J721E DRA829/TDA4VM/AM68P Processors Silicon Revision 1.1 Texas Instruments Families of Products

1 ADC Registers

1.1 ADC Configuration Registers

Table 1-2 lists the memory-mapped registers for the ADC. All register offset addresses not listed in Table 1-2 should be considered as reserved locations and the register contents should not be modified.

Table 1-1. ADC Instances

Instance	Base Address
MCU_ADC0	4020 0000h
MCU_ADC1	4021 0000h

Table 1-2. ADC Registers

Offset	Acronym	Register Name	MCU_ADC0 Physical Address	MCU_ADC1 Physical Address
0h	ADC_REVISION	Revision Identifier Register	4020 0000h	4021 0000h
20h	ADC_EOI	End of Interrupt Register	4020 0020h	4021 0020h
24h	ADC_STATUS_RAW	Raw Interrupt Status Register	4020 0024h	4021 0024h
28h	ADC_STATUS	Interrupt Status Register	4020 0028h	4021 0028h
2Ch	ADC_ENABLE_SET	Interrupt Enable Register	4020 002Ch	4021 002Ch
30h	ADC_ENABLE_CLR	Interrupt Disable Register	4020 0030h	4021 0030h
38h	ADC_DMAENABLE_SET	DMA Request Enable Register	4020 0038h	4021 0038h
3Ch	ADC_DMAENABLE_CLR	DMA Request Disable Register	4020 003Ch	4021 003Ch
40h	ADC_CONTROL	Control Register	4020 0040h	4021 0040h
44h	ADC_SEQUENCER_STAT	Sequencer Status Register	4020 0044h	4021 0044h
48h	ADC_RANGE	Range Check Register	4020 0048h	4021 0048h
50h	ADC_MISC	AFE Input/Output Control Register	4020 0050h	4021 0050h
54h	ADC_STEPENABLE	Sequencer Step Enable Register	4020 0054h	4021 0054h
64h + formula	ADC_STEPCONFIG_j	Step Configuration Register	4020 0000h	4021 0000h
68h + formula	ADC_STEPDELAY_j	Step Delay Register	4020 0000h	4021 0000h
E4h	ADC_FIFO0WC	FIFO0 Word Count Register	4020 00E4h	4021 00E4h
E8h	ADC_FIFO0THRESHOLD	FIFO0 Threshold Level Register	4020 00E8h	4021 00E8h
ECh	ADC_FIFO0DMAREQ	FIFO0 DMA Request Level Register	4020 00ECh	4021 00ECh
F0h	ADC_FIFO1WC	FIFO1 Word Count Register	4020 00F0h	4021 00F0h
F4h	ADC_FIFO1THRESHOLD	FIFO1 Threshold Level Register	4020 00F4h	4021 00F4h
F8h	ADC_FIFO1DMAREQ	FIFO1 DMA Request Level Register	4020 00F8h	4021 00F8h
100h	ADC_FIFO0DATA	FIFO0 Read Data Register	4020 0100h	4021 0100h
200h	ADC_FIFO1DATA	FIFO1 Read Data Register	4020 0200h	4021 0200h

1.2 ADC_REVISION Register (Offset = 0h) [reset = Xh]

ADC_REVISION is shown in [Figure 1-1](#) and described in [Table 1-4](#).

Return to [Summary Table](#).

IP Revision Identifier (X.Y.R) Used by software to track features, bugs, and compatibility.

Reset = 00452900h

Table 1-3. ADC_REVISION Instances

Instance	Physical Address
MCU_ADC0	4020 0000h
MCU_ADC1	4021 0000h

R-5h					R-1h			R-0h		R-0h					

LEGEND: R = Read Only; -n = value after reset

Table 1-4. ADC_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	MODID	R	45h	Module ID field
15-11	REVRTL	R	5h	RTL ADC_REVISION. Will vary depending on release.
10-8	REVMAJ	R	1h	Major ADC_REVISION
7-6	CUSTOM	R	0h	Custom
5-0	REVMIN	R	0h	Minor ADC_REVISION

1.3 ADC_EOI Register (Offset = 20h) [reset = 0h]

ADC_EOI is shown in [Figure 1-2](#) and described in [Table 1-6](#).

Return to [Summary Table](#).

The End of Interrupt (ADC_EOI) ADC_MISC Register allows the CPU to acknowledge completion of an interrupt by writing to the ADC_EOI for ADC_MISC interrupt sources. An eoi_write signal will be generated and another interrupt will be triggered if interrupt sources remain. This register will be reset one cycle after it has been written to.

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 1-5. ADC_EOI Instances

Instance	Physical Address
MCU_ADC0	4020 0020h
MCU_ADC1	4021 0020h

0	LINENUMEIOI	W	0h	Software End Of Interrupt (EOI) control. 0h = EOI for interrupt line number 0. Read returns 0.

1.4 ADC_STATUS_RAW Register (Offset = 24h) [reset = 0h]

ADC_STATUS_RAW is shown in [Figure 1-3](#) and described in [Table 1-8](#).

Return to [Summary Table](#).

The ADC_STATUS_RAW register allows the MCU_ADC0/1 interrupt sources to be manually set when writing a 1 to a specific bit. Write 0: No action Write 1: Set event Read 0: No event pending Read 1: Event pending

Table 1-7. ADC_STATUS_RAW Instances

1.5 ADC_STATUS Register (Offset = 28h) [reset = 0h]

ADC_STATUS is shown in [Figure 1-4](#) and described in [Table 1-10](#).

Return to [Summary Table](#).

The ADC_STATUS register allows the MCU_ADC0/1 interrupt sources to be manually cleared when writing a 1 to a specific bit. Write 0: No action Write 1: Clear event Read 0: No event pending Read 1: Event pending

Table 1-9. ADC_STATUS Instances

0	MODULE_ENABLE	R/W	0h	<p>ADC module enable bit.</p> <p>After programming all the configuration and step enable registers, write a 1 to this bit to start conversion.</p> <p>Writing a 0 will disable the module after the current conversion.</p> <p>Before turning on again, the ADC_SEQUENCER_STAT register show read back STEP_IDLE = 10h and FSM_BUSY = 0h.</p> <p>Enabling the controller will be held off until MEM_INIT_DONE = 1h.</p>

1.11 ADC_SEQUENCER_STAT Register (Offset = 44h) [reset = 20h]

ADC_SEQUENCER_STAT is shown in [Figure 1-10](#) and described in [Table 1-22](#).

Return to [Summary Table](#).

SW can read this register to find out the currently scheduled step id being converted on the ADC port. If you want to turn the controller off and then back on, the step_id bit should be checked and compared to IDLE before enabling the ADC module again. Also, before enabling the controller again, the user should wait for the FSM bit 5 to read idl.

Table 1-21. ADC_SEQUENCER_STAT Instances

Instance	Physical Address
MCU_ADC0	4020 0044h
MCU_ADC1	4021 0044h

6	MEM_INIT_DONE	R	0h	ADC_STATUS of RAM initialization for ECC. 1h = RAM initialization to 0 after reset is done.
5	FSM_BUSY	R	1h	ADC_STATUS of FSM. 0h = Idle 1h = Conversion in progress
4-0	STEP_IDLE	R	0h	10h = Idle 0h - Fh = Corresponds to Step 1 - Step 16

1.12 ADC_RANGE Register (Offset = 48h) [reset = 0h]

ADC_RANGE is shown in [Figure 1-11](#) and described in [Table 1-24](#).

Return to [Summary Table](#).

This feature requires the ADC_RANGE check interrupt bit to be enabled first. The user can decide which input (channel) is compared by programming the RangeCheck bit of the ADC_STEPCONFIG_j Registers. It is up to software to sort through FIFO data to determine which input (channel) data was out of ADC_RANGE.

Table 1-23. ADC_RANGE Instances

Instance	Physical Address
MCU_ADC0	4020 0048h
MCU_ADC1	4021 0048h

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19-16	ADCCHANLID	R	0h	Optional ID tag of input (channel) that captured the data. If tag option is disabled, these bits will be 0.
15-12	RESERVED	R	X	Reserved
11-0	ADCDATA	R	0h	Sampled ADC converted data value stored in FIFO1.

1.28 ADC ECC Registers

Table 1-56 lists the memory-mapped registers for the ADC ECC. All register offset addresses not listed in Table 1-56 should be considered as reserved locations and the register contents should not be modified.

Table 1-55. ADC ECC Instances

Instance	Base Address
MCU_ADC0_ECC	4070 7000h
MCU_ADC1_ECC	4070 8000h

Table 1-56. ADC ECC Registers

Offset	Acronym	Register Name	MCU_ADC0_ECC Physical Address	MCU_ADC1_ECC Physical Address
0h	ADC_AGGR_REVISION	Aggregator Revision Register	4070 7000h	4070 8000h
8h	ADC_ECC_VECTOR	ECC Vector Register	4070 7008h	4070 8008h
Ch	ADC_MISC_STATUS	Misc Status Register	4070 700Ch	4070 800Ch
10h	ADC_ECC_WRAP_REV	ECC Wrapper Revision Register	4070 7010h	4070 8010h
14h	ADC_ECC_CTRL	ECC Control Register	4070 7014h	4070 8014h
18h	ADC_ECC_ERR_CTRL1	ECC Error Control1 Register	4070 7018h	4070 8018h
1Ch	ADC_ECC_ERR_CTRL2	ECC Error Control2 Register	4070 701Ch	4070 801Ch
20h	ADC_ECC_ERR_STAT1	ECC Error Status1 Register	4070 7020h	4070 8020h
24h	ADC_ECC_ERR_STAT2	ECC Error Status2 Register	4070 7024h	4070 8024h
3Ch	ADC_ECC_SEC_EOI_REG	SEC End of Interrupt Register	4070 703Ch	4070 803Ch
40h	ADC_ECC_SEC_STATUS_REG0	Interrupt Status Register	4070 7040h	4070 8040h
80h	ADC_ECC_SEC_ENABLE_SET_REG0	Interrupt Enable Set Register	4070 7080h	4070 8080h
C0h	ADC_ECC_SEC_ENABLE_CLR_REG0	Interrupt Enable Clear Register	4070 70C0h	4070 80C0h
13Ch	ADC_ECC_DED_EOI_REG	DED End of Interrupt Register	4070 713Ch	4070 813Ch
140h	ADC_ECC_DED_STATUS_REG0	Interrupt Status Register	4070 7140h	4070 8140h
180h	ADC_ECC_DED_ENABLE_SET_REG0	Interrupt Enable Set Register	4070 7180h	4070 8180h
1C0h	ADC_ECC_DED_ENABLE_CLR_REG0	Interrupt Enable Clear Register	4070 71C0h	4070 81C0h

1.29 ADC_AGGR_REVISION Register (Offset = 0h) [reset = Xh]

ADC_AGGR_REVISION is shown in [Figure 1-26](#) and described in [Table 1-58](#).

Return to [Summary Table](#).

Revision parameters

Reset = 60060B00h

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	Reserved
1	RAM1_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ram1_pend
0	RAM0_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ram0_pend

1.45 ADC_ECC_DED_ENABLE_CLR_REG0 Register (Offset = 1C0h) [reset = X]

ADC_ECC_DED_ENABLE_CLR_REG0 is shown in [Figure 1-42](#) and described in [Table 1-90](#).

Return to [Summary Table](#).

Interrupt Enable Clear Register 0

Table 1-90. ADC_ECC_DED_ENABLE_CLR_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	Reserved
1	RAM1_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ram1_pend
0	RAM0_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ram0_pend

2 GPIO Registers

Table 2-2 lists the memory-mapped registers for the GPIO registers. All register offset addresses not listed in Table 2-2 should be considered as reserved locations and the register contents should not be modified.

Table 2-1. GPIO Instances

Instance	Base Address
GPIO0	0060 0000h
GPIO1	0060 1000h
GPIO2	0061 0000h
GPIO3	0061 1000h
GPIO4	0062 0000h
GPIO5	0062 1000h
GPIO6	0063 0000h
GPIO7	0068 0000h
WKUP_GPIO1	4210 0000h
WKUP_GPIO0	4211 0000h

Table 2-2. GPIO Registers

Offset	Acronym	Register Name	GPIO0 Physical Address	GPIO2 Physical Address
0h	GPIO_PID		0060 0000h	0061 0000h

3.4 I2C_EOI Register (Offset = 20h) [reset = X]

I2C_EOI is shown in [Figure 3-4](#) and described in [Table 3-13](#).

Return to [Summary Table](#).

End Of Interrupt number specification

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 3-12. I2C_EOI Instances

9	AAS	R/W	0h	Address recognized as slave IRQ enabled status
8	BF	R/W	0h	Bus Free IRQ enabled status
7	AERR	R/W	0h	Access Error IRQ enabled status
6	STC	R/W	0h	Start Condition IRQ enabled status

Table 3-17. I2C_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	GC	R/W	0h	General call IRQ enabled status Set to '1' by core when General call address detected and interrupt signaled to MPUSS Write '1' to clear
4	XRDY	R/W	0h	Transmit data ready IRQ enabled status Set to '1' by core when transmitter and when new data is requested When set to '1' by core, an interrupt is signaled to MPUSS Write '1' to clear
3	RRDY	R/W	0h	Receive data ready IRQ enabled status Set to '1' by core when receiver mode, a new data is able to be read When set to '1' by core, an interrupt is signaled to MPUSS Write '1' to clear
2	ARDY	R/W	0h	Register access ready IRQ enabled status When set to '1' it indicates that previous access has been performed and registers are ready to be accessed again An interrupt is signaled to MPUSS Write '1' to clear
1	NACK	R/W	0h	No acknowledgement IRQ enabled status Bit is set when No Acknowledge has been received, an interrupt is signaled to MPUSS Write '1' to clear this bit
0	AL	R/W	0h	Arbitration lost IRQ enabled status This bit is automatically set by the hardware when it loses the Arbitration in master transmit mode, an interrupt is signaled to MPUSS During reads, it always returns 0

3.7 I2C_IRQENABLE_SET Register (Offset = 2Ch) [reset = X]

I2C_IRQENABLE_SET is shown in [Figure 3-7](#) and described in [Table 3-19](#).

Return to [Summary Table](#).

Per-event interrupt enable bit vector.

Table 4-8. I3C_CONF_STATUS0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	CMDR_MEM_DEPTH	R	3h	CMD Resp MEM depth coded into 3 bits.
28-24	ASF	R	1Fh	Indicates supported ASF checks.
23-16	GPO_NUM	R	1h	Returns the value of User GPO [1-126].
15-8	GPI_NUM	R	1h	Returns the value of User GPI [1-126].
7-6	IBIR_MEM_DEPTH	R	1h	IBI Resp MEM depth coded into 2 bits.
5	DDR	R	1h	Indicates if DDR is supported.
4	DEV_ROLE	R	0h	Returns status of Device Role [Main/Secondary Master].
3-0	DEVS_NUM	R	Bh	Returns the number of retaining registers for I3C Slave devices [Addresses and Characteristics], the max value is 11.

4.4 I3C_CONF_STATUS1 Register (Offset = 8h) [reset = ACC61127h]

I3C_CONF_STATUS1 is shown in [Figure 4-3](#) and described in [Table 4-10](#).

Return to the [Summary Table](#).

The read-only Configuration Status Register 1 indicates the hardware configuration options chosen for implementation of the I3C-Master.

Table 4-9. I3C_CONF_STATUS1 Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIP1_I3C_MST	40B8 8008h

Table 4-14. I3C_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DEV_EN	R/W	0h	<p>When set HIGH the I3C-Master is enabled and it can initiate the I3C/I2C transactions.</p> <p>Also write access to the following fields of various registers is forbidden :</p> <p>I3C_CTRL.bus_mode I3C_CTRL.ahdr_opt I3C_CTRL.halt_en I3C_PRESCAL_CTRL0.i3c I3C_PRESCAL_CTRL0.i2c I3C_PRESCAL_CTRL1.od_low I3C_PRESCAL_CTRL1.pp_low</p> <p>When set LOW the I3C-Master is disabled and access to the key control fields that listed above is available.</p> <p>If this bit is being set to 0 during ongoing transfer then it will wait until the transfer completion and then the controller will be disabled.</p> <p>I3C Master IP is returned by I3C_MST_STATUS0.idle bit of Status Register and this field should be checked before accessing key control fields.</p>
30	HALT_EN	R/W	0h	Enable halt on abort behavior.
29	MCS	W	0h	<p>Manual Command Start writing 1 starts execution of the commands currently in CMD Memories.</p> <p>Self-cleared bit.</p> <p>Relevant only if MCS_EN bit [I3C_CTRL.mcs_en] set to 1, disregarded otherwise.</p>
28	MCS_EN	R/W	0h	<p>Manual Command Start Enable if set 1 the IP will wait with starting of command execution until MCS but [I3C_CTRL.mcs] would be set 1.</p> <p>If set to 0, the IP will start execute commands automatically as soon as at least one is present in the CMD MEM and the MCS [I3C_CTRL.mcs] bit is disregarded.</p>
27	RSVD2	R	0h	Reserved.
26	I3C_11_SUPP	R/W	0h	<p>Enables support for timing parameter that has been changed in v1.1, i.e.</p> <p>tCASr_min.</p> <p>If: 1'b</p> <p>0 - then tCASr_min = tCAS_min [as per MIPI spec v1.0], 1'b</p> <p>1 - then tCASr_min = tCAS_min/2 [as per draft version of MIPI spec v1.0]</p>
25-24	THD_DEL	R/W	0h	<p>Field that provides option to add data hold delay with respect to the SCL clock on which data on SDA is launched [applied only during actual Data transfer]</p> <p>00 - adds delay of 3x sys_clock cycles, 01 - adds delay of 2x sys_clk clock cycles, 10 - adds delay of 1x sys_clk clock cycles, 11 - no delay [data is launched simultaneously with SCL clock edge].</p>
23-9	RSVD1	R	0h	Reserved.

Table 4-14. I3C_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	HJ_DISEC	R/W	0h	This bit controls the HW response for ACK'ed HJ request. When set HIGH, then the DISEC CCC is used. Otherwise, if set LOW the ENTDAACCC is used. This control bit is meaningful if hj_ack=1 and controller operates in Main Master configuration.
7	MST_ACK	R/W	1h	Specifies ACK response type for GETACCMST CCC, it can be either ACK response type [mst_ack = 1] or NACK response type [mst_ack = 0]. This control bit is meaningful in Slave Mode only.
6	HJ_ACK	R/W	1h	Specifies ACK response type for HJ request, it can be either ACK response type [hj_ack = 1] or NACK response type [hj_ack = 0]. For Secondary Master configuration, this bit tied off to 0.
5	HJ_INIT	W	0h	Initiate HJ request - applicable only for Secondary master in slave mode. Self-cleared bit.
4	MST_INIT	W	0h	Initiate Mastership request - applicable only in slave mode. When set in master mode this bit has no effect. Self-cleared bit.
3	AHDR_OPT	R/W	0h	Enable[1]/Disable[0] the Address Header optimization. If enabled, FW needs to restrict DAs to 0x03 - 0x3F range.
2	RSVD0	R	0h	Reserved
1-0	BUS_MODE	R/W	0h	Bus Mode 00 : Pure Bus Mode 01 : Invalid Config 10 : Mixed Fast Bus Mode 11 : Mixed Slow/Limited Bus Mode

4.7 I3C_PRESCL_CTRL0 Register (Offset = 14h) [reset = 007C0004h]

I3C_PRESCL_CTRL0 is shown in [Figure 4-6](#) and described in [Table 4-16](#).

Return to the [Summary Table](#).

Prescale settings for SDR/I2C modes

Table 4-16. I3C_PRESCL_CTRL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	I2C	R/W	7Ch	Prescaler value for I2C SCL clock generation. It should be generated based on sys clock freq and should be 5x w.r.t. to the slowest I2C device's SCL speed: presc_ctl_i2c [15:0] = sys_clk_freq / [i2c_freq * 5] - 1'b1 if presc_ctl_i2c [15:0] == 0 - no sys_clk division
15-10	RSVD0	R	0h	Reserved
9-0	I3C	R/W	4h	Prescaler value for I3C Push-Pull SDR Mode SCL clock generation. When the bus is configured in mixed fast mode, the resulting SCL frequency must be faster than 11MHz. It should be generated based on sys clock freq and should be 4x w.r.t. to the SDR SCL speed: presc_ctl_i3c [9:0] = [sys_clk_freq / sdr_freq * 4] - 1'b1 If sys_clk == 4*sdr_freq, presc_ctl_i3c [9:0] should be 0

4.8 I3C_PRESCL_CTRL1 Register (Offset = 18h) [reset = X]

I3C_PRESCL_CTRL1 is shown in [Figure 4-7](#) and described in [Table 4-18](#).

[Return to the Summary Table.](#)

Prescale settings related to Open Drain / Push Pull I3C timings

LEGEND: R/W = Read/Write; -n = value after reset

Table 4-18. I3C_PRESCL_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15-8	PP_LOW	R/W	0h	Counter for low period of SCL clock for Push Pull in I3C. When particular I3C device does not support Max SCL speed, low period stretching is required for PP as well. Controller will determine that by inspecting BCR[0] bit. When BCR[0] is 0, SCL waveform will have constant asymmetric ratio in Push-Pull mode as it will be calculated by $1/4 \text{ SCL} * [\text{pp_low} + 2]$. The resolution used is 1/4 SDR SCL clock. FW need to ensure $1/4 \text{ SCL} * [\text{pp_low} + 2] \geq$ minimum low period duration for the particular device. When BCR[0] is 1, PP timings will have 50/50 DC.
7-0	OD_LOW	R/W	9h	Counter for low period of SCL clock for Open Drain in I3C. SCL waveform will have constant asymmetric ratio in OD as it will be calculated by $1/4 \text{ SCL} * [\text{od_low} + 2]$. The resolution used is 1/4 SDR SCL clock. FW need to ensure $1/4 \text{ SCL} * [\text{od_low} + 2] \geq 160\text{ns}$.

4.9 I3C_MST_IER Register (Offset = 20h) [reset = 0h]

I3C_MST_IER is shown in [Figure 4-8](#) and described in [Table 4-20](#).

Return to the [Summary Table](#).

The write only Interrupt Enable Register is used to enable interrupts by setting bits in the read only Interrupt Mask Register - Master Mode (I3C_MST_IMR).

See Interrupt Status Register - Master Mode (I3C_MST_ISR) description for details on specific interrupt conditions.

When any bit is written high, the corresponding interrupt is enabled. Writing a low to any bit has no effect.

4.11 I3C_MST_IMR Register (Offset = 28h) [reset = 0h]

I3C_MST_IMR is shown in [Figure 4-10](#) and described in [Table 4-24](#).

Return to the [Summary Table](#).

This read only register, indicates the current state of the interrupts mask.

See Interrupt Status Register - Master Mode (I3C_MST_ISR) description for details on specific interrupt conditions.

A high value indicates the interrupt is enabled to generate an interrupt.

A low value indicates the interrupt is disabled from generating an interrupt (masked).

LEGEND: R = Read Only; R/W1C = Read/Write 1 to Clear Bit; -n = value after reset

Table 4-30. I3C_MST_STATUS0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RSVD2	R	0h	Reserved
18	IDLE	R	1h	Indicates when the core is IDLE and ready to accept new commands. When I3C_CTRL.dev_en is deasserted, FW should poll this reg in order to ensure that core completed its last command. It is advisable to use this bit in order to ensure that currently the core is IDLE and I3C_CTRL register can be changed.
17	HALTED	R/W1C	0h	Core Halted. This status bit will be asserted on the second abort has occurred during Read operation [if I3C_CTRL.halt_en=1] or in case of Rx DATA FIFO is full [regardless of I3C_CTRL.halt_en state]. Writing 1 will unhalt the controllers core.
16	OP_MODE	R	1h	Indicates current mode of the controller: 0 - Slave mode 1 - Master mode. For Main Master configuration the reset value is 1 For Secondary Master configuration the reset value is 0 Set by HW.

Table 4-30. I3C_MST_STATUS0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-14	RSVD1	R	0h	Reserved.
13	TX_FULL	R	0h	TX Full.
12	IBID_FULL	R	0h	IBID Full.
11	IBIR_FULL	R	0h	I3C_IBIR Full.
10	RX_FULL	R	0h	RX Full.
9	CMDD_FULL	R	0h	CMDD Full.
8	CMDR_FULL	R	0h	I3C_CMDR Full.
7-6	RSVD0	R	0h	Reserved.
5	TX_EMP	R	1h	TX Empty.
4	IBID_EMP	R	1h	IBID Empty.
3	IBIR_EMP	R	1h	I3C_IBIR Empty.
2	RX_EMP	R	1h	RX Empty.
1	CMDD_EMP	R	1h	CMDD Empty.
0	CMDR_EMP	R	1h	I3C_CMDR Empty.

4.15 I3C_CMDR Register (Offset = 38h) [reset = 0h]

I3C_CMDR is shown in [Figure 4-14](#) and described in [Table 4-32](#).

Return to the [Summary Table](#).

Stores status on completion of each command, works on FIFO-basis.

Table 4-31. I3C_CMDR Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIP1_I3C_MST	40B8 8038h

Table 4-34. I3C_IBIR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RSVD0	R	0h	Reserved
12	RESP	R	0h	If HIGH IBI has been ACKed, NACK response otherwise
11-8	SLV_ID	R	0h	ID of a Slave that has issued an IBI request
7	ERROR	R	0h	Set to 1 if IBI Data FIFO overflow has occurred during the transaction.
6-2	XFER_BYTES	R	0h	Number of received DATA bytes.
1-0	IBI_TYPE	R	0h	This field contains the type of an IBI.

4.17 I3C_SLV_IER Register (Offset = 40h) [reset = X]

I3C_SLV_IER is shown in [Figure 4-16](#) and described in [Table 4-36](#).

Return to the [Summary Table](#).

The write only Interrupt Enable Register is used to enable interrupts by setting bits in the read only Interrupt Mask Register - Slave Mode (I3C_SLV_IMR).

See Interrupt Status Register - Slave Mode (I3C_SLV_ISR) description for details on specific interrupt conditions.

When any bit is written high, the corresponding interrupt is enabled. Writing a low to any bit has no effect.

Table 4-35. I3C_SLV_IER Instances

4.19 I3C_SLV_IMR Register (Offset = 48h) [reset = X]

I3C_SLV_IMR is shown in [Figure 4-18](#) and described in [Table 4-40](#).

Return to the [Summary Table](#).

This read only register, indicates the current state of the interrupts mask.

See Interrupt Status Register - Slave Mode (I3C_SLV_ISR) description for details on specific interrupt conditions.

A high value indicates the interrupt is enabled to generate an interrupt.

A low value indicates the interrupt is disabled from generating an interrupt (masked).

Table 4-44. I3C_SLV_ISR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	RESERVED	R	X	
21	DEFSLVs	R	0h	This interrupt is triggered whenever I3C-Slave DEFSLVs CCC command is received.
20	TM	R	0h	This interrupt is triggered whenever I3C-Slave is not in Test Mode and ENT TM CCC command with byte value of 0x01 [general Test Mode] is received.
19	ERROR	R	0h	This event is triggered whenever SDR Error is detected - applicable for S0, S1, S2, S4 and S5 Errors from MIPI spec.
18	EVENT_UP	R	0h	This event is triggered whenever DISEC CCC or ENEC CCC is received.
17	HJ_DONE	R	0h	This event is triggered whenever Hot-Join request is completed.
16	MR_DONE	R	0h	This event is triggered whenever Mastership Request is completed.
15	DA_UPDATE	R	0h	This event is triggered whenever Dynamic Address of the device has been updated.
14	SDR_FAIL	R	0h	This event is triggered whenever fail event during SDR transfer is detected [applicable for Private Write transfers only].

Table 4-44. I3C_SLV_ISR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	DDR_FAIL	R	0h	This event is triggered whenever fail event during DDR transfer is detected.
12	M_RD_ABORT	R	0h	Read Transfer Aborted by Master.
11	DDR_RX_THR	R	0h	This event is triggered whenever threshold level for DDR Rx DATA Buffer is reached.
10	DDR_TX_THR	R	0h	This event is triggered whenever threshold level for DDR Tx DATA Buffer is reached.
9	SDR_RX_THR	R	0h	Rx DATA Buffer Threshold. It is set when the number of bytes in the Rx DATA Buffer reaches value programmed in I3C_TX_RX_THR_CTRL.rx_thr field.
8	SDR_TX_THR	R	0h	Tx DATA Buffer Threshold. It is set when the number of bytes in the Tx DATA Buffer reaches value programmed in I3C_TX_RX_THR_CTRL.tx_thr field.
7	DDR_RX_UNF	R	0h	Set if the host attempts to read from the DDR_RX_FIFO register when there is no more data.
6	DDR_TX_OVF	R	0h	Set if the host attempts to write to DDR_TX_FIFO register more times than the FIFO depth.
5	SDR_RX_UNF	R	0h	Rx DATA Buffer Underflow. Set if the host attempts to read from the empty Rx DATA Buffer.
4	SDR_TX_OVF	R	0h	Tx DATA Buffer Overflow. Set if host attempts to write to Tx DATA Buffer which is already full.
3	DDR_RD_COMP	R	0h	This bit is set whenever the Slave terminates the DDR Read transfer.
2	DDR_WR_COMP	R	0h	This bit is set whenever the Master terminates the DDR Write transfer.
1	SDR_RD_COMP	R	0h	This bit is set whenever the Slave terminates the SDR Private Read transfer.
0	SDR_WR_COMP	R	0h	This bit is set whenever the Master terminates the SDR Private Write transfer.

4.22 I3C_SLV_STATUS0 Register (Offset = 54h) [reset = 0h]

I3C_SLV_STATUS0 is shown in [Figure 4-21](#) and described in [Table 4-46](#).

Return to the [Summary Table](#).

The read only Status 0 register (I3C_SLV_STATUS0) is provided to enable the continuous monitoring of the raw unmasked status information of the I3C-Master operating in Slave mode.

Table 4-45. I3C_SLV_STATUS0 Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIPi_I3C_MST	40B8 8054h

LEGEND: R = Read Only; -n = value after reset

Table 4-48. I3C_SLV_STATUS1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	RSVD1	R	0h	Reserved
21-20	ENTAS	R	0h	Bits that indicate current Activity State. It is updated based on ENTASx CCC [broadcast or direct], by default is set to 2'b00.
19	VEN_TM	R	0h	Vendor Test Mode. This bit is set whenever ENTTM CCC is received with value of 0x01. It remains HIGH until reception of another ENTTM CCC with different value.
18	HJ_DIS	R	1h	Hot-Join Disabled. This bit is set whenever HJ request is disabled by Current I3C-Master using DISEC CCC.
17	MR_DIS	R	1h	This bit is set whenever MR request is disabled by Current I3C-Master using DISEC CCC.
16	PROT_ERROR	R	0h	Protocol Error Condition Indicator. This bit is set whenever SDR error condition is detected by I3C-Master operating in Slave mode. It remains High until detection of recovery pattern.

Table 4-48. I3C_SLV_STATUS1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-9	DA	R	8h	Slave Dynamic Address.
8	HAS_DA	R	1h	This bit is set whenever Slave has Dynamic Address assigned.
7	DDRRX_FULL	R	0h	This bit is set whenever I3C_SLV_DDR_RX_FIFO is full.
6	DDRTX_FULL	R	0h	This bit is set whenever I3C_SLV_DDR_TX_FIFO is full.
5	DDRRX_EMPTY	R	1h	This bit is set whenever I3C_SLV_DDR_RX_FIFO is empty.
4	DDRTX_EMPTY	R	1h	This bit is set whenever I3C_SLV_DDR_TX_FIFO is empty.
3	SDRRX_FULL	R	0h	This bit is set whenever SDR_RX_FIFO is full.
2	SDRTX_FULL	R	0h	This bit is set whenever SDR_TX_FIFO is full.
1	SDRRX_EMPTY	R	1h	This bit is set whenever SDR_RX_FIFO is empty.
0	SDRTX_EMPTY	R	1h	This bit is set whenever SDR_TX_FIFO is empty.

4.24 I3C_CMD0_FIFO Register (Offset = 60h) [reset = X]

I3C_CMD0_FIFO is shown in [Figure 4-23](#) and described in [Table 4-50](#).

Return to the [Summary Table](#).

Command0 FIFO. When implemented, the commands will be executed sequentially in order of arrival from the FW.

Table 4-49. I3C_CMD0_FIFO Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIP1_I3C_MST	40B8 8060h

DEV_ADDR							RNW
W-0h							W-0h

LEGEND: W = Write Only; -n = value after reset

Table 4-50. I3C_CMD0_FIFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IS_DDR	W	0h	IS_DDR - DDR command. Enables DDR mode of transfer. 0 - SDR mode 1 - DDR mode, note that ENTHDR-DDR CCC should precede any commands with DDR mode enabled.
30	IS_CCC	W	0h	IsCCC. Denotes whether it is a CCC or generic command. 0 - generic command 1 - CCC command
29	BCH	W	0h	BCH - Broadcast Header. Defines whether command will includes broadcast address header [0x7E] or not. Implicitly set for CCC commands. 0 - broadcast header disabled 1 - broadcast header enabled

Table 4-50. I3C_CMD0_FIFO Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28-27	XMIT_MODE	W	0h	Defines transfer modes for I3C private read/write commands [not CCC], the following options are available: 00 - single CSR address. Send one single slave CSR address followed by data bytes only. Expecting slave will make self-increment of the address for each data byte or will have payload buffer implemented. 01 - multi byte incrementing CSR address, each data byte followed by repeated start condition and the slave's CSR address incremented explicitly. 10 - multi byte static CSR address, each data byte followed by repeat start condition and the slave's CSR address unchanged. 11 - No CSR ADDR [NCA], CCC/CSR ADDR0 filed is not used. First data byte after the slave address is a payload.
26	SBCA	W	0h	SBCA - Sixteen Bits CSR Addressing. Defines the CSR addressing mode for I3C private commands only. 0 - normal CSR addressing mode [8-bit] - ADDR0_ 7 - ADDR0_ 1 - extended CSR addressing mode [16-bit] - ADDR0_ 7 - ADDR0_0 and ADDR1_ 7 - ADDR1_0
25	RSBC	W	0h	RSBC - Repeated Start Between Commands. When this bit is set then between commands he repeated start condition is issued instead stop condition. It is only applicable when there is more than one command is in the command queue and next command is for Slave device of same type. The stop condition will be generated regardless of RSCB bit value for the following scenarios: - current command is the last command in the command queue - next command has invalid DA/SA - immediate command comes through
24	IS10B	W	0h	Is10B - Normal/Extended Address. Defines the addressing mode, applicable only for legacy I2C messaging. 0 - normal addressing mode [7-bit] - ID 6-ID0 1 - extended addressing mode [10-bit] - ID10B 2-ID10B0 and ID 6-ID0
23-12	PL_LEN	W	0h	PL_LEN - Payload Length. The number of bytes to be sent for particular CCC or generic R/Q command. Supports up to 4095 bytes.
11	RESERVED	W	X	
10-8	DEV_ADDR_MSB	W	0h	DEV_ADDR_MSB - legacy I2C Extended Address. The 3 MSB bits of legacy I2C 10-bit address. Applicable only if Is_10B is set for I2C legacy transfers.

Table 4-50. I3C_CMD0_FIFO Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-1	DEV_ADDR	W	0h	DEV_ADDR - Static/Dynamic slave Address. Correspond to a given slave Dynamic Address and Static Address. For CCC is applicable only when it is direct CCC command. For broadcast CCC this field is ignored.
0	RNW	W	0h	RnW - Read no Write. Defines the direction of transfer, for broadcast CCC this field is ignored. 0 - Write Transfer 1 - Read Transfer

4.25 I3C_CMD1_FIFO Register (Offset = 64h) [reset = 0h]

I3C_CMD1_FIFO is shown in [Figure 4-24](#) and described in [Table 4-52](#).

Return to the [Summary Table](#).

Command 1 FIFO. When implemented, the commands will be executed sequentially in order of arrival from the FW.

Table 4-51. I3C_CMD1_FIFO Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIPI_I3C_MST	40B8 8064h

LEGEND: R = Read Only; W = Write Only; -n = value after reset

Table 4-52. I3C_CMD1_FIFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	CMD_ID	W	0h	COMMAND ID - generated by the host and used by the DMA to sort incoming read data to different consumers [channelization].
23-16	RSVD0	R	0h	Reserved
15-8	CSRADDR1	W	0h	CSR ADDR 1 - second byte of the CSR address in 16-bit addressing mode. Applicable only when 16-bit addressing mode is used and for private commands [non CCC commands].
7-0	CCC_CSRADDR0	W	0h	CCC/CSR ADDR 0 - CCC or CSR Address. Meaning of this field depends on bit 30 [IsCCC] of Command Word0. - When IsCCC is set to '0' then this field holds address of slave CSR. When 16-bit addressing is used, then it is the first byte of the CSR address. - When IsCCC is set to '1' then this field holds code of CCC.

4.26 I3C_TX_FIFO Register (Offset = 68h) [reset = 0h]

I3C_TX_FIFO is shown in [Figure 4-25](#) and described in [Table 4-54](#).

Return to the [Summary Table](#).

Tx Data FIFO which stores number of bytes to be sent with particular command.
APB->I3C direction

Table 4-53. I3C_TX_FIFO Instances

Instance	Physical Address
MCU_I3C0_VBP2APB_WRAP_CORE_VBP_MIP1_I3C_MST	40B8 8068h

4.85 I3C_ASF_INT_STATUS Register (Offset = 300h) [reset = 0h]

I3C_ASF_INT_STATUS is shown in [Figure 4-84](#) and described in [Table 4-172](#).

Return to the [Summary Table](#).

ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_fatal or asf_nonfatal signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register.

4.89 I3C_ASF_FATAL_NONFATAL_SELECT Register (Offset = 310h) [reset = 7Fh]

I3C_ASF_FATAL_NONFATAL_SELECT is shown in [Figure 4-88](#) and described in [Table 4-180](#).

Return to the [Summary Table](#).

The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered.

Bit	Field	Type	Reset	Description
7	ASF_PROTOCOL_FAULT_S2_STATUS	R/W1C	0h	Status bit for s2 protocol fault.
6	ASF_PROTOCOL_FAULT_S1_STATUS	R/W1C	0h	Status bit for s1 protocol fault.
5	ASF_PROTOCOL_FAULT_S0_STATUS	R/W1C	0h	Status bit for s0 protocol fault.
4	ASF_PROTOCOL_FAULT_MST_SDR_RD_ABORT_STATUS	R/W1C	0h	Status bit for mst_sdr_rd_abort protocol fault.
3	ASF_PROTOCOL_FAULT_MST_DDR_FAIL_STATUS	R/W1C	0h	Status bit for mst_ddr_fail protocol fault.
2	ASF_PROTOCOL_FAULT_M2_STATUS	R/W1C	0h	Status bit for m2 protocol fault.
1	ASF_PROTOCOL_FAULT_M1_STATUS	R/W1C	0h	Status bit for m1 protocol fault.
0	ASF_PROTOCOL_FAULT_M0_STATUS	R/W1C	0h	Status bit for m0 protocol fault.

4.98 I3C_MMR Registers

Table 4-198 lists the I3C_MMR registers. All register locations not listed in Table 4-198 should be considered as reserved locations and the register contents should not be modified.

The Global Control Registers region is accessed by setting the rsel signal to 0 during the access. The address map for the region is as follows:

Table 4-197. I3C_MMR Instances

Instance	Base Address
MCU_I3C0_MMR_MMVBVP	40B8 0000h

Table 4-274. I3C_S_AGGR_STATUS_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3-2	TIMEOUT	R/Wdecr	0h	interrupt status clear for svbus timeout errors
1-0	PARITY	R/Wdecr	0h	interrupt status clear for parity errors

5 MCSPi Registers

Table 5-2 lists the memory-mapped registers for the MCSPi. All register offset addresses not listed in Table 5-2 should be considered as reserved locations and the register contents should not be modified.

Table 5-1. MCSPi Instances

Instance	Base Address
MCSPi0_CFG	0210 0000h
MCSPi1_CFG	0211 0000h
MCSPi2_CFG	0212 0000h
MCSPi3_CFG	0213 0000h
MCSPi4_CFG	0214 0000h
MCSPi5_CFG	0215 0000h
MCSPi6_CFG	0216 0000h
MCSPi7_CFG	0217 0000h
MCU_MCSPi0_CFG	4030 0000h
MCU_MCSPi1_CFG	4031 0000h
MCU_MCSPi2_CFG	4032 0000h

Table 5-2. MCSPi Registers

Offset	Acronym	Register Name	MCSPi0_CFG Physical Address	MCSPi1_CFG Physical Address	MCSPi2_CFG Physical Address
0h	MCSPi_HL_REV	IP Revision register	0210 0000h	0211 0000h	0212 0000h
4h	MCSPi_HL_HWINFO	MCSPi hardware configuration register	0210 0004h	0211 0004h	0212 0004h
10h	MCSPi_HL_SYSCONFIG	Clock management configuration register	0210 0010h	0211 0010h	0212 0010h
100h	MCSPi_REVISION	Revision number	0210 0100h	0211 0100h	0212 0100h
110h	MCSPi_SYSCONFIG	Configuration register	0210 0110h	0211 0110h	0212 0110h
114h	MCSPi_SYSSTATUS	Status information register	0210 0114h	0211 0114h	0212 0114h
118h	MCSPi_IRQSTATUS	Interrupt status register	0210 0118h	0211 0118h	0212 0118h
11Ch	MCSPi_IRQENABLE	Interrupt enable register	0210 011Ch	0211 011Ch	0212 011Ch
120h	MCSPi_WAKEUPENABLE	Wake-up enable register	0210 0120h	0211 0120h	0212 0120h
124h	MCSPi_SYST	System interconnect check in system test mode	0210 0124h	0211 0124h	0212 0124h
128h	MCSPi_MODULCTRL	MCSPi configuration register	0210 0128h	0211 0128h	0212 0128h
12Ch	MCSPi_CHCONF_0	Configuration register of channel 0	0210 012Ch	0211 012Ch	0212 012Ch
130h	MCSPi_CHSTAT_0	Status register of channel 0	0210 0130h	0211 0130h	0212 0130h
134h	MCSPi_CHCTRL_0	Enable register of channel 0	0210 0134h	0211 0134h	0212 0134h
138h	MCSPi_TX_0	TX register of channel 0	0210 0138h	0211 0138h	0212 0138h
13Ch	MCSPi_RX_0	RX register of channel 0	0210 013Ch	0211 013Ch	0212 013Ch
140h	MCSPi_CHCONF_1	Configuration register of channel 1	0210 0140h	0211 0140h	0212 0140h
144h	MCSPi_CHSTAT_1	Status register of channel 1	0210 0144h	0211 0144h	0212 0144h
148h	MCSPi_CHCTRL_1	Enable register of channel 1	0210 0148h	0211 0148h	0212 0148h
14Ch	MCSPi_TX_1	TX register of channel 1	0210 014Ch	0211 014Ch	0212 014Ch
150h	MCSPi_RX_1	RX register of channel 1	0210 0150h	0211 0150h	0212 0150h
154h	MCSPi_CHCONF_2	Configuration register of channel 2	0210 0154h	0211 0154h	0212 0154h
158h	MCSPi_CHSTAT_2	Status register of channel 2	0210 0158h	0211 0158h	0212 0158h
15Ch	MCSPi_CHCTRL_2	Enable register of channel 2	0210 015Ch	0211 015Ch	0212 015Ch
160h	MCSPi_TX_2	TX register of channel 2	0210 0160h	0211 0160h	0212 0160h
164h	MCSPi_RX_2	RX register of channel 2	0210 0164h	0211 0164h	0212 0164h
168h	MCSPi_CHCONF_3	Configuration register of channel 3	0210 0168h	0211 0168h	0212 0168h

Table 5-2. MCSPI Registers (continued)

Offset	Acronym	Register Name	MCSPI0_CFG Physical Address	MCSPI1_CFG Physical Address	MCSPI2_CFG Physical Address
16Ch	MCSPI_CHSTAT_3	Status register of channel 3	0210 016Ch	0211 016Ch	0212 016Ch
170h	MCSPI_CHCTRL_3	Enable register of channel 3	0210 0170h	0211 0170h	0212 0170h

5.1 MCSPI_HL_REV Register (Offset = 0h) [reset = 40301A0Bh]

MCSPi_HL_REV is shown in [Figure 5-1](#) and described in [Table 5-7](#).

Return to [Summary Table](#).

IP Revision Identifier (X.Y.R)

Used by software to track features, bugs, and compatibility

Table 5-6. MCSPI_HL_REV Instances

Instance	Physical Address
MCSPi0_CFG	0210 0000h

5.2 MCSPI_HL_HWINFO Register (Offset = 4h) [reset = 41h]

MCSPI_HL_HWINFO is shown in [Figure 5-2](#) and described in [Table 5-9](#).

Return to [Summary Table](#).

Information about the IP module's hardware configuration, that is, typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.

Note

Some of the MCSPI features described in this section may not be supported on this family of devices. For more information, see *MCSPI Not Supported Features*.

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	0h	Reads returns 0

Table 5-15. MCSPI_SYSCONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	CLOCKACTIVITY	R/W	0h	Clocks activity during wake-up mode period 0h (R/W) = Interface and functional clocks may be switched off. 1h (R/W) = Interface clock is maintained. Functional clock may be switched off. 2h (R/W) = Functional clock is maintained. Interface clock may be switched off. 3h (R/W) = Interface and functional clocks are maintained.
7-5	RESERVED	R	0h	Reads returns 0
4-3	SIDLEMODE	R/W	2h	Power management 0h (R/W) = If an IDLE request is detected, the MCSPI acknowledges it unconditionally and goes in inactive mode. Interrupt, DMA requests and wake-up lines are unconditionally deasserted and the module wake-up capability is deactivated even if the MCSPI_SYSCONFIG[2] ENAWAKEUP bit is set. 1h (R/W) = If an IDLE request is detected, the request is ignored and the module does not switch to wake-up mode, and keeps on behaving normally. 2h (R/W) = If an IDLE request is detected, the module will switch to wake-up mode based on its internal activity, and the wake-up capability can be used if the bit MCSPI_SYSCONFIG[2] ENAWAKEUP is set. 3h (R/W) = Reserved - do not use.
2	ENAWAKEUP	R/W	1h	Wake-up feature control 0h (R/W) = Wake-up capability is disabled. 1h (R/W) = Wake-up capability is enabled.
1	SOFTRESET	R/W	0h	Software reset. During reads it always returns 0. 0h (R/W) = (write) Normal mode 1h (R/W) = (write) Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware.
0	AUTOIDLE	R/W	1h	Internal interface clock-gating strategy 0h (R/W) = Interface clock is free-running. 1h (R/W) = Automatic interface clock gating strategy is applied, based on the configuration interface activity.

5.6 MCSPI_SYSSTATUS Register (Offset = 114h) [reset = 1h]

MCSPi_SYSSTATUS is shown in [Figure 5-6](#) and described in [Table 5-17](#).

[Return to Summary Table.](#)

This register provides status information about the module excluding the interrupt status information.

Table 5-16. MCSPI_SYSSTATUS Instances

Instance	Physical Address

5.7 MCSPI_IRQSTATUS Register (Offset = 118h) [reset = 0h]

MCSPI_IRQSTATUS is shown in [Figure 5-7](#) and described in [Table 5-19](#).

Return to [Summary Table](#).

The interrupt status regroups all the status of the module internal events that can generate an interrupt.

Note

Some of the MCSPI features described in this section may not be supported on this family of devices. For more information, see *MCSPI Not Supported Features*.

5.9 MCSPI_WAKEUPENABLE Register (Offset = 120h) [reset = 0h]

MCSPI_WAKEUPENABLE is shown in [Figure 5-9](#) and described in [Table 5-23](#).

Return to [Summary Table](#).

The wake-up enable register allows enabling and disabling of the module internal sources of wakeup on event-by-event basis.

Note

Some of the MCSPI features described in this section may not be supported on this family of devices. For more information, see *MCSPI Not Supported Features*.

5.10 MCSPI_SYST Register (Offset = 124h) [reset = 0h]

MCSPi_SYST is shown in [Figure 5-10](#) and described in [Table 5-25](#).

Return to [Summary Table](#).

This register is used to check the correctness of the system interconnect either internally to peripheral bus, or externally to device I/O pads, when the module is configured in system test (SYSTEST) mode.

Table 5-25. MCSPI_SYST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	Reads returns 0.
11	SSB	R/W	0h	Set status bit 0h (R/W) = No action. Writing 0 does not clear already set status bits. This bit must be cleared before trying to clear a status bit of the MCSPi_IRQSTATUS register. 1h (R/W) = Force to 1 all status bits of MCSPi_IRQSTATUS register. Writing 1 into this bit sets to 1 all status bits in the MCSPi_IRQSTATUS register.
10	SPIENDIR	R/W	0h	Set the direction of the SPIEN[3:0] lines and SPICLK line. 0h (R/W) = Output (as in master mode) 1h (R/W) = Input (as in slave mode)

Table 5-25. MCSPI_SYST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	SPIDATDIR1	R/W	0h	Set the direction of the SPIDAT[1]. 0h (R/W) = Output 1h (R/W) = Input
8	SPIDATDIR0	R/W	0h	Set the direction of the SPIDAT[0]. 0h (R/W) = Output 1h (R/W) = Input
7	WAKD	R/W	0h	SWAKEUP output (signal data value of internal signal to system). The signal is driven high or low according to the value written into this bit. 0h (R/W) = The pin is driven low. 1h (R/W) = The pin is driven high.
6	SPICLK	R/W	0h	SPICLK line (signal data value) If MCSPI_SYST[10] SPIENDIR = 1 (input mode direction), this bit returns the value on the CLKSPI line (high or low), and a write into this bit has no effect. If MCSPI_SYST[10] SPIENDIR = 0 (output mode direction), the CLKSPI line is driven high or low according to the value written into this bit.
5	SPIDAT_1	R/W	0h	SPIDAT[1] line (signal data value) If MCSPI_SYST[9] SPIDATDIR1 = 0 (output mode direction), the SPIDAT[1] line is driven high or low according to the value written into this bit. If MCSPI_SYST[9] SPIDATDIR1 = 1 (input mode direction), this bit returns the value on the SPIDAT[1] line (high or low), and a write into this bit has no effect.
4	SPIDAT_0	R/W	0h	SPIDAT[0] line (signal data value) If MCSPI_SYST[8] SPIDATDIR0 = 0 (output mode direction), the SPIDAT[0] line is driven high or low according to the value written into this bit. If MCSPI_SYST[8] SPIDATDIR0 = 1 (input mode direction), this bit returns the value on the SPIDAT[0] line (high or low), and a write into this bit has no effect.
3	SPIEN_3	R/W	0h	SPIEN[3] line (signal data value) If MCSPI_SYST[10] SPIENDIR = 0 (output mode direction), the SPIEN[3] line is driven high or low according to the value written into this bit. If MCSPI_SYST[10] SPIENDIR = 1 (input mode direction), this bit returns the value on the SPIEN[3] line (high or low), and a write into this bit has no effect.
2	SPIEN_2	R/W	0h	SPIEN[2] line (signal data value) If MCSPI_SYST[10] SPIENDIR = 0 (output mode direction), the SPIEN[2] line is driven high or low according to the value written into this bit. If MCSPI_SYST[10] SPIENDIR = 1 (input mode direction), this bit returns the value on the SPIEN[2] line (high or low), and a write into this bit has no effect.

Table 5-25. MCSPI_SYST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SPIEN_1	R/W	0h	<p>SPIEN[1] line (signal data value)</p> <p>If MCSPI_SYST[10] SPIENDIR = 0 (output mode direction), the SPIEN[1] line is driven high or low according to the value written into this bit.</p> <p>If MCSPI_SYST[10] SPIENDIR = 1 (input mode direction), this bit returns the value on the SPIEN[1] line (high or low), and a write into this bit has no effect.</p>
0	SPIEN_0	R/W	0h	<p>SPIEN[0] line (signal data value)</p> <p>If MCSPI_SYST[10] SPIENDIR = 0 (output mode direction), the SPIEN[0] line is driven high or low according to the value written into this bit.</p> <p>If MCSPI_SYST[10] SPIENDIR = 1 (input mode direction), this bit returns the value on the SPIEN[0] line (high or low), and a write into this bit has no effect.</p>

5.11 MCSPI_MODULCTRL Register (Offset = 128h) [reset = 4h]

MCSPI_MODULCTRL is shown in [Figure 5-11](#) and described in [Table 5-27](#).

Return to [Summary Table](#).

This register is dedicated to the configuration of the serial peripheral interface.

Table 5-26. MCSPI_MODULCTRL Instances

Table 5-27. MCSPI_MODULCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	Reads returns 0.
8	FDAA	R/W	0h	FIFO DMA address 256-bit aligned This bit is used when a FIFO is managed by the module and DMA connected to the controller provides only 256-bit aligned address. If this bit is set the enabled channel which uses the FIFO has its data managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX(i) and MCSPI_RX(i) registers. 0h (R/W) = FIFO data managed by MCSPI_TX(i) and MCSPI_RX(i) registers. 1h (R/W) = FIFO data managed by MCSPI_DAFTX and MCSPI_DAFRX registers.

Table 5-27. MCSPI_MODULCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	MOA	R/W	0h	Multiple word configuration interface access: This bit can only be used when a channel is enabled using a FIFO. It allows the system to perform multiple MCSPI word access for a single 32-bit interface word access. This is possible for WL < 16. 0h (R/W) = Multiple word access disabled 1h (R/W) = Multiple word access enabled with FIFO
6-4	INITDLY	R/W	0h	Initial MCSPI delay for first transfer: This field is an option only available in SINGLE master mode. The controller waits for a delay to transmit the first MCSPI word after channel enabled and corresponding TX register filled. This delay is based on MCSPI output frequency clock. No clock output provided to the boundary and chip select is not active in 4-pin mode within this period. 0h (R/W) = No delay for first MCSPI transfer. 1h (R/W) = The controller wait 4 MCSPI bus clock 2h (R/W) = The controller wait 8 MCSPI bus clock 3h (R/W) = The controller wait 16 MCSPI bus clock 4h (R/W) = The controller wait 32 MCSPI bus clock
3	SYSTEM_TEST	R/W	0h	Enables the system test mode 0h (R/W) = Functional mode 1h (R/W) = System test mode (SYSTEST)
2	MS	R/W	1h	Master/slave 0h (R/W) = Master - The module generates the SPICLK and SPIEN[3:0]. 1h (R/W) = Slave - The module receives the SPICLK and SPIEN[3:0].
1	PIN34	R/W	0h	Pin mode selection: This bit is used in master or slave mode to configure the MCSPI pin mode (3-pin or 4-pin). If asserted the controller only uses SIMO, SOMI, and SPICLK clock pin for MCSPI transfers. 0h (R/W) = SPIEN is used as a chip-select. 1h (R/W) = SPIEN is not used. In this mode all related options to chip-select have no meaning.
0	SINGLE	R/W	0h	Single channel/Multi Channel (master mode only) 0h (R/W) = More than one channel will be used in master mode. 1h (R/W) = Only one channel will be used in master mode. This bit must be set in Force SPIEN[i] mode.

5.12 MCSPI_CHCONF_0 Register (Offset = 12Ch) [reset = 00060000h]

MCSPI_CHCONF_0 is shown in [Figure 5-12](#) and described in [Table 5-29](#).

Return to [Summary Table](#).

This register is dedicated to the configuration of the channel i.

Table 5-59. MCSPI_CHCONF_3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5-2	CLKD	R/W	0h	<p>Frequency divider for SPICLK (only when the module is a Master MCSPI device). A programmable clock divider divides the MCSPI reference clock (SPICLKREF) with a 4-bit value, and results in a new clock SPICLK available to shift-in and shift-out data. By default the clock divider ratio has a power of 2 granularity when MCSPI_CHCONF_0/1/2/3[29] CLKG is cleared. Otherwise this field is the 4-LSB bit of a 12-bit register concatenated with clock divider extension MCSPI_CHCTRL_3[15-8] EXTCLK register. The value description below defines the clock ratio when MCSPI_CHCONF_3[29] CLKG is set to 0.</p> <p>0h (R/W) = 1 1h (R/W) = 2 2h (R/W) = 4 3h (R/W) = 8 4h (R/W) = 16 5h (R/W) = 32 6h (R/W) = 64 7h (R/W) = 128 8h (R/W) = 256 9h (R/W) = 512 Ah (R/W) = 1024 Bh (R/W) = 2048 Ch (R/W) = 4096 Dh (R/W) = 8192 Eh (R/W) = 16384 Fh (R/W) = 32768</p>
1	POL	R/W	0h	<p>SPICLK polarity (see <i>Transfer Format</i>) 0h (R/W) = SPICLK is held low during the INACTIVE state 1h (R/W) = SPICLK is held high during the INACTIVE state</p>
0	PHA	R/W	0h	<p>SPICLK phase (see <i>Transfer Format</i>) 0h (R/W) = Data are latched on odd-numbered edges of SPICLK. 1h (R/W) = Data are latched on even-numbered edges of SPICLK.</p>

5.28 MCSPI_CHSTAT_3 Register (Offset = 16Ch) [reset = 0h]

MCSPi_CHSTAT_3 is shown in [Figure 5-28](#) and described in [Table 5-61](#).

Return to [Summary Table](#).

This register provides status information about transmitter and receiver registers of channel i.

6.1 UART_THR Register (Offset = 0h) [reset = 0h]

UART_THR is shown in [Figure 6-1](#) and described in [Table 6-8](#).

Return to [Summary Table](#).

The transmitter section consists of the transmit holding register (UART_THR) and the transmit shift register. The UART_THR is a 64-byte FIFO. The local host (LH) writes data to the UART_THR. The data is placed in the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled, location 0 of the FIFO stores the data.

Table 6-7. UART_THR Instances

Instance	Physical Address

6.2 UART_RHR Register (Offset = 0h) [reset = 0h]

UART_RHR is shown in [Figure 6-2](#) and described in [Table 6-10](#).

Return to [Summary Table](#).

The receiver section consists of the receiver holding register (UART_RHR) and the receiver shift register. The UART_RHR is a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the UART_RHR. If the FIFO is disabled, location 0 of the FIFO stores the single data character. Note: If an overflow occurs, the data in the UART_RHR is not overwritten.

Table 6-9. UART_RHR Instances

6.3 UART_DLL Register (Offset = 0h) [reset = 0h]

UART_DLL is shown in [Figure 6-3](#) and described in [Table 6-12](#).

Return to [Summary Table](#).

This register, with UART_DLH, stores the 14-bit divisor for generation of the baud clock in the baud rate generator. UART_DLH stores the most-significant part of the divisor. UART_DLL stores the least-significant part of the divisor.

Table 6-11. UART_DLL Instances

Instance	Physical Address

6.4 UART_IER_UART Register (Offset = 4h) [reset = 0h]

UART_IER_UART is shown in [Figure 6-4](#) and described in [Table 6-14](#).

Return to [Summary Table](#).

Interrupt enable register

The interrupt enable register (UART_IER_UART) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, UART_RHR interrupt, UART_THR interrupt, XOFF received and CTS*/RTS* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.

Table 6-13. UART_IER_UART Instances

6.5 UART_IER_IRDA Register (Offset = 4h) [reset = 0h]

UART_IER_IRDA is shown in [Figure 6-5](#) and described in [Table 6-16](#).

Return to [Summary Table](#).

There are 8 types of interrupt in these modes, received EOF, LSR interrupt, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually. Note: The TX_STATUS_IT interrupt reflects two possible conditions. The UART_MDR2[0] should be read to determine the status in the event of this interrupt.

Table 6-15. UART_IER_IRDA Instances

Instance	Physical Address

6.6 UART_IER_CIR Register (Offset = 4h) [reset = X]

UART_IER_CIR is shown in [Figure 6-6](#) and described in [Table 6-18](#).

Return to [Summary Table](#).

There are 6 types of interrupt in these modes, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually. Notes: The RX_STOP_IT interrupt is generated based on the value set in the BOF Length register (UART_EBLR). In IR-CIR mode, contrary to the IR-IRDA mode, the TX_STATUS_IT has only one meaning corresponding to the case UART_MDR2[0] = 0.

Table 6-17. UART_IER_CIR Instances

6.7 UART_DLH Register (Offset = 4h) [reset = 0h]

UART_DLH is shown in [Figure 6-7](#) and described in [Table 6-20](#).

Return to [Summary Table](#).

This register, with UART_DLL, stores the 14-bit divisor for generating the baud clock in the baud rate generator. DLH stores the most-significant part of the divisor. DLL stores the least-significant part of the divisor.

Table 6-19. UART_DLH Instances

Table 6-28. UART_FCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	RX_FIFO_TRIG	W	0h	Sets the trigger level for the RX FIFO: If UART_SCR[7] = 0 and UART_TLR[7:4] = 0000: 0h = 8 characters 1h = 16 characters 2h = 56 characters 3h = 60 characters If UART_SCR[7] = 0 and UART_TLR[7:4] != 0000, RX_FIFO_TRIG is not considered. If UART_SCR[7] = 1, RX_FIFO_TRIG is 2 LSBs of the trigger level (1-63 on 6 bits) with the granularity 1.
5-4	TX_FIFO_TRIG	W	0h	Sets the trigger level for the TX FIFO: If UART_SCR[6] = 0 and UART_TLR[3:0] = 0000: 0h = 8 spaces 1h = 16 spaces 2h = 32 spaces 3h = 56 spaces If UART_SCR[6] = 0 and UART_TLR[3:0] != 0000, TX_FIFO_TRIG is not considered. If UART_SCR[6] = 1, TX_FIFO_TRIG is 2 LSBs of the trigger level (1-63 on 6 bits) with the granularity 1
3	DMA_MODE	W	0h	This register is considered if UART_SCR[0] = 0. Write 0h = DMA_MODE 0 (No DMA) Write 1h = DMA_MODE 1 (UART_nDMA_REQ[0] in TX (UARTi_DREQ_TX), UART_nDMA_REQ[1] in RX (UARTi_DREQ_RX))
2	TX_FIFO_CLEAR	W	0h	Write 0h = No change Write 1h = Clears the TX FIFO and resets its counter logic to 0. Returns to 0 after clearing FIFO.
1	RX_FIFO_CLEAR	W	0h	Write 0h = No change Write 1h = Clears the RX FIFO and resets its counter logic to 0. Returns to 0 after clearing FIFO.
0	FIFO_EN	W	0h	Write 0h = Disables the transmit and RX FIFOs. The transmit and receive holding registers are 1-byte FIFOs. Write 1h = Enables the transmit and RX FIFOs. The transmit and receive holding registers are 64-byte FIFOs.

6.12 UART_EFR Register (Offset = 8h) [reset = 0h]

UART_EFR is shown in [Figure 6-12](#) and described in [Table 6-30](#).

Return to [Summary Table](#).

Enhanced feature register

This register enables or disables enhanced features. Most of the enhanced functions apply only to UART modes, but UART_EFR[4] enables write accesses to UART_FCR[5:4], the TX trigger level, which is also used in IrDA modes.

Table 6-29. UART_EFR Instances

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7	DIV_EN	R/W	0h	0h = Normal operating condition 1h = Divisor latch enable. Allows access to UART_DLL, UART_DLH, and other registers (see <i>UART Register Access Mode Programming (Using UART_LCR)</i>).
6	BREAK_EN	R/W	0h	Break control bit 0h = Normal operating condition 1h = Forces the transmitter output to go low to alert the communication terminal

Table 6-32. UART_LCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	PARITY_TYPE2	R/W	0h	Selects the forced parity format (if UART_LCR[3] = 1). If UART_LCR[5] = 1 and UART_LCR[4] = 0, the parity bit is forced to 1 in the transmitted and received data. If UART_LCR[5] = 1 and UART_LCR[4] = 1, the parity bit is forced to 0 in the transmitted and received data.
4	PARITY_TYPE1	R/W	0h	0h = Odd parity is generated (if UART_LCR[3] = 1). 1h = Even parity is generated (if UART_LCR[3] = 1).
3	PARITY_EN	R/W	0h	0h = No parity 1h = A parity bit is generated during transmission and the receiver checks for received parity.
2	NB_STOP	R/W	0h	Specifies the number of stop-bits 0h = 1 stop-bit (word length = 5, 6, 7, 8) 1h = 1.5 stop-bits (word length = 5) 2 stop-bits (word length = 6, 7, 8)
1-0	CHAR_LENGTH	R/W	0h	Specifies the word length to be transmitted or received 0h = 5 bits 1h = 6 bits 2h = 7 bits 3h = 8 bits

6.14 UART_MCR Register (Offset = 10h) [reset = 0h]

UART_MCR is shown in [Figure 6-14](#) and described in [Table 6-34](#).

Return to [Summary Table](#).

Modem control register UART_MCR[3:0] controls the interface with the modem, data set, or peripheral device that emulates the modem.

Table 6-33. UART_MCR Instances

Instance	Physical Address

6.22 UART_TCR Register (Offset = 18h) [reset = Fh]

UART_TCR is shown in [Figure 6-22](#) and described in [Table 6-50](#).

Return to [Summary Table](#).

Transmission control register

This register stores the RX FIFO threshold levels to start/stop transmission during hardware/software flow control. Notes: Trigger levels from 0 to 60 bytes are available with a granularity of 4. (Trigger level = 4 x [4-bit register value]) The programmer must ensure that UART_TCR[3:0] > UART_TCR[7:4] when auto-RTS or software flow control is enabled to avoid a mis-operation of the device. In FIFO interrupt mode with flow control, the programmer must ensure that the trigger level to halt transmission is greater than or equal to the RX FIFO trigger level (UART_TLR[7:4] or UART_FCR[7:6]); otherwise, FIFO operation stalls. In FIFO DMA mode with flow control, this concept does not exist because a DMA request is sent each time a byte is received.

6.26 UART_MDR1 Register (Offset = 20h) [reset = 7h]

UART_MDR1 is shown in [Figure 6-26](#) and described in [Table 6-58](#).

[Return to Summary Table.](#)

Mode definition register 1

The mode of operation can be programmed by writing to MDR1[2:0] and therefore the UART_MDR1 must be programmed on startup after configuration of the configuration registers (UART_DLL, UART_DLH, and UART_LCR). The value of MDR1[2:0] must not be changed again during normal operation. Note: If the module is disabled by setting the MODE_SELECT field to 111, interrupt requests can still be generated unless disabled through the interrupt enable register (UART_IER). In this case, UART mode interrupts are visible. Reading the interrupt identification register (UART_IIR) shows UART mode interrupt flags.

6.27 UART_MDR2 Register (Offset = 24h) [reset = 0h]

UART_MDR2 is shown in [Figure 6-27](#) and described in [Table 6-60](#).

Return to [Summary Table](#).

Mode definition register 2

IR-IrDA and IR-CIR modes only. UART_MDR2[0] describes the status of the interrupt in UART_IIR[5]. The IRTX_UNDERRUN bit should be read after an UART_IIR[5] TX_STATUS_IT interrupt. The bits [2:1] of this register set the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in UART_MDR1[2:0].

Note: The UART_MDR2[6] gives the flexibility to invert the RX pin in the UART to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most transceivers invert the IR receive pin.

Table 6-59. UART_MDR2 Instances

7	SET_TXIR_ALT	R/W	0h	Provide alternate function for UART_MDR1[4] (SET_TXIR). 0h = Normal mode 1h = Alternate mode for SET_TXIR

Table 6-60. UART_MDR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	IRRXINVERT	R/W	0h	IR mode only (IrDA and CIR). Invert RX pin in the module before the voting or sampling system logic of the infrared block. This does not affect the RX path in UART modem modes. 0h = Inversion is performed. 1h = No inversion is performed.
5-4	CIR_PULSE_MODE	R/W	0h	CIR pulse modulation definition. Defines high level of the pulse width associated with a digit: 0h = Pulse width of 3 from 12 cycles 1h = Pulse width of 4 from 12 cycles 2h = Pulse width of 5 from 12 cycles 3h = Pulse width of 6 from 12 cycles
3	UART_PULSE	R/W	0h	UART mode only. Allows pulse shaping in UART mode. 0h = Normal UART mode 1h = UART mode with a pulse shaping
2-1	STS_FIFO_TRIG	R/W	0h	IR-IrDA mode only. Frame status FIFO threshold select: 0h = 1 entry 1h = 4 entries 2h = 7 entries 3h = 8 entries
0	IRTX_UNDERRUN	R	0h	IrDA transmission status interrupt. When the UART_IIR[5] interrupt occurs, the meaning of the interrupt is: Read 0h = The last bit of the frame transmitted successfully without error. Read 1h = An underrun occurred. The last bit of the frame was transmitted but with an underrun error. The bit is reset to 0 when the UART_RESUME register is read.

6.28 UART_SFLSR Register (Offset = 28h) [reset = 0h]

UART_SFLSR is shown in [Figure 6-28](#) and described in [Table 6-62](#).

Return to [Summary Table](#).

Status FIFO line status register

IrDA modes only. Reading this register effectively reads frame status information from the status FIFO (this register does not physically exist). Reading this register increments the status FIFO read pointer (UART_SFREGL and UART_SFREGH must be read first).

Table 6-61. UART_SFLSR Instances

6.36 UART_BLR Register (Offset = 38h) [reset = 40h]

UART_BLR is shown in [Figure 6-36](#) and described in [Table 6-78](#).

Return to [Summary Table](#).

BOF control register

IrDA modes only. The UART_BLR[6] bit selects whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR mode. If only one start flag is required, this is always 0xC0. If n start flags are required, (-1) 0xC0 or (-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).

6.37 UART_UASR Register (Offset = 38h) [reset = 0h]

UART_UASR is shown in [Figure 6-37](#) and described in [Table 6-80](#).

Return to [Summary Table](#).

UART autobauding status register

UART autobauding mode only. This status register returns the speed, the number of bits by characters, and the type of the parity in UART autobauding mode. In autobauding mode, the input frequency of the UART modem must be fixed to 48 MHz. Any other module clock frequency results in incorrect baud rate recognition.

Note: When the UART is in autobauding mode, this register, instead of the UART_LCR, UART_DLL, and UART_DLH registers, is used to set up transmission according to the characteristics of the previous reception.

To reset the autobauding hardware (to start a new AT detection), set UART_MDR1[2:0] to 111 (reset value), then set UART_MDR1[2:1] to 010 (UART in autobaud mode).

To set the UART to standard mode (no autobaud), set UART_MDR1[2:1] to 000.

Table 6-82. UART_ACREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7	PULSE_TYPE	R/W	0h	SIR pulse width select 0h = 3/16 of baud-rate pulse width 1h = 1.6 μ s
6	SD_MOD	R/W	0h	Primary output used to configure transceivers. Connected to the SD/ MODE input pin of IrDA transceivers. 0h = SD pin is set to high. 1h = SD pin is set to low.
5	DIS_IR_RX	R/W	0h	0h = Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation) 1h = Disables RX input (permanent state - independent of transmit)

Table 6-82. UART_ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DIS_TX_UNDERRUN	R/W	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting UART_ACREG[4] = 1, garbage data is sent over TX line. 0h = Long stop-bits cannot be transmitted; TX underrun is enabled. 1h = Long stop-bits can be transmitted; TX underrun is disabled.
3	SEND_SIP	R/W1S	0h	MIR/FIR modes only. Send serial infrared interaction pulse (SIP). If this bit is set during an MIR/FIR transmission, the SIP is sent at the end of it. This bit is cleared automatically at the end of the SIP transmission. 0h = No action 1h = Send SIP pulse.
2	SCTX_EN	R/W1S	0h	Store and controlled TX start. When UART_MDR1[5] = 1 and the LH writes 1 to this bit, the TX state-machine starts frame transmission. This bit is self-clearing.
1	ABORT_EN	R/W	0h	Frame abort. The LH can intentionally abort transmission of a frame by writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If TX FIFO is not empty and UART_MDR1[5] = 1, UART IrDA starts a new transfer with data of the previous frame when the abort frame is sent. Therefore, TX FIFO must be reset before sending an abort frame.
0	EOT_EN	R/W1S	0h	EOT (end of transmission) bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit is cleared automatically when the LH writes to the THR (TX FIFO).

6.39 UART_SCR Register (Offset = 40h) [reset = 0h]

UART_SCR is shown in [Figure 6-39](#) and described in [Table 6-84](#).

[Return to Summary Table.](#)

Supplementary control register

Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the UART_IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the UART_IIR register, the UART_SSR[1] bit must be checked. To clear the wake-up interrupt, bit UART_SCR[4] must be reset to 0.

Table 6-83. UART_SCR Instances

6.41 UART_EBLR Register (Offset = 48h) [reset = 0h]

UART_EBLR is shown in [Figure 6-41](#) and described in [Table 6-88](#).

Return to [Summary Table](#).

BOF length register

IR-IrDA and IR-CIR modes only. In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must account for the BOF character; therefore, to send only one BOF with no XBOF, this register must be set to 1. To send one BOF with N XBOF, this register must be set to N + 1. The value 0 sends 1 BOF plus 255 XBOF. In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags). In IR-CIR mode, this register specifies the number of consecutive 0s to be received before generating the RX_STOP interrupt (UART_IIR[2]). All received 0s are stored in the RX FIFO. When the register is set to 0, this feature is deactivated and always in reception state, which can be disabled by setting the UART_ACREG[5] to 1.

Note: If the RX_STOP interrupt occurs before a byte boundary, the remaining bits of the last byte are filled with 0s and passed into the RX FIFO.

6.43 UART_SYSC Register (Offset = 54h) [reset = 0h]

UART_SYSC is shown in [Figure 6-43](#) and described in [Table 6-92](#).

[Return to Summary Table.](#)

System configuration register

The AUTOIDLE bit controls a power-saving technique to reduce the logic power consumption of the open-core protocol (OCP) interface. When the feature is enabled, the clock is gated off until an OCP command for this device is detected. When the software reset bit is set high, it causes a full device reset.

6.45 UART_WER Register (Offset = 5Ch) [reset = FFh]

UART_WER is shown in [Figure 6-45](#) and described in [Table 6-96](#).

Return to [Summary Table](#).

Wake-up enable register

The UART wake-up enable register is used to mask and unmask a UART event that would subsequently notify the system. An event is any activity in the logic that could cause an interrupt and/or an activity that would require the system to wake up. Even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, the UART registers the interrupt.

Table 6-95. UART_WER Instances

6.46 UART_CFPS Register (Offset = 60h) [reset = 69h]

UART_CFPS is shown in [Figure 6-46](#) and described in [Table 6-98](#).

Return to [Summary Table](#).

Carrier frequency prescaler

Because the consumer IR works at modulation rates of 30 to 56.8 kHz, the 48-MHz clock must be prescaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote-control requirements in baud multiples of 12x. The value of the CFPS at reset is 0105 decimal, which equals 38.1 kHz output from starting conditions. The 48-MHz carrier is prescaled by the CFPS, which is then divided by the 12x baud multiple.

Table 6-120. UART_EFR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7	BROADCAST	R/W	0h	Enables broadcast address matching in multi-drop address match mode
6	TIMEOUT_BEHAVE	R/W	0h	Specifies how timeout is measured 0h = Timeout after at least one character has been received 1h = Periodic timeout even when no character has been received
5	C8	R/W	0h	Value for ISO 7816 C8 pin for software control
4	C4	R/W	0h	Value for ISO 7816 C4 pin for software control
3	C2	R/W	0h	Value for ISO 7816 reset pin [software controllable]
2	MULTIDROP	R/W	0h	Enables parity Multi-drop mode [overrides UART_LCR[5..3]] when '1'

Table 6-120. UART_EFR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	RHR_OVERRUN	R/W	0h	UART_RHR Overrun behavior when buffer full 0h = Data in RHR is not overwritten (standard) 1h = Data in RHR is overwritten when buffer full (and FIFO disabled)
0	ENDIAN	R/W	0h	Endianness 0h = Little Endian (LSB First) 1h = Big Endian (MSB First)

6.58 UART_ECR Register (Offset = 90h) [reset = 18h]

UART_ECR is shown in [Figure 6-58](#) and described in [Table 6-122](#).

[Return to Summary Table.](#)

Enhanced Control register

10-8	MAJOR_REVISION	R	1h	Major Revision.
7-6	CUSTOM_REVISION	R	0h	Custom Revision.
5-0	MINOR_REVISION	R	4h	Minor Revision.

7.1.2 CPSW_ALE_STATUS Register (Offset = 0003E004h) [reset = X]

CPSW_ALE_STATUS is shown in Figure 7-2 and described in Table 7-6.

Return to [Summary Table](#).

The ALE status provides information on the ALE configuration and state. The RAMDEPTH is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry Hi is designated by the odd slice index and Lo is designated by the even slice index. The slice index is above the ram depth like {SlixelIndex,RamIndex}. So for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|0x040 and the Lo portion is located at 0x005&(~0x040).

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	POLCNTDIV8	R	1h	This is the number of policer engines the ALE implements divided by 8. A value of 4 indicates 32 policer engines total.
7	RAMDEPTH128	R	0h	The number of ALE entries per slice of the table when this is set it indicates the depth is 128 if both RAMDEPTH128 and RAMDEPTH32 are zero the depth is 64.
6	RAMDEPTH32	R	1h	The number of ALE entries per slice of the table when this is set it indicates the depth is 32 if both RAMDEPTH128 and RAMDEPTH32 are zero the depth is 64.
5	RESERVED	R	0h	
4-0	KLUENTRIES	R	0h	This is the number of table entries total divided by 1024. A value of 1h indicates 1024 table entries. A value of 8h indicates 8192 table entries.

7.1.3 CPSW_ALE_CONTROL Register (Offset = 0003E008h) [reset = X]

CPSW_ALE_CONTROL is shown in [Figure 7-3](#) and described in [Table 7-8](#).

Return to [Summary Table](#).

The ALE Control Register is used to set the ALE modes used for all ports.

Table 7-7. CPSW_ALE_CONTROL Instances

LEGEND: R/W = Read/Write; -n = value after reset

Table 7-8. CPSW_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE. 0h = Drop all packets 1h = Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table. Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now. Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28-25	RESERVED	R/W	0h	

Table 7-8. CPSW_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	MIRROR_DP	R/W	0h	Mirror Destination Port. This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the MIRROR_TOP port.
23-21	UPD_BW_CTRL	R/W	0h	The UPD_BW_CTRL field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the UPD_BW_CTRL can be programmed more aggressive. If the UPD_BW_CTRL is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0h = 350Mhz, 5M 1h = 359Mhz, 11M 2h = 367Mhz, 16M 3h = 375Mhz, 22M 4h = 384Mhz, 28M 5h = 392Mhz, 34M 6h = 400Mhz, 39M 7h = 409Mhz, 45M
20-17	RESERVED	R/W	0h	
16	MIRROR_TOP	R/W	0h	Mirror To Port. This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be 0h for most switch configurations.
14	RESERVED	R/W	0h	
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn. This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable. This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ly_REG_P0_MIRROR_SP set in the CPSW_ly_ALE_PORTCTL0_y registers set will have its received traffic also sent to the MIRROR_TOP port.
9	RESERVED	R/W	X	
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host. 0h = Unknown unicast packets are not sent to the host. 1h = Unknown unicast packets flood to host port as well as other ports.
7	LEARN_NO_VLANID	R/W	0h	Learn No VID. 0h = VID is learned with the source address. 1h = VID is not learned with the source address (source address is not tied to VID). Determines the entry type.

Table 7-8. CPSW_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0h = Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1h = Process the priority tagged packet with VID = 0h.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode. 0h = Any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry. 1h = Any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass. When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0h = No bypass 1h = Bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode. 0h = Broadcast and multicast rate limit counters are received port based. 1h = Broadcast and multicast rate limit counters are transmit port based.
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware. Determines how traffic is forwarded using VLAN rules. 0h = Simple switch rules, packets forwarded to all ports for unknown destinations. 1h = VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode. Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0h = The ALE is not in MAC authorization mode 1h = The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0h = Broadcast/Multicast rates not limited 1h = Broadcast/Multicast packet reception limited to the port control register rate limit fields.

7.1.4 CPSW_ALE_CTRL2 Register (Offset = 0003E00Ch) [reset = X]

CPSW_ALE_CTRL2 is shown in [Figure 7-4](#) and described in [Table 7-10](#).

Return to [Summary Table](#).

The ALE Control 2 Register is used to set the extended features used for all ports.

Table 7-9. CPSW_ALE_CTRL2 Instances

Table 7-10. CPSW_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address. This field enables the destination MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address. This field enables the source MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority. This field enables the VLAN Priority bits to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	R/W	0h	
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN. This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
26	RESERVED	R/W	0h	

Table 7-10. CPSW_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address. This field enables the source IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address. This field enables the destination IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the CPSW_ALE_NXT_HDR register values.
19	RESERVED	R/W	X	
18-16	TRK_BASE	R/W	0h	Trunk Base. This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the [31]TRK_EN_DST, [30]TRK_EN_SRC, [29]TRK_EN_PRI and [27]TRK_EN_VLAN bits are cleared (value: 0h), this value is used as the distribution index. That is a 0h will select the 1st bit of an 'N' link trunk, a 1h will select the second, etc. Below is the distribution across the trunk links. The first number in the sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0h will go to the base port (0), hash result 1h will go to the highest port of the trunk group (2), hash result 2h will go to the middle port (1), etc. 1h = 00000000 2h = 01010101 3h = 02102102 4h = 03210321
15-6	RESERVED	R/W	0h	
5-0	MIRROR_MIDX	R/W	0h	Mirror Index. This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the MIRROR_TOP port. That is any VLAN, ONU or address with or without VLAN can be selected for traffic mirroring.

7.1.5 CPSW_ALE_PRESCALE Register (Offset = 0003E010h) [reset = X]

CPSW_ALE_PRESCALE is shown in [Figure 7-5](#) and described in [Table 7-12](#).

Return to [Summary Table](#).

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 7-11. CPSW_ALE_PRESCALE Instances

Instance	Physical Address
MCU_CPSW0_NUSS_ALE	4603 E010h

31-20	RESERVED	R/W	X	
19-0	ALE_PRESCALE	R/W	0h	ALE Prescale. The input clock is divided by this value for use in the multicast/broadcast rate limiters. The minimum operating value is 10h. The prescaler is off when the value is zero.

7.1.6 CPSW_ALE_AGING_CTRL Register (Offset = 0003E014h) [reset = X]

CPSW_ALE_AGING_CTRL is shown in [Figure 7-6](#) and described in [Table 7-14](#).

Return to [Summary Table](#).

The ALE Aging Control sets the aging interval which will cause periodic aging to occur. This value specifies the minimum time between aging starts.

Table 7-13. CPSW_ALE_AGING_CTRL Instances

Instance	Physical Address
MCU_CPSW0_NUSS_ALE	4603 E014h

Bit	Field	Type	Reset	Description
31	PRESALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable. When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable. When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29-24	RESERVED	R/W	X	
23-0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer. This field specifies the number of clock cycles times 1,000,000 between aging operations.

7.1.7 CPSW_ALE_NXT_HDR Register (Offset = 0003E01Ch) [reset = 0h]

CPSW_ALE_NXT_HDR is shown in [Figure 7-7](#) and described in [Table 7-16](#).

Return to [Summary Table](#).

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the DEFLMTNXTHDR bit in the VLAN entry. All four IP_NXT_HDR0 to IP_NXT_HDR3 bits are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 7-15. CPSW_ALE_NXT_HDR Instances

Table 7-26. CPSW_ly_ALE_PORTCTL0_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ly_REG_P0_BCAST_LIMI T	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	ly_REG_P0_MCAST_LIMI T	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field. The ly_REG_P0_MCAST_LIMIT bit field is the number of Multicast packets that will be forwarded per CPSW_ALE_PRESCALE time.
15	ly_REG_P0_DROP_DOU BLE_VLAN	R/W	0h	Drop Double VLAN. When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	ly_REG_P0_DROP_DUA L_VLAN	R/W	0h	Drop Dual VLAN. When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.

Table 7-26. CPSW_ly_ALE_PORTCTL0_y Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	ly_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames. When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ly_REG_P0_MACONLY set.
12	ly_REG_P0_DIS_PAUTH_MOD	R/W	0h	Disable Port authorization. When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	ly_REG_P0_MACONLY	R/W	0h	MAC Only. When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ly_REG_P0_MACONLY bit set and the ly_REG_P0_NO_LEARN also set. If ly_REG_P0_MACONLY bit is set and the ly_REG_P0_NO_LEARN is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that the host can broadcast to all ports including MacOnly ports in this mode.
10	ly_REG_P0_TRUNKEN	R/W	0h	Trunk Enable. This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ly_REG_P0_TRUNKEN bit is set and having the same ly_REG_P0_TRUNKNUM will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never transmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9-8	ly_REG_P0_TRUNKNUM	R/W	0h	Trunk Number. This field is used as the trunk number when the ly_REG_P0_TRUNKEN bit is also set. Ports with the same trunk number that have the ly_REG_P0_TRUNKEN bit is also set will have traffic distributed within the trunk based on the result of the hash function described above.
7	ly_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the ly_REG_P0_MIRROR_SP bit set will have its received traffic also sent to the MIRROR_TOP port.
6	RESERVED	R/W	X	
5	ly_REG_P0_NO_SA_UPD_ATE	R/W	0h	No Source Address Update. When set will not update the source addresses for this port.
4	ly_REG_P0_NO_LEARN	R/W	0h	No Learn. When set will not learn the source addresses for this port.
3	ly_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check. When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	ly_REG_P0_DROP_UNTAGGED	R/W	0h	If Drop Untagged. When set will drop packets without a VLAN tag.
1-0	ly_REG_P0_PORTSTATE	R/W	0h	Port State. Defines the current port state used for lookup operations. 0h = Disabled 1h = Blocked 2h = Learning 3h = Forwarding

7.1.13 CPSW_ALE_UVLAN_MEMBER Register (Offset = 0003E090h) [reset = X]

CPSW_ALE_UVLAN_MEMBER is shown in [Figure 7-13](#) and described in [Table 7-28](#).

Return to [Summary Table](#).

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

7.1.21 CPSW_ALE_EGRESSOP Register (Offset = 0003E0FCh) [reset = X]

CPSW_ALE_EGRESSOP is shown in [Figure 7-21](#) and described in [Table 7-44](#).

Return to [Summary Table](#).

The Egress Operation register allows enabled classifiers with IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host, but matches a classifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions.

Table 7-43. CPSW_ALE_EGRESSOP Instances

Table 7-44. CPSW_ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0h = NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. FFh: Swaps source address (SA) and destination address (DA) of packet, this is intended to allow OAM diagnostics for a link.
23-21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19-2	RESERVED	R/W	X	
1-0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunk must be set.

7.1.22 CPSW_ALE_POLICECFG0 Register (Offset = 0003E100h) [reset = X]

CPSW_ALE_POLICECFG0 is shown in [Figure 7-22](#) and described in [Table 7-46](#).

Return to [Summary Table](#).

The Policing Config 0 holds the port, frame priority and ONU address index as well as match enables for port, frame priority and ONU address matching.

Table 7-62. CPSW_ALE_POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
30	RESERVED	R/W	X	
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	YELLOW Drop Enable - Enables the ALE to drop yellow packets based on the YELLOWTHRESH bit value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
27	RESERVED	R/W	0h	
26-24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the YELLOW_DROP_EN bit enable. 0h = 100% 1h = 50% 2h = 33% 3h = 25% 4h = 20% 5h = 17% 6h = 14% 7h = 13%

Table 7-62. CPSW_ALE_POLICECONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0h = No Hit packets are marked GREEN 1h = No Hit packets are marked YELLOW 2h = No Hit packets are marked RED 3h = No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.
19-0	RESERVED	R/W	X	

7.1.31 CPSW_ALE_POLICETESTCTL Register (Offset = 0003E128h) [reset = X]

CPSW_ALE_POLICETESTCTL is shown in [Figure 7-31](#) and described in [Table 7-64](#).

Return to [Summary Table](#).

The Policing Test Control enables the ability to determine which policing entry has been hit and whether they reported a red or yellow rate condition.

Table 7-63. CPSW_ALE_POLICETESTCTL Instances

Table 7-78. CPSW_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ECC_CRC_MODE	R/W	0h	ECC CRC Mode. 0h = ECC errors induced through the ECC aggregator flip bits in the packet headers (not in packet data). 1h = ECC errors induced through the ECC aggregator flip bits in the packet data (not in the packet headers).
30-19	RESERVED	R/W	X	
18	EST_ENABLE	R/W	0h	Enhanced Scheduled Traffic enable (EST) 0h = EST is disabled 1h = EST is enabled
17	IET_ENABLE	R/W	0h	Interspersed Express Traffic enable (IET) 0h = IET is disabled 1h = IET is enabled
16	EEE_ENABLE	R/W	0h	Energy Efficient Ethernet enable 0h = Energy Efficient Ethernet is disabled 1h = Energy Efficient Ethernet is enabled
15	P0_RX_PASS_CRC_ERR	R/W	0h	Port 0 Pass Received CRC errors 0h = Packets received with CRC errors on Port 0 are dropped. 1h = Packets received with CRC errors on Port 0 are transferred to the destination ports.

Table 7-78. CPSW_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	P0_RX_PAD	R/W	0h	Port 0 Receive Short Packet Pad 0h = Short packets are dropped. 1h = Short packets are padded to 64-bytes (with pad and added CRC) if the CRC is not passed in. Short packets are dropped if the CRC is passed (in the Info0 word).
13	P0_TX_CRC_REMOVE	R/W	0h	Port 0 Transmit CRC remove. 0h = Do not remove the CRC on Port 0 transmit (egress) packets. 1h = Remove the CRC on all Port 0 transmit (egress) packets.
12	RESERVED	R/W	X	
11	P8_PASS_PRI_TAGGED	R/W	0h	Port 8 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P8_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
10	P7_PASS_PRI_TAGGED	R/W	0h	Port 7 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P7_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
9	P6_PASS_PRI_TAGGED	R/W	0h	Port 6 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P6_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
8	P5_PASS_PRI_TAGGED	R/W	0h	Port 5 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P5_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
7	P4_PASS_PRI_TAGGED	R/W	0h	Port 4 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P4_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
6	P3_PASS_PRI_TAGGED	R/W	0h	Port 3 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P3_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
5	P2_PASS_PRI_TAGGED	R/W	0h	Port 2 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P2_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
4	P1_PASS_PRI_TAGGED	R/W	0h	Port 1 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P1_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
3	P0_PASS_PRI_TAGGED	R/W	0h	Port 0 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port P0_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
2	P0_ENABLE	R/W	0h	Port 0 Enable 0h = CPPI port (port 0) packet operations are disabled 1h = CPPI port (port 0) packet operations are enabled

Table 7-78. CPSW_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	VLAN_AWARE	R/W	0h	VLAN Aware Mode: 0h = CPSW_NU is in the VLAN unaware mode. 1h = CPSW_NU is in the VLAN aware mode.
0	S_CN_SWITCH	R/W	0h	Service or Customer VLAN switch. 0h = Customer switch. VLAN processing uses the inner_vlan_ltype. 1h = Service switch. VLAN processing uses the outer_vlan_ltype.

7.2.3 CPSW_EM_CONTROL_REG Register (Offset = 00020010h) [reset = X]

EST_TS_PRI			EST_TS_ONEPRI	EST_TS_FIRST	EST_TS_EN	EST_BUFSEL	EST_ONEBUF
R/W-0h			R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; -n = value after reset

Table 7-220. CPSW_PN_EST_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	EST_FILL_MARGIN	R/W	0h	EST Fill Margin. Sets the fill margin required to ensure that the Ethernet wire is clear (including IPG) so that the timed EST express packet can egress at the required time. Setting this value too high will put an unnecessary gap on the wire. Setting this value too low will cause the express packet to egress at a time later than intended.
15-9	RESERVED	R/W	X	
8	EST_FILL_EN	R/W	0h	EST Fill Enable. Enable EST fill mode.
7-5	EST_TS_PRI	R/W	0h	EST Timestamp Express Priority. Selects the express priority that timestamp(s) will be generated on when CPSW_PN_EST_CONTROL_REG[4] EST_TS_ONEPRI bit is set.
4	EST_TS_ONEPRI	R/W	0h	EST Timestamp One Express Priority. When set, timestamp only enabled packets on the express priority selected by CPSW_PN_EST_CONTROL_REG[7-5] ST_TS_PRI bit field. When cleared to zero, express packet selection for timestamp is independent of priority.

Table 7-220. CPSW_PN_EST_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	EST_TS_FIRST	R/W	0h	EST Timestamp First Express Packet only. Generate a timestamp only on the first selected express packet in each EST time interval when express timestamps are enabled. (If CPSW_PN_EST_CONTROL_REG[4] EST_TS_ONEPRI is also set then the timestamp is generated only on the first packet on CPSW_PN_EST_CONTROL_REG[7-5] ST_TS_PRI).
2	EST_TS_EN	R/W	0h	EST Timestamp Enable. Enable express timestamps (when CPSW_CONTROL_REG[18] EST_ENABLE and CPSW_PN_CONTROL_REG[17] EST_PORT_EN bits are set).
1	EST_BUFSEL	R/W	0h	EST Buffer Select. If CPSW_PN_EST_CONTROL_REG[0] EST_ONEBUF is cleared, this bit selects the upper (when set) or the lower (when cleared) 64-word fetch buffer. The actual fetch buffer used changes only at the start of the EST time interval and can be read in the CPSW_PN_FIFO_STATUS_REG register, bit [18] EST_BUFACT.
0	EST_ONEBUF	R/W	0h	EST One Fetch Buffer. When set indicates that all 128 fetch words are used in one buffer. When cleared, indicates that the 128 fetch words are split into two 64-word fetch buffers. The CPSW_PN_EST_CONTROL_REG[1] EST_BUFSEL bit selects the buffer to be used when bit [0] EST_ONEBUF is cleared to zero.

7.2.74 CPSW_PN_RX_DSCP_MAP_REG_y Register (Offset = 00022120h + formula) [reset = X]

Table 7-262. CPSW_PN_MAC_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	X	
24	RX_CMF_EN	R/W	0h	RX Copy MAC Control Frames Enable. Enables MAC control frames to be transferred to memory. MAC control frames are normally acted upon (if enabled), but not copied to memory. MAC control frames that are pause frames will be acted upon if enabled in the CPSW_PN_MAC_CONTROL_REG register, regardless of the value of [24] RX_CMF_EN bit. Frames transferred to memory due to [24] RX_CMF_EN will have the control bit set in their EOP buffer descriptor. 0h = MAC control frames are filtered (but acted upon if enabled). 1h = MAC control frames are transferred to memory.
23	RX_CSF_EN	R/W	0h	RX Copy Short Frames Enable. Enables frames or fragments shorter than 64 bytes to be copied to memory. Frames transferred to memory due to CPSW_PN_MAC_CONTROL_REG [23] RX_CSF_EN will have the fragment or undersized bit set in their receive footer. Fragments are short frames that contain CRC/align/code errors and undersized are short frames without errors. 0h = Short frames are filtered. 1h = Short frames are transferred to memory.

Table 7-262. CPSW_PN_MAC_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	RX_CEF_EN	R/W	0h	RX Copy Error Frames Enable. Enables frames containing errors to be transferred to memory. The appropriate error bit will be set in the frame receive footer. Frames containing errors will be filtered when CPSW_PN_MAC_CONTROL_REG[22] RX_CEF_EN is not set. 0h = Frames containing errors are filtered. 1h = Frames containing errors are transferred to memory.
21	TX_SHORT_GAP_LIM_EN	R/W	0h	Transmit Short Gap Limit Enable When set this bit limits the number of short gap packets transmitted to 100ppm. Each time a short gap packet is sent, a counter is loaded with 10,000 and decremented on each wireside clock. Another short gap packet will not be sent out until the counter decrements to zero. This mode is included to preclude the host from filling up the FIFO and sending every packet out with short gap which would violate the maximum number of packets per second allowed. This bit is used only with GMII (not XGMII).
20	EXT_TX_FLOW_EN	R/W	0h	External Transmit Flow Control Enable. Enables the TX_FLOW_EN to be selected from the EXT_TX_FLOW_EN input signal and not from the [4] TX_FLOW_EN bit in CPSW_PN_MAC_CONTROL_REG register.
19	EXT_RX_FLOW_EN	R/W	0h	External Receive Flow Control Enable. Enables the RX_FLOW_EN to be selected from the EXT_RX_FLOW_EN input signal and not from the CPSW_PN_MAC_CONTROL_REG[3] RX_FLOW_EN bit in this register.
18	CTL_EN	R/W	0h	External Control Enable. Enables the full duplex and gigabit mode to be selected from the FULLDUPLEX_IN and GIG_IN input signals and not from the [0] FULLDUPLEX and [7] GIG bits in the CPSW_PN_MAC_CONTROL_REG register. The [0] FULLDUPLEX bit reflects the actual full duplex mode selected.
17	GIG_FORCE	R/W	0h	Gigabit Mode Force. This bit is used to force the Ethernet Mac into gigabit mode if the input GMII_MTCLK has been stopped by the PHY.
16	IFCTL_B	R/W	0h	Interface Control B - Not used.
15	IFCTL_A	R/W	0h	Interface Control A - Determines the RMII link speed 0h = 10Mbps 1h = 100Mbps
14-13	RESERVED	R/W	X	
12	CRC_TYPE	R/W	0h	Port CRC Type 0h = Ethernet CRC 1h = Castagnoli CRC
11	CMD_IDLE	R/W	0h	Command Idle 0h = Idle not commanded 1h = Idle Commanded (read bit [31] IDLE in CPSW_PN_MAC_STATUS_REG register)

Table 7-262. CPSW_PN_MAC_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	TX_SHORT_GAP_ENABLE	R/W	0h	Transmit Short Gap Enable 0h = Transmit with a short IPG is disabled 1h = Transmit with a short IPG (when TX_SHORT_GAP input is asserted) is enabled.
9-8	RESERVED	R/W	X	
7	GIG	R/W	0h	Gigabit Mode. 0h = 10/100 mode 1h = Gigabit mode (full duplex only) The GIG_OUT output is the value of this bit.
6	TX_PACE	R/W	0h	Transmit Pacing Enable 0h = Transmit Pacing Disabled 1h = Transmit Pacing Enabled
5	GMII_EN	R/W	0h	GMII Enable. 0h = GMII RX and TX held in reset. 1h = GMII RX and TX released from reset.
4	TX_FLOW_EN	R/W	0h	Transmit Flow Control Enable. Determines if incoming pause frames are acted upon in full-duplex mode. Incoming pause frames are not acted upon in half-duplex mode regardless of this bit setting. The RX_MBP_ENABLE bits determine whether or not received pause frames are transferred to memory. 0h = Transmit Flow Control Disabled. Full-duplex mode – Incoming pause frames are not acted upon. 1h = Transmit Flow Control Enabled. Full-duplex mode – Incoming pause frames are acted upon.
3	RX_FLOW_EN	R/W	0h	Receive Flow Control Enable. 0h = Receive Flow Control Disabled Half-duplex mode – No flow control generated collisions are sent. Full-duplex mode – No outgoing pause frames are sent. 1h = Receive Flow Control Enabled Half-duplex mode – Collisions are initiated when receive flow control is triggered. Full-duplex mode – Outgoing pause frames are sent when receive flow control is triggered.
2	MTEST	R/W	0h	Manufacturing Test mode. This bit must be set to allow writes to the CPSW_PN_MAC_BOFFTEST_REG and CPSW_PN_MAC_RX_PAUSETIMER_REG registers.
1	LOOPBACK	R/W	0h	Loop Back Mode. Loopback mode forces internal full duplex mode regardless of whether the CPSW_PN_MAC_CONTROL_REG[0] FULLDUPLEX bit is set or not. The [1] LOOPBACK bit should be changed only when [5] GMII_EN is de-asserted. Loopback is used only with GMII (not XGMII). Loopback is not compatible with timestamp operations (CPTS). 0h = Not looped back mode 1h = Loop Back mode enabled

Table 7-262. CPSW_PN_MAC_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	FULLDUPLEX	R/W	0h	<p>Full Duplex mode.</p> <p>Gigabit mode forces fullduplex mode regardless of whether the [0] FULLDUPLEX bit is set or not.</p> <p>The FULLDUPLEX_OUT output is the value of this register bit</p> <p>0h = Half duplex mode</p> <p>1h = Full duplex mode</p>

Table 7-264. CPSW_PN_MAC_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	Enet IDLE. The Ethernet port (express and preempt) are in the Idle state (valid after an Idle command) 0h = The port is not in the Idle state. 1h = The port is in the Idle state.
30	E_IDLE	R	1h	Express MAC is Idle.
29	P_IDLE	R	1h	Preempt MAC is Idle.
28	TX_IDLE	R	1h	Mac Transmit Idle. Both Preempt and Express MAC Transmit are in Idle state.
27	TORF	R	0h	Top of receive FIFO flow control trigger occurred. This bit is write one to clear.
26-24	TORF_PRI	R	0h	The lowest priority that caused top of receive FIFO flow control trigger since the last write to clear. This field is write 7h to clear.
23-16	TX_PFC_FLOW_ACT	R	0h	Transmit Priority Based Flow Control Active (priority 7 down to 0)
15-8	RX_PFC_FLOW_ACT	R	0h	Receive Priority Based Flow Control Active (priority 7 down to 0)
7	RESERVED	R	X	
6	EXT_RX_FLOW_EN	R	0h	External Receive Flow Control Enable. This is the value of the CPSW_PN_MAC_CONTROL_REG [19] EXT_RX_FLOW_EN input bit.

Table 7-264. CPSW_PN_MAC_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	EXT_TX_FLOW_EN	R	0h	External Transmit Flow Control Enable. This is the value of the CPSW_PN_MAC_CONTROL_REG [20] EXT_TX_FLOW_EN input bit.
4	EXT_GIG	R	0h	External GIG. This is the value of the [4] EXT_GIG input bit.
3	EXT_FULLDUPLEX	R	0h	External Fullduplex. This is the value of the [3] EXT_FULLDUPLEX input bit.
2	RESERVED	R	X	
1	RX_FLOW_ACT	R	0h	Receive Flow Control Active. When asserted, indicates that receive flow control is enabled and triggered.
0	TX_FLOW_ACT	R	0h	Transmit Flow Control Active. When asserted, this bit indicates that the pause time period is being observed for a received pause frame. No new transmissions will begin while this bit is asserted except for the transmission of pause frames. Any transmission in progress when this bit is asserted will complete.

7.2.96 CPSW_PN_MAC_SOFT_RESET_REG Register (Offset = 00022338h) [reset = X]

Table 7-268. CPSW_PN_MAC_BOFFTEST_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-26	PACEVAL	R/W	0h	Pacing Current Value. A non-zero value in this field indicates that transmit pacing is active. A transmit frame collision or deferral causes paceval to loaded with decimal 31, good frame transmissions (with no collisions or deferrals) cause paceval to be decremented down to zero. When paceval is nonzero, the transmitter delays 4 IPGs between new frame transmissions after each successfully transmitted frame that had no deferrals or collisions. Transmit pacing helps reduce "capture" effects improving overall network bandwidth.
25-16	RNDNUM	R/W	0h	Backoff Random Number Generator. This field allows the Backoff Random Number Generator to be read (or written in test mode only). This field can be written only when CPSW_PN_MAC_CONTROL_REG[2] MTEST bit has previously been set. Reading this field returns the generator's current value. The value is reset to zero and begins counting on the clock after the de-assertion of reset.
15-12	COLL_COUNT	R	0h	Collision Count.
11-10	RESERVED	R/W	X	

Table 7-268. CPSW_PN_MAC_BOFFTEST_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description

7.3.2 CPSW_INT_EOI_REG Register (Offset = 1010h) [reset = X]

CPSW_INT_EOI_REG is shown in [Figure 7-145](#) and described in [Table 7-296](#).

Return to [Summary Table](#).

End of Interrupt Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 7-316. CPSW_CPTS_TS_PUSH_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	TS_PUSH	W	0h	Time stamp event push. When a logic high is written to this bit a time stamp event is pushed onto the event FIFO. The time stamp value is the time of the write of this register, not the time of the event read. The time stamp value can then be read on interrupt via the event registers. Software should not push a second time stamp event onto the event FIFO until the first time stamp value has been read from the event FIFO (there should be only one time stamp event in the event FIFO at any given time). This bit is write only and always reads zero.

7.4.5 CPSW_CPTS_TS_LOAD_VAL_REG Register (Offset = 0003D010h) [reset = 0h]

CPSW_CPTS_TS_LOAD_VAL_REG is shown in [Figure 7-155](#) and described in [Table 7-318](#).

CPSW_ECC_SEC_EOI_REG is shown in [Figure 7-199](#) and described in [Table 7-408](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

7.5.9 CPSW_ECC_DED_EOI_REG Register (Offset = 13Ch) [reset = X]

CPSW_ECC_DED_EOI_REG is shown in [Figure 7-203](#) and described in [Table 7-416](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 7-436. CPSW_MDIO_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1h when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1h to this bit enables the MDIO state machine, writing a 0h disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	R/W	X	
28-24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest user access channel that is available in the module and is currently set to 1h. This implies that MDIOUserAccess1 is the highest available user access channel.
23-21	RESERVED	R/W	X	
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1h to this bit disables this device from sending MDIO frame preambles in clause 22 mode of operation. This bit has no effect in clause 45 mode of operation.

Table 7-436. CPSW_MDIO_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	FAULT	R/W	0h	Fault indicator. This bit is set to 1h if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1h to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1h to enable the physical layer fault detection.
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable. This bit can be set to 1h to enable the host to set the userint and linkint bits for test purposes.
16	RESERVED	R/W	X	
15-0	CLKDIV	R/W	FFh	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0h. $\text{MDCLK frequency} = \text{clk frequency} / (\text{clkdiv} + 1)$.

7.6.3 CPSW_MDIO_ALIVE_REG Register (Offset = F08h) [reset = 0h]

CPSW_MDIO_ALIVE_REG is shown in [Figure 7-213](#) and described in [Table 7-438](#).

Return to [Summary Table](#).

LEGEND: R = Read Only; -n = value after reset

Table 7-440. CPSW_MDIO_LINK_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LINK	R	0h	<p>MDIO Link state.</p> <p>This register is updated after a read of the Generic Status Register of a PHY. The corresponding bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is cleared to 0h if the PHY indicates it does not have link or fails to acknowledge the read transaction.</p> <p>Writes to the register have no effect. In addition, in Normal Mode Operation, the status of the two PHYs specified in the MDIOUserPhySel registers can be determined using the MLINK input pins. This is determined by the linksel bit in the MDIOUserPhySel register. In State Change Mode the MLINK input pins are unused.</p>

7.6.5 CPSW_MDIO_LINK_INT_RAW_REG Register (Offset = F10h) [reset = X]

CPSW_MDIO_LINK_INT_RAW_REG is shown in [Figure 7-215](#) and described in [Table 7-442](#).

Return to [Summary Table](#).

Table 7-444. CPSW_MDIO_LINK_INT_MASKED_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	LINKINTMASKED	R/W	0h	MDIO link change interrupt masked value. Normal mode operation: When asserted '1', a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register and the corresponding CPSW_MDIO_USER_PHY_SEL_REG_k[6] LINKINT_ENABLE bit was set. CPSW_MDIO_LINK_INT_MASKED_REG[0] LINKINTMASKED and [1] LINKINTMASKED correspond to MDIOUserPhySel0 and MDIOUserPhySel1, respectively. Writing a 1h will clear the interrupt and writing 0h has no effect. These masked interrupt bits are the MDIO_LINKINT[1:0] pin values. MDIO link change interrupt masked value. State Change Mode operation: The [0] LINKINTMASKED bit will be asserted '1' when CPSW_MDIO_LINK_INT_RAW_REG[0] LINKINTRAW is asserted '1' and when the CPSW_MDIO_LINK_INT_MASK_SET_REG[0] LINKINTMASKSET bit is set to 1h. Writing a 1h will clear [0] LINKINTMASKED (and the MDIO_LINKINT[0] output) and writing 0h has no effect. The [1] LINKINTMASKED bit is not used in State Change Mode (MDIO_LINKINT[1] is therefore also unused in State Change Mode).

7.6.7 CPSW_MDIO_LINK_INT_MASK_SET_REG Register (Offset = F18h) [reset = X]

CPSW_MDIO_LINK_INT_MASK_SET_REG is shown in [Figure 7-217](#) and described in [Table 7-446](#).

Return to [Summary Table](#).

Table 7-458. CPSW_MDIO_MANUAL_IF_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	X	
2	MDIO_MDCLK_O	R/W	0h	MDIO Clock Output. This value is the MDCLK_O output value when the [31] MANUALMODE bit is set in the CPSW_MDIO_POLL_REG register.
1	MDIO_OE	R/W	0h	MDIO Output Enable. This value is inverted and output on the MDIO_OE_N output when the [31] MANUALMODE bit is set in the CPSW_MDIO_POLL_REG register.
0	MDIO_PIN	R/W	0h	MDIO_Pin Value. This is the external MDIO data pin value when the [31] MANUALMODE bit is set in the CPSW_MDIO_POLL_REG register. That is, this value is driven on the MDIO_O (the MDIO serial data output) when MDIO_OE is asserted '1'. The read value for this bit comes from MDIO_I (the MDIO serial data input). If MDIO_OE is asserted '1' and MDIO_PIN is written with a 1h then MDIO_PIN should read a 1h if there are no external devices pulling the MDIO data line low.

7.6.14 CPSW_MDIO_POLL_REG Register (Offset = F34h) [reset = X]

CPSW_MDIO_POLL_REG is shown in Figure 7-224 and described in Table 7-460.

Return to [Summary Table](#).

Table 7-470. CPSW_MDIO_USER_ACCESS_REG_k Register Field Descriptions

Bit	Field	Type	Reset	Description
31	GO	R/W	0h	Go. Writing a 1h to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0h to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1h. If byte access is being used, the go bit should be written last.
30	WRITE	R/W	0h	Write enable. Setting this bit to a 1h causes the MDIO transaction to be a register write, otherwise it is a register read.
29	ACK	R/W	0h	Acknowledge. This bit is set if the PHY acknowledged the read transaction.
28-26	RESERVED	R/W	X	
25-21	REGADR	R/W	0h	Register address. This field specifies the PHY register to be accessed for this transaction in clause 22 mode or the MMD value in clause 45 mode.
20-16	PHYADR	R/W	0h	PHY address. This field specifies the PHY to be accessed for this transaction.

Table 7-470. CPSW_MDIO_USER_ACCESS_REG_k Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-0	DATA	R/W	0h	User data. The data value read from or to be written to the specified PHY register.

7.6.20 CPSW_MDIO_USER_PHY_SEL_REG_k Register (Offset = F84h + formula) [reset = X]

CPSW_MDIO_USER_PHY_SEL_REG_k is shown in Figure 7-230 and described in Table 7-472.

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1	RT_SOFT_RESET	R/W	0h	Transmit and Receive Software Reset. Write 0h = The reset condition is removed. Write 1h = Causes the CPSGMII transmit and receive logic to be in the reset condition (the VBUSP_CLK domain is not reset). This bit is intended to be used when changing between loopback mode and normal mode of operation.
0	SOFT_RESET	R/W	0h	Software Reset. Write 1h = Causes the CPSGMII logic to be reset. Software reset occurs immediately. This bit reads as a zero.

7.9.3 CPSW_SGMII_CONTROL_REG Register (Offset = 110h) [reset = X]

CPSW_SGMII_CONTROL_REG is shown in [Figure 7-240](#) and described in [Table 7-498](#).

Return to [Summary Table](#).

SGMII Control Register

LEGEND: R/W = Read/Write; -n = value after reset

Table 7-498. CPSW_SGMII_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	X	
6	TEST_PATTERN_EN	R/W	0h	Test Pattern Enable. Force the output of K28.5 on TX_ENC for test purposes. 0h = Operation 1h = Forced K28.5 on transmit output
5	MASTER	R/W	0h	Master Mode. 0h = Slave Mode 1h = Master mode – Set to one for one side of a direct connection. When this bit is set, the control logic uses the CPSW_SGMII_MR_ADV_ABILITY_REG register to determine speed and duplexity instead of the CPSW_SGMII_MR_LP_ADV_ABILITY_REG register. Master mode allows a CPSPGMII direct connection with auto-negotiation or with a forced link.
4	LOOPBACK	R/W	0h	Loopback mode. 0h = Not in internal loopback mode 1h = Internal loopback mode. The transmit clock (TX_CLK) is used for transmit and receive.

Table 7-498. CPSW_SGMII_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MR_NP_LOADED	R/W	0h	Next Page Loaded. Writing 1h to this bit informs the auto-negotiation process that the next page register has been loaded. This bit is cleared by the auto-negotiation state machine before the CPSW_SGMII_STATUS_REG [3] MR_PAGE_RX status bit is set. This bit is not used when the SGMII_MODE input is asserted.
2	FAST_LINK_TIMER	R/W	0h	Fast Link Timer. 0h = The link timer value is 10ms in FIBER mode and 1.6ms in SGMII mode. 1h = The link timer value is 2μs in FIBER and SGMII mode. This is included for test purposes.
1	MR_AN_RESTART	R/W	0h	Auto Negotiation Restart. Writing 1h and then 0h to this bit causes the auto-negotiation process to be restarted.
0	MR_AN_ENABLE	R/W	0h	Auto Negotiation Enable. Writing 1h to this bit enables the auto-negotiation process.

7.9.4 CPSW_SGMII_STATUS_REG Register (Offset = 114h) [reset = X]

CPSW_SGMII_STATUS_REG is shown in [Figure 7-241](#) and described in [Table 7-500](#).

Return to [Summary Table](#).

SGMII Status Register

Note: SGMII mode is not supported on the 2-port CPSW module.

Table 7-500. CPSW_SGMII_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	X	
5	FIB_SIG_DETECT	R	0h	Fiber Signal Detect. This is the FIB_SIG_DETECT input pin.
4	LOCK	R	0h	Lock. This is the LOCK input pin. Indicates that the SERDES PLL is locked.
3	MR_PAGE_RX	R	0h	Next Page Received. This bit is set to one by the auto-negotiation state machine when the next page has been received. This bit is cleared to 0h by a host write of 1h to the [3]MR_NP_LOADED bit in the CPSW_SGMII_CONTROL_REG register. This value is not valid until the lock status bit is ([4] LOCK) asserted.
2	MR_AN_COMPLETE	R	0h	Auto negotiation complete. This value is not valid until the lock status bit is asserted. 0h = Auto-negotiation is not complete 1h = Auto-negotiation is completed.

Table 7-500. CPSW_SGMII_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	AN_ERROR	R	0h	Auto negotiation error. For SGMII mode, an auto-negotiation error occurs when halfduplex Gigabit is commanded. For FIBER mode, an auto-negotiation error occurs if both sides cannot be full duplex. This value is not valid until the lock status bit is asserted. 0h = No auto-negotiation error 1h = Auto-negotiation error
0	LINK	R	0h	Link indicator. This value is not valid until the lock status bit is asserted. 0h = Link is not up. 1h = Link is up.

7.9.5 CPSW_SGMII_MR_ADV_ABILITY_REG Register (Offset = 118h) [reset = X]

7.10.1 CPSW_STAT0_RXGOODFRAMES Register (Offset = 0003A000h) [reset = 0h]

CPSW_STAT0_RXGOODFRAMES is shown in [Figure 7-252](#) and described in [Table 7-524](#).

Return to [Summary Table](#).

The total number of good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Had a length of 64 to SL_RX_MAXLEN[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the RX_ALIGN_CODE_ERRORS and [CPSW_STAT0_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

7.10.2 CPSW_STAT0_RXBROADCASTFRAMES Register (Offset = 0003A004h) [reset = 0h]

CPSW_STAT0_RXBROADCASTFRAMES is shown in [Figure 7-253](#) and described in [Table 7-526](#).

Return to [Summary Table](#).

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- Any data or MAC control frame which was destined for only address 0xFFFFFFFF
- Had a length of CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the CPSW_STAT0_RXCRCERRORS statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

7.10.3 CPSW_STAT0_RXMULTICASTFRAMES Register (Offset = 0003A008h) [reset = 0h]

CPSW_STAT0_RXMULTICASTFRAMES is shown in [Figure 7-254](#) and described in [Table 7-528](#).

Return to [Summary Table](#).

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- Any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFF
- Had a length of CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the [CPSW_STAT0_RXCRCERRORS](#) statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

7.10.4 CPSW_STAT0_RXCRCERRORS Register (Offset = 0003A010h) [reset = 0h]

CPSW_STAT0_RXCRCERRORS is shown in [Figure 7-255](#) and described in [Table 7-530](#).

Return to [Summary Table](#).

The total number of frames received on the port that experienced a CRC error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to CPSW0_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no code/align error,
- Had a CRC error Overruns have no effect upon this statistic.

A CRC error is defined to be:

- A frame containing an even number of nibbles
- Failing the Frame Check Sequence test.

7.10.5 CPSW_STAT0_RXOVERSIZEDFRAMES Register (Offset = 0003A018h) [reset = 0h]

CPSW_STAT0_RXOVERSIZEDFRAMES is shown in [Figure 7-256](#) and described in [Table 7-532](#).

Return to [Summary Table](#).

The total number of oversized frames received on the port. An oversized frame is defined to be:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than [CPSW_P0_RX_MAXLEN_REG](#)[13-0] RX_MAXLEN in bytes
- Had no CRC error, alignment error or code error

See the [CPSW_STAT0_RXCRCERRORS](#) statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT0_RXUNDERSIZEDFRAMES is shown in [Figure 7-257](#) and described in [Table 7-534](#).

Return to [Summary Table](#).

The total number of undersized frames received on the port. An undersized frame is defined to be:

- Was any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was less than 64 octets long
- Had no CRC error, alignment error or code error

See the [CPSW_STAT0_RXCRCERRORS](#) statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

7.10.7 CPSW_STAT0_RXFRAGMENTS Register (Offset = 0003A024h) [reset = 0h]

CPSW_STAT0_RXFRAGMENTS is shown in [Figure 7-258](#) and described in [Table 7-536](#).

Return to [Summary Table](#).

The total number of frame fragments received on the port. A frame fragment is defined to be:

- Any data frame (address matching does not matter)
- Less than 64 bytes long
- Having a CRC error, an alignment error, or a code error
- Not the result of a collision caused by half duplex, collision based flow control

See the [CPSW_STAT0_RXCRCERRORS](#) statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT0_TXBROADCASTFRAMES is shown in [Figure 7-263](#) and described in [Table 7-546](#).

Return to [Summary Table](#).

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- Any data or MAC control frame which was destined for only address 0xFFFFFFFF
- Any length
- Had no late or excessive collisions, no carrier loss and no underrun

7.10.14 CPSW_STAT0_TXOCTETS Register (Offset = 0003A064h) [reset = 0h]

CPSW_STAT0_TXOCTETS is shown in Figure 7-265 and described in Table 7-550.

Return to [Summary Table](#).

The total number of bytes in all good frames transmitted on the port. A good frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Was any size
- Had no late or excessive collisions, no carrier loss and no underrun.

CPSW_STAT0_OCTETFRAMES64 is shown in [Figure 7-266](#) and described in [Table 7-552](#).

Return to [Summary Table](#).

The total number of 64-byte frames received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was exactly 64 bytes long. (If the frame was being transmitted and experienced carrier loss that resulted in a frame of this size being transmitted, then the frame will be recorded in this statistic).

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

7.10.16 CPSW_STAT0_OCTETFRAMES65T127 Register (Offset = 0003A06Ch) [reset = 0h]

CPSW_STAT0_OCTETFRAMES65T127 is shown in [Figure 7-267](#) and described in [Table 7-554](#).

Return to [Summary Table](#).

The total number of frames of size 65 to 127 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 65 to 127 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

CPSW_STAT0_OCTETFRAMES512T1023 is shown in [Figure 7-270](#) and described in [Table 7-560](#).

Return to [Summary Table](#).

The total number of frames of size 512 to 1023 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 512 to 1023 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

7.10.20 CPSW_STAT0_OCTETFRAMES1024TUP Register (Offset = 0003A07Ch) [reset = 0h]

CPSW_STAT0_OCTETFRAMES1024TUP is shown in [Figure 7-271](#) and described in [Table 7-562](#).

Return to [Summary Table](#).

The total number of frames of size 1024 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes for receive or 1024 up for transmit on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
 - Did not experience late collisions, excessive collisions, or carrier sense error
 - Was 1024 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes long on receive, or any size on transmit
- CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 1024 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes received and 1024 bytes or greater transmitted.

7.10.21 CPSW_STAT0_NETOCTETS Register (Offset = 0003A080h) [reset = 0h]

CPSW_STAT0_NETOCTETS is shown in Figure 7-272 and described in Table 7-564.

Return to [Summary Table](#).

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter)
- Any length (including less than 64 bytes and greater than CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes)

Also counted in this statistic is:

- Every byte transmitted before a carrier- loss was experienced
- Every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time)
- Every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting)

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic. The objective of this statistic is to give a reasonable indication of ethernet utilization

7.11.1 CPSW_STAT1_RXGOODFRAMES Register (Offset = 0003A200h) [reset = 0h]

CPSW_STAT1_RXGOODFRAMES is shown in [Figure 7-303](#) and described in [Table 7-628](#).

Return to [Summary Table](#).

The total number of good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Had a length of 64 to [CPSW_P0_RX_MAXLEN_REG](#)[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

7.11.2 CPSW_STAT1_RXBROADCASTFRAMES Register (Offset = 0003A204h) [reset = 0h]

CPSW_STAT1_RXBROADCASTFRAMES is shown in [Figure 7-304](#) and described in [Table 7-630](#).

Return to [Summary Table](#).

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- Any data or MAC control frame which was destined for only address 0xFFFFFFFF
- Had a length of CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT1_RXMULTICASTFRAMES is shown in [Figure 7-305](#) and described in [Table 7-632](#).

Return to [Summary Table](#).

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- Any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFF
- Had a length of CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

7.11.4 CPSW_STAT1_RXPAUSEFRAMES Register (Offset = 0003A20Ch) [reset = 0h]

CPSW_STAT1_RXPAUSEFRAMES is shown in Figure 7-306 and described in Table 7-634.

Return to [Summary Table](#).

The total number of IEEE 802.3X pause frames received by the port (whether acted upon or not). Such a frame:

- Contained any unicast, broadcast, or multicast address
- Contained the length/type field value 88.08 (hex) and the opcode 0x0001
- Was of length 64 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error
- Pause-frames had been enabled on the port (CPSW_PN_MAC_CONTROL_REG[4] TX_FLOW_EN = 1h). The port could have been in either half or full-duplex mode.

See the CPSW_STAT1_RXALIGNCODEERRORS and CPSW_STAT1_RXCRCERRORS statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

**Table 7-633. CPSW_STAT1_RXPAUSEFRAMES

7.11.5 CPSW_STAT1_RXCRCERRORS Register (Offset = 0003A210h) [reset = 0h]

CPSW_STAT1_RXCRCERRORS is shown in [Figure 7-307](#) and described in [Table 7-636](#).

Return to [Summary Table](#).

The total number of frames received on the port that experienced a CRC error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no code/align error,
- Had a CRC error Overruns have no effect upon this statistic.

A CRC error is defined to be:

- A frame containing an even number of nibbles
- Failing the Frame Check Sequence test

**Table 7-635. CPSW_STAT1_RXCRCERRORS

7.11.6 CPSW_STAT1_RXALIGNCODEERRORS Register (Offset = 0003A214h) [reset = 0h]

CPSW_STAT1_RXALIGNCODEERRORS is shown in [Figure 7-308](#) and described in [Table 7-638](#).

Return to [Summary Table](#).

The total number of frames received on the port that experienced an alignment error or code error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had either an alignment error or a code error Overruns have no effect upon this statistic. An alignment error is defined to be:
 - A frame containing an odd number of nibbles
 - Failing the Frame Check Sequence test if the final nibble is ignored

A code error is defined to be a frame which has been discarded because the port's MRXER pin driven with a one for at least one bit-time's duration at any point during the frame's reception.

Note: RFC 1757 etherStatsCRCAlignErrors Ref. 1.5 can be calculated by summing

CPSW_STAT1_RXALIGNCODEERRORS and CPSW_STAT1_RXCRCERRORS.

7.11.7 CPSW_STAT1_RXOVERSIZEDFRAMES Register (Offset = 0003A218h) [reset = 0h]

CPSW_STAT1_RXOVERSIZEDFRAMES is shown in [Figure 7-309](#) and described in [Table 7-640](#).

Return to [Summary Table](#).

The total number of oversized frames received on the port. An oversized frame is defined to be:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than [CPSW_P0_RX_MAXLEN_REG](#)[13-0] RX_MAXLEN in bytes
- Had no CRC error, alignment error or code error

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT1_RXJABBERFRAMES is shown in [Figure 7-310](#) and described in [Table 7-642](#).

Return to [Summary Table](#).

The total number of jabber frames received on the port. A jabber frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN in bytes
- Had no CRC error, alignment error or code error

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT1_RXUNDERSIZEDFRAMES is shown in [Figure 7-311](#) and described in [Table 7-644](#).

Return to [Summary Table](#).

The total number of undersized frames received on the port. An undersized frame is defined to be:

- Was any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was less than 64 octets long
- Had no CRC error, alignment error or code error

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT1_RXFRAGMENTS is shown in Figure 7-312 and described in Table 7-646.

Return to [Summary Table](#).

The total number of frame fragments received on the port. A frame fragment is defined to be:

- Any data frame (address matching does not matter)
- Less than 64 bytes long
- Having a CRC error, an alignment error, or a code error
- Not the result of a collision caused by half duplex, collision based flow control

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

7.11.13 CPSW_STAT1_RXOCTETS Register (Offset = 0003A230h) [reset = 0h]

CPSW_STAT1_RXOCTETS is shown in [Figure 7-315](#) and described in [Table 7-652](#).

Return to [Summary Table](#).

The total number of bytes in all good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Of length 64 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error

See the [CPSW_STAT1_RXALIGNCODEERRORS](#) and [CPSW_STAT1_RXCRCERRORS](#) statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

7.11.17 CPSW_STAT1_TXPAUSEFRAMES Register (Offset = 0003A240h) [reset = 0h]

CPSW_STAT1_TXPAUSEFRAMES is shown in [Figure 7-319](#) and described in [Table 7-660](#).

Return to [Summary Table](#).

This statistic indicates the number of IEEE 802.3X pause frames transmitted by the port. Pause frames cannot underrun or contain a CRC error because they are created in the transmitting MAC, so these error conditions have no effect upon the statistic. Pause frames sent by software will not be included in this count. Since pause frames are only transmitted in full duplex carrier loss and collisions have no effect upon this statistic. Transmitted pause frames are always 64 byte multicast frames so will appear in the [CPSW_STAT1_TXMULTICASTFRAMES](#) and [CPSW_STAT1_OCTETFRAMES64](#) statistics.

**Table 7-659. CPSW_STAT1_TXPAUSEFRAMES

7.11.18 CPSW_STAT1_TXDEFERREDFRAMES Register (Offset = 0003A244h) [reset = 0h]

CPSW_STAT1_TXDEFERREDFRAMES is shown in Figure 7-320 and described in Table 7-662.

Return to [Summary Table](#).

The total number of frames transmitted on the port that first experienced deferment. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced no collisions before being successfully transmitted
- Found the medium busy when transmission was first attempted, so had to wait. CRC errors have no effect upon this statistic.

7.11.19 CPSW_STAT1_TXCOLLISIONFRAMES Register (Offset = 0003A248h) [reset = 0h]

CPSW_STAT1_TXCOLLISIONFRAMES is shown in [Figure 7-321](#) and described in [Table 7-664](#).

Return to [Summary Table](#).

This statistic records the total number of times that the port experienced a collision. Collisions occur under two circumstances.

1. When a transmit data or MAC control frame:
 - Was destined for any unicast, broadcast or multicast address
 - Was any size
 - Had no carrier loss and no underrun
 - Experienced a collision. A jam sequence is sent for every non-late collision, so this statistic will increment on each occasion if a frame experiences multiple collisions (and increments on late collisions) CRC errors have no effect upon this statistic.
2. When the port is in half-duplex mode, flow control is active, and a frame reception begins.

**Table 7-663. CPSW_STAT1_TXCOLLISIONFRAMES
Instances**

7.11.20 CPSW_STAT1_TXSINGLECOLLFRAMES Register (Offset = 0003A24Ch) [reset = 0h]

CPSW_STAT1_TXSINGLECOLLFRAMES is shown in [Figure 7-322](#) and described in [Table 7-666](#).

Return to [Summary Table](#).

The total number of frames transmitted on the port that experienced exactly one collision. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced one collision before successful transmission. The collision was not late.

CRC errors have no effect upon this statistic.

CPSW_STAT1_TXMULTCOLLFRAMES is shown in [Figure 7-323](#) and described in [Table 7-668](#).

Return to [Summary Table](#).

The total number of frames transmitted on the port that experienced multiple collisions. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced 2 to 15 collisions before being successfully transmitted. None of the collisions were late.

CRC errors have no effect upon this statistic.

7.11.22 CPSW_STAT1_TXEXCESSIVECOLLISIONS Register (Offset = 0003A254h) [reset = 0h]

CPSW_STAT1_TXEXCESSIVECOLLISIONS is shown in [Figure 7-324](#) and described in [Table 7-670](#).

Return to [Summary Table](#).

The total number of frames for which transmission was abandoned due to excessive collisions. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- Had no carrier loss and no underrun
- Experienced 16 collisions before abandoning all attempts at transmitting the frame. None of the collisions were late.

CRC errors have no effect upon this statistic.

7.11.23 CPSW_STAT1_TXLATECOLLISIONS Register (Offset = 0003A258h) [reset = 0h]

CPSW_STAT1_TXLATECOLLISIONS is shown in Figure 7-325 and described in Table 7-672.

Return to [Summary Table](#).

The total number of frames on the port for which transmission was abandoned because they experienced a late collision. Such a frame:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
 - Was any size
 - Experienced a collision later than 512 bit-times into the transmission. There may have been up to 15 previous (non-late) collisions which had previously required the transmission to be re-attempted. The Late Collisions statistic dominates over the single, multiple and excessive Collisions statistics - if a late collision occurs the frame will not be counted in any of these other three statistics.
- CRC errors have no effect upon this statistic.

7.11.25 CPSW_STAT1_TXCARRIERSENSEERRORS Register (Offset = 0003A260h) [reset = 0h]

CPSW_STAT1_TXCARRIERSENSEERRORS is shown in [Figure 7-327](#) and described in [Table 7-676](#).

Return to [Summary Table](#).

The total number of frames received on the port that had a middle of frame (MOF) overrun. MOF overrun frame is defined to be:

- Was any data or MAC control frame destined for any unicast, broadcast or multicast address
- Was any size
- The carrier sense condition was lost or never asserted when transmitting the frame (the frame is not retransmitted). This is a transmit only statistic. Carrier Sense is a don't care for received frames. Transmit frames with carrier sense errors are sent until completion and are not aborted.

CRC errors have no effect upon this statistic.

CPSW_STAT1_OCTETFRAMES64 is shown in [Figure 7-329](#) and described in [Table 7-680](#).

Return to [Summary Table](#).

The total number of 64-byte frames received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was exactly 64 bytes long. (If the frame was being transmitted and experienced carrier loss that resulted in a frame of this size being transmitted, then the frame will be recorded in this statistic).

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

7.11.30 CPSW_STAT1_OCTETFRAMES256T511 Register (Offset = 0003A274h) [reset = 0h]

CPSW_STAT1_OCTETFRAMES256T511 is shown in [Figure 7-332](#) and described in [Table 7-686](#).

Return to [Summary Table](#).

The total number of frames of size 256 to 511 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 256 to 511 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

7.11.31 CPSW_STAT1_OCTETFRAMES512T1023 Register (Offset = 0003A278h) [reset = 0h]

CPSW_STAT1_OCTETFRAMES512T1023 is shown in [Figure 7-333](#) and described in [Table 7-688](#).

Return to [Summary Table](#).

The total number of frames of size 512 to 1023 bytes received and transmitted on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
- Did not experience late collisions, excessive collisions, or carrier sense error
- Was 512 to 1023 bytes long

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

CPSW_STAT1_OCTETFRAMES1024TUP is shown in [Figure 7-334](#) and described in [Table 7-690](#).

Return to [Summary Table](#).

The total number of frames of size 1024 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes for receive or 1024 up for transmit on the port. Such a frame is defined to be:

- Any data or MAC control frame which was destined for any unicast, broadcast or multicast address
 - Did not experience late collisions, excessive collisions, or carrier sense error
 - Was 1024 to CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes long on receive, or any size on transmit
- CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

7.11.33 CPSW_STAT1_NETOCTETS Register (Offset = 0003A280h) [reset = 0h]

CPSW_STAT1_NETOCTETS is shown in [Figure 7-335](#) and described in [Table 7-692](#).

Return to [Summary Table](#).

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter)
- Any length (including less than 64 bytes and greater than CPSW0_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes)

Also counted in this statistic is:

- Every byte transmitted before a carrier- loss was experienced
- Every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time)
- Every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting)

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic. The objective of this statistic is to give a reasonable indication of ethernet utilization

5-0	MINOR_REVISION	R	4h	Minor Revision.

8.1.2 CPSW_ALE_STATUS Register (Offset = 0003E004h) [reset = X]

CPSW_ALE_STATUS is shown in [Figure 8-2](#) and described in [Table 8-6](#).

Return to [Summary Table](#).

The ALE status provides information on the ALE configuration and state. The RAMDEPTH is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry Hi is designated by the odd slice index and Lo is designated by the even slice index. The slice index is above the ram depth like {SlixelIndex,RamIndex}. So for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|0x040 and the Lo portion is located at 0x005&(~0x040).

Table 8-8. CPSW_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE. 0h = Drop all packets 1h = Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table. Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.

Table 8-8. CPSW_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now. Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28	RESERVED	R/W	X	
27-24	MIRROR_DP	R/W	0h	Mirror Destination Port. This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the MIRROR_TOP port.
23-21	UPD_BW_CTRL	R/W	0h	The UPD_BW_CTRL field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the UPD_BW_CTRL can be programmed more aggressive. If the UPD_BW_CTRL is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0h = 350Mhz, 5M 1h = 359Mhz, 11M 2h = 367Mhz, 16M 3h = 375Mhz, 22M 4h = 384Mhz, 28M 5h = 392Mhz, 34M 6h = 400Mhz, 39M 7h = 409Mhz, 45M
20	RESERVED	R/W	X	
19-16	MIRROR_TOP	R/W	0h	Mirror To Port. This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries. A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be 0h for most switch configurations.
14	RESERVED	R/W	X	
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn. This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.

Table 8-8. CPSW_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable. This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the MIRROR_MIDX entry index will have that traffic also sent to the MIRROR_TOP port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable. This field enables the destination port mirror option. When this bit is set any traffic destined for the MIRROR_DP port will have its transmit traffic also sent to the MIRROR_TOP port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable. This field enables the source port mirror option. When this bit is set any port with the ly_REG_P0_MIRROR_SP set in the CPSW_ly_ALE_PORTCTL0_y registers set will have its received traffic also sent to the MIRROR_TOP port.
9	RESERVED	R/W	X	
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host. 0h = Unknown unicast packets are not sent to the host 1h = Unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID. 0h = VID is learned with the source address 1h = VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode. 0h = Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1h = Process the priority tagged packet with VID = 0h.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode. When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass. When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0h = No bypass 1h = Bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode. 0h = Broadcast and multicast rate limit counters are received port based 1h = Broadcast and multicast rate limit counters are transmit port based

Table 8-8. CPSW_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware. Determines how traffic is forwarded using VLAN rules. 0h = Simple switch rules, packets forwarded to all ports for unknown destinations. 1h = VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode. Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0h = The ALE is not in MAC authorization mode 1h = The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0h = Broadcast/Multicast rates not limited 1h = Broadcast/Multicast packet reception limited to the port control register rate limit fields.

8.1.4 CPSW_ALE_CTRL2 Register (Offset = 0003E00Ch) [reset = X]

CPSW_ALE_CTRL2 is shown in [Figure 8-4](#) and described in [Table 8-10](#).

Return to [Summary Table](#).

The ALE Control 2 Register is used to set the extended features used for all ports.

Table 8-9. CPSW_ALE_CTRL2 Instances

Instance	Physical Address

Table 8-10. CPSW_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address. This field enables the destination MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address. This field enables the source MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority. This field enables the VLAN Priority bits to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	R/W	X	
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN. This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
26	RESERVED	R/W	X	

Table 8-10. CPSW_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address. This field enables the source IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address. This field enables the destination IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the CPSW_ALE_NXT_HDR register values.
19	RESERVED	R/W	X	
18-16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the [31]TRK_EN_DST, [30]TRK_EN_SRC, [29]TRK_EN_PRI and [27]TRK_EN_IVLAN are cleared (value: 0h), this value is used as the distribution index. That is a 0h will select the 1st bit of an 'N' link trunk, a 1h will select the second, etc. Below is the distribution across the trunk links. The first number in the sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0h will go to the base port (0), hash result 1h will go to the highest port of the trunk group (2), hash result 2h will go to the middle port (1), etc. 1h = 00000000 2h = 01010101 3h = 02102102 4h = 03210321
15-10	RESERVED	R/W	X	
9-0	MIRROR_MIDX	R/W	0h	Mirror Index. This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the MIRROR_TOP port. That is any VLAN, ONU or address with or without VLAN can be selected for traffic mirroring.

8.1.5 CPSW_ALE_PRESCALE Register (Offset = 0003E010h) [reset = X]

CPSW_ALE_PRESCALE is shown in [Figure 8-5](#) and described in [Table 8-12](#).

Return to [Summary Table](#).

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 8-11. CPSW_ALE_PRESCALE Instances

Instance	Physical Address
CPSW0_NUSS_ALE	0C03 E010h

Bit	Field	Type	Reset	Description
31	PRESALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable. When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable. When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29-24	RESERVED	R/W	X	
23-0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer. This field specifies the number of clock cycles times 1,000,000 between aging operations.

8.1.7 CPSW_ALE_NXT_HDR Register (Offset = 0003E01Ch) [reset = 0h]

CPSW_ALE_NXT_HDR is shown in [Figure 8-7](#) and described in [Table 8-16](#).

Return to [Summary Table](#).

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the DEFLMTNXTHDR bit in the VLAN entry. All four IP_NXT_HDR0 to IP_NXT_HDR3 bits are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 8-15. CPSW_ALE_NXT_HDR Instances

Table 8-26. CPSW_ly_ALE_PORTCTL0_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ly_REG_Py_BCAST_LIMI T	R/W	0h	Broadcast Packet Rate Limit. Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	ly_REG_Py_MCAST_LIMI T	R/W	0h	Multicast Packet Rate Limit. Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field. The ly_REG_Py_MCAST_LIMIT bit field is the number of Multicast packets that will be forwarded per CPSW_ALE_PRESCALE time.

Table 8-26. CPSW_Iy_ALE_PORTCTL0_y Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	Iy_REG_Py_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN. When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	Iy_REG_Py_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN. When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	Iy_REG_Py_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames. When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with Iy_REG_Py_MACONLY set.
12	Iy_REG_Py_DIS_PAUTH_MOD	R/W	0h	Disable Port authorization. When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	Iy_REG_Py_MACONLY	R/W	0h	MAC Only. When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the Iy_REG_Py_MACONLY bit set and the Iy_REG_Py_NO_LEARN also set. If Iy_REG_Py_MACONLY bit is set and the Iy_REG_Py_NO_LEARN is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	Iy_REG_Py_TRUNKEN	R/W	0h	Trunk Enable. This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the Iy_REG_Py_TRUNKEN its set and having the same Iy_REG_Py_TRUNKNUM will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9-8	Iy_REG_Py_TRUNKNUM	R/W	0h	Trunk Number. This field is used as the trunk number when the Iy_REG_Py_TRUNKEN is also set. Ports with the same trunk number that have the Iy_REG_Py_TRUNKEN also set will have traffic distributed within the trunk based on the result of the hash function described above.
7	Iy_REG_Py_MIRROR_SP	R/W	0h	Mirror Source Port. This field enables the source port mirror option. When this bit is set any traffic received on the port with the Iy_REG_Py_MIRROR_SP bit set will have its received traffic also sent to the MIRROR_TOP port.
6	RESERVED	R/W	X	
5	Iy_REG_Py_NO_SA_UPD_ATE	R/W	0h	No Source Address Update. When set will not update the source addresses for this port.
4	Iy_REG_Py_NO_LEARN	R/W	0h	No Learn. When set will not learn the source addresses for this port.

Table 8-26. CPSW_ly_ALE_PORTCTL0_y Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	ly_REG_Py_VID_INGRES S_CHECK	R/W	0h	VLAN Ingress Check. When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	ly_REG_Py_DROP_UN_T AGGED	R/W	0h	If Drop Untagged. When set will drop packets without a VLAN tag.
1-0	ly_REG_Py_PORTSTATE	R/W	0h	Port State. Defines the current port state used for lookup operations. 0h = Disabled 1h = Blocked 2h = Learning 3h = Forwarding

8.1.13 CPSW_ALE_UVLAN_MEMBER Register (Offset = 0003E090h) [reset = X]

CPSW_ALE_UVLAN_MEMBER is shown in [Figure 8-13](#) and described in [Table 8-28](#).

Return to [Summary Table](#).

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

Bit	Field	Type	Reset	Description
31-9	RESERVED	R/W	X	
8-0	OAM_LB_CTRL	R/W	0h	The OAM_LB_CTRL bit field allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an CPSW_ALE_EGRESSOP of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotely requested and disabled.

8.1.19 CPSW_ALE_EGRESSOP Register (Offset = 0003E0FCh) [reset = X]

CPSW_ALE_EGRESSOP is shown in [Figure 8-19](#) and described in [Table 8-40](#).

Return to [Summary Table](#).

The Egress Operation register allows enabled classifiers with IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host, but matches a classifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions.

Table 8-39. CPSW_ALE_EGRESSOP Instances

Table 8-40. CPSW_ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0h = NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. FFh: Swaps source address (SA) and destination address (DA) of packet, this is intended to allow OAM diagnostics for a link.
23-21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19-9	RESERVED	R/W	X	

Table 8-40. CPSW_ALE_EGRESSOP Register Field Descriptions (continued)

Table 8-74. CPSW_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ECC_CRC_MODE	R/W	0h	ECC CRC Mode. 0h = ECC errors induced through the ECC aggregator flip bits in the packet headers (not in packet data). 1h = ECC errors induced through the ECC aggregator flip bits in the packet data (not in the packet headers).
30-19	RESERVED	R/W	X	
18	EST_ENABLE	R/W	0h	Enhanced Scheduled Traffic enable (EST) 0h = EST is disabled 1h = EST is enabled
17	IET_ENABLE	R/W	0h	Interspersed Express Traffic enable (IET) 0h = IET is disabled 1h = IET is enabled
16	EEE_ENABLE	R/W	0h	Energy Efficient Ethernet enable 0h = Energy Efficient Ethernet is disabled 1h = Energy Efficient Ethernet is enabled
15	P0_RX_PASS_CRC_ERR	R/W	0h	Port 0 Pass Received CRC errors 0h = Packets received with CRC errors on Port 0 are dropped. 1h = Packets received with CRC errors on Port 0 are transferred to the destination ports.

Table 8-74. CPSW_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	P0_RX_PAD	R/W	0h	Port 0 Receive Short Packet Pad 0h = Short packets are dropped. 1h = Short packets are padded to 64-bytes (with pad and added CRC) if the CRC is not passed in. Short packets are dropped if the CRC is passed (in the Info0 word).
13	P0_TX_CRC_REMOVE	R/W	0h	Port 0 Transmit CRC remove. 0h = Do not remove the CRC on Port 0 transmit (egress) packets. 1h = Remove the CRC on all Port 0 transmit (egress) packets.
12	P0_TX_CRC_TYPE	R/W	0h	
11	P8_PASS_PRI_TAGGED	R/W	0h	Port 8 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P8_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
10	P7_PASS_PRI_TAGGED	R/W	0h	Port 7 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P7_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
9	P6_PASS_PRI_TAGGED	R/W	0h	Port 6 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P6_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
8	P5_PASS_PRI_TAGGED	R/W	0h	Port 5 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P5_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
7	P4_PASS_PRI_TAGGED	R/W	0h	Port 4 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P4_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
6	P3_PASS_PRI_TAGGED	R/W	0h	Port 3 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P3_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
5	P2_PASS_PRI_TAGGED	R/W	0h	Port 2 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P2_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
4	P1_PASS_PRI_TAGGED	R/W	0h	Port 1 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port Enet_P1_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
3	P0_PASS_PRI_TAGGED	R/W	0h	Port 0 Pass Priority Tagged 0h = Priority tagged packets have the zero VID replaced with the input port P0_PORT_VLAN[11:0] on ingress. 1h = Priority tagged packets are processed unchanged.
2	P0_ENABLE	R/W	0h	Port 0 Enable 0h = CPPI port (port 0) packet operations are disabled 1h = CPPI port (port 0) packet operations are enabled

Table 8-74. CPSW_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	VLAN_AWARE	R/W	0h	VLAN Aware Mode: 0h = CPSW_NU is in the VLAN unaware mode. 1h = CPSW_NU is in the VLAN aware mode.
0	S_CN_SWITCH	R/W	0h	Service or Customer VLAN switch. 0h = Customer switch. VLAN processing uses the inner_vlan_ltype. 1h = Service switch. VLAN processing uses the outer_vlan_ltype.

25-16	EST_FILL_MARGIN	R/W	0h	EST Fill Margin. Sets the fill margin required to ensure that the Ethernet wire is clear (including IPG) so that the timed EST express packet can egress at the required time. Setting this value too high will put an unnecessary gap on the wire. Setting this value too low will cause the express packet to egress at a time later than intended.
15-9	RESERVED	R/W	X	
8	EST_FILL_EN	R/W	0h	EST Fill Enable. Enable EST fill mode.
7-5	EST_TS_PRI	R/W	0h	EST Timestamp Express Priority. Selects the express priority that timestamp(s) will be generated on when CPSW_PN_EST_CONTROL_REG[4] EST_TS_ONEPRI bit is set.

Table 8-212. CPSW_PN_EST_CONTROL_REG_k Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	EST_TS_ONEPRI	R/W	0h	EST Timestamp One Express Priority. When set, timestamp only enabled packets on the express priority selected by CPSW_PN_EST_CONTROL_REG[7-5] ST_TS_PRI bit field. When cleared to zero, express packet selection for timestamp is independent of priority.
3	EST_TS_FIRST	R/W	0h	EST Timestamp First Express Packet only. Generate a timestamp only on the first selected express packet in each EST time interval when express timestamps are enabled. (If CPSW_PN_EST_CONTROL_REG[4] EST_TS_ONEPRI is also set then the timestamp is generated only on the first packet on CPSW_PN_EST_CONTROL_REG[7-5] ST_TS_PRI).
2	EST_TS_EN	R/W	0h	EST Timestamp Enable. Enable express timestamps (when CPSW_CONTROL_REG[18] EST_ENABLE and CPSW_PN_CONTROL_REG[17] EST_PORT_EN bits are set).
1	EST_BUFSEL	R/W	0h	EST Buffer Select. If CPSW_PN_EST_CONTROL_REG[0] EST_ONEBUF is cleared, this bit selects the upper (when set) or the lower (when cleared) 64-word fetch buffer. The actual fetch buffer used changes only at the start of the EST time interval and can be read in the CPSW_PN_FIFO_STATUS_REG register, bit [18] EST_BUFACT.
0	EST_ONEBUF	R/W	0h	EST One Fetch Buffer. When set indicates that all 128 fetch words are used in one buffer. When cleared, indicates that the 128 fetch words are split into two 64-word fetch buffers. The CPSW_PN_EST_CONTROL_REG[1] EST_BUFSEL bit selects the buffer to be used when bit [0] EST_ONEBUF is cleared to zero.

Table 8-254. CPSW_PN_MAC_CONTROL_REG_k Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25	EXT_EN_XGIG	R/W	0h	10G External Enable
24	RX_CMF_EN	R/W	0h	RX Copy MAC Control Frames Enable. Enables MAC control frames to be transferred to memory. MAC control frames are normally acted upon (if enabled), but not copied to memory. MAC control frames that are pause frames will be acted upon if enabled in the CPSW_PN_MAC_CONTROL_REG register, regardless of the value of [24] RX_CMF_EN bit. Frames transferred to memory due to [24] RX_CMF_EN will have the control bit set in their EOP buffer descriptor. 0h = MAC control frames are filtered (but acted upon if enabled). 1h = MAC control frames are transferred to memory.

Table 8-254. CPSW_PN_MAC_CONTROL_REG_k Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	RX_CSF_EN	R/W	0h	<p>RX Copy Short Frames Enable.</p> <p>Enables frames or fragments shorter than 64 bytes to be copied to memory.</p> <p>Frames transferred to memory due to CPSW_PN_MAC_CONTROL_REG[23] RX_CSF_EN will have the fragment or undersized bit set in their receive footer. Fragments are short frames that contain CRC/align/code errors and undersized are short frames without errors.</p> <p>0h = Short frames are filtered.</p> <p>1h = Short frames are transferred to memory.</p>
22	RX_CEF_EN	R/W	0h	<p>RX Copy Error Frames Enable.</p> <p>Enables frames containing errors to be transferred to memory. The appropriate error bit will be set in the frame receive footer. Frames containing errors will be filtered when CPSW_PN_MAC_CONTROL_REG[22] RX_CEF_EN is not set.</p> <p>0h = Frames containing errors are filtered.</p> <p>1h = Frames containing errors are transferred to memory.</p>
21	TX_SHORT_GAP_LIM_EN	R/W	0h	<p>Transmit Short Gap Limit Enable</p> <p>When set this bit limits the number of short gap packets transmitted to 100ppm. Each time a short gap packet is sent, a counter is loaded with 10,000 and decremented on each wireside clock. Another short gap packet will not be sent out until the counter decrements to zero. This mode is included to preclude the host from filling up the FIFO and sending every packet out with short gap which would violate the maximum number of packets per second allowed. This bit is used only with GMII (not XGMII).</p>
20	EXT_TX_FLOW_EN	R/W	0h	<p>External Transmit Flow Control Enable.</p> <p>Enables the TX_FLOW_EN to be selected from the EXT_TX_FLOW_EN input signal and not from the [4] TX_FLOW_EN bit in CPSW_PN_MAC_CONTROL_REG register.</p>
19	EXT_RX_FLOW_EN	R/W	0h	<p>External Receive Flow Control Enable.</p> <p>Enables the RX_FLOW_EN to be selected from the EXT_RX_FLOW_EN input signal and not from the CPSW_PN_MAC_CONTROL_REG[3] RX_FLOW_EN bit in this register.</p>
18	EXT_EN	R/W	0h	<p>External Control Enable.</p> <p>Enables the fullduplex and gigabit mode to be selected from the FULLDUPLEX_IN and GIG_IN input signals and not from the [0] FULLDUPLEX and [7] GIG bits in the CPSW_PN_MAC_CONTROL_REG register.</p> <p>The [0] FULLDUPLEX bit reflects the actual fullduplex mode selected.</p>
17	GIG_FORCE	R/W	0h	<p>Gigabit Mode Force.</p> <p>This bit is used to force the Ethernet Mac into gigabit mode if the input GMII_MTCLK has been stopped by the PHY.</p>
16	IFCTL_B	R/W	0h	Interface Control B - Not used.
15	IFCTL_A	R/W	0h	<p>Interface Control A - Determines the RMII link speed</p> <p>0h = 10Mbps</p> <p>1h = 100Mbps</p>
14	RESERVED	R/W	X	

Table 8-254. CPSW_PN_MAC_CONTROL_REG_k Register Field Descriptions (continued)

8	XGIG	R	0h	10 Gigabit Mode. Note: 10 Gigabit Mode is not supported for this device.
7	GIG	R/W	0h	Gigabit Mode. 0h = 10/100 mode 1h = Gigabit mode (full duplex only) The GIG_OUT output is the value of this bit.
6	TX_PACE	R/W	0h	Transmit Pacing Enable 0h = Transmit Pacing Disabled 1h = Transmit Pacing Enabled
5	GMII_EN	R/W	0h	GMII Enable. 0h = GMII RX and TX held in reset. 1h = GMII RX and TX released from reset.
4	TX_FLOW_EN	R/W	0h	Transmit Flow Control Enable. Determines if incoming pause frames are acted upon in full-duplex mode. Incoming pause frames are not acted upon in half-duplex mode regardless of this bit setting. The RX_MBP_ENABLE bits determine whether or not received pause frames are transferred to memory. 0h = Transmit Flow Control Disabled. Full-duplex mode – Incoming pause frames are not acted upon. 1h = Transmit Flow Control Enabled. Full-duplex mode – Incoming pause frames are acted upon.
3	RX_FLOW_EN	R/W	0h	Receive Flow Control Enable. 0h = Receive Flow Control Disabled Half-duplex mode – No flow control generated collisions are sent. Full-duplex mode – No outgoing pause frames are sent. 1h = Receive Flow Control Enabled Half-duplex mode – Collisions are initiated when receive flow control is triggered. Full-duplex mode – Outgoing pause frames are sent when receive flow control is triggered.
2	MTEST	R/W	0h	Manufacturing Test mode. This bit must be set to allow writes to the CPSW_PN_MAC_BOFFTEST_REG and CPSW_PN_MAC_RX_PAUSETIMER_REG registers.

Table 8-254. CPSW_PN_MAC_CONTROL_REG_k Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	LOOPBACK	R/W	0h	<p>Loop Back Mode.</p> <p>Loopback mode forces internal full duplex mode regardless of whether the CPSW_PN_MAC_CONTROL_REG[0] FULLDUPLEX bit is set or not.</p> <p>The [1] LOOPBACK bit should be changed only when [5] GMII_EN is de-asserted. Loopback is used only with GMII (not XGMII). Loopback is not compatible with timestamp operations (CPTS).</p> <p>0h = Not looped back mode 1h = Loop Back mode enabled</p>
0	FULLDUPLEX	R/W	0h	<p>Full Duplex mode.</p> <p>Gigabit mode forces full duplex mode regardless of whether the [0] FULLDUPLEX bit is set or not.</p> <p>The FULLDUPLEX_OUT output is the value of this register bit</p> <p>0h = Half duplex mode 1h = Full duplex mode</p>

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-26	PACEVAL	R/W	0h	Pacing Current Value. A non-zero value in this field indicates that transmit pacing is active. A transmit frame collision or deferral causes paceval to loaded with decimal 31, good frame transmissions (with no collisions or deferrals) cause paceval to be decremented down to zero. When paceval is nonzero, the transmitter delays 4 IPGs between new frame transmissions after each successfully transmitted frame that had no deferrals or collisions. Transmit pacing helps reduce "capture" effects improving overall network bandwidth.
25-16	RNDNUM	R/W	0h	Backoff Random Number Generator. This field allows the Backoff Random Number Generator to be read (or written in test mode only). This field can be written only when CPSW_PN_MAC_CONTROL_REG[2] MTEST bit has previously been set. Reading this field returns the generator's current value. The value is reset to zero and begins counting on the clock after the de-assertion of reset.
15-12	COLL_COUNT	R	0h	Collision Count.
11-10	RESERVED	R/W	X

CPSW_INT_EOI_REG is shown in [Figure 8-141](#) and described in [Table 8-289](#).

Return to [Summary Table](#).

End of Interrupt Register.

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	TS_PUSH	W	0h	Time stamp event push. When a logic high is written to this bit a time stamp event is pushed onto the event FIFO. The time stamp value is the time of the write of this register, not the time of the event read. The time stamp value can then be read on interrupt via the event registers. Software should not push a second time stamp event onto the event FIFO until the first time stamp value has been read from the event FIFO (there should be only one time stamp event in the event FIFO at any given time). This bit is write only and always reads zero.

8.4.5 CPSW_CPTS_TS_LOAD_VAL_REG Register (Offset = 0003D010h) [reset = 0h]

CPSW_CPTS_TS_LOAD_VAL_REG is shown in [Figure 8-151](#) and described in [Table 8-317](#).

EOI Register.

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 8-435. CPSW_MDIO_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1h when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1h to this bit enables the MDIO state machine, writing a 0h disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	R/W	X	
28-24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest user access channel that is available in the module and is currently set to 1h. This implies that MDIOUserAccess1 is the highest available user access channel.
23-21	RESERVED	R/W	X	
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1h to this bit disables this device from sending MDIO frame preambles in clause 22 mode of operation. This bit has no effect in clause 45 mode of operation.

Table 8-435. CPSW_MDIO_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	FAULT	R/W	0h	Fault indicator. This bit is set to 1h if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1h to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1h to enable the physical layer fault detection.
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable. This bit can be set to 1h to enable the host to set the userint and linkint bits for test purposes.
16	RESERVED	R/W	X	
15-0	CLKDIV	R/W	FFh	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0h. $\text{MDCLK frequency} = \text{clk frequency} / (\text{clkdiv} + 1)$.

8.6.3 CPSW_MDIO_ALIVE_REG Register (Offset = F08h) [reset = 0h]

R/W-X						R/W-0h	

LEGEND: R/W = Read/Write; -n = value after reset

Table 8-443. CPSW_MDIO_LINK_INT_MASKED_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	LINKINTMASKED	R/W	0h	MDIO link change interrupt masked value. Normal mode operation: When asserted '1', a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register and the corresponding CPSW_MDIO_USER_PHY_SEL_REG_k[6] LINKINT_ENABLE bit was set. CPSW_MDIO_LINK_INT_MASKED_REG[0] LINKINTMASKED and [1] LINKINTMASKED correspond to MDIOUserPhySel0 and MDIOUserPhySel1, respectively. Writing a 1h will clear the interrupt and writing 0h has no effect. These masked interrupt bits are the MDIO_LINKINT[1:0] pin values. MDIO link change interrupt masked value. State Change Mode operation: The [0] LINKINTMASKED bit will be asserted '1' when CPSW_MDIO_LINK_INT_RAW_REG[0] LINKINTRAW is asserted '1' and when the CPSW_MDIO_LINK_INT_MASK_SET_REG[0] LINKINTMASKSET bit is set to 1h. Writing a 1h will clear [0] LINKINTMASKED (and the MDIO_LINKINT[0] output) and writing 0h has no effect. The [1] LINKINTMASKED bit is not used in State Change Mode (MDIO_LINKINT[1] is therefore also unused in State Change Mode).

8.6.7 CPSW_MDIO_LINK_INT_MASK_SET_REG Register (Offset = F18h) [reset = X]

Table 8-469. CPSW_MDIO_USER_ACCESS_REG_k Register Field Descriptions

Bit	Field	Type	Reset	Description
31	GO	R/W	0h	Go. Writing a 1h to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0h to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1h. If byte access is being used, the go bit should be written last.
30	WRITE	R/W	0h	Write enable. Setting this bit to a 1h causes the MDIO transaction to be a register write, otherwise it is a register read.
29	ACK	R/W	0h	Acknowledge. This bit is set if the PHY acknowledged the read transaction.
28-26	RESERVED	R/W	X	
25-21	REGADR	R/W	0h	Register address. This field specifies the PHY register to be accessed for this transaction in clause 22 mode or the MMD value in clause 45 mode.
20-16	PHYADR	R/W	0h	PHY address. This field specifies the PHY to be accessed for this transaction.

LEGEND: R/W = Read/Write; -n = value after reset

Table 8-564. CPSW_SGMII_CONTROL_REG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	X	
6	TEST_PATTERN_EN	R/W	0h	Test Pattern Enable. Force the output of K28.5 on TX_ENC for test purposes. 0h = Operation 1h = Forced K28.5 on transmit output
5	MASTER	R/W	0h	Master Mode. 0h = Slave Mode 1h = Master mode – Set to one for one side of a direct connection. When this bit is set, the control logic uses the CPSW_SGMII_MR_ADV_ABILITY_REG register to determine speed and duplexity instead of the CPSW_SGMII_MR_LP_ADV_ABILITY_REG register. Master mode allows a CPSPGMII direct connection with auto-negotiation or with a forced link.
4	LOOPBACK	R/W	0h	Loopback mode. 0h = Not in internal loopback mode 1h = Internal loopback mode. The transmit clock (TX_CLK) is used for transmit and receive.

Table 8-564. CPSW_SGMII_CONTROL_REG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MR_NP_LOADED	R/W	0h	Next Page Loaded. Writing 1h to this bit informs the auto-negotiation process that the next page register has been loaded. This bit is cleared by the auto-negotiation state machine before the CPSW_SGMII_STATUS_REG[3] MR_PAGE_RX status bit is set. This bit is not used when the SGMII_MODE input is asserted.
2	FAST_LINK_TIMER	R/W	0h	Fast Link Timer. 0h = The link timer value is 10ms in FIBER mode and 1.6ms in SGMII mode. 1h = The link timer value is 2μs in FIBER and SGMII mode. This is included for test purposes.
1	MR_AN_RESTART	R/W	0h	Auto Negotiation Restart. Writing 1h and then 0h to this bit causes the auto-negotiation process to be restarted.
0	MR_AN_ENABLE	R/W	0h	Auto Negotiation Enable. Writing 1h to this bit enables the auto-negotiation process.

8.11.1 CPSW_STAT_RXGOODFRAMES_k Register (Offset = 0003A000h + formula) [reset = 0h]

CPSW_STAT_RXGOODFRAMES_k is shown in [Figure 8-273](#) and described in [Table 8-602](#).

Return to [Summary Table](#).

The total number of good frames received on the port. A good frame is defined to be:

- Any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Had a length of 64 to SL_RX_MAXLEN[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the RX_ALIGN_CODE_ERRORS and CPSW_STAT0_RXCRCERRORS statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

Offset = 0003A000h + (k * 200h); where k = 0h to 8h

8.11.3 CPSW_STAT_RXMULTICASTFRAMES_k Register (Offset = 0003A008h + formula) [reset = 0h]

CPSW_STAT_RXMULTICASTFRAMES_k is shown in [Figure 8-275](#) and described in [Table 8-606](#).

Return to [Summary Table](#).

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- Any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFF
- Had a length of CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no CRC error, alignment error or code error.

See the CPSW_STAT0_RXCRCERRORS statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

Offset = 0003A008h + (k * 200h); where k = 0h to 8h

8.11.5 CPSW_STAT_RXCRCERRORS_k Register (Offset = 0003A010h + formula) [reset = 0h]

CPSW_STAT_RXCRCERRORS_k is shown in [Figure 8-277](#) and described in [Table 8-610](#).

Return to [Summary Table](#).

The total number of frames received on the port that experienced a CRC error. Such a frame:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was of length 64 to CPSW0_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes inclusive
- Had no code/align error,
- Had a CRC error Overruns have no effect upon this statistic.

A CRC error is defined to be:

- A frame containing an even number of nibbles
- Failing the Frame Check Sequence test.

Offset = 0003A010h + (k * 200h); where k = 0h to 8h

8.11.7 CPSW_STAT_RXOVERSIZEDFRAMES_k Register (Offset = 0003A018h + formula) [reset = 0h]

CPSW_STAT_RXOVERSIZEDFRAMES_k is shown in [Figure 8-279](#) and described in [Table 8-614](#).

Return to [Summary Table](#).

The total number of oversized frames received on the port. An oversized frame is defined to be:

- Was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was greater than CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN in bytes
- Had no CRC error, alignment error or code error

See the CPSW_STAT0_RXCRCERRORS statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

CPSW_STAT_RXUNDERSIZEDFRAMES_k is shown in [Figure 8-281](#) and described in [Table 8-618](#).

Return to [Summary Table](#).

The total number of undersized frames received on the port. An undersized frame is defined to be:

- Was any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode
- Was less than 64 octets long
- Had no CRC error, alignment error or code error

See the CPSW_STAT0_RXCRCERRORS statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

8.11.10 CPSW_STAT_RXFRAGMENTS_k Register (Offset = 0003A024h + formula) [reset = 0h]

CPSW_STAT_RXFRAGMENTS_k is shown in [Figure 8-282](#) and described in [Table 8-620](#).

Return to [Summary Table](#).

The total number of frame fragments received on the port. A frame fragment is defined to be:

- Any data frame (address matching does not matter)
- Less than 64 bytes long
- Having a CRC error, an alignment error, or a code error
- Not the result of a collision caused by half duplex, collision based flow control

See the CPSW_STAT0_RXCRCERRORS statistic descriptions for total number of CRC errors. Overruns have no effect upon this statistic.

8.11.33 CPSW_STAT_NETOCTETS_k Register (Offset = 0003A080h + formula) [reset = 0h]

CPSW_STAT_NETOCTETS_k is shown in [Figure 8-305](#) and described in [Table 8-666](#).

Return to [Summary Table](#).

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter)
- Any length (including less than 64 bytes and greater than CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bytes)

Also counted in this statistic is:

- Every byte transmitted before a carrier- loss was experienced
- Every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time)
- Every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting)

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic. The objective of this statistic is to give a reasonable indication of ethernet utilization

Offset = 0003A080h + (k * 200h); where k = 0h to 8h

9 PCIe Subsystem Registers

This section describes the PCIe Subsystem registers.

9.1 PCIE_CORE_AXI Registers

Table 9-2 lists the PCIE_CORE_AXI registers. All register offset addresses not listed in Table 9-2 should be considered as reserved locations and the register contents should not be modified.

PCIE core AXI configuration registers

Table 9-1. PCIE_CORE_AXI Instances

PCIE_CORE_ATU_WRAPPER_IB_k_ADDR0 is shown in Figure 9-15 and described in Table 9-47.

Return to the [Summary Table](#).

Provides bits 31:8 of the AXI Address and the number of PCIe address bits passed through

Offset = 400800h + (k * 8h); where k = 0h to 2h

Table 9-46.

9.2.1 PCIE_CORE_PFn_I_VENDOR_ID_DEVICE_ID Register (Offset = 0h + formula) [reset = 010017CDh]

PCIE_CORE_PFn_I_VENDOR_ID_DEVICE_ID is shown in [Figure 9-21](#) and described in [Table 9-68](#).

Return to the [Summary Table](#).

16-bit Vendor ID register and 16-bit Device ID register.

Offset = 0h + (n * 1000h); where n = 0h to 5h

Table 9-67.

Table 9-68. PCIE_CORE_PFn_I_VENDOR_ID_DEVICE_ID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	DID	R/W	100h	Device ID assigned by the manufacturer of the device. On power-up, the Controller sets it to the value defined in the RTL file reg_defaults.h. This field can be rewritten independently for each Function from the local management bus.
15-0	VID	R	17CDh	This is the Vendor ID assigned by PCI SIG to the manufacturer of the device. The Vendor ID is set in the Vendor ID Register within the local management register block.

LEGEND: R = Read Only; R/W = Read/Write; R/W1C = Read/Write 1 to Clear Bit; -n = value after reset

Table 9-71. PCIE_CORE_PFn_I_COMMAND_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DPE	R/W1C	0h	This bit is set when the Controller has received a poisoned TLP. The Parity Error Response enable bit [bit 6] has no effect on the setting of this bit. This field can also be cleared from the local management bus by writing a 1 into this bit position.
30	SSE	R/W1C	0h	If the SERR enable bit is 1, this bit is set when the Controller has sent out a fatal or non-fatal error message on the link to the Root Complex. If the SERR enable bit is 0, this bit remains 0. This field can also be cleared from the local management bus by writing a 1 into this bit position.
29	RMA	R/W1C	0h	This bit is set when the Controller has received a completion from the link with the Unsupported Request status. This field can also be cleared from the local management bus by writing a 1 into this bit position

Table 9-71. PCIE_CORE_PFn_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	RTA	R/W1C	0h	This bit is set when the Controller has received a completion from the link with the Completer Abort status. This field can also be cleared from the local management bus by writing a 1 into this bit position
27	STA	R/W1C	0h	This bit is set when the Controller has sent a completion to the link with the Completer Abort status. This field can also be cleared from the local management bus by writing a 1 into this bit position.
26-25	R6	R	0h	Reserved
24	MDPE	R/W1C	0h	When the Parity Error Response enable bit is 1, the Controller sets this bit when it detects the following error conditions: [i] The Controller receives a poisoned completion from the link in response to a request. [ii] The Controller sends out a poisoned write request on the link [this may be because an underflow occurred during the packet transfer at the host interface of the Controller.]. This bit remains 0 when the Parity Error Response enable bit is 0. This field can also be cleared from the local management bus by writing a 1 into this bit position.
23-21	R5	R	0h	Reserved
20	CL	R	1h	Indicates the presence of PCI Extended Capabilities registers. This bit is hardwired to 1.
19	IS	R	0h	This bit is valid only when the Controller is configured to support legacy interrupts. Indicates that the Controller has a pending interrupt, that is, the Controller has sent an Assert_INTx message but has not transmitted a corresponding Deassert_INTx message.
18-16	R4	R	0h	Reserved
15-11	R3	R	0h	Reserved
10	IMD	R/W	0h	Enables or disables the transmission of INTx Assert and De-assert messages from the Controller. Setting this bit to 1 disables generation of INTx assert/de-assert messages in the Controller. This field can be written from the local management bus.
9	R2	R	0h	Reserved
8	SE	R/W	0h	Enables the reporting of fatal and non-fatal errors detected by the Controller to the Root Complex. This field can be written from the local management bus.
7	R1	R	0h	Reserved
6	PERE	R/W	0h	When this bit is 1, the Controller sets the Master Data Parity Error status bit when it detects the following error conditions: [i] The Controller receives a poisoned completion from the link in response to a request. [ii] The Controller sends out a poisoned write request on the link [this may be because an underflow occurred during the packet transfer at the host interface of the Controller.]. When this bit is 0, the Master Data Parity Error status bit is never set. This field can be written from the local management bus.

Table 9-71. PCIE_CORE_PFn_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5-3	R0	R	0h	Reserved
2	BE	R/W	0h	Controls the ability of a Function to issue Memory and I/O Read/Write Requests, in the Upstream direction. This field can be written from the local management bus. Note: The Controller does not gate any requests based on this bit. The Client Application logic must use this bit to gate requests as follows: - When this bit is Set, the Function is allowed to issue Memory or I/O Requests on the pcie_master_AXI interface. - When this bit is Clear, the Function must not allowed to issue any Memory or I/O Requests on the pcie_master_AXI interface.
1	MSE	R/W	0h	Controls a Function's response to Memory Space accesses received from PCIe Link. The Controller internally uses this bit to respond to received Memort Requests as follows: - When this bit is Clear, all received Memory Space accesses are handled as Unsupported Requests. - When this bit is Set, all received Memory Space accesses are decoded and processed normally. This field can be written from the local management bus.
0	ISE	R/W	0h	Controls a Function's response to IO Space accesses received from PCIe Link. The Controller internally uses this bit to respond to received IO Requests as follows: - When this bit is Clear, all received IO Space accesses are handled as Unsupported Requests. - When this bit is Set, all received IO Space accesses are decoded and processed normally. This field can be written from the local management bus.

9.2.5 PCIE_CORE_PFn_I_BASE_ADDR_0 Register (Offset = 10h + formula) [reset = 0h]

PCIE_CORE_PFn_I_BASE_ADDR_0 is shown in Figure 9-25 and described in Table 9-80.

Return to the [Summary Table](#).

This is one of the six Base Address Registers defined by the PCI Specifications 3.0. These registers are used to define address ranges for memory and I/O accesses to the Endpoint device. During the initial configuration of the device, the configuration program determines the size of the address range defined by the BAR by writing a pattern of all 1s into the BAR, reading back from the BAR, and noting the position of the first 1 (the most significant) in the returned value. A value of 0 is returned by the Controller if BAR 0 is not configured. Otherwise, the number of 1s returned is based on the size of the BAR. BAR0 can be setup as 32-bit memory or IO BAR, or can be paired with BAR 1 to form a 64bit memory BAR. The settings of this BAR is defined in the BAR Configuration Register associated with this PF.

The BAR aperture can be controller in two different ways:

- (i) When the Resizable BAR Capability is enabled, the aperture is controlled by the setting of the BAR width field in Resizable BAR Control Register. The Resizable BAR Capability is enabled by setting the Enable Resizable BAR Capability bit (bit 31) of the associated Physical Function BAR Configuration Register 1.
- (ii) When the Resizable BAR Capability is disabled for the Physical Function, the aperture is controlled by the setting of the PF BAR Configuration Register.

Offset = 10h + (n * 1000h); where n = 0h to 5h

Table 9-80. PCIE_CORE_PFn_I_BASE_ADDR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	BAMRW	R/W	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in BAR Configuration Registers of the associated Physical Function.
11-8	BAMR0	R	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in BAR Configuration Registers of the associated Physical Function. All other bits are not writeable, and are read as 0's.
7-4	R8	R	0h	These bits are hardwired to 0
3	P0	R	0h	When the BAR is used to define a memory address range, this field declares whether data from the address range is prefetchable [0 = non-prefetchable, 1 = prefetchable]. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function
2	S0	R	0h	When the BAR is used to define a memory address range, this field indicates whether the address range is 32-bit or 64-bit [0 = 32-bit, 1 = 64 bit]. For 64-bit address ranges, the value in BAR 1 is treated as a continuation of the base address in BAR 0. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function.
1	R7	R	0h	This bit is hardwired to 0 for both memory and I/O BARs.
0	MSI0	R	0h	Specifies whether this BAR defines a memory address range or an I/O address range [0 = memory, 1 = I/O]. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function

PCIE_CORE_PFn_I_BASE_ADDR_1 is shown in Figure 9-26 and described in Table 9-83.

Return to the [Summary Table](#).

This is one of the six Base Address Registers defined by the PCI

Specifications 3.0. BAR1 can be setup as 32-bit memory or IO BAR, or

can be paired with BAR 0 to form a 64bit memory BAR.

This register can be used in two distinct ways: (i) When BAR 0 defines a 64-bit memory address range, this register is used to define the high-order bits of the base address. The number of writable bits

in this field is based on the aperture setting of the BAR. (ii) When the BAR 0 is

used to define a 32-bit memory address range or an I/O address range, this register can be used

to define a new 32-bit memory address range or an I/O address range. The individual fields in

the register have the same format as those of BAR 0 and is described below. The settings of this BAR

is defined in the BAR Configuration Register associated with this PF.

When configured as a 32-bit memory or IO BAR, the BAR aperture can be controller in two different ways:

(a) When the Resizable BAR Capability is enabled, the aperture is

controlled by the setting of the BAR width field in Resizable BAR Control Register 1.

The Resizable BAR Capability is enabled by setting the Enable Resizable BAR

Capability bit (bit 31) of the associated Physical Function BAR Configuration Register.

(b) When the Resizable BAR Capability is disabled for the Physical

Function, the aperture is controlled by the setting of the Physical Function BAR

Configuration Register.

Offset = 14h + (n * 1000h); where n = 0h to 5h

9.2.7 PCIE_CORE_PFn_I_BASE_ADDR_2 Register (Offset = 18h + formula) [reset = 0h]

PCIE_CORE_PFn_I_BASE_ADDR_2 is shown in Figure 9-27 and described in Table 9-86.

Return to the [Summary Table](#).

This is one of the six Base Address Registers defined by the PCI Specifications 3.0. These registers are used to define address ranges for memory and I/O accesses to the Endpoint device. During the initial configuration of the device, the configuration program determines the size of the address range defined by the BAR by writing a pattern of all 1s into the BAR, reading back from the BAR, and noting the position of the first 1 (the most significant) in the returned value. A value of 0 is returned by the Controller if BAR 2 is not configured. Otherwise, the number of 1s returned is based on the size of the BAR. BAR2 can be setup as 32-bit memory or IO BAR, or can be paired with BAR 3 to form a 64bit memory BAR. The settings of this BAR is defined in the BAR Configuration Register associated with this PF.

The BAR aperture can be controller in two different ways:

- (i) When the Resizable BAR Capability is enabled, the aperture is controlled by the setting of the BAR width field in Resizable BAR Control Register. The Resizable BAR Capability is enabled by setting the Enable Resizable BAR Capability bit (bit 31) of the associated Physical Function BAR Configuration Register 1.
- (ii) When the Resizable BAR Capability is disabled for the Physical Function, the aperture is controlled by the setting of the PF BAR Configuration Register.

9.2.16 PCIE_CORE_PFn_I_INTRPT_LINE_INTRPT_PIN Register (Offset = 3Ch + formula) [reset = 1FFh]

PCIE_CORE_PFn_I_INTRPT_LINE_INTRPT_PIN is shown in Figure 9-36 and described in Table 9-113.

Return to the [Summary Table](#).

This location contains the PCI 3.0 Interrupt Line and Interrupt Pin Registers. These registers are used only when the Controller is configured to support PCI legacy interrupts. If the legacy interrupt mode is configured, the Controller receives interrupt indications from the client logic on its INTA_IN, INTB_IN, INTC_IN and INTD_IN inputs, and sends out Assert_INTx or Deassert_INTx messages on the link in response to their activation or deactivation, respectively. The Interrupt Pin Register defines which of the four inputs is connected to the Function corresponding to this register set. The Interrupt Line register defines the input of the interrupt controller (IRQ0 - IRQ15) in the Root Complex that is activated by each Assert_INTx message.

Offset = 3Ch + (n * 1000h); where n = 0h to 5h

Bit	Field	Type	Reset	Description
31-11	R16	R	0h	Reserved
10-8	IPR	R/W	1h	Identifies the interrupt input [A, B, C, D] to which this Functions interrupt output is connected to [01 = INTA, 02 = INTB, 03 = INTC, 04 = INTD]. The assignment of interrupt inputs to Functions is fixed when the Controller is configured. This field can be re-written independently for each Function from the local management bus. Please see the define macros den_db_Fx_INTR_PIN values [where x is the function number] for default values of each function in the reg_defaults.v files.
7-0	ILR	R/W	FFh	Identifies the IRQx input of the interrupt controller at the Root Complex that is activated by this Functions interrupt [00 = IRQ0, ... , 0F = IRQ15, FF = unknown or not connected]. This field is writable from the local management bus. Please see the define macros den_db_Fx_INTR_LINE values [where x is the function number] for default values of each function in the reg_defaults.v files.

Table 9-119. PCIE CORE PFn I PWR MGMT CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PSDCS	R	0h	Indicates whether the Function is capable of sending PME messages when in the D3cold state. Because the device does not have aux power, this bit is hardwired to 0.
30	PSDHS	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D3hot state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0's Power Management Capabilities Register.
29	PSD2S	R	0h	Indicates whether the Function is capable of sending PME messages when in the D2 state. This bit is hardwired to 0 because D2 state is not supported.

Table 9-119. PCIe_CORE_PFn_I_PWR_MGMT_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	PSD1S	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D1 state. This bit can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
27	PSD0S	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D0 state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
26	D2S	R	0h	Set if the Function supports the D2 power state. Currently hardwired to 0.
25	D1S	R/W	1h	Set if the Function supports the D1 power state. This bit can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
24-22	MCRAPS	R	0h	Specifies the maximum current drawn by the device from the aux power source in the D3cold state. This field is not implemented in devices not supporting PME notification when in the D3cold state, and is therefore hardwired to 0.
21	DSI	R	0h	This bit, when set, indicates that the device requires additional configuration steps beyond setting up its PCI configuration space, to bring it to the D0 active state from the D0 uninitialized state. This bit is hardwired to 0.
20	R0	R	0h	Reserved
19	PC	R	0h	Not applicable to PCI Express. This bit is hardwired to 0.
18-16	VID	R/W	3h	Indicates the version of the PCI Bus Power Management Specifications that the Function implements. This field is set by default to 011 [Version 1.2]. It can be re-written independently for each Function from the local management bus.
15-8	CP	R/W	90h	Contains pointer to the next PCI Capability Structure. The Controller sets it to the value defined in the RTL file reg_defaults.h. This field can be re-written independently for each Function from the local management bus.
7-0	CID	R/W	1h	Identifies that the capability structure is for Power Management. This field is set by default to 01 hex. It can be re-written independently for each Function from the local management bus.

Table 9-122. PCIE_CORE_PFn_I_PWR_MGMT_CTRL_STAT_REP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	DR	R	0h	This optional register is not implemented in the PCIe Controller. This field is hardwired to 0.
23-16	R1	R	0h	Reserved
15	PMES	R/W	0h	When PME notification is enabled, writing a 1 into this bit position from the local management bus sets this bit and causes the Controller to send a PME message from the associated Function. When the Root Complex processes this message, it will turn off this bit by writing a 1 into this bit position through a Config Write. This bit can be set or cleared from the local management bus, by writing a 1 or 0, respectively. It can only be cleared from the configuration path [by writing a 1]. This is a sticky field.
14-9	R2	R	0h	Reserved

Table 9-122. PCIE_CORE_PFn_I_PWR_MGMT_CTRL_STAT_REP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PE	R/W	0h	Setting this bit enables the notification of PME events from the associated Function. This bit can be set also by writing into this register from the local management bus. This is a sticky field.
7-4	R3	R	0h	Reserved
3	NSR	R/W	1h	When this bit is set to 1, the Function will maintain all its state in the PM state D3hot. The software is not required to re-initialize the Function registers on the transition back to D0. This bit is set to 1 by default, but can be modified independently for each PF from the local management bus.
2	R4	R	0h	Reserved
1-0	PS	R/W	0h	Indicates the power state this Function is currently in. This field can be read by the software to monitor the current power state, or can be written to cause a transition to a new state. The valid settings are 00 [state D0], 01 [state D1] and 11 [state D3hot]. The software should not write any other value into this field. This field can also be written from the local management bus independently for each Function.

Table 9-128. PCIE_CORE_PFn_I_MSI_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	R0	R	0h	Reserved
24	MC	R/W	1h	can be modified using localmanagement interface
23	BAC64	R/W	1h	Set to 1 to indicate that the device is capable of generating 64-bit addresses for MSI messages.Can be modified using local management interface
22-20	MME	R/W	0h	Encodes the number of distinct messages that the Controller is programmed to generate for this Function [000 = 1, 001 = 2, 010 = 4, 011 = 8, 100 = 16, 101 = 32]. This setting must be based on the number of interrupt inputs of the Controller that are actually used by this Function. This field can be written from the local management bus.

Table 9-128. PCIE_CORE_PFn_I_MSI_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19-17	MMC	R/W	0h	Encodes the number of distinct messages that the Controller is capable of generating for this Function [000 = 1, 001 = 2, 010 = 4, 011 = 8, 100 = 16, 101 = 32]. Thus, this field defines the number of the interrupt vectors for this Function. The Controller allows up to 32 distinct messages, but the setting of this field must be based on the number of interrupt inputs of the Controller that are actually used by the client. For example, if the client logic uses 8 of the 32 distinct MSI interrupt inputs of the Controller for this Function, then the value of this field must be set to 011. This field can be written from the local management bus. Please see the define den_db_Fx_MSI_MULTIPLE_MSG_CAPABLE values [where x is the function number] for default values of each function in the reg_defaults.v files.
16	ME	R/W	0h	Set by the configuration program to enable the MSI feature. This field can also be written from the local management bus.
15-8	CP1	R/W	B0h	Pointer to the next PCI Capability Structure. This can be modified from the local management bus. This field can be written from the local management bus.
7-0	CID1	R	5h	Specifies that the capability structure is for MSI. Hardwired to 05 hex.

9.2.22 PCIE_CORE_PFn_I_MSI_MSG_LOW_ADDR Register (Offset = 94h + formula) [reset = 0h]

PCIE_CORE_PFn_I_MSI_MSG_LOW_ADDR is shown in Figure 9-42 and described in Table 9-131.

Return to the [Summary Table](#).

This register contains the first 32 bits of the address to be used in the MSI messages generated by the Controller for this Function. This address is taken as a 32-bit address if the value programmed in the MSI Message High Address Register is 0. Otherwise, this address is taken as the least significant 32 bits of the 64-bit address sent in MSI messages.

Offset = 94h + (n * 1000h); where n = 0h to 5h

9.2.24 PCIE_CORE_PFn_I_MSI_MSG_DATA Register (Offset = 9Ch + formula) [reset = 0h]

PCIE_CORE_PFn_I_MSI_MSG_DATA is shown in Figure 9-44 and described in Table 9-137.

Return to the [Summary Table](#).

This register contains the write data to be used in the MSI messages to be generated for the associated PCI Function. When the number of distinct messages programmed in the MSI Control Register is 1, the 32-bit value from this register is used as the data value in the MSI packets generated by the Controller for this Function. If the number of distinct messages is more than 1, the least significant bits of the programmed value are replaced with the encoded interrupt vector [31:0] of the specific message to generate the write data value for the message.

Offset = 9Ch + (n * 1000h); where n = 0h to 5h

Table 9-155. PCIE_CORE_PFn_I_MSIX_PENDING_INTRPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	PBAO	R/W	1h	Offset of the memory address where the PBA is located, relative to the selected BAR. The three least significant bits of the address are omitted, as the addresses are QWORD aligned. Please see the define den_db_Fx_MSIX_PBA_OFFSET values [where x is the function number] for default values of each function in the reg_defaults.v files.

Table 9-155. PCIE_CORE_PFn_I_MSIX_PENDING_INTRPT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2-0	BAR1	R/W	0h	Identifies the BAR corresponding to the memory address range where the PBA Structure is located [000 = BAR 0, 001 = BAR 1, ... , 101 = BAR 5]. The value programmed must be the same as the BAR Indicator configured in the MSI-X Table Offset Register. Identifies the BAR corresponding to the memory address range where the PBA Structure is located [000 = BAR 0, 001 = BAR 1, ... , 101 = BAR 5]. The value programmed must be the same as the BAR Indicator configured in the MSI-X Table Offset Register. Please see the define den_db_Fx_MSIX_PBA_BIR values [where x is the function number] for default values of each function in the reg_defaults.v files.

Bit	Field	Type	Reset	Description
31	R0	R	0h	Reserved
30	TRS	R	0h	When set to 1, this bit indicates that the device supports routing of Trusted Configuration Requests. Not valid for Endpoints. Hardwired to 0.
29-25	IMN	R	0h	Identifies the MSI or MSI-X interrupt vector for the interrupt message generated corresponding to the status bits in the Slot Status Register, Root Status Register, or this capability structure. This field must be defined based on the chosen interrupt mode - MSI or MSI-X. This field is hardwired to 0.
24	SS	R	0h	Set to 1 when the link connected to a slot. Hardwired to 0.
23-20	DT	R	0h	Indicates the type of device implementing this Function. This field is hardwired to 0 in the EP mode.
19-16	PCV	R/W	2h	Identifies the version number of the capability structure. This field is set to 2 by default to indicate that the Controller is compatible to PCI Express Base Specification Revision 3.0. This field can be modified through local management interface.
15-8	NCP	R	0h	Points to the next PCI capability structure. Set to 0 because this is the last capability structure.

Table 9-161. PCIE_CORE_PFn_I_PCIE_CAP_LIST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	CID	R	10h	Specifies Capability ID assigned by PCI SIG for this structure. This field is hardwired to 10 hex.

Bit	Field	Type	Reset	Description
31-29	R3	R	0h	Reserved
28	FC	R/W	1h	Set when device has Function-Level Reset capability. It is set by default to 1. It can be re-written independently for each Function from the local management bus.
27-26	CPLS	R/W	0h	Specifies the scale used by Slot Power Limit Value. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
25-18	CSPLV	R/W	0h	Specifies upper limit on power supplied by slot. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
17-16	R2	R	0h	Reserved
15	RBER	R/W	1h	Enables role-based error reporting. It is hardwired to 1. It can be re-written independently for each Function from the local management bus.

Table 9-164. PCIE_CORE_PFn_I_PCIE_DEV_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-12	R1	R	0h	Reserved
11-9	AL1SL	R/W	0h	Specifies acceptable latency that the Endpoint can tolerate while transitioning from L1 to L0. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
8-6	AL0SL	R/W	4h	Specifies acceptable latency that the Endpoint can tolerate while transitioning from L0S to L0. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
5	ETFS	R	0h	Extended Tag Field not Supported. Hard coded to 0.
4-3	PFS	R	0h	This field is used to extend the tag field by combining unused Function bits with the tag bits. This field is hardwired to 00 to disable this feature.
2-0	MPS	R/W	1h	Specifies maximum payload size supported by the device.

Table 9-167. PCIE_CORE_PFn_I_PCIE_DEV_CTRL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	R4	R	0h	Reserved
21	TP	R	0h	Indicates if any of the Non-Posted requests issued by the Function are still pending.
20	APD	R	0h	Set when auxiliary power is detected by the device. This is an unused field.
19	URD	R/W1C	0h	Set to 1 by the Controller when it receives an unsupported request, regardless of whether its reporting is enabled or not.
18	FED	R/W1C	0h	Set to 1 by the Controller when it detects a fatal error, regardless of whether error reporting is enabled or not, and regardless of whether the error is masked.
17	NFED	R/W1C	0h	Set to 1 by the Controller when it detects a non-fatal error, regardless of whether error reporting is enabled or not, and regardless of whether the error is masked.

Table 9-167. PCIE_CORE_PFn_I_PCIE_DEV_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	CED	R/W1C	0h	Set to 1 by the Controller when it detects a correctable error, regardless of whether error reporting is enabled or not, and regardless of whether the error is masked.
15	FLR	R/W	0h	Writing a 1 into this bit position generates a Function-Level Reset for the selected Function. This bit reads as 0.
14-12	MRRS	R/W	2h	Specifies the maximum size allowed in read requests generated by the device.
11	ENS	R/W	1h	When set to 1, the device is allowed to set the No Snoop bit in initiated transactions in which cache coherency is not needed.
10	EAP	R	0h	Used only when device used aux power. This field is hardwired to 0.
9	EPH	R	0h	This field is hardwired to 0 as the Controller does not support this feature.
8	ETFE	R	0h	Enables the extension of the tag field from 5 to 8 bits.
7-5	MPS	R/W	0h	Specifies the maximum TLP payload size configured. The device must be able to receive a TLP of this maximum size, and should not generate TLPs larger than this value. The configuration program sets this field based on the maximum payload size in the Device Capabilities Register, and the capability of the other side.
4	ERO	R/W	1h	When set, this bit indicates that the device is allowed to set the Relaxed Ordering bit in the Attributes field of transactions initiated from it, when the transactions do not require Strong Ordering.
3	EURR	R/W	0h	Enables the sending of error messages by the Controller on receiving unsupported requests.
2	EFER	R/W	0h	Enables the sending of ERR_FATAL messages by the Controller on the detection of fatal errors.
1	ENFER	R/W	0h	Enables the sending of ERR_NONFATAL messages by the Controller on the detection of non-fatal errors.
0	ECER	R/W	0h	Enables the sending of ERR_COR messages by the Controller on the detection of correctable errors.

Table 9-170. PCIE_CORE_PFn_I_LINK_CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PN	R	0h	Specifies the port number assigned to the PCI Express link connected to this device.
23	R5	R	0h	Reserved
22	AOC	R/W	1h	Setting this bit indicates that the device supports the ASPM Optionality feature. It can be turned off by writing a 0 to this bit position through the local management bus.
21	LBNC	R	0h	A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. Reserved for Endpoint.
20	DLLARC	R	0h	Set to 1 if the device is capable of reporting that the DL Control and Management State Machine has reached the DL_Active state. This bit is hardwired to 0, as this version of the Controller does not support the feature.

Table 9-170. PCIE_CORE_PFn_I_LINK_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	SDERC	R	0h	Indicates the capability of the device to report a Surprise Down error condition. This bit is hardwired to 0, as this version of the Controller does not support the feature.
18	CPM	R/W	0h	Indicates that the device supports removal of referenc clocks. It is set by default to the value of the define in reg_defaults.h. It can be re-written independently for each function from the local management bus.
17-15	L1EL	R/W	3h	Specifies the exit latency from L1 state. This parameter is dependent on the Physical Layer implementation. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
14-12	LOSEL	R/W	2h	Specifies the time required for the device to transition from LOS to L0. This parameter is dependent on the Physical Layer implementation. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
11-10	ASPM	R/W	3h	Indicates the level of ASPM support provided by the device. This field can be re-written independently for each Function from the local management bus. When SRIS is enabled in local management register bit, L0s capability is not supported and is forced low.
9-4	MLW	R	2h	Indicates the maximum number of lanes supported by the device. This field is hardwired based on the setting of the LANE_COUNT_IN strap input.
3-0	MLS	R	4h	Indicates the maximum speed supported by the link. [2.5 GT/s, 5 GT/s, 8 GT/s, 16 GT/s per lane]. This field is hardwired to 0001 [2.5GT/s] when the strap input PCIE_GENERATION_SEL is set to 0, to 0010 [5 GT/s] when the strap is set to 1, and to 0011 [8 GT/s] when the strap input is set to 10, to 0100 [16 GT/s] when the strap input is set to 11.

Table 9-173. PCIE_CORE_PFn_I_LINK_CTRL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LABS	R/W1C	0h	This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This triggers an interrupt to be generated through PHY_INTERRUPT_OUT if enabled. Hardwired to 0 if Link Bandwidth Notification Capability is 0. Not applicable to Endpoints where field is hardwired to 0.
30	LBMS	R/W1C	0h	This bit is Set by hardware to indicate that either link training has completed following write to retrain link bit, or when HW has changed link speed or width to attempt to correct unreliable link operation. This triggers an interrupt to be generated through PHY_INTERRUPT_OUT if enabled. Hardwired to 0 if Link Bandwidth Notification Capability is 0. Not applicable to Endpoints where field is hardwired to 0.
29	DLLA	R	0h	Indicates the status of the Data Link Layer. Set to 1 when the DL Control and Management State Machine has reached the DL_Active state. This bit is hardwired to 0 in this version of the Controller.

Table 9-173. PCIE_CORE_PFn_I_LINK_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SCC	R/W	0h	This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For PF0, this bit can also be written from the local management bus.
27	LTS	R	0h	This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. Not applicable to Endpoints where field is hardwired to 0.
26	R8	R	0h	Reserved
25-20	NLW	R	2h	Set at the end of link training to the actual link width negotiated between the two sides. Value is undefined if this registers is accessed before link training.
19-16	NLS	R	1h	Negotiated link speed of the device. The only supported speed ids are 2.5 GT/s per lane [0001], 5 GT/s per lane [0010], 8 GT/s per lane [0011], 16 GT/s per lane [0100].
15-12	R15_12	R	0h	Reserved
11	LABIE	R	0h	When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set. This enables an interrupt to be generated through PHY_INTERRUPT_OUT if triggered. Hardwired to 0 if Link Bandwidth Notification Capability is 0. Not applicable to Endpoints where field is hardwired to 0.
10	LBMIE	R	0h	When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This enables an interrupt to be generated through PHY_INTERRUPT_OUT if triggered. Hardwired to 0 if Link Bandwidth Notification Capability is 0. Not applicable to Endpoints where field is hardwired to 0.
9	HAWD	R/W	0h	When this bit is set, the local application must not request to change the operating width of the link, other than attempting to correct unreliable Link operation by reducing Link width.
8	ECPM	R	0h	When this bit is set to 1, the device may use the CLKREQ# pin on the PCIe connector to power manage the Link clock. This bit is writeable only when the Clock Power Management bit in the Link Capability Register is set to 1.
7	ES	R/W	0h	Set to 1 to extend the sequence of ordered sets transmitted while exiting from the LOS state.
6	CCC	R/W	0h	A value of 0 indicates that the reference clock of this device is asynchronous to that of the upstream device. A value of 1 indicates that the reference clock is common.
5	RL	R	0h	Setting this bit to 1 causes the LTSSM to initiate link training. Reserved for Endpoint mode. This bit always reads as 0
4	LD	R	0h	Writing a 1 to this bit position causes the LTSSM to go to the Disable Link state. The LTSSM stays in the Disable Link state while this bit is set. Reserved for Endpoint mode.

Table 9-173. PCIE_CORE_PFn_I_LINK_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	RCB	R/W	0h	Indicates the Read Completion Boundary of the Root Port connected to this Endpoint [0 = 64 bytes, 1 = 128 bytes]. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
2	R6	R	0h	Reserved
1-0	ASPMC	R/W	0h	Controls the level of ASPM support on the PCI Express link associated with this Function. The valid setting are 00: ASPM disabled 01: L0s entry enabled, L1 disabled 10: L1 entry enabled, L0s disabled 11: Both L0s and L1 enabled.

Bit	Field	Type	Reset	Description
31-24	R14	R	0h	Reserved
23-22	MEEP	R/W	1h	Indicates the maximum number of End-End TLP Prefixes supported by the Function. The supported values are: 01b 1 End-End TLP Prefix 10b 2 End-End TLP Prefixes
21	EEPS	R/W	1h	Indicates whether the Function supports End-End TLP Prefixes. A 1 in this field indicates that the Function supports receiving TLPs containing End-End TLP Prefixes.
20	EXFS	R	1h	Indicates that the Function supports the 3-bit definition of the Fmt field in the TLP header. This bit is hardwired to 1 for all Functions.
19-18	OPFFS	R	0h	A 1 in this bit position indicates that the Function supports the Optimized Buffer Flush/Fill [OBFF] capability using message signaling.
17	T10RS	R	0h	If set function supports 1-bit requester capability otherwise, the function does not. This bit can be disabled using local management register.

Table 9-185. PCIE_CORE_PFn_I_PCIE_DEV_CAP_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	T10CS	R/W	1h	If set function supports 1-bit completer capability otherwise, the function does not. This field can be modified using local management interface.
15-14	R13	R	0h	Reserved
13	RESERVED	R/W	X	
12	TCS	R	0h	Hardwired to 0.
11	LMS	R/W	1h	A 1 in this bit position indicates that the Function supports the Latency Tolerance Reporting [LTR] Capability. This bit is set to 1 by default, but can be turned off for all Physical Functions by writing into PF 0.
10	R12	R	0h	Reserved
9	BAOCS128	R	0h	Hardwired to 0.
8	BAOCS64	R	0h	Hardwired to 0.
7	BAOCS32	R	0h	Hardwired to 0.
6	OPRS	R	0h	Atomic OP routing supported.
5	AFS	R	0h	ARI forwarding supported.
4	CTDS	R/W	1h	A 1 in this field indicates that the associated Function supports the capability to turn off its Completion timeout. This bit is set to 1 by default, but can be re-written independently for each Function from the local management bus.
3-0	CTR	R/W	2h	Specifies the Completion Timeout values supported by the device. This field is set by default to 0010 [10 ms - 250 ms]. The actual timeout values are in two programmable local management registers, which allow the timeout settings of the two sub-ranges within Range B to be programmed independently.

Table 9-188. PCIE_CORE_PFn_I_PCIE_DEV_CTRL_STATUS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	R18	R	0h	Reserved
14-13	OBFFE	R	0h	Enables the Optimized Buffer Flush/Fill [OBFF] capability in the device. This field is implemented only in PF 0. Valid settings are 00 [disabled], 01 [Variation A] and 10 [Variation B]. This field can also be written from the local management bus. RW if OBFF capability is supported, RO otherwise.
12	T10RE	R	0h	10bit TAGs generation are not supported in this configuration.
11	R17	R	0h	Reserved
10	LTRME	R/W	0h	This must be set to 1 to enable the Latency Tolerance Reporting Mechanism. This bit is implemented only in PF 0. Its default value is 1, but can be modified from the local management bus. This bit is read-only in PF 1.

Table 9-188. PCIE_CORE_PFn_I_PCIE_DEV_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	IDOCE	R/W	0h	When this bit is 1, the Function is allowed to set the ID-based Ordering [IDO] Attribute bit in the Completions it generates.
8	IDORE	R/W	0h	When this bit is 1, the Function is allowed to set the ID-based Ordering [IDO] Attribute bit in the requests it generates.
7	R16	R	0h	Reserved
6	AORE	R	0h	This bit must be set to enable the generation of Atomic Op Requests from the Function. If the client logic attempts to send an Atomic Op for a Function for which this bit is not set, logic in the Controller will nullify the TLP on its way to the link.
5	AFE	R	0h	ARI forwarding enable
4	CTD	R/W	0h	Setting this bit disables Completion Timeout in the device. This bit can also be written from the local management bus.
3-0	CTV	R/W	0h	Specifies the Completion Timeout value for the device. Allowable values are 0101 [sub-range 1] and 0110 [sub-range 2]. The corresponding timeout values are stored in the local management registers Completion Timeout Interval Registers 0 and 1, respectively. Value of 0 selects completion timeout from Completion-Timeout-Interval-Registers-0 in local management register.

Bit	Field	Type	Reset	Description
31	DMR	R	0h	DRS is not supported by the Controller and hence this field is not implemented.
30-28	DCP	R	0h	DRS is not supported by the Controller and hence this field is not implemented.
27-24	R21	R	0h	Reserved
23	TWRTP	R	0h	When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation.
22	RTP	R	0h	When set to 1b, this bit indicates that a Retimer was present during the most recent Link negotiation.

Table 9-194. PCIE_CORE_PFn_I_LINK_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21	LE	R/W	0h	This bit can be set by the software running on the EndPoint to force the Endpoint to perform link equalization for 8.0 GT/s. Setting this bit causes the LTSSM of the Controller to enter the Recovery state and request its link partner to perform equalization. This bit is cleared when the LTSSM enters the Recovery.Equalization state. It can also be cleared by writing a 1 to this bit position by the host, or writing a 0 from the LMI. STICKY.
20	EP3S	R	0h	This bit, when set to 1, indicates that the Phase 3 of the Transmitter Equalization procedure has completed successfully for 8.0 GT/s. STICKY.
19	EP2S	R	0h	This bit, when set to 1, indicates that the Phase 2 of the Transmitter Equalization procedure has completed successfully for 8.0 GT/s. STICKY.
18	EP1S	R	0h	This bit, when set to 1, indicates that the Phase 1 of the Transmitter Equalization procedure has completed successfully for 8.0 GT/s. STICKY.
17	EQC	R	0h	This bit, when set to 1, indicates that the Transmitter Equalization procedure has completed for 8.0 GT/s. STICKY.
16	CDEL	R	1h	This status bit indicates the current operating de-emphasis level of the transmitter [0 = -6 dB, 1 = -3.5 dB]. This field is undefined when link is not at Gen2 speed.
15-12	CDE	R/W	0h	This bit sets the de-emphasis level [for 5 GT/s operation] or the Transmitter Preset level [for 8 GT/s or 16 GT/s operation] when the LTSSM enters the Polling.Compliance state because of software setting the Enter Compliance bit in this register. It is used only when the link is running at 5 GT/s or 8 GT/s or 16 GT/s. At 5 GT/s, the only valid setting are 0 [-6 dB] and 1 [-3.5 dB]. STICKY.
11	CS	R/W	0h	When this bit is set to 1, the device will transmit SKP ordered sets between compliance patterns. STICKY.
10	EMC	R/W	0h	This field is intended for debug and compliance testing purposes only. If this bit is set to 1, the device will transmit the Modified Compliance Pattern when the LTSSM enters the Polling.Compliance substate. Note: Setting this bit alone will not cause the LTSSM to enter Polling.Compliance. The Enter Compliance bit must also be set and a Hot Reset needs to be initiated by Host to enter Polling.Compliance. STICKY.

Table 9-194. PCIE_CORE_PFn_I_LINK_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-7	TM	R/W	0h	This field is intended for debug and compliance testing purposes only. It controls the non-de-emphasized voltage level at the transmitter outputs. Its encodings are: 000: Normal operating range. 001: 800 - 1200 mV for full swing and 400 - 700 mV for half swing. 010 - 111: See PCI Express Base Specification 2.0. This field is reset to 0 when the LTSSM enters the Polling.Configuration substate during link training. STICKY.
6	SDE	R	0h	This bit selects the de-emphasis level when the Controller is operating at 5 GT/s [0 = -6 dB, 1 = -3.5 dB]. This is reserved for Endpoints.
5	HASD	R/W	0h	When this bit is set, the LTSSM is prevented from changing the operating speed of the link, other than reducing the speed to correct unreliable operation of the link. STICKY
4	EC	R/W	0h	This bit is used to force the Endpoint device to enter the Compliance mode. Software sets this bit to 1 and initiates a hot reset to force the device into the Compliance mode. The target speed for the Compliance mode is determined by the Target Link Speed field of this register. STICKY.
3-0	TLS	R/W	4h	For an upstream component, this field sets an upper limit on Link operational speed during reconfiguration. Additionally for both upstream and downstream components, this field sets the target speed when the software forces the link into Compliance mode by setting the Enter Compliance bit in this register [0001 = 2.5 GT/s, 0010 = 5 GT/s, 0011 = 8 GT/s, 0100 = 16 GT/s]. The default value of this field is 0001 [2.5 GT/s] when the PCIE_GENERATION_SEL strap pins of the Controller are set to 0, 0010 [5 GT/s] when the strap is set to 1, 0011 [8 GT/s] when the strap pin is set to 10 , and 0100 [16 GT/s] when the strap pin is set to 11. These bits are STICKY.

9.2.46 PCIE_CORE_PFn_I_UNCORR_ERR_STATUS Register (Offset = 104h + formula) [reset = 0h]

PCIE_CORE_PFn_I_UNCORR_ERR_STATUS is shown in Figure 9-66 and described in Table 9-203.

Return to the [Summary Table](#).

This register provides the status of the various uncorrectable errors detected by the PCI Express Controller. Software may clear any error bit by writing a 1 into the corresponding bit position. The states of the bits in the Uncorrectable Error Mask Register have no effect on the status bits of this register. The setting of an uncorrectable error status bit causes the Controller to generate an ERR_FATAL message if the corresponding severity bit of the Uncorrectable Error Severity Register is 1. If the severity bit is 0, however, there are two separate ways the error could be processed: (i) In certain cases, the uncorrectable error is treated as an Advisory Non-Fatal Error. These cases are treated as similar to correctable errors, causing the Controller to generate an ERR_COR message instead of an ERR_NONFATAL message. For details on these special cases, refer to Section 6.2.3.2.4 of the PCI Express Base Specifications, Version 1.1. (ii) In all other cases, the Controller sends an ERR_NONFATAL message when the error is detected. In all cases, the sending of the error message can be suppressed by setting the bit corresponding to the error type in the Uncorrectable Error Mask Register. For errors that are not Function-specific, the error status bus is set in the registers belonging to all the Functions associated with the link, but only a single message is generated for the entire link. In the case of certain errors detected by the Transaction Layer, the associated TLP header is logged in the Header Log Registers. All the RW1C bits can also be cleared from the local management bus by writing a 1 into the bit position.

Offset = 104h + (n * 1000h); where n = 0h to 5h

Bit	Field	Type	Reset	Description
22	UIE	R/W1C	0h	This bit is set when the Controller has detected an internal uncorrectable error [HAL parity error or an uncorrectable ECC error while reading from any of the RAMs]. This bit is also set in response to the client signaling an internal error through the input UNCORRECTABLE_ERROR_IN. This error is not Function-specific. This error is considered fatal by default, and is reported by sending an ERR_FATAL message. STICKY.
21	R2	R	0h	Reserved
20	URES	R/W1C	0h	This bit is set when the Controller has received a request from the link that it does not support. This error is not Function-specific. This error is considered non-fatal by default. In the special case described in Sections 6.2.3.2.4.1 of the PCI Express Specifications, the error is reported by sending an ERR_COR message. In all other cases, the error is reported by sending an ERR_NONFATAL message. The header of the received request that caused the error is logged in the Header Log Registers. STICKY.
19	EES	R/W1C	0h	This bit is set when the Controller has detected an ECRC error in a received TLP. This error is not Function-specific. The header of the received TLP with error is logged in the Header Log Registers. STICKY.
18	MTS	R/W1C	0h	This bit is set when the Controller receives a malformed TLP from the link. This error is not Function-specific. This error is considered fatal by default, and is reported by sending an ERR_FATAL message. The header of the received TLP with error is logged in the Header Log Registers. STICKY.
17	ROS	R/W1C	0h	This bit is set when the Controller receives a TLP in violation of the receive credit currently available. This error is not Function-specific. STICKY.
16	UCS	R/W1C	0h	This bit is set when the Controller has received an unexpected Completion packet from the link. This error is not Function-specific. STICKY.
15	CAS	R/W1C	0h	This bit is set when the Controller has returned the Completer Abort [CA] status to a request received from the link. This error is Function-specific. The header of the received request that caused the error is logged in the Header Log Registers. STICKY.

Table 9-203. PCIE_CORE_PFn_I_UNCORR_ERR_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	CTS	R/W1C	0h	This bit is set when the completion timer associated with an outstanding request times out. This error is Function-specific. This error is considered non-fatal by default. STICKY.
13	FCPES	R/W1C	0h	This bit is set when certain violations of the flow control protocol are detected by the Controller. Controller reports FCPE upon the following conditions: [i] InitFC/UpdateFC DLLP received which issues more than 2047 cumulative outstanding unused credits to the Transmitter for data payload or 127 for header. [ii] InitFC_P is received with Payload Credits less than 128B. Or [iii] InitFC_CPL is received with Payload Credits less than 128B. This error is not Function-specific STICKY.
12	PTS	R/W1C	0h	This bit is set when the Controller receives a poisoned TLP from the link. This error is Function-specific. This error is considered non-fatal by default. The error is reported by sending an ERR_NONFATAL message. The header of the received TLP with error is logged in the Header Log Registers. STICKY.
11-5	R1	R	0h	Reserved
4	DLPES	R/W1C	0h	This bit is set when the Controller receives an Ack or Nak DLLP whose sequence number does not correspond to that of an unacknowledged TLP or that of the last acknowledged TLP [for details, refer to PCI Express Base Specification 1.1, Section 3.5.2]. This error is not Function-specific, and is reported by Function 0. STICKY.

9.2.47 PCIE_CORE_PFn_I_UNCORR_ERR_MASK Register (Offset = 108h + formula) [reset = 00400000h]

PCIE_CORE_PFn_I_UNCORR_ERR_MASK is shown in Figure 9-67 and described in Table 9-206.

Return to the [Summary Table](#).

The mask bits in this register control the reporting of uncorrectable errors. For each error type in the Uncorrectable Error Status Register, there is a corresponding bit in this register to mask its reporting. Setting the mask bit has the following effects: (i) The occurrence of the error is not reported to the Root Complex (by a PCI Express error message). (ii) The header of the TLP in which the error was detected is not logged in the Header Log Registers. (iii) The First Error Pointer in the Advanced Error Capabilities and Control Register is not updated on detection of the error. The individual bits of the mask register are described below. The bits marked RW can also be written from the local management bus.

Offset = 108h + (n * 1000h); where n = 0h to 5h

9.2.49 PCIE_CORE_PFn_I_CORR_ERR_STATUS Register (Offset = 110h + formula) [reset = 0h]

PCIE_CORE_PFn_I_CORR_ERR_STATUS is shown in [Figure 9-69](#) and described in [Table 9-212](#).

Return to the [Summary Table](#).

This register provides the status of the various correctable errors detected by the PCI Express Controller. Software may clear any error bit by writing a 1 into the corresponding bit position. The states of the bits in the Correctable Error Mask Register have no effect on the status bits of this register. The setting of a correctable error status bit causes the Controller to generate an ERR_COR error message to the Root Complex if the error is not masked in the Correctable Error Mask Register. For errors that are not Function-specific, the error status bus is set in the registers belonging to all the Functions associated with the link, but only a single message is generated for the entire link. Header logging of received TLPs does not apply to correctable errors. All the RW1C bits can also be cleared from the local management bus by writing a 1 into the bit position.

Offset = 110h + (n * 1000h); where n = 0h to 5h

Bit	Field	Type	Reset	Description
31-16	R14	R	0h	Reserved
15	HLOS	R/W1C	0h	This bit is set on a Header Log Register overflow, that is, when the header could not be logged in the Header Log Register because it is occupied by a previous header. STICKY.

Table 9-212. PCIE_CORE_PFn_I_CORR_ERR_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	CIES	R/W1C	0h	This bit is set when the Controller has detected an internal correctable error condition [a correctable ECC error while reading from any of the RAMs]. This bit is also set in response to the client signaling an internal error through the input CORRECTABLE_ERROR_IN. This error is not Function-specific. STICKY.
13	ANFES	R/W1C	0h	This bit is set when an uncorrectable error occurs, which is determined to belong to one of the special cases described in Section 6.2.3.2.4 of the PCI Express 2.0 Specifications. This causes the Controller to generate an ERR_COR message in place of an ERR_NONFATAL message. STICKY.
12	RTTS	R/W1C	0h	This bit is set when the replay timer in the Data Link Layer of the Controller times out, causing the Controller to retransmit a TLP. This error is not Function-specific. STICKY.
11-9	R13	R	0h	Reserved
8	RNRS	R/W1C	0h	This bit is set when the replay count rolls over after three re-transmissions of a TLP at the Data Link Layer of the Controller. This error is not Function-specific STICKY.
7	BDS	R/W1C	0h	This bit is set when an LCRC error is detected in a received DLLP, and no errors were detected by the Physical Layer. This error is not Function-specific. STICKY.
6	BTS	R/W1C	0h	This bit is set when an error is detected in a received TLP by the Data Link Layer of the Controller. The conditions causing this error are: [i] An LCRC error [ii] The packet terminates with EDB symbol, but its LCRC field does not equal the inverted value of the calculated CRC. This error is not Function-specific. STICKY.
5-1	R12	R	0h	Reserved
0	RES	R/W1C	0h	This bit is set when an error is detected in the receive side of the Physical Layer of the Controller [e.g. a bit error or coding violation]. This bit is set upon any of the following errors: [1] PHY reported 8B10B error, Disparity Error, Elastic Buffer Overflow Error, Underflow Error [2] GEN3 TLP, DLLP Framing Errors [3] OS Block Received Without EDS [4] Data Block Received After EDS [5] Illegal OS Block After EDS [6] OS Block Received After SKIP OS [7] OS Block Received After SDS [8] Sync Header Error [9] Loss of Gen3 Block Alignment This error is not Function-specific. STICKY.

- [PCIE_CORE_EP_PF](#) Registers: [0] [1]

9.2.50 PCIE_CORE_PFn_I_CORR_ERR_MASK Register (Offset = 114h + formula) [reset = E000h]

PCIE_CORE_PFn_I_CORR_ERR_MASK is shown in Figure 9-70 and described in Table 9-215.

Return to the [Summary Table](#).

The mask bits in this register control the reporting of correctable errors. For each error type in the Correctable Error Status Register, there is a corresponding bit in this register to mask its reporting. When a mask bit is set, the occurrence of the error is not reported to the Root Complex (by a PCI Express error message). The individual bits of the mask register are described below. The bits marked RW can also be written from the local management bus.

Offset = 114h + (n * 1000h); where n = 0h to 5h

Table 9-218. PCIE_CORE_PFn_I_ADVCD_ERR_CAP_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	R18	R	0h	Reserved
11	TPLP	R	0h	If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined. Default value of this bit is 0. This bit is RsvdP if the End-End TLP Prefix Supported bit is Clf Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	MHRE	R	0h	Setting this bit enables the Function to log multiple error headers in its Header Log Registers. It is hardwired to 0

Table 9-218. PCIE_CORE_PFn_I_ADVCD_ERR_CAP_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	MHRC	R	0h	This bit is set when the Function has the capability to log more than one error header in its Header Log Registers. It is hardwired to 0.
8	EEC	R/W	0h	Setting this bit enables ECRC checking on the receive side of the Controller. This bit is writable from the local management bus. STICKY.
7	ECC	R/W	1h	This read-only bit indicates to the software that the device is capable of checking ECRC in packets received from the link. This bit is writable from the local management bus.
6	EEG	R/W	0h	Setting this bit enables the ECRC generation on the transmit side of the Controller. This bit is writable from the local management bus. STICKY.
5	EGC	R/W	1h	This read-only bit indicates to the software that the device is capable of generating ECRC in packets transmitted on the link. This bit is writable from the local management bus.
4-0	FER	R	0h	This is a 5-bit pointer to the bit position in the Uncorrectable Error Status Register corresponding to the error that was detected first. When there are multiple bits set in the Uncorrectable Error Status Register, this field informs the software which error was observed first. To prevent the field from being overwritten before software was able to read it, this field is not updated while the status bit pointed by it in the Uncorrectable Error Status Register remains set. After the software clears this status bit, a subsequent error condition that sets any bit in the Uncorrectable Error Status Register will update the First Error Pointer. Any uncorrectable error type, including the special cases where the error is reported using an ERR_COR message, will set the First Error Pointer [assuming the software has reset the error pointed by it in the Uncorrectable Error Status Register]. STICKY.

9.2.52 PCIE_CORE_PFn_I_HDR_LOG_0 Register (Offset = 11Ch + formula) [reset = 0h]

PCIE_CORE_PFn_I_HDR_LOG_0 is shown in Figure 9-72 and described in Table 9-221.

Return to the [Summary Table](#).

This is the first of a set of four registers used to capture the header of a TLP received by the Controller from the link upon detection of an uncorrectable error. When multiple bits are set in the Uncorrectable Error Status Register, the captured header corresponds to the error that was detected first, that is, the error pointed by the First Error Pointer. To prevent the captured header from being over-written before software was able to read it, this register is not updated while the status bit pointed by the First Error Pointer in the Uncorrectable Error Status Register remains set. After the software clears this status bit, a subsequent error condition that sets any bit in the Uncorrectable Error Status Register will also cause the Header Log Registers to be updated. The doublewords of the TLP header are stored in the Header Log Registers with their bytes transposed. That is, the byte containing the Type/Format fields of the header is stored at bit positions 31:24 of the Header Log Register 0.

Offset = 11Ch + (n * 1000h); where n = 0h to 5h

Table 9-239. PCIE_CORE_PFn_I_ARI_EXT_CAP_HDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	ARINCO	R/W	150h	Indicates offset to the next PCI Express capability structure. The default next pointer value is dynamic and is dependent on whether the strap or LMI bits are set.
19-16	ARICV	R/W	1h	Specifies the SIG-assigned value for the version of the capability structure. This field is set to 1 by default, but can be modified independently for each Function from the local management bus
15-0	PECID	R	Eh	This field is hardwired to the Capability ID assigned by PCI-SIG to the ARI Extended Capability [000E hex].

9.2.70 PCIE_CORE_PFn_I_RESIZE_BAR_EXT_CAP_HDR Register (Offset = 180h + formula) [reset = 0h]

PCIE_CORE_PFn_I_RESIZE_BAR_EXT_CAP_HDR is shown in Figure 9-90 and described in Table 9-275.

Return to the [Summary Table](#).

This register contains the PCI Express Extended Capability ID for the Resizable BAR Capability, its capability version, and the pointer to the next capability structure. This register is enabled only when the Resizable BAR Capability is enabled for the Physical Function by setting the Enable Resizable BAR Capability bit (bit 31) of the associated Physical Function BAR Configuration Register (Section 8.4.2.24). When the Resizable BAR Capability is not enabled, a read from this location returns all zeroes.

Offset = 180h + (n * 1000h); where n = 0h to 5h

9.2.76 PCIE_CORE_PFn_I_RESIZE_BAR_CTRL_2 Register (Offset = 198h + formula) [reset = 0h]

PCIE_CORE_PFn_I_RESIZE_BAR_CTRL_2 is shown in Figure 9-96 and described in Table 9-293.

Return to the [Summary Table](#).

This register controls the aperture setting of the first memory BAR of the associated Physical Function, and also has a field that specifies the number of resizable BARs configurable through the Resizable BAR Capability Structure. This register is active only when the Resizable BAR Capability is enabled for the Physical Function by setting the Enable Resizable BAR Capability bit (bit 31) of the associated Physical Function BAR Configuration Register. When the Resizable BAR Capability is not enabled, a read from this location returns all zeroes. When the Resizable BAR Capability is enabled, all valid fields of this register can be modified from the local management bus.

Offset = 198h + (n * 1000h); where n = 0h to 5h

9.2.82 PCIE_CORE_PFn_I_RESIZE_BAR_CTRL_5 Register (Offset = 1B0h + formula) [reset = 0h]

PCIE_CORE_PFn_I_RESIZE_BAR_CTRL_5 is shown in Figure 9-102 and described in Table 9-311.

Return to the [Summary Table](#).

This register controls the aperture setting of the first memory BAR of the associated Physical Function, and also has a field that specifies the number of resizable BARs configurable through the Resizable BAR Capability Structure. This register is active only when the Resizable BAR Capability is enabled for the Physical Function by setting the Enable Resizable BAR Capability bit (bit 31) of the associated Physical Function BAR Configuration Register. When the Resizable BAR Capability is not enabled, a read from this location returns all zeroes. When the Resizable BAR Capability is enabled, all valid fields of this register can be modified from the local management bus.

Offset = 1B0h + (n * 1000h); where n = 0h to 5h

9.2.90 PCIE_CORE_PFn_I_DPA_POWER_ALLOC_REG1 Register (Offset = 1D4h + formula) [reset = 07060504h]

PCIE_CORE_PFn_I_DPA_POWER_ALLOC_REG1 is shown in Figure 9-110 and described in Table 9-335.

Return to the [Summary Table](#).

This is a register in an array of 2 registers that contain the power allocations for the DPA substates. Each location contains power allocation values for four substates, 8 bits per substate. The value in each 8-bit field, when multiplied by the Power Allocation Scale programmed in the DPA Capability Register, provides the power associated with the corresponding substate in Watts.

Offset = 1D4h + (n * 1000h); where n = 0h to 5h

Bit	Field	Type	Reset	Description
31-24	SPA3_1	R/W	7h	This field contains the power allocation for the DPA substate #7 covered by this register. This value, when multiplied by the Power Allocation Scale programmed in the DPA Capability Register, provides the power associated with the corresponding substate in Watts.
23-16	SPA2_1	R/W	6h	This field contains the power allocation for the DPA substate #6 covered by this register. This value, when multiplied by the Power Allocation Scale programmed in the DPA Capability Register, provides the power associated with the corresponding substate in Watts.
15-8	SPA1_1	R/W	5h	This field contains the power allocation for the DPA substate #5 covered by this register. This value, when multiplied by the Power Allocation Scale programmed in the DPA Capability Register, provides the power associated with the corresponding substate in Watts.
7-0	SPA0_1	R/W	4h	This field contains the power allocation for the DPA substate #4 covered by this register. This value, when multiplied by the Power Allocation Scale programmed in the DPA Capability Register, provides the power associated with the corresponding substate in Watts.

9.2.101 PCIE_CORE_PFn_I_VF_BAR_0_REG Register (Offset = 224h + formula) [reset = 4h]

PCIE_CORE_PFn_I_VF_BAR_0_REG is shown in Figure 9-121 and described in Table 9-368.

Return to the [Summary Table](#).

This is part of the set of six Virtual Function Base Address Registers defined by the SR-IOV Specifications. These registers are used to define address ranges for memory accesses to the Endpoint device. This register may be used to define a range of 32-bit addresses, or paired with the next adjacent register to define a 64-bit address range. During the initial configuration of the device, the configuration program determines the size of the address range defined by the BAR by writing a pattern of all 1's into the BAR, reading back from the BAR, and noting the position of the first 1 (the most significant) in the returned value. A value of 0 is returned by the Controller if this BAR is not configured. Otherwise, the number of 1's returned is based on the length of the BAR.

Offset = 224h + (n * 1000h); where n = 0h to 5h

Table 9-368. PCIE_CORE_PFn_I_VF_BAR_0_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	BAMRW	R/W	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in BAR Configuration Registers of the associated Physical Function.
21-8	BAMR0	R	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in BAR Configuration Registers of the associated Physical Function. All other bits are not writeable, and are read as 0's.
7-4	R8	R	0h	These bits are hardwired to 0
3	P0	R	0h	When the BAR is used to define a memory address range, this field declares whether data from the address range is prefetchable [0 = non-prefetchable, 1 = prefetchable]. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function

Table 9-368. PCIE_CORE_PFn_I_VF_BAR_0_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	S0	R	1h	When the BAR is used to define a memory address range, this field indicates whether the address range is 32-bit or 64-bit [0 = 32-bit, 1 = 64 bit]. For 64-bit address ranges, the value in BAR 1 is treated as a continuation of the base address in BAR 0. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function.
1	R7	R	0h	This bit is hardwired to 0 for both memory and I/O BARs.
0	MSI	R	0h	Specifies whether this BAR defines a memory address range or an I/O address range [0 = memory, 1 = I/O]. The value read in this field is determined by the setting of BAR Configuration Registers of the associated Physical Function

9.2.111 PCIE_CORE_PF0_I_LANE_ERROR_STATUS_REG Register (Offset = 308h) [reset = 0h]

PCIE_CORE_PF0_I_LANE_ERROR_STATUS_REG is shown in Figure 9-131 and described in Table 9-398.

Return to the [Summary Table](#).

This register contains one bit per lane indicating the physical-layer error status of the corresponding lane. A 1 indicates that a physical-layer error was detected by the Controller in the corresponding lane. The error can be cleared by writing a 1 into the bit position, either through a Configuration Write transaction from the link or from the local management bus.

The following errors are reported in this status bit:

- (i) Parity error detected in Gen3 SKP OS,
- (ii) Loss of Block Alignment in the lane.

LEGEND: R/W = Read/Write; -n = value after reset

Table 9-482. PCIE_CORE_PFn_ATS_OUTSTANDING_PR_CAPACITY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ATSOUTPRCAP	R/W	1h	This register contains the number of outstanding page request messages the associated Page Request Interface physically supports. This is the upper limit on the number of pages that can be usefully allocated to the Page Request Interface.

Table 9-483. Register Call Summary for PCIE_CORE_PFn_ATS_OUTSTANDING_PR_CAPACITY

PCIE_CORE_EP_PF Registers

- PCIE_CORE_PFn_ATS_OUTSTANDING_PR_CAPACITY Register (Offset = 648h + formula) [reset = 1h]: [0]
- PCIE_CORE_EP_PF Registers: [0] [1]

9.2.140 PCIe_CORE_PFn_ATS_OUTSTANDING_PR_ALLOC Register (Offset = 64Ch + formula) [reset = 0h]

PCIE_CORE_PFn_ATS_OUTSTANDING_PR_ALLOC is shown in [Figure 9-160](#) and described in [Table 9-485](#).

Return to the [Summary Table](#).

This register contains the number of outstanding page request messages the associated Page Request Interface is allowed to issue.

Offset = 64Ch + (n * 1000h); where n = 0h to 5h
