is generated in the MMCSD12_ERROR_INTR_STS register.</p> <p>0h: Response Error Check is disabled 1h: Response Error Check is enabled</p>
6	RESP_TYPE	R/W	0h	<p>Response Type R1/R5</p> <p>When response error check is enabled (MMCSD12_TRANSFER_MODE[7] RESP_ERR_CHK_ENA = 1h), this bit selects either R1 or R5 response types. Two types of response checks are supported: R1 for memory and R5 for SDIO. Error Statuses Checked in R1:</p> <p>Bit31 OUT_OF_RANGE Bit30 ADDRESS_ERROR Bit29 BLOCK_LEN_ERROR Bit26 WP_VIOLATION Bit25 CARD_IS_LOCKED Bit23 COM_CRC_ERROR Bit21 CARD_ECC_FAILED Bit20 CC_ERROR Bit19 ERROR</p> <p>Response Flags Checked in R5:</p> <p>Bit07 COM_CRC_ERROR Bit03 ERROR Bit01 FUNCTION_NUMBER Bit00 OUT_OF_RANGE</p> <p>0h: R1 (Memory) 1h: R5 (SDIO)</p>
5	MULTI_BLK_SEL	R/W	0h	<p>Multi/Single Block Select</p> <p>This bit enables multiple block data transfers.</p> <p>0h: Single Block 1h: Multiple Block</p>
4	DATA_XFER_DIR	R/W	0h	<p>Data Transfer Direction Select</p> <p>This bit defines the direction of data transfers.</p> <p>0h: Write (Host to Card) 1h: Read (Card to Host)</p>

Table 18-481. MMCSDB12_TRANSFER_MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	AUTO_CMD_ENA	R/W	0h	<p>Auto CMD Enable</p> <p>This field determines use of auto command functions. There are three methods to stop Multiple-block read and write operation by CMD23 or CMD12. In the other operations (for example single read/write operation), this field is set to 0h.</p> <p>(1) Auto CMD12 Enable:</p> <p>Multiple-block read and write commands for memory require CMD12 to stop the operation. When this field is set to 1h, the Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the MMCSDB12_AUTOCMD_ERR_STS register. The Host Driver shall not set this bit if the command does not require CMD12. When MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h, CMD12 is issued when 16-bit Block Count is expired. When MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h, CMD12 is issued when 16-bit Block Count or 32-bit Block Count is expired.</p> <p>(2) Auto CMD23 Enable:</p> <p>When this bit field is set to 2h, the Host Controller issues a CMD23 automatically before issuing a command specified in the MMCSDB12_COMMAND register. The Host Controller Version 3.00 and later shall support this function.</p> <p>The following conditions are required to use the Auto CMD23: Auto CMD23 Supported (Host Controller Version is 3.00 or later). A memory card that supports CMD23 (SCR[33] = 1h). If DMA is used, it shall be ADMA.</p> <p>Only when CMD18 or CMD25 is issued. Auto CMD23 can be used with or without ADMA. By writing the MMCSDB12_COMMAND register, the Host Controller issues a CMD23 first and then issues a command specified by the MMCSDB12_COMMAND[13:8] CMD_INDEX bit field. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the MMCSDB12_AUTOCMD_ERR_STS register.</p> <p>32-bit block count value for CMD23 is set to 32-bit Block Count (MMCSDB12_SDMA_SYS_ADDR_LO/MMCSDB12_SDMA_SYS_ADDR_HI) register.</p> <p>(3) Auto CMD Auto Select (Version 4.10):</p> <p>As CMD23 is optional for SD memory card except UHS 104 card, if card supports CMD23, Auto CMD 23 should be used instead of Auto CMD12. Host Controller Version 4.10 defines this "Auto CMD Auto Select" mode. Selection of Auto CMD depends on setting of the MMCSDB12_HOST_CONTROL2[11] CMD23_ENA bit which indicates whether card supports CMD23. If MMCSDB12_HOST_CONTROL2[11] CMD23_ENA = 1h, Auto CMD23 is used and if MMCSDB12_HOST_CONTROL2[11] CMD23_ENA = 0h, Auto CMD12 is used. In case of Version 4.10 or later, use of Auto CMD Auto Select is recommended rather than use of Auto CMD12 Enable or Auto CMD23 Enable.</p> <p>0h: Auto Command Disabled 1h: Auto CMD12 Enable 2h: Auto CMD23 Enable 3h: Reserved</p>

Table 18-481. MMCSD12_TRANSFER_MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	BLK_CNT_ENA	R/W	0h	Block Count Enable This bit is used to enable the MMCSD12_BLOCK_COUNT register, which is only relevant for multiple block transfers. When this bit is 0h, the MMCSD12_BLOCK_COUNT register is disabled, which is useful in executing an infinite transfer. 0h: Disable 1h: Enable
0	DMA_ENA	R/W	0h	DMA Enable DMA can be enabled only if the MMCSD12_CAPABILITIES[22] SDMA_SUPPORT bit is set. If this bit is set to 1h, a DMA operation shall begin when the HD writes to the upper byte of the MMCSD12_COMMAND register. 0h: Disable 1h: Enable

This register is used to control the operations of data transfers.

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to MMCSD12_COMMAND[5] DATA_PRESENT bit), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the MMCSD12_PRESENTSTATE[1] INHIBIT_DAT bit is 1h.

Table 18-482 shows the determination of transfer type.

Table 18-482. Determination of Transfer Type

Multi/Single Block Select	Block Count Enable	Block Count	Function
0	Don't Care	Don't Care	Single Transfer
1	0	Don't Care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

18.6.8 MMCSDB12_COMMAND Register (Offset = Eh) [reset = 0h]

MMCSDB12_COMMAND is shown in [Figure 18-188](#) and described in [Table 18-484](#).

Return to [Summary Table](#).

This register is used to program the Command for host controller.

Table 18-483. MMCSDB12_COMMAND Instances

Table 18-486. Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	CMD_RESP	R	0h	Command Response R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register.

[Table 18-487](#) defines the relation between the parameter and name of response type.

Table 18-487. Relation between Parameters and the Name of Response Type

Response Type	Index Check Enable	CRC Check Enable	Name of Response Type
00	0	0	No Response
01	0	1	R2
10	0	0	R3, R4
10	1	1	R1, R6, R5, R7
11	1	1	R1b, R5b

The following table describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register.

[Table 18-488](#) shows response bit definition for each response type.

Table 18-488. Response Bit Definition for each Response Type

Kind of Response	Meaning of Response	Response Field	Response Register
R1, R1b (normal response)	Card Status	R[39:8]	REP[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	REP[127:96]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	REP [127:96]
R2 (CID, CSD Register)	CID or CSD register include	R[127:8]	REP[119:0]
R3 (OCR Register)	OCR Register for memory	R[39:8]	REP[31:0]
R4 (OCR Register)	OCR Register for I/O etc.	R[39:8]	REP[31:0]
R5, R5b	SDIO Response	R[39:8]	REP[31:0]
R6 (Published RCA response)	New published RCA[31:16] etc.	R[39:8]	REP[31:0]

The Response Field indicates bit positions of "Responses" defined in the Physical Layer Specification. The table shows most responses with a length of 48 (R[47:0]) have 32 bits of the response data (R[39:8]) stored in the Response register at REP[31:0]. Responses of type R1b (Auto CMD12 responses) and R1 (Auto CMD23 response) have response data bits R[39:8] stored in the Response register at REP[127:96]. Responses with length 136 (R[135:0]) have 120 bits of the response data (R[127:8]) stored in the Response register at REP[119:0].

To read the response status efficiently, the Host Controller only stores part of the response data in the Response register. This enables the Host Driver to read 32 bits of response data efficiently in one read cycle on a 32-bit bus system. Parts of the response, the Index field and the CRC, are checked by the Host Controller (as specified by the MMCSD12_COMMAND[4] CMD_INDEX_CHK_ENA and MMCSD12_COMMAND[3] CMD_CRC_CHK_ENA bits) and generate an error interrupt if an error is detected. The bit range for the CRC check depends on the response length. If the response length is 48, the Host Controller shall check R[47:1], and if the response length is 136 the Host Controller shall check R[119:1].

Since the Host Controller may have a multiple block data DAT line transfer executing concurrently with a CMD_wo_DAT command, the Host Controller stores the Auto CMD12 response in the upper bits (REP[127:96]) of the Response register. The CMD_wo_DAT response is stored in REP[31:0]. This allows the Host Controller to avoid overwriting the Auto CMD12 response with the CMD_wo_DAT and vice versa.

While executing Auto CMD23, the response of CMD23 is saved to REP [127:96] and the response of multiple-block read and write command is save to REP [31:0]. The response error of CMD23 is indicated in the MMCSD12_AUTOCMD_ERR_STS register. When the Host Controller modifies part of the Response register, as shown in the table, it shall preserve the unmodified bits.

18.6.10 MMCSD12_DATA_PORT Register (Offset = 20h) [reset = 0h]

MMCSD12_DATA_PORT is shown in [Figure 18-190](#) and described in [Table 18-490](#).

Return to [Summary Table](#).

This register is used to access internal buffer.

Table 18-492. MMCSDB12_PRESENTSTATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	UHS2_IF_DETECTION	R	0h	<p>UHS-II IF Detection (UHS-II Only)</p> <p>This status indicates whether a card supports UHS-II IF. This status is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCSDB12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). UHS-II interface initialization is activated by setting the MMCSDB12_CLOCK_CONTROL[2] SD_CLK_ENA bit. Host Controller drives STB.L on D0 lane from EIDL state and waits for receiving STB.L on D1 lane. This bit is set to 1h if STB.L is detected on D1 lane. Host Controller shall compensate latency from setting SD Clock Enable to output STB.L on D0 lane when reading this status. This bit may be read any time after setting SD Clock Enable for faster UHS-II IF detection but Host Driver shall check this status at least 200µs period from setting SD Clock Enable (MMCSDB12_CLOCK_CONTROL[2] SD_CLK_ENA) until detecting UHS-II IF.</p> <p>After UHS-II IF is detected, this bit is cleared by when EIDL is detected on D0 lane, UHS-II Interface Enable is set to 0h (MMCSDB12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or Host full reset is executed.</p> <p>1h: UHS-II IF is detected 0h: UHS-II IF is not detected</p>

Table 18-492. MMCSD12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	UHS2_IF_LANE_SYNC	R	0h	<p>Lane Synchronization (UHS-II Only)</p> <p>This status indicates whether lane is synchronized in UHS-II mode. This status is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCSD12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). On detecting UHS-II Interface (D31 = 1h), Host Controller provides SYN LSS on D0 lane and waits for receiving SYN LSS on D1 lane. If SYN LSS is detected on D1 lane, Host Controller provides LIDL LSS on D0 lane and waits for receiving LIDL LSS on D1 lane.</p> <p>In case of Version 4.00, this bit indicates completion of Device PHY Initialization by detecting LIDL LSS on D1 lane.</p> <p>From Version 4.10, Host Controller may implement a specific PHY verification method and PHY Initialization Failure can be indicated by keeping this bit to 0h even LIDL LSS is detected on D1 lane. Host Driver detects PHY Initialization Failure by timeout.</p> <p>This bit is cleared by when D0 lane is set to EIDL, UHS-II Interface Enable is set to 0h (MMCSD12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or executes Host full reset.</p> <p>1h: UHS-II PHY is initialized 0h: UHS-II PHY is not initialized</p>
29	UHS2_DORMANT	R	0h	<p>In Dormant State (UHS-II Only)</p> <p>This status indicates whether UHS-II lanes enter Dormant state. This function is enabled by setting UHS-II Interface Enable to 1h in the Host Control 2 register (MMCSD12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 1h). On issuing GO_DORMANT_STATE command, "Go Dormant Command (7h)" is set to Command type in the UHS-II Command register (MMCSD12_UHS2_COMMAND[7:6] CMD_TYPE). This command type acts as a trigger to enter lanes into dormant state. Host Controller provides STB.H and EIDL on D0 lane and waits for receiving STB.H and EIDL on D1 lane. This bit is set to 1h after the time of T_DMT_ENTRY (750 RCLK cycle) or more from detecting EIDL on D1 lane.</p> <p>RCLK may be stopped in dormant state, by setting SD Clock Enable to 0h in the Clock Control register (MMCSD12_CLOCK_CONTROL[2] SD_CLK_ENA = 0h) while In Dormant State bit is set to 1h. On writing Clock Control register with setting SD Clock Enable to 1h (MMCSD12_CLOCK_CONTROL[2] SD_CLK_ENA = 1h), Host Controller wakes lanes to exit Dormant State and In Dormant State is set to 0h.</p> <p>In case of the card enters Hibernate Mode (RCLK is stopped), Host Driver may turn off VDD1 by clearing SD Bus Power for VDD1 bit in the MMCSD12_POWER_CONTROL register. Host Controller shall turn off VDD1 after stopping RCLK. This bit is cleared by when Host Controller drives STB.L on D0 lane, UHS-II Interface Enable is set to 0h (MMCSD12_HOST_CONTROL2[8] UHS2_INTF_ENABLE = 0h) or executes Host full reset.</p> <p>1h: In DORMANT state 0h: Not in DORMANT state</p>

Table 18-492. MMCSDB12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SUB_COMMAND_STS	R	0h	<p>Sub Command Status</p> <p>The MMCSDB12_COMMAND register and Response register (MMCSDB12_RESPONSE_0 to MMCSDB12_RESPONSE_7) are commonly used for main command and sub command. This status is used to distinguish which response error statuses, main command or sub command, indicated in the MMCSDB12_ERROR_INTR_STS register or in the MMCSDB12_UHS2_ERR_INTR_STS register. Just before reading of this register, the MMCSDB12_COMMAND[2] SUB_CMD bit or the MMCSDB12_UHS2_COMMAND register is copied to this status. This status is effective not only when Response Error interrupt is generated but also when data error interrupt is generated with Command Not Issued by Error (D27 of this register) or Auto CMD Error interrupt is generated with Command Not Issued by Error by Auto CMD12 in the MMCSDB12_AUTOCMD_ERR_STS register.</p> <p>1h: Sub Command Status 0h: Main Command Status</p>
27	CMD_NOT_ISS_BY_ERR	R	0h	<p>Command Not Issued by Error</p> <p>Setting of this status indicates that a command cannot be issued due to an error except Auto CMD12 error (equivalent error status by Auto CMD12 error is defined as Command Not Issued By Auto CMD12 Error in the MMCSDB12_AUTOCMD_ERR_STS register). This status is set to 1h when Host Controller cannot issue a command after setting MMCSDB12_COMMAND register or MMCSDB12_UHS2_COMMAND register. Sub Command Status (D28) indicates which command is not issued (main or sub).</p> <p>1h: Command cannot be issued 0h: No error for issuing a command</p>
26-25	RESERVED	R	0h	Reserved
24	SDIF_CMDIN	R	1h	<p>CMD Line Signal Level (SD Mode Only)</p> <p>This status is used to check CMD line level to recover from errors, and for debugging.</p>
23	SDIF_DAT3IN	R	1h	<p>DAT[3] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[3].</p> <p>D23 - DAT[3]</p>
22	SDIF_DAT2IN	R	1h	<p>DAT[2] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[2].</p> <p>D22 - DAT[2]</p>
21	SDIF_DAT1IN	R	1h	<p>DAT[1] Line Signal Level (SD Mode Only)</p> <p>This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[1].</p> <p>D21 - DAT[1]</p>

Table 18-492. MMCSD12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	SDIF_DAT0IN	R	1h	DAT[0] Line Signal Level (SD Mode Only) This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. D20 - DAT[0]
19	WRITE_PROTECT	R	0h	Write Protect Switch Pin Level The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP pin. 0h: Write protected (SDWP = 1) 1h: Write enabled (SDWP = 0)
18	CARD_DETECT	R	0h	Card Detect Pin Level This bit reflects the inverse value of the SDCD# pin. 0h: No Card present (SDCD# = 1) 1h: Card present (SDCD# = 0)
17	CARD_STATE_STABLE	R	0h	Card State Stable This bit is used for testing. If it is 0h, the Card Detect Pin Level is not stable. If this bit is set to 1h, it means the Card Detect Pin Level is stable. The MMCSD12_SOFTWARE_RESET[0] SWRST_FOR_ALL bit shall not affect this bit. 0h: Reset of Debouncing 1h: No Card or Inserted
16	CARD_INSERTED	R	0h	Card Inserted This bit indicates whether a card has been inserted. Changing from 0h to 1h generates a Card Insertion interrupt in the MMCSD12_NORMAL_INTR_STS register and changing from 1h to 0h generates a Card Removal Interrupt in the MMCSD12_NORMAL_INTR_STS register. The MMCSD12_SOFTWARE_RESET[0] SWRST_FOR_ALL bit shall not affect this bit. If a Card is removed while its power is on and its clock is oscillating, the HC shall clear the MMCSD12_POWER_CONTROL[0] SD_BUS_POWER bit and the MMCSD12_CLOCK_CONTROL[2] SD_CLK_ENA bit. In addition the HD should clear the HC by the MMCSD12_SOFTWARE_RESET[0] SWRST_FOR_ALL bit. The card detect is active regardless of the SD Bus Power. 0h: Reset or Debouncing or No Card 1h: Card Inserted
15-12	RESERVED	R	0h	Reserved
11	BUF_RD_ENA	R	0h	Buffer Read Enable This status is used for non-DMA read transfers. This read only flag indicates that valid data exists in the host side buffer status. If this bit is 1h, readable data exists in the buffer. A change of this bit from 1h to 0h occurs when all the block data is read from the buffer. A change of this bit from 0h to 1h occurs when all the block data is ready in the buffer and generates the Buffer Read Ready Interrupt. 0h: Read Disable 1h: Read Enable

Table 18-492. MMCSDB12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	BUF_WR_ENA	R	0h	<p>Buffer Write Enable</p> <p>This status is used for non-DMA write transfers. This read only flag indicates if space is available for write data. If this bit is 1h, data can be written to the buffer. A change of this bit from 1h to 0h occurs when all the block data is written to the buffer. A change of this bit from 0h to 1h occurs when top of block data can be written to the buffer and generates the Buffer Write Ready Interrupt.</p> <p>0h: Write Disable 1h: Write Enable</p>
9	RD_XFER_ACTIVE	R	0h	<p>Read Transfer Active (SD Mode Only)</p> <p>This status is used for detecting completion of a read transfer. This bit is set to 1h for either of the following conditions:</p> <p>After the end bit of the read command.</p> <p>When writing a 1h to continue Request in the MMCSDB12_BLOCK_GAP_CONTROL register to restart a read transfer.</p> <p>This bit is cleared to 0h for either of the following conditions:</p> <p>When the last data block as specified by block length is transferred to the system.</p> <p>When all valid data blocks have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request set to 1h (MMCSDB12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h). A transfer complete interrupt is generated when this bit changes to 0h.</p> <p>1h: Transferring data 0h: No valid data</p>
8	WR_XFER_ACTIVE	R	0h	<p>Write Transfer Active (SD Mode Only)</p> <p>This status indicates a write transfer is active. If this bit is 0h, it means no valid write data exists in the HC. This bit is set in either of the following cases:</p> <p>After the end bit of the write command.</p> <p>When writing a 1h to the MMCSDB12_BLOCK_GAP_CONTROL[1] CONTINUE bit to restart a write transfer.</p> <p>This bit is cleared in either of the following cases:</p> <p>After getting the CRC status of the last data block as specified by the transfer count (Single or Multiple).</p> <p>After getting a CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0h, as a result of the Stop At Block Gap Request being set. This status is useful for the HD in determining when to issue commands during write busy.</p> <p>1h: Transferring data 0h: No valid data</p>

Table 18-492. MMCSD12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SDIF_DAT7IN	R	0h	DAT[7] Line Signal Level (Embedded Only) This status is used to check DAT line level to recover from errors, and for debugging. D07 - DAT[7]
6	SDIF_DAT6IN	R	0h	DAT[6] Line Signal Level (Embedded Only) This status is used to check DAT line level to recover from errors, and for debugging. D06 - DAT[6]
5	SDIF_DAT5IN	R	0h	DAT[5] Line Signal Level (Embedded Only) This status is used to check DAT line level to recover from errors, and for debugging. D05 - DAT[5]
4	SDIF_DAT4IN	R	0h	DAT[4] Line Signal Level (Embedded Only) This status is used to check DAT line level to recover from errors, and for debugging. D04 - DAT[4]
3	RETUNING_REQ	R	0h	Re-Tuning Request (UHS-I Only) Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This bit is cleared when a command is issued with setting the MMCSD12_HOST_CONTROL2[6] EXECUTE_TUNING bit. Changing of this bit from 0h to 1h generates Re-Tuning Event. This bit isn't set to 1h if the MMCSD12_HOST_CONTROL2[7] SAMPLING_CLK_SELECT bit is set to 0h (using fixed sampling clock). 1h: Sampling clock needs re-tuning 0h: Fixed or well tuned sampling clock
2	DATA_LINE_ACTIVE	R	0h	DAT Line Active (SD Mode Only) This bit indicates whether one of the DAT line on SD bus is in use. 1h: DAT line active 0h: DAT line inactive
1	INHIBIT_DAT	R	0h	Command Inhibit (DAT) (SD Mode Only) This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1h. If this bit is 0h, it indicates the HC can issue the next SD command. Commands with busy signal belong to Command Inhibit (DAT) (for example R1b, R5b type). Changing from 1h to 0h generates a Transfer Complete interrupt in the MMCSD12_NORMAL_INTR_STS register. Note: The SD Host Driver can save registers in the range of 04FB 0000h - 04FB 000Dh (04F9 8000h - 04F9 800Dh) for a suspend transaction after this bit has changed from 1h to 0h. 1h: Cannot issue command which uses the DAT line 0h: Can issue command which uses the DAT line

Table 18-492. MMCSDB12_PRESENTSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INHIBIT_CMD	R	0h	<p>Command Inhibit (CMD)</p> <p>SD Mode:</p> <p>If this bit is 0h, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line. This bit is set immediately after the MMCSDB12_COMMAND register is written. This bit is cleared when the command response is received. Even if the Command Inhibit (DAT) is set to 1h.</p> <p>Commands using only the CMD line can be issued if this bit is 0h. Changing from 1h to 0h generates a Command complete interrupt in the MMCSDB12_NORMAL_INTR_STS register. If the HC cannot issue the command because of a command conflict error or because of Command Not Issued By Auto CMD12 Error, this bit shall remain 1h and the Command Complete is not set. Status issuing Auto CMD12 is not read from this bit. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by the MMCSDB12_COMMAND register.</p> <p>UHS-II Mode:</p> <p>This bit is 0h means that a command packet can be issued by the Host Controller. While this bit is set to 1h, which means the Host Controller is not ready to issue a next command, Host Driver shall not write the registers from the MMCSDB12_UHS2_BLOCK_SIZE to the MMCSDB12_UHS2_COMMAND. Changing from 1h to 0h generates a Command Complete Interrupt in the MMCSDB12_NORMAL_INTR_STS register.</p> <p>1h: Host Controller is not ready to issue a command 0h: Host Controller is ready to issue a command</p> <p>Version 4.10 adds a new control to prevent error statuses from overwriting by receipt of a next command. This status keeps indicating 1h while any of response error statuses is set to 1h, Command Not Issued by Error in this register is set to 1h or the MMCSDB12_AUTOCMD_ERR_STS[7] CMD_NOT_ISSUED bit is set to 1h. Software Reset For CMD Line is used to clear the error statuses above and this status (MMCSDB12_SOFTWARE_RESET[1] SWRST_FOR_CMD).</p>

Note: DAT line active indicates whether one of the DAT line is on SD bus is in use.

(a) In the case of read transactions

This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1h to 0h generates a Block Gap Event interrupt in the MMCSDB12_NORMAL_INTR_STS register, as the result of the Stop At Block Gap Request being set.

This bit shall be set in either of the following cases:

- (1) After the end bit of the read command.
- (2) When writing a 1h to the MMCSDB12_BLOCK_GAP_CONTROL[1] CONTINUE bit to restart a read transfer.

This bit shall be cleared in either of the following cases:

(1) When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.

(2) When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP).

The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend/resume function.

(b) In the case of write transactions

This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1h to 0h generate a Transfer Complete interrupt in the MMCSD12_NORMAL_INTR_STS register.

This bit shall be set in either of the following cases:

(1) After the end bit of the write command.

(2) When writing to 1h to the MMCSD12_BLOCK_GAP_CONTROL[1] CONTINUE bit to continue a write transfer.

This bit shall be cleared in either of the following cases:

(1) When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive "Not Busy". In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.

(2) When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request (MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP).

(c) Command with busy

This status indicates whether a command indicates busy (for example erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1h to 0h generate a Transfer Complete interrupt in the MMCSD12_NORMAL_INTR_STS register.

Note

The HD can issue cmd0, cmd12, cmd13 (for memory) and cmd52 (for SDIO) when the DAT lines are busy during data transfer. These commands can be issued when Command Inhibit (CMD) is set to zero (MMCSD12_PRESENTSTATE[0] INHIBIT_CMD = 0h). Other commands shall be issued when Command Inhibit (DAT) is set to zero (MMCSD12_PRESENTSTATE[1] INHIBIT_DAT = 0h).

18.6.12 MMCSDB12_HOST_CONTROL1 Register (Offset = 28h) [reset = 0h]

MMCSDB12_HOST_CONTROL1 is shown in [Figure 18-192](#) and described in [Table 18-494](#).

Return to [Summary Table](#).

This register is used to program DMA modes, LED control, data transfer width, High Speed enable, card detect test level and signal selection.

Table 18-493. MMCSDB12_HOST_CONTROL1 Instances

Instance	Physical Address
MMCSDB1_CTL_CFG	04FB 0028h
MMCSDB2_CTL_CFG	04F9 8028h

LEGEND: R/W = Read/Write; -n = value after reset

Table 18-494. MMCSDB12_HOST_CONTROL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	CD_SIG_SEL	R/W	0h	Card Detect Signal Detection This bit selects source for card detection. 1h: The card detect test level is selected 0h: SDCD# is selected (for normal use)
6	CD_TEST_LEVEL	R/W	0h	Card Detect Test Level This bit is enabled while the Card Detect Signal Selection is set to 1h and it indicates card inserted or not. Generates (card ins or card removal) interrupt when the normal interrupt status enable bit is set. 1h: Card Inserted 0h: No Card
5	EXT_DATA_WIDTH	R/W	0h	Extended Data Transfer Width (Embedded and SD Mode Only) This bit controls 8-bit bus width mode for embedded device. Support of this function is indicated in 8-bit Support for Embedded Device in the MMCSDB12_CAPABILITIES register. If a device supports 8-bit bus mode, this bit may be set to 1h. If this bit is 0h, bus width is controlled by the MMCSDB12_HOST_CONTROL1[1] DATA_WIDTH bit. This bit is not effective when multiple devices are installed on a bus slot (Slot Type is set to 2h in the MMCSDB12_CAPABILITIES register). In this case, each device bus width is controlled by Bus Width Preset field in the Shared Bus register (MMCSDB12_SHARED_BUS_CTRL_PTR). 1h: 8-bit Bus Width 0h: Bus Width is Selected by Data Transfer Width

Table 18-494. MMCSD12_HOST_CONTROL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-3	DMA_SELECT	R/W	0h	<p>DMA Select</p> <p>This field is used to select DMA type. The Host Driver shall check support of DMA modes by referring the MMCSD12_CAPABILITIES register. Selected DMA is enabled by the MMCSD12_TRANSFER_MODE[0] DMA_ENA bit in SD mode and the MMCSD12_UHS2_XFER_MODE[0] DMA_ENA bit in UHS-II mode.</p> <p>(1) Up to Version 3.00:</p> <p>When MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 0h, setting of this field is compatible to Host Controller Version 3.00.</p> <p>SDMA is initiated by writing to the MMCSD12_COMMAND register when this field is set to 0h and the SDMA System Address register (32-bit) is used (MMCSD12_SDMA_SYS_ADDR_LO/ MMCSD12_SDMA_SYS_ADDR_HI). SDMA does not support 64-bit addressing.</p> <p>ADMA2 is initiated by writing to the MMCSD12_COMMAND register when this field is set to 2h or 3h. Lower 32-bit of the ADMA System Address register (MMCSD12_SDMA_SYS_ADDR_LO/ MMCSD12_SDMA_SYS_ADDR_HI) is used when this field is set to 2h and 64-bit of the ADMA System Address register is used when this field is set to 3h. Support of 64-bit System Addressing is indicated by the MMCSD12_CAPABILITIES[28] ADDR_64BIT_SUPPORT_V3 bit. 64-bit ADMA2 uses 96-bit Descriptor.</p> <p>0h: SDMA is selected</p> <p>1h: 32-bit Address ADMA1 is selected</p> <p>2h: 32-bit Address ADMA2 is selected</p> <p>3h: 64-bit Address ADMA2 is selected (Optional)</p> <p>(2) Version 4.00 or later:</p> <p>When the MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, setting of this field is changed as follows.</p> <p>SDMA is initiated by Host Driver writes to the MMCSD12_COMMAND register when this field is set to 0h.</p> <p>ADMA2 is initiated by Host Driver writes to the MMCSD12_COMMAND register when this field is set to 2h or 3h and by ADMA3 sets to the ADMA System Address register (MMCSD12_SDMA_SYS_ADDR_LO/ MMCSD12_SDMA_SYS_ADDR_HI) when this field is set to 3h.</p> <p>ADMA3 is initiated by Host Driver writes to the MMCSD12_ADMA3_DESC_ADDRESS register when this field is set to 3h.</p> <p>0h: SDMA is selected</p> <p>1h: Not Used (New assignment is not allowed)</p> <p>2h: ADMA2 is selected (ADMA3 is not supported or disabled)</p> <p>3h: ADMA2 or ADMA3 is selected</p>

Table 18-494. MMCSDB12_HOST_CONTROL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				Support of 64-bit DMA and 128-bit Descriptor is indicated by the MMCSDB12_CAPABILITIES[27] ADDR_64BIT_SUPPORT_V4 bit. If the support bit is set to 1h, all supported DMAs (depends on Support, ADMA2 Support and ADMA3 Support) shall support 64-bit addressing. The MMCSDB12_HOST_CONTROL2[13] BIT64_ADDRESSING bit selects either 32-bit or 64-bit system addressing of DMAs.
2	HIGH_SPEED_ENA	R/W	0h	<p>High Speed Enable (SD Mode Only)</p> <p>This bit is optional. Before setting this bit, the HD shall check the MMCSDB12_CAPABILITIES[21] HIGH_SPEED_SUPPORT bit. If this bit is set to 0h (default), the HC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz/20 MHz for MMC). If this bit is set to 1h, the HC outputs CMD line and DAT lines at the rising edge of the SD clock (up to 50 MHz for SD/52 MHz for MMC)/208 MHz (for SD3.0).</p> <p>If the MMCSDB12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to 1h, Host Driver needs to reset SD Clock Enable (MMCSDB12_CLOCK_CONTROL[2] SD_CLK_ENA) before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. This bit is not effective in UHS-II mode.</p> <p>1h: High Speed Mode 0h: Normal Speed Mode</p>
1	DATA_WIDTH	R/W	0h	<p>Data Transfer Width (SD Mode Only)</p> <p>This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card. This bit is not effective in UHS-II mode.</p> <p>1h: 4 bit mode 0h: 1 bit mode</p>
0	LED_CONTROL	R/W	0h	<p>LED Control</p> <p>This bit is used to caution the user not to remove the card while the SD card is being accessed. If the software is going to issue multiple SD commands, this bit can be set during all transactions. It is not necessary to change for each transaction.</p> <p>1h: LED on 0h: LED off</p>

18.6.13 MMCSD12_POWER_CONTROL Register (Offset = 29h) [reset = 0h]

MMCSD12_POWER_CONTROL is shown in [Figure 18-193](#) and described in [Table 18-496](#).

Return to [Summary Table](#).

This register is used to program the SD Bus power and voltage level.

Table 18-495. MMCSD12_POWER_CONTROL Instances

Instance	Physical Address

Bit	Field	Type	Reset	Description
7-5	UHS2_VOLTAGE	R/W	0h	SD Bus Voltage Select for VDD2 (UHS-II Only) This field determines supply voltage range to VDD2. This field can be set to 5h if the MMCSD12_CAPABILITIES[60] VDD2_1P8_SUPPORT bit is set to 1h. 111b: Not used 110b: Not used 101b: 1.8 V 100b: Reserved for 1.2 V 011b – 001b: Reserved 000b: VDD2 Not Supported
4	UHS2_POWER	R/W	0h	SD Bus Power for VDD2 (UHS-II Only) Setting this bit enables providing VDD2. 1h: Power on 0h: Power off
3-1	SD_BUS_VOLTAGE	R/W	0h	SD Bus Voltage Select for VDD1 By setting these bits, the HD selects the voltage level for the SD card. Before setting this register, the HD shall check the voltage support bits in the MMCSD12_CAPABILITIES register. If an unsupported voltage is selected, the Host System shall not supply SD bus voltage. 111b: 3.3 V (Flattop.) 110b: 3.0 V (Typ.) 101b: 1.8 V (Typ.) for Embedded 100b – 000b: Reserved

Table 18-496. MMCSDB12_POWER_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SD_BUS_POWER	R/W	0h	<p>SD Bus Power for VDD1</p> <p>Before setting this bit, the SD host driver shall set SD Bus Voltage Select (MMCSDB12_POWER_CONTROL[3-1] SD_BUS_VOLTAGE). If the HC detects the No Card State, this bit shall be cleared. If this bit is cleared, the Host Controller should immediately stop driving CMD and DAT[3:0] (tri-state), and drive SDCLK to low level. If card is connected to Host Controller, Host Controller shall set these lines to low before stopping to supply VDD1.</p> <p>In UHS-II mode, before clearing this bit, Host Driver shall clear the MMCSDB12_CLOCK_CONTROL[2] SD_CLK_ENA bit and before stopping to supply VDD1, Host Controller shall set DAT[2] to low if DAT[2] is used as out-of band interrupt.</p> <p>1h: Power on 0h: Power off</p>

18.6.14 MMCSD12_BLOCK_GAP_CONTROL Register (Offset = 2Ah) [reset = 80h]

MMCSD12_BLOCK_GAP_CONTROL is shown in [Figure 18-194](#) and described in [Table 18-498](#).

Return to [Summary Table](#).

This register is used to program the block gap request, read wait control and interrupt at block gap.

**Table 18-497. MMCSD12_BLOCK_GAP_CONTROL
Instances**

Instance	Physical Address
MMCSD1_CTL_CFG	04FB 002Ah

Table 18-498. MMCSD12_BLOCK_GAP_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
7	BOOT_ACK_ENA	R/W	1h	Boot Acknowledge Check To check for the boot acknowledge in boot operation. 1h: Wait for boot ack from eMMC card 0h: Will not wait for boot ack from eMMC card
6	ALT_BOOT_MODE	R/W	0h	Alternative Boot Mode To start boot code access in alternative mode. 1h: To start alternate boot mode access 0h: To stop alternate boot mode access
5	BOOT_ENABLE	R/W	0h	Boot Enable To start boot code access. 1h: To start boot code access 0h: To stop boot code access
4	RESERVED	R	0h	Reserved
3	INTRPT_AT_BLK_GAP	R/W	0h	Interrupt At Block Gap (SD Mode Only) This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1h enables interrupt detection at the block gap for a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0h. When the HD detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.

Table 18-498. MMCSDB12_BLOCK_GAP_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	RDWAIT_CTRL	R/W	0h	<p>Read Wait Control (SD Mode Only)</p> <p>The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using DAT[2] line. Otherwise the HC has to stop the SD clock to hold read data, which restricts commands generation. When the HD detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1h otherwise DAT line conflict may occur. If this bit is set to 0h, Suspend/Resume cannot be supported.</p> <p>In UHS-II mode, Read Wait is disabled and DAT[2] line is used for Interrupt Signal from UHS-II Card.</p> <p>1h: Enable Read Wait Control 0h: Disable Read Wait Control</p>
1	CONTINUE	R/W	0h	<p>Continue Request</p> <p>This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At block Gap Request to 0h (MMCSDB12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 0h) and set this bit to restart the transfer.</p> <p>The Host Controller automatically clears this bit when the transaction re-starts.</p> <p>If MMCSDB12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h, any write to this bit is ignored.</p> <p>In SD mode, this bit is cleared in either of the following cases:</p> <ol style="list-style-type: none"> 1) In the case of a read transaction, the DAT Line Active changes from 0h to 1h as a read transaction restarts. 2) In the case of a write transaction, the Write transfer active changes from 0h to 1h as the write transaction restarts. <p>Therefore it is not necessary for Host driver to set this bit to 0h. If MMCSDB12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP = 1h, any write to this bit is ignored.</p> <p>1h: Restart 0h: Ignored</p>

Table 18-498. MMCSD12_BLOCK_GAP_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	STOP_AT_BLK_GAP	R/W	0h	<p>Stop At Block Gap Request</p> <p>This bit is used to stop executing a transaction at the next block gap for non-DMA, SDMA and ADMA transfers. Until the transfer complete is set to 1h, indicating a transfer completion the HD shall leave this bit set to 1h.</p> <p>Clearing both the MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP and MMCSD12_BLOCK_GAP_CONTROL[1] CONTINUE bits shall not cause the transaction to restart. The MMCSD12_BLOCK_GAP_CONTROL[2] RDWAIT_CTRL bit is used to stop the read transaction at the block gap. The HC shall honour Stop At Block Gap Request for write transfers, but for read transfers it requires that the SD card support Read Wait. Therefore the HD shall not set this bit during read transfers unless the SD card supports Read Wait and has set Read Wait Control to 1h (MMCSD12_BLOCK_GAP_CONTROL[2] RDWAIT_CTRL) = 1h). In case of write transfers in which the HD writes data to the MMCSD12_DATA_PORT register, the HD shall set this bit after all block data is written. If this bit is set to 1h, the HD shall not write data to the MMCSD12_DATA_PORT register. This bit affects Read Transfer Active, Write Transfer Active, DAT line active and Command Inhibit (DAT) in the MMCSD12_PRESENTSTATE register.</p> <p>In case of UHS-II, a transaction can be stopped at the boundary of DATA Burst (Flow Control basis). Host Controller waits for sending Flow Control MSG until the MMCSD12_BLOCK_GAP_CONTROL[1] CONTINUE bit is set to 1h.</p> <p>1h: Stop 0h: Transfer</p>

There are three cases to restart the transfer after stop at the block gap. Which case is appropriate depends on whether the HC issues a Suspend command or the SD card accepts the Suspend command.

1. If the HD does not issue Suspend command, the Continue Request shall be used to restart the transfer.
2. If the HD issues a Suspend command and the SD card accepts it, a Resume Command shall be used to restart the transfer.
3. If the HD issues a Suspend command and the SD card does not accept it, the Continue Request shall be used to restart the transfer.

Any time Stop At Block Gap Request stops the data transfer, the HD shall wait for Transfer Complete (in the MMCSD12_NORMAL_INTR_STS register) before attempting to restart the transfer. When restarting the data transfer by Continue Request, the HD shall clear Stop At Block Gap Request before or simultaneously.

Host Controller should not generate timeout interrupts while Stop At Block Gap is set. Host Driver should ignore timeout interrupts while Stop At Block Gap is set.

18.6.15 MMCSDB12_WAKEUP_CONTROL Register (Offset = 2Bh) [reset = 0h]

MMCSDB12_WAKEUP_CONTROL is shown in [Figure 18-195](#) and described in [Table 18-500](#).

Return to [Summary Table](#).

This register is used to program the wakeup functionality.

The MMCSDB12_WAKEUP_CONTROL register is mandatory for the HC, but wakeup functionality depends on the HC system hardware and software. The HD shall maintain voltage on the SD Bus, by setting the MMCSDB12_POWER_CONTROL[0] SD_BUS_POWER bit to 1h, when wakeup event via card interrupt is desired.

Table 18-499. MMCSDB12_WAKEUP_CONTROL Instances

Instance	Physical Address

2	CARD_REMOVAL	R/W	0h	Wakeup Event Enable On SD Card Removal This bit enables wakeup event via Card removal assertion in the MMCSDB12_NORMAL_INTR_STS register. FN_WUS (Wake up Support) in CIS does not affect this bit. 1h: Enable 0h: Disable
1	CARD_INSERTION	R/W	0h	Wakeup Event Enable On SD Card Insertion This bit enables wakeup event via Card Insertion assertion in the MMCSDB12_NORMAL_INTR_STS register. FN_WUS (Wake up Support) in CIS does not affect this bit. 1h: Enable 0h: Disable
0	CARD_INTERRUPT	R/W	0h	Wakeup Event Enable On Card Interrupt This bit enables wakeup event via Card Interrupt assertion in the MMCSDB12_NORMAL_INTR_STS register. This bit can be set to 1h if FN_WUS (Wake Up Support) in CIS is set to 1h. 1h: Enable 0h: Disable

18.6.16 MMCSD12_CLOCK_CONTROL Register (Offset = 2Ch) [reset = 0h]

MMCSD12_CLOCK_CONTROL is shown in [Figure 18-196](#) and described in [Table 18-502](#).

Return to [Summary Table](#).

This register is used to program the Clock frequency select, Clock generator select, Clock enable, Internal clock state fields.

At the initialization of the HC, the HD shall set the SDCLK Frequency Select (MMCSD12_CLOCK_CONTROL[15-8] SDCLK_FRQSEL) according to the MMCSD12_CAPABILITIES register. This register controls SDCLK in SD Mode and RCLK in UHS-II mode.

**Table 18-501. MMCSD12_CLOCK_CONTROL

Table 18-502. MMCS12_CLOCK_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-8	SDCLK_FRQSEL	R/W	0h	<p>SDCLK/RCLK Frequency Select</p> <p>This register is used to select the frequency of the SDCLK pin. The frequency is not programmed directly; rather this register holds the divisor of the Base Clock Frequency For SD clock in the Capabilities register (MMCS12_CAPABILITIES[15-8] BASE_CLK_FREQ).</p> <p>Only the following settings are allowed.</p> <p>(1) 8-bit Divided Clock Mode:</p> <p>80h: base clock divided by 256</p> <p>40h: base clock divided by 128</p> <p>20h: base clock divided by 64</p> <p>10h: base clock divided by 32</p> <p>08h: base clock divided by 16</p> <p>04h: base clock divided by 8</p> <p>02h: base clock divided by 4</p> <p>01h: base clock divided by 2</p> <p>00h: base clock (10 MHz - 63 MHz)</p> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor. But multiple bits should not be set. The three default divider values can be calculated by the frequency that is defined by the MMCS12_CAPABILITIES[15-8] BASE_CLK_FREQ bit field.</p> <p>400 KHz divider value</p> <p>25 MHz divider value</p> <p>50 MHz divider value</p> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50 MHz in high speed mode, and shall never exceed this limit.</p> <p>The frequency of SDCLK is set by the following formula:</p> <p>Clock Frequency = (Base Clock) / divisor</p> <p>Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency.</p> <p>For example, if the MMCS12_CAPABILITIES[15-8] BASE_CLK_FREQ bit field has the value 33 MHz, and the target frequency is 25 MHz, then choosing the divisor value of 1h will yield 16.5 MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400 KHz, the divisor value of 40h yields the optimal clock value of 258 KHz.</p> <p>(2) 10-bit Divided Clock Mode:</p> <p>Host Controller Version 3.00 or later supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits and all divider values shall be supported.</p> <p>3FFh: 1/2046 Divided Clock</p> <p>N: 1/2N Divided Clock (Duty 50%)</p> <p>002h: 1/4 Divided Clock</p> <p>001h: 1/2 Divided Clock</p> <p>000h: Base Clock (10 MHz - 254 MHz)</p> <p>(3) Programmable Clock Mode:</p>

Table 18-502. MMCSD12_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				<p>Host Controller Version 3.00 or later supports this mode as optional. A non-zero value set to the MMCSD12_CAPABILITIES[55-48] CLOCK_MULTIPLIER bit field indicates support of this clock mode. The multiplier enables the Host System to select a finer grain SD clock frequency. It is not necessary to support all frequency generation specified by this field because programmable clock generator is vendor specific and dependent on the implementation. Therefore, this mode is used with Preset Value registers (MMCSD12_PRESET_VALUE0 - MMCSD12_PRESET_VALUE10). The Host Controller vendor provides possible settings and the Host System vendor sets appropriate values to the Preset Value registers (MMCSD12_PRESET_VALUE0 - MMCSD12_PRESET_VALUE10).</p> <p>3FFh - Base Clock \times M / 1024</p> <p>.....</p> <p>N-1 - Base Clock \times M / N</p> <p>.....</p> <p>002h - Base Clock \times M / 3</p> <p>001h - Base Clock \times M / 2</p> <p>000h - Base Clock \times M</p> <p>This field depends on setting of the MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit. If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this field is set by Host Driver. If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this field is automatically set to a value specified in one of Preset Value registers (MMCSD12_PRESET_VALUE0 - MMCSD12_PRESET_VALUE10).</p>
7-6	SDCLK_FRQSEL_UPBITS	R/W	0h	<p>Upper Bits of SDCLK/RCLK Frequency Select</p> <p>This bit field is assigned to the MMCSD12_CLOCK_CONTROL[9-8] SDCLK_FRQSEL bit field of clock divider in SDCLK/RCLK Frequency Select.</p>
5	CLKGEN_SEL	R/W	0h	<p>Clock Generator Select</p> <p>This bit is used to select the clock generator mode in SDCLK/RCLK Frequency Select (MMCSD12_CLOCK_CONTROL[15-8] SDCLK_FRQSEL).</p> <p>If the Programmable Clock Mode is supported (non-zero value is set to the MMCSD12_CAPABILITIES[55-48] CLOCK_MULTIPLIER bit field), this bit attribute is R/W, and if not supported, this bit attribute is RO and zero is read.</p> <p>This bit depends on the setting of the MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit. If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this bit is set by Host Driver. If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this bit is automatically set to a value specified in one of Preset Value registers (MMCSD12_PRESET_VALUE0 - MMCSD12_PRESET_VALUE10).</p> <p>1h: Programmable Clock Mode</p> <p>0h: Divided Clock Mode</p>

Table 18-502. MMCS12_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	RESERVED	R	0h	Reserved
3	PLL_ENA	R/W	0h	<p>PLL Enable</p> <p>This bit is added from Version 4.10 for Host Controller using PLL. This feature allows Host Controller to initialize clock generator in two steps: by Internal Clock Enable (MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA) and PLL Enable and to minimize output latency (for example SDCLK/RCLK, D0 lane) from SD Clock Enable (MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA). There are two modes to keep Host Drivers compatibility. In both modes, PLL Locked timing is indicated by Internal Clock Stable (MMCS12_CLOCK_CONTROL[1] INT_CLK_STABLE).</p> <p>(1) When MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h (Host Driver Version 3, which does not support this bit) or this bit is not implemented, the MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA bit (or the MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA bit) may activate PLL (exit low power mode and start locking clock).</p> <p>(2) When MMCS12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h (Host Driver Version 4), the MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA bit is set before setting this bit and then setting this bit may activate PLL (exit low power mode and start locking clock).</p> <p>1h: PLL is enabled 0h: PLL is in low power mode</p>
2	SD_CLK_ENA	R/W	0h	<p>SD Clock Enable</p> <p>The HC shall stop SDCLK when writing this bit to 0h. The MMCS12_CLOCK_CONTROL[15-8] SDCLK_FRQSEL bit field can be changed when this bit is 0h. Then, the HC shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If the HC detects the No Card state, this bit shall be cleared.</p> <p>1h: Enable providing SDCLK or RCLK 0h: Disable providing SDCLK or RCLK</p>
1	INT_CLK_STABLE	R	0h	<p>Internal Clock Stable</p> <p>This bit is set to 1h when SD clock is stable after writing 1h to MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA bit. The SD Host Driver shall wait to set the MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA bit until this bit is set to 1h.</p> <p>Note: This is useful when using PLL for a clock oscillator that requires setup time.</p> <p>(1) Internal Clock Stable (when MMCS12_CLOCK_CONTROL[3] PLL_ENA = 0h or not supported)</p> <p>This bit is set to 1h when internal clock is stable after writing 1h to MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA bit.</p> <p>(2) PLL Clock Stable (when MMCS12_CLOCK_CONTROL[3] PLL_ENA = 1h)</p> <p>Host Controller which supports PLL Enable sets this status to 0h once when PLL Enable is changed 0h to 1h and then this status is set to 1h when PLL is locked (PLL uses an internal clock in stable as a reference clock which is enabled by the MMCS12_CLOCK_CONTROL[0] INT_CLK_ENA bit). After this bit is set to 1h, Host Driver may set the MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA bit.</p> <p>1h: Ready 0h: Not Ready</p>

Table 18-502. MMCSD12_CLOCK_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	INT_CLK_ENA	R/W	0h	<p>Internal Clock Enable</p> <p>This bit is set to 0h when the HD is not using the HC or the HC awaits a wakeup event. The HC should stop its internal clock to go very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1h. When clock oscillation is stable, the HC shall set the MMCSD12_CLOCK_CONTROL[1] INT_CLK_STABLE bit to 1h. This bit shall not affect card detection.</p> <p>1h: Oscillate 0h: Stop</p>

18.6.17 MMCS12_TIMEOUT_CONTROL Register (Offset = 2Eh) [reset = 0h]

MMCS12_TIMEOUT_CONTROL is shown in [Figure 18-197](#) and described in [Table 18-504](#).

Return to [Summary Table](#).

The register sets the data timeout counter value.

At the initialization of the HC, the HD shall set the Data Timeout Counter Value according to the MMCS12_CAPABILITIES register.

Refer to the MMCS12_ERROR_INTR_STS[4] DATA_TIMEOUT bit for information on factors that dictate time-out generation. Time-out clock frequency will be generated by dividing the SD clock TMCLK by this value. When setting this register, prevent inadvertent time-out events by clearing the MMCS12_ERROR_INTR_STS[4] DATA_TIMEOUT bit.</p> <p>1111: Reserved</p> <p>1110: $TMCLK \times 2^{27}$</p> <p>-----</p> <p>-----</p> <p>0001: $TMCLK \times 2^{14}$</p> <p>0000: $TMCLK \times 2^{13}$</p>

18.6.18 MMCSD12_SOFTWARE_RESET Register (Offset = 2Fh) [reset = 0h]

MMCSD12_SOFTWARE_RESET is shown in [Figure 18-198](#) and described in [Table 18-506](#).

Return to [Summary Table](#).

This register is used to program the software reset for data, command and for all.

A reset pulse is generated when writing 1h to each bit of this register. After completing the reset, the HC shall clear each bit. Because it takes some time to complete software reset, the SD Host Driver shall confirm that these bits are 0h.

During its initialization, the HD shall set this bit to 1h to reset the HC. The HC shall reset this bit to 0h when Capabilities registers are valid and the HD can read them. Additional use of 'Software Reset For All' may not affect the value of the Capabilities registers. If this bit is set to 1h, the SD card shall reset itself and must be re-initialized by the HD.</p> <p>1h: Reset</p> <p>0h: Work</p>

18.6.19 MMCSDB12_NORMAL_INTR_STS Register (Offset = 30h) [reset = 0h]

MMCSDB12_NORMAL_INTR_STS is shown in [Figure 18-199](#) and described in [Table 18-508](#).

Return to [Summary Table](#).

This register gives the status of all the interrupts.

The Normal Interrupt Signal Enable (see MMCSDB12_NORMAL_INTR_SIG_ENA register) affects read of this register, but Normal Interrupt Signal does not affect these reads. An Interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1h. For all bits except Card Interrupt (MMCSDB12_NORMAL_INTR_STS[8] CARD_INTR) and Error Interrupt (MMCSDB12_NORMAL_INTR_STS[15] ERROR_INTR), writing 1h to a bit clears it. The MMCSDB12_NORMAL_INTR_STS[8] CARD_INTR bit is cleared when the card stops asserting the interrupt: that is when the Card Driver services the Interrupt condition.

Table 18-508. MMCSDB12_NORMAL_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
15	ERROR_INTR	R	0h	Error Interrupt If any of the bits in the MMCSDB12_ERROR_INTR_STS register are set, then this bit is set. Therefore the HD can test for an error by checking this bit first. In UHS-II mode is enabled, if any of the bits in the MMCSDB12_UHS2_ERR_INTR_STS register are set, this bit is also set. 0h: No Error 1h: Error
14	BOOT_COMPLETE	R/W1C	0h	Boot Terminate Interrupt This status is set if the boot operation gets terminated. 0h: Boot operation is not terminated 1h: Boot operation is terminated
13	RCV_BOOT_ACK	R/W1C	0h	Boot Acknowledge Receive This status is set if the boot acknowledge is received from device. 0h: Boot acknowledge is not received 1h: Boot acknowledge is received

Table 18-508. MMCS D12_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	RETUNING_EVENT	R	0h	Re-Tuning Event (UHS-I Only) This status is set if the MMCS D12_PRESENTSTATE[3] RETUNING_REQ bit changes from 0h to 1h. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. In UHS-II mode, this bit is not effective. 1h: Re-Tuning should be performed 0h: Re-Tuning is not required
11	INTC	R	0h	int_c (Embedded) This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_C interrupt factor.
10	INTB	R	0h	int_b (Embedded) This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_B interrupt factor.
9	INTA	R	0h	int_a (Embedded) This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1h does not clear this bit. It is cleared by resetting the INT_A interrupt factor.

Table 18-508. MMCSD12_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	CARD_INTR	R	0h	<p>Card Interrupt</p> <p>When this status has been set and the Host Driver needs to start this interrupt service, the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit may be set to 0h in order to clear the card interrupt status latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit to 1h and start sampling the interrupt signal again. Writing this bit to 1h does not clear this bit. It is cleared by resetting the SD card interrupt factor.</p> <p>(1) DAT[1] Interrupt Input in SD Mode</p> <p>In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of UHS-I mode, switching time of Interrupt Period is relaxed for 2 clock cycles. Then Host Controller needs to delay start of interrupt sampling at least 2 clocks and should sample interrupt while Interrupt Period is stable.</p> <p>(2) DAT[2] Interrupt Input in UHS-II Mode</p> <p>When the MMCSD12_PRESENTSTATE[16] CARD_INSERTED and MMCSD12_POWER_CONTROL[0] SD_BUS_POWER bits are set to 1h, Host Controller configures DAT[2] as Interrupt Input and enables pull-up of DAT[2]. DAT[2] interrupt is asynchronous to RCLK, low level sensitive and 3.3 V signal level. DAT[2] interrupt is masked by setting the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit to 0h. When either the MMCSD12_PRESENTSTATE[16] CARD_INSERTED bit or the MMCSD12_POWER_CONTROL[0] SD_BUS_POWER bit is set to 0h, Host Controller sets DAT[2] to low. Only point to point connection is allowed between Host and Card.</p> <p>(3) INT MSG in UHS-II Mode</p> <p>INT MSG is enabled by setting the MMCSD12_UHS2_DEVICE_SELECT[7] INT_MSG_ENA bit. DAT[2] and INT MSG interrupt sources are ORed and indicated to Card Interrupt. If any bit in the MMCSD12_UHS2_DEVICE_INTR_STATUS register is set to 1h, INT MSG interrupt is generated. INT MSG interrupt is cleared by writing a correspondent bit to 1h in the MMCSD12_UHS2_DEVICE_INTR_STATUS register. Masking DAT[2] interrupt also disables INT MSG interrupt due to the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit is set to 0h. SDIO Version 4.00 does not support INT MSG.</p> <p>1h: Generate Card Interrupt 0h: No Card Interrupt</p>

Table 18-508. MMCSDB12_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	CARD_REM	R/W1C	0h	<p>Card Removal</p> <p>This status is set if the MMCSDB12_PRESENTSTATE[16] CARD_INSERTED bit changes from 1h to 0h. When the HD writes this bit to 1h to clear this status the status of the MMCSDB12_PRESENTSTATE[16] CARD_INSERTED bit should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated.</p> <p>0h: Card State Stable or Debouncing 1h: Card Removed</p>
6	CARD_INS	R/W1C	0h	<p>Card Insertion</p> <p>This status is set if the MMCSDB12_PRESENTSTATE[16] CARD_INSERTED bit changes from 0h to 1h. When the HD writes this bit to 1h to clear this status the status of the MMCSDB12_PRESENTSTATE[16] CARD_INSERTED bit should be confirmed. Because the card detect may possibly be changed when the HD clear this bit an Interrupt event may not be generated.</p> <p>0h: Card State Stable or Debouncing 1h: Card Inserted</p>
5	BUF_RD_READY	R/W1C	0h	<p>Buffer Read Ready</p> <p>This status is set if the MMCSDB12_PRESENTSTATE[11] BUF_RD_ENA bit changes from 0h to 1h.</p> <p>The MMCSDB12_PRESENTSTATE[11] BUF_RD_ENA bit is set to 1h for every CMD19 execution in tuning procedure.</p> <p>In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: Not Ready to read Buffer 1h: Ready to read Buffer</p>
4	BUF_WR_READY	R/W1C	0h	<p>Buffer Write Ready</p> <p>This status is set if the MMCSDB12_PRESENTSTATE[10] BUF_WR_ENA bit changes from 0h to 1h.</p> <p>In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: Not Ready to Write Buffer 1h: Ready to Write Buffer</p>
3	DMA_INTERRUPT	R/W1C	0h	<p>DMA Interrupt</p> <p>This status is set if the HC detects the Host DMA Buffer Boundary in the MMCSDB12_BLOCK_SIZE register.</p> <p>0h: No DMA Interrupt 1h: DMA Interrupt is Generated</p>
2	BLK_GAP_EVENT	R/W1C	0h	<p>Block Gap Event</p> <p>If the MMCSDB12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit is set, this bit is set.</p> <p>Read Transaction:</p> <p>This bit is set at the falling edge of the DAT Line Active Status (see MMCSDB12_PRESENTSTATE[2] DATA_LINE_ACTIVE bit). When the transaction is stopped at SD Bus timing. The Read Wait must be supported in order to use this function.</p> <p>Write Transaction:</p> <p>This bit is set at the falling edge of Write Transfer Active Status (see MMCSDB12_PRESENTSTATE[8] WR_XFER_ACTIVE bit). After getting CRC status at SD Bus timing. In UHS-II mode, this bit is set at FC (Flow Control) unit basis.</p> <p>0h: No Block Gap Event 1h: Transaction stopped at Block Gap</p>

Table 18-508. MMCSD12_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	XFER_COMPLETE	R/W1C	0h	<p>Transfer Complete</p> <p>This bit is set when a read/write transaction is completed.</p> <p>SD Mode</p> <p>Read Transaction:</p> <p>This bit is set at the falling edge of Read Transfer Active Status (MMCSD12_PRESENTSTATE[9] RD_XFER_ACTIVE).</p> <p>There are two cases in which the Interrupt is generated. The first is when a data transfer is completed as specified by data length (after the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit (after valid data has been read to the Host System).</p> <p>Write Transaction:</p> <p>This bit is set at the falling edge of the DAT Line Active Status (see MMCSD12_PRESENTSTATE[2] DATA_LINE_ACTIVE bit). There are two cases in which the Interrupt is generated. The first is when the last data is written to the card as specified by data length and Busy signal is released. The second is when data transfers are stopped at the block gap by setting the MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit and data transfers completed (after valid data is written to the SD card and the busy signal is released).</p> <p>Note: MMCSD12_NORMAL_INTR_STS[1] XFER_COMPLETE bit has higher priority than the MMCSD12_ERROR_INTR_STS[4] DATA_TIMEOUT bit. If both bits are set to 1h, the data transfer can be considered complete.</p> <p>Note: While performing tuning procedure (the MMCSD12_HOST_CONTROL2[6] EXECUTE_TUNING bit is set to 1h), the MMCSD12_NORMAL_INTR_STS[1] XFER_COMPLETE bit is not set to 1h.</p> <p>Command with Busy:</p> <p>This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the MMCSD12_PRESENTSTATE register.</p> <p>UHS-I mode</p> <p>While performing tuning procedure (the MMCSD12_HOST_CONTROL2[6] EXECUTE_TUNING bit is set to 1h), the MMCSD12_NORMAL_INTR_STS[1] XFER_COMPLETE bit is not set to 1h.</p> <p>0h: No Data Transfer Complete 1h: Data Transfer Complete</p> <p>UHS-II Mode</p> <p>This interrupt is generated in following two cases:</p> <p>(a) EBSY Completion (for EBSY supported commands) When the MMCSD12_UHS2_XFER_MODE[14] EBSY_WAIT bit is set to 1h, this bit is set when EBSY packet has been received, and all valid data have been sent to system memory in case of read operation.</p> <p>(b) Stop and Continue during DCMD Data Transfer When the MMCSD12_BLOCK_GAP_CONTROL[0] STOP_AT_BLK_GAP bit is set to 1h and data transfer is stopped at the Flow Control.</p> <p>Following is for both SD mode and UHS-II mode.</p>

Table 18-508. MMCSDB12_NORMAL_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
				<p>The table below shows that the MMCSDB12_NORMAL_INTR_STS[1] XFER_COMPLETE bit has higher priority than the MMCSDB12_ERROR_INTR_STS[4] DATA_TIMEOUT bit. If both bits are set to 1h, execution of a command can be considered to be completed.</p> <p>1h: Command execution is completed 0h: Not complete</p>
0	CMD_COMPLETE	R/W1C	0h	<p>Command Complete</p> <p>SD Mode</p> <p>This bit is set when we get the end bit of the command response (Except Auto CMD12 and Auto CMD23).</p> <p>Note: The MMCSDB12_ERROR_INTR_STS[0] CMD_TIMEOUT bit has higher priority than the MMCSDB12_NORMAL_INTR_STS[0] CMD_COMPLETE bit. If both are set to 1h, it can be considered that the response was not received correctly.</p> <p>Version 4.00 defines response check function for R1 and R5. If the MMCSDB12_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 1h, generation of this interrupt is prohibited regardless of the MMCSDB12_NORMAL_INTR_SIG_ENA[0] CMD_COMPLETE bit.</p> <p>UHS-II Mode</p> <p>If the MMCSDB12_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 0h, this interrupt is generated when response packet is received.</p> <p>If the MMCSDB12_TRANSFER_MODE[8] RESP_INTR_DIS bit is set to 1h, generation of this interrupt is prohibited regardless of the MMCSDB12_NORMAL_INTR_SIG_ENA[0] CMD_COMPLETE bit.</p> <p>0h: No Command Complete 1h: Command Complete</p>

Table 18-509 shows the relation between transfer complete and data timeout error.

Table 18-509. Relation between transfer complete and data timeout error

Transfer Complete	Data Timeout Error	Meaning of the Status
0	0	Interrupted by Another Factor
0	1	Timeout occur during transfer
1	Don't Care	Data Transfer Complete

Table 18-510 shows the relation between command complete and command timeout error.

Table 18-510. Relation between command complete and command timeout error

Command Complete	Command Timeout Error	Meaning of the Status
0	0	Interrupted by Another Factor
Don't Care	1	Response not received within 64 SDCLK cycles
1	0	Response Received

18.6.20 MMCSD12_ERROR_INTR_STS Register (Offset = 32h) [reset = 0h]

MMCSD12_ERROR_INTR_STS is shown in [Figure 18-200](#) and described in [Table 18-512](#).

Return to [Summary Table](#).

This register gives the status of the error interrupts.

Status defined in this register can be enabled by the MMCSD12_ERROR_INTR_STS_ENA register, but not by the MMCSD12_ERROR_INTR_SIG_ENA register. The Interrupt is generated when the MMCSD12_ERROR_INTR_SIG_ENA register is enabled and at least one of the statuses is set to 1h. Writing to 1h clears the bit and writing to 0h keeps the bit unchanged. More than one status can be cleared at the one register write.

**Table 18-511. MMCSD12_ERROR_INTR_STS

Bit	Field	Type	Reset	Description
15-13	RESERVED	R	0h	Reserved
12	HOST	R/W1C	0h	Target Response Error Occurs when detecting ERROR in m_hresp (DMA transaction) 0h: No error 1h: Error
11	RESP	R/W1C	0h	Response Error (SD Mode Only) Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If the MMCSD12_TRANSFER_MODE[7] RESP_ERR_CHK_ENA bit is set to 1h, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1h. 0h: No error 1h: Error
10	RESERVED	R	0h	Reserved
9	ADMA	R/W1C	0h	ADMA Error This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the MMCSD12_ADMA_ERR_STATUS register. 0h: No error 1h: Error

Table 18-512. MMCSDB12_ERROR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	AUTO_CMD	R/W1C	0h	<p>Auto CMD Error (SD Mode Only)</p> <p>Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that any of the bits D00 to D05 in the MMCSDB12_AUTOCMD_ERR_STS register has changed from 0h to 1h. D07 is effective in case of Auto CMD12. The MMCSDB12_AUTOCMD_ERR_STS register is valid while this bit is set to 1h and may be cleared with clearing of this bit (another implementation is also allowed).</p> <p>0h: No error 1h: Error</p>
7	CURR_LIMIT	R/W1C	0h	<p>Current Limit Error</p> <p>By setting the MMCSDB12_POWER_CONTROL[0] SD_BUS_POWER bit, the HC is requested to supply power for the SD Bus. If the HC supports the Current Limit Function, it can be protected from an Illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1h means the HC is not supplying power to SD card due to some failure. Reading 0 means that the HC is supplying power and no error has occurred. This bit shall always set to be 0, if the HC does not support this function.</p> <p>0h: No error 1h: Power Fail</p>
6	DATA_ENDBIT	R/W1C	0h	<p>Data End Bit Error (SD Mode Only)</p> <p>Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.</p> <p>0h: No error 1h: Error</p>
5	DATA_CRC	R/W1C	0h	<p>Data CRC Error (SD Mode Only)</p> <p>Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 2h.</p> <p>0h: No error 1h: Error</p>
4	DATA_TIMEOUT	R/W1C	0h	<p>Data Timeout Error (SD Mode Only)</p> <p>Occurs when detecting one of following timeout conditions:</p> <ol style="list-style-type: none"> 1. Busy Timeout for R1b, R5b type 2. Busy Timeout after Write CRC status 3. Write CRC status Timeout 4. Read Data Timeout <p>0h: No error 1h: Timeout</p>
3	CMD_INDEX	R/W1C	0h	<p>Command Index Error (SD Mode Only)</p> <p>Occurs if a Command Index error occurs in the Command Response (MMCSDB12_RESPONSE_0 to MMCSDB12_RESPONSE_7).</p> <p>0h: No error 1h: Error</p>

Table 18-512. MMCSD12_ERROR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	CMD_ENDBIT	R/W1C	0h	Command End Bit Error (SD Mode Only) Occurs when detecting that the end bit of a command response is 0h. 0h: No error 1h: End Bit Error Generated
1	CMD_CRC	R/W1C	0h	Command CRC Error (SD Mode Only) Command CRC Error is generated in two cases. 1. If a response is returned and the MMCSD12_ERROR_INTR_STS[0] CMD_TIMEOUT bit is set to 0h, this bit is set to 1h when detecting a CRT error in the command response. 2. The HC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the HC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the HC shall abort the command (Stop driving CMD line) and set this bit to 1h. The MMCSD12_ERROR_INTR_STS[0] CMD_TIMEOUT bit shall also be set to 1h to distinguish CMD line conflict. 0h: No error 1h: CRC Error Generated
0	CMD_TIMEOUT	R/W1C	0h	Command Timeout Error (SD Mode Only) Occurs only if the no response is returned within 64 SDCLK cycles from the end bit of the command. If the HC detects a CMD line conflict, in which case the MMCSD12_ERROR_INTR_STS[1] CMD_CRC bit shall also be set. This bit shall be set without waiting for 64 SDCLK cycles because the command will be aborted by the HC. 0h: No error 1h: Timeout

Table 18-513 shows the relation between command CRC error and command time-out error.

Table 18-513. Relation between command CRC error and command time-out error

Command CRC Error	Command Time-out Error	Kinds of Error
0	0	No Error
0	1	Response Timeout Error
1	0	Response CRC Error
1	1	CMD Line Conflict

18.6.21 MMCSDB12_NORMAL_INTR_STS_ENA Register (Offset = 34h) [reset = 0h]

MMCSDB12_NORMAL_INTR_STS_ENA is shown in [Figure 18-201](#) and described in [Table 18-515](#).

Return to [Summary Table](#).

This register is used to enable the MMCSDB12_NORMAL_INTR_STS register fields.

Table 18-514. MMCSDB12_NORMAL_INTR_STS_ENA Instances

Bit	Field	Type	Reset	Description
15	BIT15_FIXED0	R	0h	Fixed to 0 The HC shall control error Interrupts using the MMCSDB12_ERROR_INTR_STS_ENA register.
14	BOOT_COMPLETE	R/W	0h	Boot Terminate Interrupt Enable 0h: Masked 1h: Enabled
13	RCV_BOOT_ACK	R/W	0h	Boot Acknowledge Enable 0h: Masked 1h: Enabled
12	RETUNING_EVENT	R/W	0h	Re-Tuning Event Status Enable (UHS-I Only) 0h: Masked 1h: Enabled
11	INTC	R/W	0h	INT_C Status Enable (Embedded) If this bit is set to 0h, the Host Controller shall clear the interrupt request to the System. The Host Driver may clear this bit before servicing the INT_C and may set this bit again after all interrupt requests to INT_C pin are cleared to prevent inadvertent interrupts.
10	INTB	R/W	0h	INT_B Status Enable (Embedded) If this bit is set to 0h, the Host Controller shall clear the interrupt request to the System. The Host Driver may clear this bit before servicing the INT_B and may set this bit again after all interrupt requests to INT_B pin are cleared to prevent inadvertent interrupts.
9	INTA	R/W	0h	INT_A Status Enable (Embedded) If this bit is set to 0h, the Host Controller shall clear the interrupt request to the System. The Host Driver may clear this bit before servicing the INT_A and may set this bit again after all interrupt requests to INT_A pin are cleared to prevent inadvertent interrupts.

Table 18-515. MMCSD12_NORMAL_INTR_STS_ENA Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	CARD_INTERRUPT	R/W	0h	<p>Card Interrupt Status Enable</p> <p>If this bit is set to 0h, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1h. The HD may clear the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit before servicing the Card Interrupt and may set this bit again after all Interrupt requests from the card are cleared to prevent inadvertent Interrupts.</p> <p>By setting this bit to 0h, interrupt input should be masked by implementation so that the interrupt Input is not affected by external signal in any state (for example: floating).</p> <p>0h: Masked 1h: Enabled</p>
7	CARD_REMOVAL	R/W	0h	<p>Card Removal Status Enable</p> <p>0h: Masked 1h: Enabled</p>
6	CARD_INSERTION	R/W	0h	<p>Card Insertion Status Enable</p> <p>0h: Masked 1h: Enabled</p>
5	BUF_RD_READY	R/W	0h	<p>Buffer Read Ready Status Enable</p> <p>0h: Masked 1h: Enabled</p>
4	BUF_WR_READY	R/W	0h	<p>Buffer Write Ready Status Enable</p> <p>0h: Masked 1h: Enabled</p>
3	DMA_INTERRUPT	R/W	0h	<p>DMA Interrupt Status Enable</p> <p>0h: Masked 1h: Enabled</p>
2	BLK_GAP_EVENT	R/W	0h	<p>Block Gap Event Status Enable</p> <p>0h: Masked 1h: Enabled</p>
1	XFER_COMPLETE	R/W	0h	<p>Transfer Complete Status Enable</p> <p>0h: Masked 1h: Enabled</p>
0	CMD_COMPLETE	R/W	0h	<p>Command Complete Status Enable</p> <p>0h: Masked 1h: Enabled</p>

Note: The HC may sample the card Interrupt signal during interrupt period and may hold its value in the flip-flop. If the MMCSD12_NORMAL_INTR_STS_ENA[8] CARD_INTERRUPT bit is set to 0h, the HC shall clear all internal signals regarding Card Interrupt (MMCSD12_NORMAL_INTR_STS[8] CARD_INTR).

18.6.22 MMCSDB12_ERROR_INTR_STS_ENA Register (Offset = 36h) [reset = 0h]

MMCSDB12_ERROR_INTR_STS_ENA is shown in [Figure 18-202](#) and described in [Table 18-517](#).

Return to [Summary Table](#).

This register is used to enable the MMCSDB12_ERROR_INTR_STS register fields.

Bit	Field	Type	Reset	Description
15-8	RESERVED	R	0h	Reserved
7	CMD_NOT_ISSUED	R	0h	Command Not Issued By Auto CMD12 Error Setting this bit to 1h means CMD_wo_DAT is not executed due to an Auto CMD12 error (D04- D01) in this register. This bit is set to 0h when Auto CMD Error is generated by Auto CMD23. 0h: No Error 1h: Not Issued
6-5	RESERVED	R	0h	Reserved
4	INDEX	R	0h	Auto CMD Index Error Occurs if the Command Index error occurs in response to a command. 0h: No Error 1h: Error
3	ENDBIT	R	0h	Auto CMD End Bit Error Occurs when detecting that the end bit of command response is 0h. 0h: No Error 1h: End Bit Error Generated
2	CRC	R	0h	Auto CMD CRC Error Occurs when detecting a CRC error in the command response. 0h: No Error 1h: CRC Error Generated

Table 18-523. MMCSD12_AUTOCMD_ERR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TIMEOUT	R	0h	Auto CMD Timeout Error Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1h, the other error status bits (D04 - D02) are meaningless. 0h: No Error 1h: Timeout
0	ACMD12_NOT_EXEC	R	0h	Auto CMD12 not Executed If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1h means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error. If this bit is set to 1h, other error status bits (D04 - D01) are meaningless. This bit is set to 0h when Auto CMD Error is generated by Auto CMD23. 0h: Executed 1h: Not Executed

Table 18-524 shows the relation between Auto CMD12 CRC error and Auto CMD12 timeout error.

Table 18-524. Relation between Auto CMD12 CRC Error and Auto CMD12 Timeout Error

Auto Cmd12 CRC Error	Auto CMD12 Timeout Error	Kinds of Error
0	0	No Error
0	1	Response Timeout Error
1	0	Response CRC Error
1	1	CMD Line Conflict

The timing of changing Auto CMD12 Error Status can be classified in three scenarios:

1. When the HC is going to issue Auto CMD12:

Set D00 to 1h if Auto CMD12 cannot be issued due to an error in the previous command.

Set D00 to 0h if Auto CMD12 is issued.

2. At the end bit of Auto CMD12 response:

Check received responses by checking the error bits D01, D02, D03, D04.

set to 1h if Error is Detected.

set to 0h if Error is Not Detected.

3. Before reading the Auto CMD12 Error Status bit D07:

Set D07 to 1h if there is a command cannot be issued.

Set D07 to 0h if there is no command to issue.

Timing of generating the Auto CMD12 Error and writing to the MMCSD12_COMMAND register are Asynchronous. Then D07 shall be sampled when driver never writing to the MMCSD12_COMMAND register. So just before reading the MMCSD12_AUTOCMD_ERR_STS register is good timing to set the D07 status bit.

18.6.26 MMCSDB12_HOST_CONTROL2 Register (Offset = 3Eh) [reset = 0h]

MMCSDB12_HOST_CONTROL2 is shown in [Figure 18-206](#) and described in [Table 18-526](#).

Return to [Summary Table](#).

This register is used to program UHS Mode Select, Driver Strength Select, Execute Tuning, Sampling Clock Select, Asynchronous Interrupt Enable and Preset Value Enable.

**Table 18-525. MMCSDB12_HOST_CONTROL2

Bit	Field	Type	Reset	Description
15	PRESET_VALUE_ENA	R/W	0h	<p>Preset Value Enable</p> <p>Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When the MMCSDB12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to automatic. This bit enables the functions defined in the Preset Value registers (MMCSDB12_PRESET_VALUE0 - MMCSDB12_PRESET_VALUE10).</p> <p>If this bit is set to 0h, SDCLK Frequency Select, Clock Generator Select in the MMCSDB12_CLOCK_CONTROL register and Driver Strength Select in the MMCSDB12_HOST_CONTROL2 register are set by Host Driver.</p> <p>If this bit is set to 1h, SDCLK Frequency Select, Clock Generator Select in the MMCSDB12_CLOCK_CONTROL register and Driver Strength Select in the MMCSDB12_HOST_CONTROL2 register are set by Host Controller as specified in the Preset Value registers (MMCSDB12_PRESET_VALUE0 - MMCSDB12_PRESET_VALUE10).</p> <p>0h: SDCLK and Driver Strength are controlled by Host Driver</p> <p>1h: Automatic Selection by Preset Value are Enabled</p>

Table 18-526. MMCSD12_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	ASYNCH_INTR_ENA	R/W	0h	<p>Asynchronous Interrupt Enable</p> <p>This bit can be set to 1h if a card support asynchronous interrupt and the MMCSD12_CAPABILITIES[29] ASYNCH_INTR_SUPPORT bit is set to 1h. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode . If this bit is set to 1h, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card.</p> <p>0h: Disabled 1h: Enabled</p>
13	BIT64_ADDRESSING	R/W	0h	<p>64-bit Addressing</p> <p>This field is effective when the MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h.</p> <p>Host Controller selects either of 32-bit or 64-bit addressing modes to access system memory. Whether 32-bit or 64-bit is determined by OS installed in a host system. Host Driver sets this bit depends on addressing mode of installed OS. Refer to 64-bit System Address Support in the MMCSD12_CAPABILITIES register.</p> <p>0h: 32-bits Addressing 1h: 64-bits Addressing</p>
12	HOST_VER40_ENA	R/W	0h	<p>Host Version 4 Enable</p> <p>This bit selects either Version 3.00 compatible mode or Version 4.00 mode. In Version 4.00, support of 64-bit System Addressing is modified. All DMAs support 64-bit System Addressing. UHS-II supported Host Driver shall enable this bit.</p> <p>In Version 4.10, supported 32-bit Block Count for all operations. Functions of following fields are modified.</p> <p>SDMA Address SDMA uses the MMCSD12_ADMA_SYS_ADDRESS register instead of SDMA System Address register (MMCSD12_SDMA_SYS_ADDR_LO/MMCSD12_SDMA_SYS_ADDR_HI)</p> <p>ADMA2/ADMA3 Selection ADMA3 is selected by MMCSD12_HOST_CONTROL1[4-3] DMA_SELECT bit.</p> <p>64-bit ADMA Descriptor Size 128-bit descriptor is used instead of 96-bit descriptor when 64-bit Addressing is set to 1h.</p> <p>Selection of 32-bit/64-bit System Addressing Either 32-bit or 64-bit system addressing is selected by 64-bit Addressing bit in this register instead of MMCSD12_HOST_CONTROL1[4-3] DMA_SELECT bit.</p> <p>32-bit Block Count SDMA System Address register (MMCSD12_SDMA_SYS_ADDR_LO/MMCSD12_SDMA_SYS_ADDR_HI) is modified to 32-bit Block Count register.</p> <p>0h: Version 3.00 Compatible Mode 1h: Version 4.Mode</p>

Table 18-526. MMCSDB12_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CMD23_ENA	R/W	0h	<p>CMD23 Enable</p> <p>In memory card initialization, Host Driver Version 4.10 checks whether card supports CMD23 by checking a bit SCR[33]. If the card supports CMD23 (SCR[33] = 1h), this bit is set to 1h. This bit is used to select Auto CMD23 or Auto CMD12 for ADMA3 data transfer. Refer to MMCSDB12_TRANSFER_MODE[3-2] AUTO_CMD_ENA bit.</p>
10	ADMA2_LEN_MODE	R/W	0h	<p>ADMA2 Length Mode</p> <p>This bit selects one of ADMA2 Length Modes either 16-bit or 26-bit.</p> <p>0h: 16-bit Data Length Mode</p> <p>1h: 26-bit Data Length Mode</p>
9	DRIVER_STRENGTH2	R/W	0h	<p>Driver Strength Select</p> <p>This is the programmed Drive Strength output and Bit[2] of the sdhccore_drivestrength value.</p>
8	UHS2_INTF_ENABLE	R/W	0h	<p>UHS-II Interface Enable</p> <p>This bit is used to enable UHS-II Interface. Before trying to start UHS-II initialization, this bit shall be set to 1h. Before trying to start SD mode initialization, this bit shall be set to 0h.</p> <p>This bit is used to enable UHS-II IF Detection, Lane Synchronization and In Dormant State in the MMCSDB12_PRESENTSTATE register, and to select clock source of either SD mode or UHS-II mode. Host Controller shall not leave unused SD 4-bit Interface lines (CLK, CMD and DAT[3:2]) floating in UHS-II mode by using pull-up or driving to low. When DAT[2] is used as interrupt input in UHS-II mode, DAT[2] of Host Controller is set to input and then DAT[2] of SDIO card is set to output to avoid conflict.</p> <p>0h: 4-bit SD Interface Enabled</p> <p>1h: UHS-II Interface Enabled</p>
7	SAMPLING_CLK_SELECT	R/W	0h	<p>Sampling Clock Select (UHS-I Only)</p> <p>This bit is set by tuning procedure when the MMCSDB12_HOST_CONTROL2[6] EXECUTE_TUNING bit is cleared. Writing 1h to this bit is meaningless and ignored. Setting 1h means that tuning is completed successfully and setting 0 means that tuning is failed. Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is cleared by writing 0h. Change of this bit is not allowed while the Host Controller is receiving response or a read data block.</p> <p>0h: Fixed clock is used to sample data</p> <p>1h: Tuned clock is used to sample data</p>
6	EXECUTE_TUNING	R/W	0h	<p>Execute Tuning (UHS-I Only)</p> <p>This bit is set to 1h to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to the MMCSDB12_HOST_CONTROL2[7] SAMPLING_CLK_SELECT bit. Tuning procedure is aborted by writing 0h for more detail about tuning procedure.</p> <p>0h: Not Tuned or Tuning Completed</p> <p>1h: Execute Tuning</p>

Table 18-526. MMCSD12_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5-4	DRIVER_STRENGTH1	R/W	0h	<p>Driver Strength Select (UHS-I Only)</p> <p>Host Controller output driver in 1.8 V signaling is selected by this bit. In 3.3 V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the MMCSD12_CAPABILITIES register. This bit depends on setting of the MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit. If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 0h, this field is set by Host Driver.</p> <p>If MMCSD12_HOST_CONTROL2[15] PRESET_VALUE_ENA = 1h, this field is automatically set by a value specified in the one of Preset Value registers (MMCSD12_PRESET_VALUE0 - MMCSD12_PRESET_VALUE10).</p> <p>0h: Driver Type B is Selected (Default) 1h: Driver Type A is Selected 2h: Driver Type C is Selected 3h: Driver Type D is Selected</p>
3	V1P8_SIGNAL_ENA	R/W	0h	<p>1.8 V Signaling Enable (UHS-I Only)</p> <p>This bit controls voltage regulator for I/O cell. 3.3 V is supplied to the card regardless of signaling voltage.</p> <p>Setting this bit from 0h to 1h starts changing signal voltage from 3.3 V to 1.8 V.</p> <p>1.8 V regulator output shall be stable within 5 ms. Host Controller clears this bit if switching to 1.8 V signaling fails.</p> <p>Clearing this bit from 1h to 0h starts changing signal voltage from 1.8 V to 3.3 V.</p> <p>3.3 V regulator output shall be stable within 5 ms.</p> <p>Host Driver can set this bit to 1h when Host Controller supports 1.8 V signaling (one of support bits is set to 1h: SDR50, SDR104 or DDR50 in the MMCSD12_CAPABILITIES register) and the card or device supports UHS-I.</p> <p>0h: 3.3 V Signaling 1h: 1.8 V Signaling</p>

Table 18-526. MMCS12_HOST_CONTROL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2-0	UHS_MODE_SELECT	R/W	0h	<p>UHS Mode Select (UHS-I Only)</p> <p>This field is used to select one of UHS-I modes or UHS-II mode. In case of UHS-I mode, this field is effective when the MMCS12_HOST_CONTROL2[3] V1P8_SIGNAL_ENA bit is set to 1h. In case of UHS-II mode, the MMCS12_HOST_CONTROL2[3] V1P8_SIGNAL_ENA bit shall be set to 0h. Setting of this field is used to select one of preset values in UHS-I or UHS-II mode.</p> <p>If the MMCS12_HOST_CONTROL2[15] PRESET_VALUE_ENA is set to 1h, Host Controller sets SDCLK/RCLK Frequency Select, Clock Generator Select in the MMCS12_CLOCK_CONTROL register and Driver Strength Select according to Preset Value registers (MMCS12_PRESET_VALUE0 - MMCS12_PRESET_VALUE10). In this case, one of preset value registers is selected by this field.</p> <p>Host Driver needs to reset the MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA bit before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets the MMCS12_CLOCK_CONTROL[2] SD_CLK_ENA bit again.</p> <p>0h: SDR12 1h: SDR25 2h: SDR50 3h: SDR104 4h: DDR50 5h: HS400 6h: Reserved 7h: UHS-II</p> <p>When SDR50, SDR104 or DDR50 is selected for SDIO card, interrupt detection at the block gap shall not be used. Read Wait timing is changed for these modes. Refer to the SDIO Specification Version 3.00 for more details.</p>

18.6.27 MMCSDB12_CAPABILITIES Register (Offset = 40h) [reset = 180004073FE8C801h]

MMCSDB12_CAPABILITIES is shown in [Figure 18-207](#) and described in [Table 18-528](#).

Return to [Summary Table](#).

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

Table 18-528. MMCSDB12_CAPABILITIES Register Field Descriptions

Bit	Field	Type	Reset	Description
63	HS400_SUPPORT	R	0h	HS400 Support 0h: HS400 is Not Supported 1h: HS400 is Supported

Table 18-528. MMCSDB12_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
62-61	RESERVED	R	0h	Reserved
60	VDD2_1P8_SUPPORT	R	1h	1.8 V VDD2 Support This bit indicates that support of VDD2 on Host system. 0h: 1.8 V VDD2 is not supported 1h: 1.8 V VDD2 is supported
59	ADMA3_SUPPORT	R	1h	ADMA3 Support This bit indicates that support of ADMA3 on Host Controller. 0h: ADMA3 is not supported 1h: ADMA3 is supported
58	RESERVED	R	0h	Reserved
57	SPI_BLK_MODE	R	0h	SPI Block Mode This bit indicates whether SPI Block Mode is supported or not. 0h: Not Supported 1h: Supported
56	SPI_SUPPORT	R	0h	SPI Mode This bit indicates whether SPI Mode is supported or not. 0h: Not Supported 1h: Supported
55-48	CLOCK_MULTIPLIER	R	0h	Clock Multiplier This field indicates clock multiplier value of programmable clock generator. Refer to the MMCSDB12_CLOCK_CONTROL register. Setting 00h means that Host Controller does not support programmable clock generator. FFh: Clock Multiplier M = 256 ---- 02h: Clock Multiplier M = 3 01h: Clock Multiplier M = 2 00h: Clock Multiplier is Not Supported
47-46	RETUNING_MODES	R	0h	Re-tuning Modes (UHS-I Only) This field defines the re-tuning capability of a Host Controller and how to manage the data transfer length and a Re-Tuning Timer by the Host Driver. 0h: Mode 1 1h: Mode 2 2h: Mode 3 3h: Reserved There are two re-tuning timings: Re-Tuning Request and expiration of a Re-Tuning Timer. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue.
45	TUNING_FOR_SDR50	R	0h	Use Tuning for SDR50 (UHS-I Only) If this bit is set to 1h, this Host Controller requires tuning to operate SDR50 (tuning is always required to operate SDR104). 0h: SDR50 does not require tuning 1h: SDR50 requires tuning Note: Tuning is required for SDR50 to compensate temperature variation.
44	RESERVED	R	0h	Reserved

37	DRIVERC_SUPPORT	R	0h	<p>Driver Type C Support (UHS-I Only)</p> <p>This bit indicates support of Driver Type C for 1.8 Signaling.</p> <p>0h: Driver Type C is Not Supported</p> <p>1h: Driver Type C is Supported</p>
36	DRIVERA_SUPPORT	R	0h	<p>Driver Type A Support (UHS-I Only)</p> <p>This bit indicates support of Driver Type A for 1.8 Signaling.</p> <p>0h: Driver Type A is Not Supported</p> <p>1h: Driver Type A is Supported</p>
35	UHS2_SUPPORT	R	0h	<p>UHS-II Support (UHS-II Only)</p> <p>This bit indicates whether Host Controller supports UHS-II.</p> <p>If this bit is set to 1h, the MMCSD12_CAPABILITIES[60] VDD2_1P8_SUPPORT bit shall be set to 1h (Host System shall support VDD2 power supply).</p> <p>0h: UHS-II is Not Supported</p> <p>1h: UHS-II is Supported</p>
34	DDR50_SUPPORT	R	1h	<p>DDR50 Support (UHS-I Only)</p> <p>This bit indicates whether DDR50 is supported or not.</p> <p>0h: DDR50 is Not Supported</p> <p>1h: DDR50 is Supported</p>
33	SDR104_SUPPORT	R	1h	<p>SDR104 Support (UHS-I Only)</p> <p>This bit indicates whether SDR104 is supported or not. SDR104 requires tuning.</p> <p>0h: SDR104 is Not Supported</p> <p>1h: SDR104 is Supported</p> <p>Note: SDR104 mode is not supported (see <i>MMCSD Not Supported Features</i>).</p>
32	SDR50_SUPPORT	R	1h	<p>SDR50 Support (UHS-I Only)</p> <p>If SDR104 is supported, this bit shall be set to 1h. Bit 40 indicates whether SDR50 requires tuning or not.</p> <p>0h: SDR50 is Not Supported</p> <p>1h: SDR50 is Supported</p>

Table 18-528. MMCSDB12_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
31-30	SLOT_TYPE	R	0h	<p>Slot Type</p> <p>This field indicates usage of a slot by a specific Host System (a host controller register set is defined per slot). Embedded slot for one device (1h) means that only one non-removable device is connected to a SD bus slot. Shared Bus Slot (2h) can be set if Host Controller supports Shared Bus Control register.</p> <p>The Standard Host Driver controls only a removable card or one embedded device is connected to a SD bus slot. If a slot is configured for shared bus (2h), the Standard Host Driver does not control embedded devices connected to a shared bus. Shared bus slot is controlled by a specific host driver developed by a Host System.</p> <p>0h: Removable Card Slot 1h: Embedded Slot for One Device 2h: Shared Bus Slot (SD Mode) 3h: UHS-II Multiple Embedded Devices</p>
29	ASYNCH_INTR_SUPPORT	R	1h	<p>Asynchronous Interrupt Support (SD Mode Only)</p> <p>Refer to SDIO Specification Version 3.00 about asynchronous interrupt.</p> <p>0h: Asynchronous Interrupt Not Supported 1h: Asynchronous Interrupt Supported</p>
28	ADDR_64BIT_SUPPORT_V3	R	1h	<p>64-bit System Address Support for V3</p> <p>Meaning of this bit is different depends on Versions. Host Controller Version 3.00 and Version 4.10 use this bit as 64-bit System Address support for V3 mode. Host Controller Version 4.00 uses this bit as 64-bit System Address support for both V3 and V4 modes.</p> <p>SDMA cannot be used in 64-bit Addressing in Version 3 mode.</p> <p>If this bit is set to 1h, 64-bit ADMA2 with using 96-bit Descriptor may be enabled as follows:</p> <p>In case of Host Controller Version 3, 64-bit ADMA2 is enabled by MMCSDB12_HOST_CONTROL1[4-3] DMA_SELECT = 3h. In case of Host Controller Version 4, 64-bit ADMA2 for Version 3 is enabled by setting MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h and MMCSDB12_HOST_CONTROL1[4-3] DMA_SELECT = 3h.</p> <p>0h: 64-bit System Address for V3 is not Supported 1h: 64-bit System Address for V3 is Supported</p>
27	ADDR_64BIT_SUPPORT_V4	R	1h	<p>64-bit System Address Support for V4</p> <p>This bit is added from Version 4.10. Setting 1h to this bit indicates that the Host Controller supports 64-bit System Addressing of Version 4 mode.</p> <p>When this bit is set to 1h, full or a part of 64-bit address should be used to decode Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller Registers is effective regardless of setting to the MMCSDB12_HOST_CONTROL2[13] BIT64_ADDRESSING bit.</p> <p>If this bit is set to 1h, 64-bit DMA Addressing for Version 4 is enabled by setting MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h, MMCSDB12_HOST_CONTROL2[13] BIT64_ADDRESSING = 1h. SDMA can be used and ADMA2 uses 128-bit Descriptor.</p> <p>0h: 64-bit System Address for V4 is not Supported 1h: 64-bit System Address for V4 is Supported</p>

Table 18-528. MMCSDB12_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	VOLT_1P8_SUPPORT	R	1h	Voltage Support 1.8 V This bit indicates whether the HC supports 1.8 V. 0h: 1.8 V Not Supported 1h: 1.8 V Supported
25	VOLT_3P0_SUPPORT	R	1h	Voltage Support 3.0 V This bit indicates whether the HC supports 3.0 V. 0h: 3.0 V Not Supported 1h: 3.0 V Supported
24	VOLT_3P3_SUPPORT	R	1h	Voltage Support 3.3 V This bit indicates whether the HC supports 3.3 V. 0h: 3.3 V Not Supported 1h: 3.3 V Supported
23	SUSP_RES_SUPPORT	R	1h	Suspend/Resume Support This bit indicates whether the HC supports Suspend/Resume functionality. If this bit is 0h, the Suspend and Resume mechanism are not supported and the HD shall not issue either Suspend/Resume commands. 0h: Not Supported 1h: Supported
22	SDMA_SUPPORT	R	1h	SDMA Support This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly. Version 4.10 Host Controller shall support SDMA if ADMA2 is supported. 0h: SDMA Not Supported 1h: SDMA Supported
21	HIGH_SPEED_SUPPORT	R	1h	High Speed Support This bit indicates whether the HC and the Host System support High Speed mode and they can supply SD Clock frequency from 25 MHz to 50 MHz (for SD)/20 MHz to 52 MHz (for MMC). 0h: High Speed Not Supported 1h: High Speed Supported
20	RESERVED	R	0h	Reserved
19	ADMA2_SUPPORT	R	1h	ADMA2 Support 0h: ADMA2 Not support 1h: ADMA2 support
18	BUS_8BIT_SUPPORT	R	0h	8-bit Support for Embedded Device (Embedded) This bit indicates whether the Host Controller is capable of using 8-bit bus width mode. This bit is not effective when the MMCSDB12_CAPABILITIES[31-30] SLOT_TYPE bit field is set to 2h. 0h: 8-bit Bus Width Not Supported 1h: 8-bit Bus Width Supported
17-16	MAX_BLK_LENGTH	R	0h	Max Block Length This value indicates the maximum block size that the HD can read and write to the buffer in the HC. The buffer shall transfer this block size without wait cycles. Three sizes can be defined as indicated below. 0h: 512 byte 1h: 1024 byte 2h: 2048 byte 3h: 4096 byte

Table 18-528. MMCSDB12_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	BASE_CLK_FREQ	R	C8h	<p>Base Clock Frequency for SD Clock</p> <p>(1) 6-bit Base Clock Frequency:</p> <p>This mode is supported by the Host Controller Version 1.00 and 2.00. Upper 2-bit is not effective and always 0. Unit values are 1 MHz. The supported clock range is 10 MHz to 63 MHz.</p> <p>11xx xxxxb: Not Supported</p> <p>0011 1111b: 63 MHz</p> <p>0000 0010b: 2 MHz</p> <p>0000 0001b: 1 MHz</p> <p>0000 0000b: Get Information via another method</p> <p>(2) 8-bit Base Clock Frequency:</p> <p>This mode is supported by the Host Controller Version 3.00. Unit values are 1 MHz. The supported clock range is 10 MHz to 255 MHz.</p> <p>FFh: 255 MHz</p> <p>02h: 2 MHz</p> <p>01h: 1 MHz</p> <p>00h: Get Information via another method</p> <p>If the real frequency is 16.5 MHz, the larger value shall be set 0001 0001b (17 MHz) because the Host Driver use this value to calculate the clock divider value (refer to the MMCSDB12_CLOCK_CONTROL[15-8] SDCLK_FRQSEL bit field) and it shall not exceed upper limit of the SD Clock frequency. If these bits are all 0, the Host System has to get information via another method.</p>
7	TIMEOUT_CLK_UNIT	R	0h	<p>Timeout Clock Unit</p> <p>This bit shows the unit of base clock frequency used to detect Data Timeout Error (MMCSDB12_ERROR_INTR_STS[4] DATA_TIMEOUT).</p> <p>0h: KHz</p> <p>1h: MHz</p>
6	RESERVED	R	0h	Reserved
5-0	TIMEOUT_CLK_FREQ	R	1h	<p>Timeout Clock Frequency</p> <p>This bit shows the base clock frequency used to detect Data Timeout Error (MMCSDB12_ERROR_INTR_STS[4] DATA_TIMEOUT).</p> <p>0h: Get Information via another method</p> <p>Not 0h: 1 KHz to 63 KHz/1 MHz to 63 MHz</p>

Table 18-529 shows the 64-bit System Address Support depends on Versions.

Table 18-529. 64-bit System Address Support depends on Versions

Host Controller	Version 3.00	Version 4.00	Version 4.10
D28 (from Version 2.00)	for V3	for V3 and V4	for V3
D27 (from Version 4.10)	D27 (from Version 4.10)	Not Defined	for V4
Register Decode	32-bit or 64-bit (up to implementation)	32-bit or 64-bit (up to implementation)	If D27 = 1h, 64-bit
SDMA	Not supported	Supported when MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h	Supported when MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h
ADMA2 (96-bit Descriptor)	DMA Select = 3h	Selected by MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h	Selected by MMCSDB12_HOST_CONTROL2[12] HOST_VER40_ENA = 0h

Table 18-529. 64-bit System Address Support depends on Versions (continued)

Host Controller	Version 3.00	Version 4.00	Version 4.10
ADMA2 (128-bit Descriptor)	Not Defined	Selected by MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h	Selected by MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA = 1h

As the specification of 64-bit System Address Support has been changed, capabilities of 64-bit functions are different depends on versions.

Definition of D28 is different depends on Versions. 96-bit Descriptor was defined by Version 2 but notation V3 is used including V2. Version 4.10 divides 64-bit System Address Support into V3 mode (D28) and V4 mode (D27) so that V3 mode can be optional. Migrate to V4 is recommended. From Host Controller Version 4.00, either V3 mode or V4 mode is selected by Host Version 4 Enable in the Host Control 2 register. V3 mode can be used if 64-bit System Address Support for V3 is set to 1h. V4 mode can be used if 64-bit System Address Support for V4 is set to 1h.

Prior to Version 4.10, address length of Host Controller registers decoding is not defined and whether 32-bit or 64-bit address is used to decode Host Controller registers is up to implementation. If Host Controller decodes 32-bit system address in default, the Host Controller Registers shall be placed in 32-bit addressing space.

When D27 = 1h, Host Controller Version 4.10 or later should use full or a part of 64-bit address to decode Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller Registers is effective regardless of setting to the MMCSD12_HOST_CONTROL2[13] BIT64_ADDRESSING bit. How to decode register also should follow a system bus specification or a mother board specification.

From Version 4.00, 64-bit System Addressing of DMA is enabled by setting to the MMCSD12_HOST_CONTROL2[13] BIT64_ADDRESSING bit. 64-bit SDMA is not supported in V3 mode and is supported in V4 mode. There are two Descriptor types for ADMA2 96-bit (V3) or 128-bit (V4). Support of 96-bit Descriptor is optional for Host Controller Version 4.10. If D28 = 0h, 96-bit Descriptor is not supported.

Note: The Host System shall support at least one of these voltages above. The HD sets the MMCSD12_POWER_CONTROL[3:1] SD_BUS_VOLTAGE bit field according to these support bits. If multiple voltages are supported, select the usable lower voltage by comparing the OCR value from the card.

These registers indicate maximum current capability for each voltage. The value is meaningful if Voltage Support is set in the MMCSD12_CAPABILITIES register.

[Table 18-530](#) describes the re-tuning modes.

Table 18-530. 64-bit System Address Support depends on Versions

Bit47-46	Re-Tuning Mode	Data length	Timer Modes
0h	Mode1	4 MB (Max.)	Always enabled
1h	Mode2	4 MB (Max.)	Stop during data transfer
2h	Reserved	Reserved	Reserved
3h	Reserved	Reserved	Reserved

There are two re-tuning timings: Re-Tuning Request and expiration of a Re-Tuning Timer. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue.

Data length per a read/write command is restricted by whether Host Controller generates Re-Tuning Request during data transfer so that re-tuning procedures can be inserted during data transfers.

18.6.28 MMCSDB12_MAX_CURRENT_CAP Register (Offset = 48h) [reset = 0h]

MMCSDB12_MAX_CURRENT_CAP is shown in [Figure 18-208](#) and described in [Table 18-532](#).

Return to [Summary Table](#).

This register indicates maximum current capability for each voltage.

Bit	Field	Type	Reset	Description
63-0	ADMA_ADDR	R/W	Xh	<p>ADMA System Address</p> <p>The 32-bit addressing Host Driver uses lower 32-bit of this register (upper 32-bit should be set to 0h) and shall program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. DMA2/3 ignores lower 2-bit of this register and assumes it to be 0h. DMA in 64-bit addressing. The 64-bit addressing Host Driver uses all bits of this register and shall program Descriptor Table on 64-bit boundary and set 64-bit boundary address to this register. DMA2/3 ignores lower 3-bit of this register and assumes it to be 0h.</p> <p>SDMA</p> <p>If the MMCSD12_HOST_CONTROL2[12] HOST_VER40_ENA bit is set to 1h, SDMA use this register to indicate System Address of data location instead of using SDMA System Address register (MMCSD12_SDMA_SYS_ADDR_LO/ MMCSD12_SDMA_SYS_ADDR_HI). SDMA can be used in 32-bit and 64-bit addressing in Version 4.00.</p> <p>ADMA2</p> <p>This register holds byte address of executing command of the Descriptor table. At the start of ADMA2, the Host Driver shall set start address of the Descriptor table. The ADMA increments this register address, which points to next line, when every fetching a Descriptor line. When the ADMA Error Interrupt is generated, this register shall hold the Descriptor address depending on the ADMA state.</p> <p>ADMA3</p> <p>This register is set by ADMA3. Host Driver is not necessary to set this register. The ADMA3 increments address of this register, which points to next line, when every time fetching a Descriptor line. When Error Interrupt is generated, this register shall hold the Descriptor address depending on the ADMA state.</p> <p>Register Value - 00000000_xxxxxxxh Addressing Mode - 32-bit System Address Register Value - xxxxxxxx_xxxxxxxh Addressing Mode - 64-bit System Address</p>

18.6.33 MMCS12_PRESET_VALUE0 Register (Offset = 60h) [reset = 100h]

MMCS12_PRESET_VALUE0 is shown in [Figure 18-213](#) and described in [Table 18-544](#).

Return to [Summary Table](#).

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, Driver Strength Select Value.

When the MMCS12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit is set to 1h, SDCLK/RCLK Frequency Select and Clock Generator Select in the MMCS12_CLOCK_CONTROL register, and Driver Strength Select in the MMCS12_HOST_CONTROL2 register are automatically set based on the Selected Bus Speed Mode (see [Table 18-542](#)). This means the Host Driver needs not set these fields when preset is enabled.

Before starting the initialization sequence, the Host Driver needs to set a clock preset value to SDCLK/RCLK Frequency Select in the MMCS12_CLOCK_CONTROL register. The MMCS12_HOST_CONTROL2[15] PRESET_VALUE_ENA bit can be set after initialization completed.

[Table 18-542](#) shows the conditions to select one of preset value registers.

Table 18-542. Preset Value Register Select Condition

Selected Bus Speed Mode	1.8 V Signaling Enable (Host Control 2)	High Speed Enable (Host Control 1)	UHS-1 Mode Selection (Host Control 2)

18.6.47 MMCSDB12_UHS2_XFER_MODE Register (Offset = 9Ch) [reset = 0h]

MMCSDB12_UHS2_XFER_MODE is shown in [Figure 18-227](#) and described in [Table 18-573](#).

Return to [Summary Table](#).

This register is used to control the operations of data transfers.

On issuing a Command Packet, a Command Packet image is set to UHS-II Command Packet register (see MMCSDB12_UHS2_COMMAND_PKT_0 - MMCSDB12_UHS2_COMMAND_PKT_19) but Host Controller does not analyze the setting of UHS-II Command Packet register. Instead, Host Controller refers setting of this register to issue a Command Packet to make the control easy. Setting of these registers shall be correspondent.

Table 18-594. MMCSD12_UHS2_ERR_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	VENDOR_SPECIFIC_ERR	R/W1C	0h	Vendor Specific Error Vendor may use this field for vendor specific error status. 0h: Interrupt is not generated 1h: Vendor Specific Error
26-18	RESERVED	R	0h	Reserved
17	DEADLOCK_TIMEOUT	R/W1C	0h	Timeout for Deadlock Setting of this bit means that deadlock timeout occurs. Host expects to receive a packet but not received in a specified timeout (1 second). Timeout value is determined by the setting of the MMCSD12_UHS2_TIMER_CONTROL[7-4] DEADLOCK_TIMEOUT_CTR bit field. 0h: Interrupt is not generated 1h: Deadlock Error

Table 18-594. MMCSDB12_UHS2_ERR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	CMD_RESP_TIMEOUT	R/W1C	0h	Timeout for CMD_RES Setting of this bit means that RES Packet timeout occurs. Host expects to receive RES packet but not received in a specified timeout (5 ms). Timeout value is determined by the setting of the MMCSDB12_UHS2_TIMER_CONTROL[3-0] CMDRESP_TIMEOUT_CTR bit field. 0h: Interrupt is not generated 1h: RES Packet Timeout Error
15	ADMA2_ADMA3	R/W1C	0h	ADMA2/3 Error Setting of this bit means that ADMA2/3 Error occurs in UHS-II mode. ADMA2/3 Error Status is indicated to the MMCSDB12_ADMA_ERR_STATUS register, which is defined in the Host spec 3.00. 0h: Interrupt is not generated 1h: ADMA2/3 Error
14-9	RESERVED	R	0h	Reserved
8	EBSY	R/W1C	0h	EBSY Error On receiving EBSY packet, if the packet indicates an error, this bit is set to 1h. Setting of this bit also sets Error Interrupt and Transfer Completer together in the MMCSDB12_NORMAL_INTR_STS register. This error check is effective for a command with setting the MMCSDB12_UHS2_XFER_MODE[14] EBSY_WAIT bit. 0h: Interrupt is not generated 1h: EBSY Error (Backend Error)
7	UNRECOVERABLE	R/W1C	0h	Unrecoverable Error Setting of this bit means that Unrecoverable Error is set in a packet from a device. 0h: Interrupt is not generated 1h: Device Unrecoverable Error
6	RESERVED	R	0h	Reserved
5	TID	R/W1C	0h	TID Error Setting of this bit means that TID Error occurs. 0h: Interrupt is not generated 1h: TID Error
4	FRAMING	R/W1C	0h	Framing Error Setting of this bit means that Framing Error occurs during a packet receiving. 0h: Interrupt is not generated 1h: Framing Error
3	CRC	R/W1C	0h	CRC Error Setting of this bit means that CRC Error occurs during a packet receiving. 0h: Interrupt is not generated 1h: CRC Error
2	RETRY_EXPIRED	R/W1C	0h	Retry Expired Setting of this bit means that Retry Counter Expired Error occurs during data transfer. If this bit is set, either Framing Error or CRC Error in this register shall be set. 0h: Interrupt is not generated 1h: Retry Expired Error

Table 18-594. MMCSD12_UHS2_ERR_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	RESP_PKT	R/W1C	0h	<p>RES Packet Error</p> <p>Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If the MMCSD12_UHS2_XFER_MODE[7] RESP_ERR_CHK_ENA bit is set to 1h, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1h.</p> <p>0h: Interrupt is not generated 1h: RES Packet Error</p>
0	HEADER	R/W1C	0h	<p>Header Error</p> <p>Setting of this bit means that Header Error occurs in a received packet.</p> <p>0h: Interrupt is not generated 1h: Header Error</p>

18.6.58 MMCSDB12_UHS2_ERR_INTR_STS_ENA Register (Offset = C8h) [reset = 0h]

MMCSDB12_UHS2_ERR_INTR_STS_ENA is shown in [Figure 18-238](#) and described in [Table 18-596](#).

Return to [Summary Table](#).

This register is used to enable the MMCSDB12_UHS2_ERR_INTR_STS register fields.

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-12	CF_MUL	R	3h	Internal Timer Clock Frequency Multiplier (ITCFMUL) ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the SQS polling period. See ITCFVAL definition for details (MMCS12_CQ_CAPABILITIES[9-0] CF_VAL). Field Value Description: 0h: 0.001 MHz 1h: 0.01 MHz 2h: 0.1 MHz 3h: 1 MHz 4h: 10 MHz Other values are reserved
11-10	RESERVED	R	0h	Reserved

Table 18-634. MMCSDB12_CQ_CAPABILITIES Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	CF_VAL	R	C8h	Internal Timer Clock Frequency Value (ITCFVAL) ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the polling period when using periodic SEND_QUEUE_STATUS (CMD13) polling. The clock frequency is calculated as $ITCFVAL \times ITCFMUL$. For example, to encode 19.2 MHz ITCFVAL shall be C0h (= 192 decimal) and ITCFMUL shall be 2h (0.1 MHz). $192 \times 0.1 \text{ MHz} = 19.2 \text{ MHz}$

18.6.78 MMCSDB12_CQ_CONFIG Register (Offset = 208h) [reset = 0h]

MMCSDB12_CQ_CONFIG is shown in [Figure 18-258](#) and described in [Table 18-636](#).

Return to [Summary Table](#).

This register controls CQE behavior affecting the general operation of command queueing 290 module or operation of multiple tasks in the same time.

Table 18-636. MMCSDB12_CQ_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R	0h	Reserved
12	DCMD_ENA	R/W	0h	Direct Command (DCMD) Enable This bit indicates to the hardware whether the Task Descriptor in slot #31 of the TDL is a Data Transfer Task Descriptor, or a Direct Command Task Descriptor. CQE uses this bit when a task is issued in slot #31, to determine how to decode the Task Descriptor. Bit Value Description 0h: Task descriptor in slot #31 is a Data Transfer Task Descriptor 1h: Task descriptor in slot #31 is a DCMD Task Descriptor
11-9	RESERVED	R	0h	Reserved
8	TASK_DESC_SIZE	R/W	0h	Task Descriptor Size This bit indicates whether the task descriptor size is 128 bits or 64 bits . This bit can only be configured when the MMCSDB12_CQ_CONFIG[0] CQ_ENABLE bit is 0h (command queueing is disabled). Bit Value Description 0h: Task descriptor size is 64 bits 1h: Task descriptor size is 128 bits
7-1	RESERVED	R	0h	Reserved

Table 18-636. MMCSDB12_CQ_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	CQ_ENABLE	R/W	0h	<p>Command Queueing Enable</p> <p>Software shall write 1h to this bit when in order to enable command queueing mode (enable CQE).</p> <p>When this bit is 0h, CQE is disabled and software controls the eMMC bus using the legacy eMMC host controller.</p> <p>Before software writes 1h to this bit, software shall verify that the eMMC host controller is in idle state and there are no commands or data transfers ongoing.</p> <p>When software wants to exit command queueing mode, it shall clear all previous tasks if such exist before setting this bit to 0h.</p>

18.6.79 MMCSd12_CQ_CONTROL Register (Offset = 20Ch) [reset = 0h]

MMCSd12_CQ_CONTROL is shown in [Figure 18-259](#) and described in [Table 18-638](#).

Return to [Summary Table](#).

This register controls CQE behavior affecting the general operation of command queueing 293 module or operation of multiple tasks in the same time.

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	Reserved
8	CLEAR_ALL_TASKS	R/W	0h	Clear All Tasks Software shall write 1h to this bit when it wants to clear all the tasks sent to the device. This bit can only be written when CQE is in halt state (Halt bit is 1h). When software writes 1h, the value of the register is updated to 1h, and CQE shall reset the MMCSd12_CQ_TASK_DOOR_BELL register and all other context information for all unfinished tasks. Then CQE will clear this bit. Software should poll on this bit until it is set to back 0 and may then resume normal operation, by clearing the Halt bit. CQE does not communicate to the device that the tasks were cleared. It is softwares responsibility to order the device to discard the tasks in its queue using CMDQ_TASK_MGMT command. Writing 0h to this register shall have no effect.
7-1	RESERVED	R	0h	Reserved

Table 18-638. MMCSD12_CQ_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	HALT_BIT	R/W	0h	<p>Halt</p> <p>Host software shall write 1h to the bit when it wants to acquire software control over the eMMC bus and disable CQE from issuing commands on the bus.</p> <p>For example, issuing a Discard Task command (CMDQ_TASK_MGMT).</p> <p>When software writes 1h, CQE shall complete the ongoing task if such a task is in progress.</p> <p>Once the task is completed and CQE is in idle state, CQE shall not issue new commands and shall indicate so to software by setting this bit to 1h.</p> <p>Software may poll on this bit until it is set to 1h, and may only then send commands on the eMMC bus.</p> <p>In order to exit halt state (resume CQE activity), software shall clear this bit (write 0h). Writing 0h when the value is already 0h shall have no effect.</p>

18.6.80 MMCSDB12_CQ_INTR_STS Register (Offset = 210h) [reset = 0h]

MMCSDB12_CQ_INTR_STS is shown in [Figure 18-260](#) and described in [Table 18-640](#).

Return to [Summary Table](#).

This register indicates pending interrupts that require service. Each bit in this registers is asserted 296 in response a specific event, only if the respective bit is set in the MMCSDB12_CQ_INTR_STS_ENA register.

Table 18-639. MMCSDB12_CQ_INTR_STS Instances

Table 18-640. MMCSDB12_CQ_INTR_STS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4	TASK_ERROR	R/W1C	0h	Task Error Interrupt (TERR) This bit is asserted when task error is detected due to invalid task descriptor.
3	TASK_CLEARED	R/W1C	0h	Task Cleared (TCL) This status bit is asserted (if MMCSDB12_CQ_INTR_STS_ENA[3] TASK_CLEARED = 1h) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (MMCSDB12_CQ_TASK_CLEAR) or clearing of all tasks (MMCSDB12_CQ_CONTROL).
2	RESP_ERR_DET	R/W1C	0h	Response Error Detected Interrupt (RED) This status bit is asserted (if MMCSDB12_CQ_INTR_STS_ENA[2] RESP_ERR_DET = 1h) when a response is received with an error bit set in the device status field. Software uses the MMCSDB12_CQ_RESP_ERR_MASK register to configure which device status bit fields may trigger an interrupt, and which are masked.

Table 18-640. MMCSD12_CQ_INTR_STS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TASK_COMPLETE	R/W1C	0h	Task Complete Interrupt (TCC) This status bit is asserted (if MMCSD12_CQ_INTR_STS_ENA[1] TASK_COMPLETE = 1h) when at least one of the following two conditions are met: (1) A task is completed and the INT bit is set in its Task Descriptor (2) Interrupt caused by Interrupt Coalescing logic
0	HALT_COMPLETE	R/W1C	0h	Halt Complete Interrupt (HAC) This status bit is asserted (if MMCSD12_CQ_INTR_STS_ENA[0] HALT_COMPLETE = 1h) when the MMCSD12_CQ_CONTROL[0] HALT_BIT bit transitions from 0h to 1h indicating that host controller has completed its current ongoing task and has entered halt state.

18.6.81 MMCSDB12_CQ_INTR_STS_ENA Register (Offset = 214h) [reset = 0h]

MMCSDB12_CQ_INTR_STS_ENA is shown in [Figure 18-261](#) and described in [Table 18-642](#).

Return to [Summary Table](#).

This register enables and disables the reporting of the corresponding interrupt to host software in 299 MMCSDB12_CQ_INTR_STS register. When a bit is set (1h) and the corresponding interrupt condition is active, then the 300 bit in the MMCSDB12_CQ_INTR_STS register is asserted. Interrupt sources that are disabled (0h) are not indicated in the MMCSDB12_CQ_INTR_STS 301 register. This register is bit-index matched to the MMCSDB12_CQ_INTR_STS register.

Table 18-646. MMCSDB12_CQ_INTR_COALESCING Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CQINTCOALESC_ENAB LE	R/W	0h	Interrupt Coalescing Enable/Disable: When set to 0h by software, command responses are neither counted nor timed. Interrupts are still triggered by completion of tasks with INT = 1 in the Task Descriptor. When set to 1h, the interrupt coalescing mechanism is enabled and coalesced interrupts are generated.
30-21	RESERVED	R	0h	Reserved
20	IC_STATUS	R	0h	Interrupt Coalescing Status Bit (ICSB): This bit indicates to software whether any tasks (with INT = 0) have completed and counted towards interrupt coalescing (ICSB is set if and only if IC counter > 0). Bit Value Description 0h: No task completions have occurred since last counter reset (IC counter = 0) 1h: At least one task completion has been counted (IC counter > 0)
19-13	RESERVED	R	0h	Reserved

Table 18-646. MMCS12_CQ_INTR_COALESCING Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12-8	CTR_THRESHOLD	R/W	0h	Interrupt Coalescing Counter Threshold (ICCTH): Software uses this field to configure the number of task completions (only tasks with INT = 0 in the Task Descriptor) which are required in order to generate an interrupt. Counter Operation: As data transfer tasks with INT = 0 complete, they are counted by CQE. The counter is reset by software during the interrupt service routine. The counter stops counting when it reaches the value configured in ICCTH. The maximum allowed value is 31. Note: When ICCTH is 0h, task completions are not counted, and counting-based interrupts are not generated.
7	RESERVED	R	0h	Reserved
6-0	TIMEOUT_VAL	R/W	0h	Interrupt Coalescing Timeout Value (ICTOVAL): Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt. Timer Operation: The timer is reset by software during the interrupt service routine. It starts running when a data transfer task with INT = 0 is completed, after the timer was reset. When the timer reaches the value configured in ICTOVAL field it generates an interrupt and stops. The timers unit is equal to 1024 clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field in the MMCS12_CQ_CAPABILITIES register. The minimum value is 1h (1024 clock periods) and the maximum value is 7Fh (127 × 1024 clock periods). For example, a MMCS12_CQ_CAPABILITIES field value of 0h indicates a 19.2 MHz clock frequency (period = 52.08 ns). If the setting in ICTOVAL is 10h, the calculated polling period is 16 × 1024 × 52.08 ns = 853.33 μs Note: When ICTOVAL is 0h, the timer is not running, and timer-based interrupts are not generated.

18.6.84 MMCSd12_CQ_TDL_BASE_ADDR Register (Offset = 220h) [reset = 0h]

MMCSd12_CQ_TDL_BASE_ADDR is shown in [Figure 18-264](#) and described in [Table 18-648](#).

Return to [Summary Table](#).

This register is used for configuring the lower 32 bits of the byte address of the head of the Task 312 Descriptor List in the host memory.

Bit	Field	Type	Reset	Description
31-0	CQTCN_VAL	R/W1C	0h	Task Complete Notification CQE shall set bit n of this register (at the same time it clears bit n of the MMCSDB12_CQ_TASK_DOOR_BELL register) when a task execution is completed (with success or error). When receiving interrupt for task completion, software may read this register to know which tasks have finished. After reading this register, software may clear the relevant bit fields by writing 1h to the corresponding bits.

18.6.88 MMCSD12_CQ_DEV_QUEUE_STATUS Register (Offset = 230h) [reset = 0h]

MMCSD12_CQ_DEV_QUEUE_STATUS is shown in [Figure 18-268](#) and described in [Table 18-656](#).

Return to [Summary Table](#).

This register stores the most recent value of the device's queue status.

Table 18-655. MMCSD12_CQ_DEV_QUEUE_STATUS Instances

Instance	Physical Address
MMCSD1_CTL_CFG	04FB 0230h
MMCSD2_CTL_CFG	04F9 8230h

LEGEND: R = Read Only; -n = value after reset

Table 18-658. MMCSDB12_CQ_DEV_PENDING_TASKS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CQDP_TSXS	R	0h	Device Pending Tasks Bit n of this register is set if and only if QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) were sent for this specific task and if this task hasnt been executed yet. CQE shall set this bit after receiving a successful response for CMD45. CQE shall clear this bit after the task has completed execution. Software needs to read this register in the task-discard procedure, when the controller is halted, to determine if the task is queued in the device. If the task is queued, the driver sends a CMDQ_TASK_MGMT (CMD48) to the device ordering it to discard the task. Then software clears the task in the CQE. Only then the software orders CQE to resume its operation using MMCSDB12_CQ_CONTROL register.

18.6.90 MMCSDB12_CQ_TASK_CLEAR Register (Offset = 238h) [reset = 0h]

MMCSDB12_CQ_TASK_CLEAR is shown in [Figure 18-270](#) and described in [Table 18-660](#).

Return to [Summary Table](#).

This register is used for removing an outstanding task in the CQE 327. The register should be used only when CQE is in Halt state.

**Table 18-659. MMCSDB12_CQ_TASK_CLEAR
Instances**

Table 18-662. MMCSDB12_CQ_SEND_STS_CONFIG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19-16	CMD_BLK_CNTR	R/W	1h	Send Status Command Block Counter This field indicates to CQE when to send SEND_QUEUE_STATUS (CMD13) command to inquire the status of the devices task queue. A value of n means CQE shall send status command on the CMD line, during the transfer of data block BLOCK_CNT-n , on the data lines, where BLOCK_CNT is the number of blocks in the current transaction. A value of 0h means that SEND_QUEUE_STATUS (CMD13) command shall not be sent during the transaction. Instead it will be sent only when the data lines are idle. A value of 1 means that STATUS command is to be sent during the last block of the transaction.
15-0	CMD_IDLE_TIMER	R/W	1000h	Send Status Command Idle Timer This field indicates to CQE the polling period to use when using periodic SEND_QUEUE_STATUS (CMD13) polling. Periodic polling is used when tasks are pending in the device, but no data transfer is in progress. When a SEND_QUEUE_STATUS response indicating that no task is ready for execution, CQE counts the configured time until it issues the next SEND_QUEUE_STATUS. Timer units are clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field in the MMCSDB12_CQ_CAPABILITIES register. The minimum value is 1h (1 clock period) and the maximum value is FFFFh (65535 clock periods). Default interval is: 4096 clock periods. For example, a MMCSDB12_CQ_CAPABILITIES field value of 0h indicates a 19.2 MHz clock frequency (period = 52.08 ns).

18.6.92 MMCSD12_CQ_SEND_STS_CONFIG2 Register (Offset = 244h) [reset = 0h]

MMCSD12_CQ_SEND_STS_CONFIG2 is shown in [Figure 18-272](#) and described in [Table 18-664](#).

Return to [Summary Table](#).

This register is used for 333 configuring RCA field in SEND_QUEUE_STATUS command argument.

18.6.95 MMCSDB12_CQ_TASK_ERR_INFO Register (Offset = 254h) [reset = 0h]

MMCSDB12_CQ_TASK_ERR_INFO is shown in Figure 18-275 and described in Table 18-670.

Return to [Summary Table](#).

This register is updated by CQE when an error occurs on data or command related to a task activity. When such error is detected by CQE or indicated by the eMMC controller CQE stores in the MMCSDB12_CQ_TASK_ERR_INFO register the task IDs and the command indices of the commands which were executed on the 343 command line and data lines when the error occurred.

Software is expected to use this information in the error recovery procedure.

Table 18-669. MMCSDB12_CQ_TASK_ERR_INFO Instances

Return to [Summary Table](#).

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Return to [Summary Table](#).

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

UFS_SEC_EOI_REG is shown in [Figure 19-5](#) and described in [Table 19-16](#).

Return to [Summary Table](#).

SEC End Of Interrupt (EOI) Register

The SEC End Of Interrupt (EOI) register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the SEC End Of Interrupt (EOI) register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the SEC End Of Interrupt (EOI) register is not functional and must not be used.

Table 19-15. UFS_SEC_EOI_REG Instances

UFS_DED_EOI_REG is shown in [Figure 19-9](#) and described in [Table 19-28](#).

Return to [Summary Table](#).

DED End Of Interrupt (EOI) Register

The DED End Of Interrupt (EOI) register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the DED End Of Interrupt (EOI) register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the DED End Of Interrupt (EOI) register is not functional and must not be used.

Table 19-80. UFS_CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29	MHS	R	0h	Multi-Host Support Indicates that the host controller supports multi-host functionality.
28	CS	R	1h	Crypto Support Indicates that the host controller supports cryptographic operations.
27	DBMMS	R	0h	Device Bus Master Mode Supported (Unified Memory (UM) UFSHCI Only) Indicates whether the UFS host controller supports the device bus master mode, which is required to support the Unified Memory feature. The device bus master mode allows sending requests from the UFS device to the UFS host controller. The host controller responds to those requests.
26	UICDMETMS	R	1h	UIC DME_TEST_MODE Command Supported Indicates whether the host controller supports the UniPro DME_TEST_MODE.req SAP primitive.

Table 19-80. UFS_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	OODDS	R	0h	Out of Order Data Delivery Supported Indicates whether the host controller supports out of order data delivery for UTP data transfer. 1h = When set to 1h, the host controller shall support out of order data delivery from the target device. 0h = When set to 0h, the host controller will not support out of order data delivery from the target device.
24	AS64	R	1h	64-bit Addressing Supported Indicates whether the host controller can access 64-bit data structures. 1h = When set to 1h, the host controller shall make the 32-bit upper bits of the UTP Transfer Request List Base Address Upper 32-bit and UTP Task Management Request List Base Address Upper 32-bit, the PRD Base, and each PRD entry read/write. 0h = When cleared to 0h, these are read-only and treated as 0h by the UFS Host Controller.
23	AUTOH8	R	1h	Auto-Hibernation Support Indicates whether the host controller support auto-hibernation: 0h = Host controller does not support auto-hibernation 1h = Host controller does support auto hibernation
22-19	RESERVED	R	0h	Reserved
18-16	NUTMRS	R	7h	Number of UTP Task Management Request Slots Zero-based value indicating the number of slots provided by the UTP Task Management Request List. A minimum of 1 and maximum of 8 slots may be supported.
15-8	NORTT	R	3h	Number of Pending RTTs supported Zero-based value indicating the maximum number of RTTs that can be pending on the host at a particular instance. RTTs will be processed in the same order as they were received (First-come-first-serve).
7-5	RESERVED	R	0h	Reserved
4-0	NUTRS	R	1Fh	Number of UTP Transfer Request Slots Zero-based value indicating the number of slots provided by the UTP Transfer Request List. A minimum of 1 and maximum of 32 slots may be supported.

19.3.2 UFS_VER Register (Offset = 8h) [reset = 210h]

UFS_VER is shown in [Figure 19-26](#) and described in [Table 19-82](#).

Return to [Summary Table](#).

UFS Version Register

This register indicates the major and minor version of the UFSHCI specification that the controller implementation supports. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number.

Table 19-81. UFS_VER Instances

Instance	Physical Address
UFS	04E8 4008h

Figure 19-26. UFS_VER Register

Table 19-84. UFS_HCPID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PID	R	0h	Product ID Product ID that host controller manufacturer assigns for the host controller. This is vendor specific.

19.3.4 UFS_HCMID Register (Offset = 14h) [reset = 0h]

UFS_HCMID is shown in [Figure 19-28](#) and described in [Table 19-86](#).

Return to [Summary Table](#).

Host Controller Identification Descriptor Register (Product ID and Manufacturer ID)

This register provides Manufacturer identification information for host controller manufacturer. The Manufacturer ID is defined by JEDEC in Standard Manufacturer's identification code (JEDEC-JEP106). The Manufacturer ID consists of two parts: Manufacturer Identification Code and Bank Index.

Table 19-85. UFS_HCMID Instances

Instance	Physical Address
UFS	04E8 4014h

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-8	BI	R	0h	Bank Index This field contains an index value of the bank that contains the Manufacturer Identification Code (MIC). The BI value shall be equal to the number of the continuation fields that precede the MIC as specified by (JEDEC-JEP106).
7-0	MIC	R	0h	Manufacturer Identification Code Manufacturer Identification code as defined by JEDEC in Standard Manufacturers identification code (JEDEC-JEP106).

19.3.5 UFS_AHIT Register (Offset = 18h) [reset = 0h]

UFS_AHIT is shown in [Figure 19-29](#) and described in [Table 19-88](#).

Return to [Summary Table](#).

Auto-Hibernate Idle Timer Register

The UFS utilizes UniPro and SCSI standards as its power management framework. To improve power efficiency, the UFS host controller may support a mechanism called auto-hibernation. Auto-hibernation allows the host controller to put the UFS link into HIBERN8 state autonomously. The UFS_CAP[23] AUTOH8 bit provides a method for software to detect support of this feature. The UFS_AHIT[9-0] AH8ITV bit filed together with the UFS_AHIT[12-10] TS bit filed provides a method for software to directly control of this feature.

Note: Additionally to the above conditions, the auto-hibernation counter checks the status of the UniPro protocol layer. The host controller will only enter hibernate state when there is no pending UniPro communication.

Table 19-87. UFS_AHIT Instances

Instance	Physical Address
UFS	04E8 4018h

19.3.7 UFS_IE Register (Offset = 24h) [reset = 0h]

UFS_IE is shown in [Figure 19-31](#) and described in [Table 19-92](#).

Return to [Summary Table](#).

Interrupt Enable Register

This register enables and disables the reporting of the corresponding interrupt to host software. When a bit is set (1h) and the corresponding interrupt condition is active, then an interrupt is generated. Interrupt sources that are disabled (0h) are still indicated in the UFS_IS register. The register bit assignment matches with the UFS_IS register.

19.3.8 UFS_HCS Register (Offset = 30h) [reset = 0h]

UFS_HCS is shown in [Figure 19-32](#) and described in [Table 19-94](#).

Return to [Summary Table](#).

Host Controller Status Register

The software shall check that the UFS_HCS[2] UTMRLRDY bit is set to 1h before issuing a Task Management command.

The software shall check that the UFS_HCS[1] UTRLRDY bit is set to 1h before issuing an UTP command.

The prerequisite to send any DME command is that the UFS_HCS[0] HCE and UFS_HCS[3] UCRDY bits are set to 1h. The hardware does not check nor restrict the usage of any UIC command.

Sending the DME_ENABLE UIC command is not permitted.

Additional UIC command specific prerequisites:

DME cmd = DME_SET, DP = Don't care, UIC state = Don't care

DME cmd = DME_GET, DP = Don't care, UIC state = Don't care

DME cmd = DME_PEER_SET, DP = 1, UIC state = LinkUp

DME cmd = DME_PEER_GET, DP = 1, UIC state = LinkUp

DME cmd = DME_RESET, DP = Don't care, UIC state = Don't care

DME cmd = DME_ENPOINTRESET, DP = 1, UIC state = LinkUp

DME cmd = DME_LINKSTARTUP, DP = 0, UIC state = LinkDown

DME cmd = DME_HIBERNATE_ENTER, DP = Don't care, UIC state = LinkUp, LinkDown

DME cmd = DME_HIBERNATE_EXIT, DP = 0, UIC state = Hibernate

19.3.29 UFS_UICCMDARG2 Register (Offset = 98h) [reset = 0h]

UFS_UICCMDARG2 is shown in [Figure 19-53](#) and described in [Table 19-136](#).

Return to [Summary Table](#).

UIC Command Argument 2 Register

AttrSetType: Indicates whether the attribute value (AttrSet = NORMAL) or the attribute non-volatile reset value (STATIC) setting is requested. See MIPI UniPro Specification (UNIPRO) for the details of the AttrSetType parameter.

ConfigResultCode: Indicates the result of the UIC configuration command request. It is valid after host controller has set the UFS_IS[10] UCCS bit to 1h. See MIPI UniPro Specification (UNIPRO) for the details of the ConfigResultCode parameter.

0h = SUCCESS

1h = INVALID_MIB_ATTRIBUTE

2h = INVALID_MIB_ATTRIBUTE_VALUE

3h = READ_ONLY_MIB_ATTRIBUTE

4h = WRITE_ONLY_MIB_ATTRIBUTE

5h = BAD_INDEX

6h = LOCKED_MIB_ATTRIBUTE

7h = BAD_TEST_FEATURE_INDEX

8h = PEER_COMMUNICATION_FAILURE

9h = BUSY

Ah = DME_FAILURE

Bh-FFh = Reserved

GenericErrorCode: Indicates the result of the UIC control command request. It is valid after host controller has set the UFS_IS[10] UCCS bit to 1h. See MIPI UniPro Specification (UNIPRO) for the details of the GenericErrorCode parameter.

0h = SUCCESS

1h = FAILURE

2h-FFh = Reserved

19.3.31 UFS_SYSTHRTL Register (Offset = A0h) [reset = 00181200h]

UFS_SYSTHRTL is shown in [Figure 19-55](#) and described in [Table 19-140](#).

Return to [Summary Table](#).

SYS Throttling Register

In case of heavy data traffic, the UFS host controller might not leave sufficient bandwidth of the OCP/AXI fabric for other peripheral. This register allows throttling the UFS host controller either by limiting the number of outstanding read requests on the OCP/AXI bus or by specifying a minimum delay between two consecutive OCP/AXI accesses.

Limiting the number of outstanding requests may also be required in case the bus fabric can only handle a limited amount of requests.

1	DSE	R/W	0h	<p>Deep Sleep Enable</p> <p>This bit enables the extended (MK2,MK2) pattern generation.</p> <p>This extension is a MIPI UniPro features which allows saving power in the MPHY by turning off part of the MPHYs RX/TX logic - assuming that host and device are supporting deep-sleep.</p> <p>This happens transparent from the rest of the UFS system - unlike hibernate enter/exit which requires either host controller or software interaction.</p> <p>Internally, this bit is connected to the LA_TxLastMessage port of the UniPro IP, thus it allows for a static setting of the port.</p> <p>0h = LA_LastMessage is de-asserted.</p> <p>No last message is generated based on the setting in the UFS_XCNF register fields.</p> <p>Sending a (MK2,MK2) pattern is still possible by using the MMTR register.</p> <p>1h = LA_LastMessage is asserted.</p> <p>The (MK2,MK2) pattern is sent in the mode defined in the UFS_XCNF[15-14] DSGM bit field.</p> <p>Setting this bit to 1h and the UFS_XCNF[15-14] DSGM to 1h will always send a (MK2,MK2) pattern after the data transmission is complete.</p> <p>Depending on the traffic pattern, this may introduce additional guard time delay on the link.</p>
0	XRSE	R/W	0h	<p>Extended Register Space Enable</p> <p>This bit enables the extended register space.</p> <p>This register space is located directly on top of the JEDEC defined UFSHCI register addresses.</p> <p>0h = Extended Register Space not enabled.</p> <p>1h = Extended Register Space enabled.</p> <p>Before enabling the pseudo error register space, the UFS_XASB[5-0] XDP bit field has to be configured with the correct base address.</p>

19.3.35 UFS_ADSIT Register (Offset = CCh) [reset = 0h]

UFS_ADSIT is shown in [Figure 19-59](#) and described in [Table 19-148](#).

Return to [Summary Table](#).

Auto-Deep-Sleep Idle Timer Register

UFS utilizes UniPro and SCSI standards as its power management framework. To improve power efficiency, the UFS host controller may support a mechanism called deep-sleep.

Deep-Sleep allows the host controller to put the UFS link into deep-sleep state autonomously. Unlike hibernation, deep-sleep can be entered without input or information from the (UFS) application layer.

Thus, deep-sleep is transparent to the UFS software stack.

In case, both, Auto-Hibernate and Auto-DeepSleep are both enabled, the Auto Hibernate Time shall be set greater than the Auto DeepSleep Time:

UFS_AHIT[12-10] TS bit filed × UFS_AHIT[9-0] AH8ITV bit filed greater than UFS_ADSIT[12-10] TS bit filed × UFS_ADSIT[9-0] ADSTV bit filed

19.3.36 UFS_CDACFG Register (Offset = D0h) [reset = 0h]

UFS_CDACFG is shown in [Figure 19-60](#) and described in [Table 19-150](#).

Return to [Summary Table](#).

C-Port Direct Access Configuration Register

This register configures and manages the basic functionality of this feature.

To use this function in a 128-bit system, the IP module provides shadow register for the upper 64 bit data.

A write in the following order is required: UFS_CDATX1, CDATX1S, UFS_CDATX2, CDATX2S.

For receive data, a read in the following order is required: UFS_CDARX1, CDARX1S, UFS_CDARX2, CDARX2S.

19.3.37 UFS_CDATX1 Register (Offset = D4h) [reset = 0h]

UFS_CDATX1 is shown in [Figure 19-61](#) and described in [Table 19-152](#).

Return to [Summary Table](#).

C-Port Direct Access Transmit 1 Register

This register takes the lower 32 bit of the 64-bit data word to be transferred.

In a 128-bit implementation, an additional shadow register is available under the same address.

Thus two writes are required to set the lower 64 bit of a received 128-bit word.

Note: Since the UIC layer follows big endian byte order, also the UFS_CDATX1 and UFS_CDATX2 registers follow big endian byte order.

19.3.38 UFS_CDATX2 Register (Offset = D8h) [reset = 0h]

UFS_CDATX2 is shown in [Figure 19-62](#) and described in [Table 19-154](#).

Return to [Summary Table](#).

C-Port Direct Access Transmit 2 Register

This register takes the lower 32 bit of the 64-bit data word to be transferred.

Writing to this address will push the data to the UniPro adapter.

In a 128bit implementation, an additional shadow register is available under the same address.

Thus two writes are required to set the lower 64 bit of a received 128-bit word.

Note: Since the UIC layer follows big endian byte order, also the UFS_CDATX1 and UFS_CDATX2 registers follow big endian byte order.

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19-16	BEP	R/W	0h	<p>Byte Enable Pattern</p> <p>This field defines the number of valid byte enables.</p> <p>The byte enables are filled up from MSB to LSB.</p> <p>This is a test mode only.</p> <p>For normal operation this field should be kept at the default value.</p> <p>1 - Byte 7 enabled</p> <p>2 - Byte 7-6 enabled</p> <p>3 - Byte 7-5 enabled</p> <p>4 - Byte 7-4 enabled</p> <p>5 - Byte 7-3 enabled</p> <p>6 - Byte 7-2 enabled</p> <p>7 - Byte 7-1 enabled</p> <p>Others - Byte 7-0 enabled</p> <p>The field width is 4 bit in case the IP module is configured for 64-bit system data bus width and 5-bit for a 128-bit configuration.</p>

Table 19-164. UFS_LBMCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	BEPS	R/W	0h	<p>Byte Enable Pattern Selection</p> <p>This bit selects between a random byte enable pattern and a fixed byte enable pattern in 'read only' mode (LUN 0). In write only and 'loopback mode' this bit is ignored. The fixed byte enable pattern is taken from the UFS_LBMCFG[19-16] BEP bit field. This is a test mode only. For normal operation this field should be kept at the default value.</p> <p>0h = Fixed byte enable pattern taken from BEP field 1h = Random byte enable pattern</p>
14-11	TRTLDV	R/W	1h	<p>Throttle Divide</p> <p>Since the bandwidth on the system bus may be much higher than actually supported by the UniPro link, this value allows to throttle the bandwidth in order to better mimic a real UFS Device. However, by this, some inaccuracy to the performance measurement will be introduced since the time to fill or empty the system bus buffer changes, which in turn has influence on the rate in which system bus requests to the bus fabric can be issued.</p> <p>Value 0h = Reserved Value 1h-15h = Divide the frequency in which data is requested from the system bus RX buffer and/or stored into the system bus TX buffer.</p>
10	MRTTE	R/W	0h	<p>Multi RTT Enable</p> <p>This bit enables the multiple RTT feature. Here multiple RTT may be submitted by the loopback logic. This feature tests the performance of back to back DATAOUT UPIUs. It provides feedback about the capabilities of the host controller RTT management capabilities. If DATAOUT UPIUs exceed a certain size (size depends on the access latency to the system memory), a second outstanding RTT may help reducing the latency between two consecutive DATAOUT UPIUs. This feature requires that a second RTT is send to the host controller ahead of time. This enables the data management to fetch the data for the second RTT, while the data for the first RTT is still being sent over the UniPro link. It should be noted, that data transfer is in-order, and thus sending of data which belongs to the second RTT will not start before the first RTT is completely handled. The maximum number of outstanding RTT is two. Once the DATAOUT UPIUs for both RTTs have been transmitted, the next RTTs (2 or less) will be issued until all data that have been requested by the SCSI command were transferred.</p> <p>0h = Only one RTT 1h = Up to two outstanding RTTs</p>

Table 19-164. UFS_LBMCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	LBME	R/W	0h	<p>Loopback Enable bit</p> <p>Setting this bit decouples the UniPro layer from the host controller logic and switches the input data stream to take packets from the loopback logic.</p> <p>If UFS_LBMCFG[9] LBME = 0h , the UPIU loopback circuit is in reset.</p> <p>If UFS_LBMCFG[9] LBME = 1h , it is assured that no interaction with an attached UFS Device takes place.</p>
8-5	PDSIZE	R/W	0h	<p>Data Size</p> <p>This value is a 4-bit field and defines the amount of the data that will be requested by the RTT.</p> <p>This mimics the ability of the UFS Device to limit the size of a DATAOUT UPIU.</p> <p>In loopback mode, the UFS_LBMCFG[8-5] PDSIZE bit field defines the size of DATAOUT and DATAIN UPIUs.</p> <p>The field should be interpreted as the exponent of the function $\text{pow}[2, \text{UFS_LBMCFG}[8-5] \text{ PDSIZE} + 1]$.</p> <p>UFS_LBMCFG[8-5] PDSIZE bit values from 3h to Eh are supported. This allows sizes from 16 to 32768 bytes.</p>
4	USDLY	R/W	0h	<p>UPIU Source Delay</p> <p>This one-bit field defines whether there is a delay before every RTTs or DATAIN packet or just before the first one.</p>
3-0	UDLY	R/W	0h	<p>UPIU Delay</p> <p>This value is a 4-bit field and defines the delay (in clock cycles) from receiving the command till the response is send back to the host controller.</p> <p>The response could either be an RTT UPIU or a DATAIN UPIU. This allows the host controller to fetch the required PRD entries an immediately continue with processing the RTT or DATAIN UPIU.</p> <p>The field should be interpreted as the exponent of the function $\text{pow}(2, \text{UFS_LBMCFG}[3-0] \text{ UDLY} + 4)$.</p> <p>This allows delays from 16 to 524288 clock cycles which is approx. from 80 ns to 2.6 ms with a 200 MHz clock.</p> <p>Those large numbers mimic the real behaviour of current devices. A value of zero disables this feature, means no delay.</p> <p>Whether or not this delay is used for every return packet or just for the first one is controlled by the USDLY field.</p>

19.3.44 UFS_LBMSTA Register (Offset = F4h) [reset = 0h]

The UPIU with no valid TAG/LUN combination will be silently discarded. 2h = No valid TAG/LUN/IID combination found. The UPIU with no valid TAG/LUN/IID combination will be silently discarded.
15-0	HCSTATE	R	0h	Host Controller State These bits indicate the internal state of the host controller. The value is used for internal use only. 0h = No error occurred value: An error occurred. The meaning of the value is not disclosed.

19.3.46 UFS_HCLKDIV Register (Offset = FCh) [reset = 190h]

UFS_HCLKDIV is shown in [Figure 19-70](#) and described in [Table 19-170](#).

Return to [Summary Table](#).

Host Clock Divider Register

Note: This register configures the Tick1us clock required by UniPro.

This clock is actually a 500 KHz signal, thus there is one clock edge every 1 μ s (rising and falling).

This signal is used for UniPro internal counters. The signal is not used as a clock directly. Rather the UniPro logic is doing an edge detection and the signal sampled inside the core.

As an alternative the UFSHCI also provides an external input ad a select to provide the signal. From a system's point of view, this signal may be created by the M-PHY logic.

Table 19-172. UFS_CCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	CFGPTR	R	5h	Configuration Array Pointer An offset pointer to the base of the Configuration Array [X-CRYPTOCFG registers], in 256B units. UFS_CCAP[31-24] CFGPTR bit filed value shall be larger than 4h, so it does not conflict with a maximum size X-UFS_CRYPTOCAP array. The address for entry x of the X-CRYPTOCFG array is calculated as follows: ADDR [X-CRYPTOCFG] = CFGPTR×100h + x×80h, with x in [0..UFS_CCAP[15-8] CFGC] and x derived from UTRD.CCI field.
23-16	RESERVED	R	0h	Reserved
15-8	CFGC	R	1h	Configuration Count The maximum number of configurations supported by the host controller. The actual number of configurations is equal to [CFGC + 1]. The minimum number of configurations supported is 1 [CFGC = 0h]. The maximum number of configurations supported is 256 [CFGC = FFh].
7-0	CC	R	1h	Crypto Capabilities The number of crypto capabilities that the host controller provides. The values allowed are between 1 and 255 (the limit on the number of crypto capabilities).

19.3.48 UFS_CRYPTOCAP Register (Offset = 104h) [reset = 00010802h]

UFS_CRYPTOCAP is shown in [Figure 19-72](#) and described in [Table 19-174](#).

Return to [Summary Table](#).

19.3.61 UFS_ASF_INT_STATUS Register (Offset = 1000h) [reset = 0h]

UFS_ASF_INT_STATUS is shown in [Figure 19-85](#) and described in [Table 19-200](#).

Return to [Summary Table](#).

ASF Interrupt Status Register

This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the `asf_int_fatal` or `asf_int_nonfatal` signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register.

19.3.74 UFS_ASF_INTEGRITY_ERR_INJ Register (Offset = 1058h) [reset = 0h]

UFS_ASF_INTEGRITY_ERR_INJ is shown in [Figure 19-98](#) and described in [Table 19-226](#).

Return to [Summary Table](#).

ASF Integrity Test Register

Write one to the enable register inject error to individual n-bit (trigger asf integrity fail to the IP Fault Logging and Reporting module). Please note that only injection error with number to N will generate a fail (i.e. the higher values do not generate fail) where N is the higher value specified in the asf_integrity_err_inj_num field.

2	SF_PLL_WATCHDOG_E N_MMIO	R/W	0h	This bit is read-write. Safety related, Enable PLL Watch Dog.
1	SF_CDR0_WATCHDOG_ EN_MMIO	R/W	0h	This bit is read-write Safety related, Enable CDR Watch Dog.
0	SF_CDR1_WATCHDOG_ EN_MMIO	R/W	0h	This bit is read-write Safety related, Enable CDR Watch Dog.

19.4 UFS0_SYSCFG_SS_CFG Registers

[Table 19-302](#) lists the memory-mapped registers for the UFS0_SYSCFG_SS_CFG registers. All register offset addresses not listed in [Table 19-302](#) should be considered as reserved locations and the register contents should not be modified.

Table 19-301. UFS0_SYSCFG_SS_CFG Instances

Instance	Base Address
UFS0_SYSCFG_SS_CFG	04E8 0000h

Table 19-302. UFS0_SYSCFG_SS_CFG Registers

Offset	Acronym	Register Name	UFS0_SYSCFG_SS_CFG Physical Address
0h	UFS_SS_PID	Revision Register	04E8 0000h

Table 19-302. UFS0_SYSCFG_SS_CFG Registers (continued)

Offset	Acronym	Register Name	UFS0_SYSCFG_SS_CFG Physical Address
4h	UFS_SS_CTRL	Control Register	04E8 0004h

19.4.1 UFS_SS_PID Register (Offset = 0h) [reset = 68556100h]

UFS_SS_PID is shown in [Figure 19-136](#) and described in [Table 19-304](#).

Return to [Summary Table](#).

The Revision Register contains the major and minor revisions for the module.

Table 19-303. UFS_SS_PID Instances

Instance	Physical Address
UFS0	04E8 0000h

Figure 19-136. UFS_SS_PID Register

RTL					MAJOR			CUSTOM		MINOR					
R-Ch					R-1h			R-0h		R-0h					

LEGEND: R = Read Only; -n = value after reset

Table 19-304. UFS_SS_PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	Register Scheme
29-28	BU	R	2h	Business Unit: 2h = Processors
27-16	MODULE_ID	R	855h	Module ID
15-11	RTL	R	Ch	RTL Revision
10-8	MAJOR	R	1h	Major Revision
7-6	CUSTOM	R	0h	Custom
5-0	MINOR	R	0h	Minor Revision

19.4.2 UFS_SS_CTRL Register (Offset = 4h) [reset = 0h]

UFS_SS_CTRL is shown in [Figure 19-137](#) and described in [Table 19-306](#).

Return to [Summary Table](#).

The Control Register contains general control bits for the module.

Table 19-305. UFS_SS_CTRL Instances

Instance	Physical Address
UFS0	04E8 0004h
