Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	X	
23-19	R0	R/W	Dh	Along with the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register sets the time [in us] that this Port requires the port on the opposite side of Link to wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register. T Power On is the minimum amount of time that each component must wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. This is to ensure no device is ever actively driving into an unpowered component.This bit can be modified using local management interface.
18	RESERVED	R/W	X	

Table 9-491. PCIE_CORE_PFO_I_L1_PM_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17-16	L1PRTPVRONSCALE	R/W	0h	Specifies the scale used for the Port T_POWER_ON Value field in the L1 PM Substates Capabilities register. Range of Values 00b = 2us 01b = 10us 10b = 100us 11b = Reserved Default value is 00. This bit can be modified using local management interface.
15-8	L1PRTCMMMDRESTRTIME	R/W	FFh	Time [in us] required for this Port to re-establish common mode during exit from PM or ASPM L1.2 substate. This bit can be modified using local management interface.
7-5	RESERVED	R/W	X	
4	L1PMSUPP	R/W	1h	When Set this bit indicates that this Port supports L1 PM Substates. This bit can be modified using local management interface.
3	L1ASPM L1.1 SUPP	R/W	1h	When Set this bit indicates that ASPM L1.1 is supported. This bit can be modified using local management interface.

Bit	Field	Type	Reset	Description
31-18	R1	R	0h	Reserved
17	MSRDY	R/W	0h	When Margining uses Driver Software is Set, then this bit, when Set, indicates that the required software has performed the required initialization. The value of this bit is Undefined if Margining users Driver Software is Clear. The Controller implementation sets the default value of this bit to 0. The driver software must initialize the Rx Margining parameters in the Local Management Lane Margining Registers and then program this bit to 1.
16	MRDY	R	0h	Indicates when the Margining feature is ready to accept margining commands. If the Margining uses Driver Software bit is 1, then the Controller sets this status bit when the Margining Software Ready bit is set and the Link is in Gen4 L0 state. If the Margining uses Driver Software bit is 0, then the Controller sets this status bit when the Link is in Gen4 L0 state.
15-1	R0	R	0h	Reserved

Table 9-512. PCIE_CORE_PF0_I_MARGINING_PORT_CAPABILITIES_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	MARUDS	R/W	1h	If Set, indicates that Margining is partially implemented using Device Driver software. Margining Software Ready indicates when this software is initialized. If Clear, Margining does not require device driver software. The Controller implementation requires driver software to initialize the Rx Margining parameter values in Local Management Registers for Lane Margining. Hence, the default value of this bit is set to 1.

Table 9-530. PCIE_CORE_PFO_I_PL_16GTS_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	R0	R	0h	Reserved
4	LE16	R/W	0h	This bit can be set by the software running on the EndPoint to force the Endpoint to request link equalization for 16.0 GT/s. Setting this bit causes the LTSSM of the Controller to enter the Recovery state and request its link partner to perform equalization. This bit is cleared when the LTSSM enters the Recovery.Equalization state. It can also be cleared by writing a 1 to this bit position by the host, or writing a 0 from the LMI. STICKY.
3	EP3S16	R	0h	This bit, when set to 1, indicates that the Phase 3 of the Transmitter Equalization procedure has completed successfully for 16.0 GT/s. STICKY.
2	EP2S16	R	0h	This bit, when set to 1, indicates that the Phase 2 of the Transmitter Equalization procedure has completed successfully for 16.0 GT/s. STICKY.

Table 9-530. PCIE_CORE_PFO_I_PL_16GTS_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
31-16	R16	R	0h	Reserved
15-8	LOCCLKGR	R/W	0h	This field indicates the granularity of the PTM Local Clock in a PTM Time Source. In EP Mode: This field is not used and is set to 8'd00 by default. Note: This bit must not be programmed in EP Mode.
7-3	R3	R	0h	Reserved
2	PTMRTCAP	R/W	0h	This bit is used to indicate that the Controller implements PTM Time Source Role and is capable of serving as PTM Root. By default, this bit is set to 0 when the Controller is in Endpoint Mode. Note: This bit must not be programmed in EP Mode.
1	PTMRSCAP	R/W	0h	This bit is used to indicate support for PTM Responder Role. By default, this bit is set to 0 when the Controller is in Endpoint Mode. Note: This bit must not be programmed in EP Mode.
0	PTMRQCAP	R/W	1h	This bit is used to indicate support for PTM Requester Role. By default, this bit is set to 1 when the Controller is in Endpoint Mode. This bit can be programmed through the local management APB interface if required.

Table 9-554. PCIE_CORE_PFO_I_PTM_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	R16	R	0h	Reserved
15-8	EFFGRN	R/W	0h	In EP Mode: This field provides information relating to the expected accuracy of the PTM Clock. However, this field does not impact the functionality of the PTM Requester. System SW is expected to program this field with to the value representing the maximum Local Clock Granularity reported by the PTM Root and all the intervening PTM Time Sources.
7-2	R2	R	0h	Reserved
1	RTSEL	R/W	0h	Since Endpoint cannot be a PTM Root, this bit is set to 0 by default in Endpoint Mode. Note: This bit must not be programmed in EP Mode.
0	PTMEN	R/W	0h	When Set, this function is permitted to participate in the PTM mechanism as PTM Requester. By default, this bit is set to 0. This field is configured by System SW.

Table 9-563. PCIE_CORE_VFm_I_COMMAND_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DPE	R/W1C	0h	This bit is set when the core has received a Poisoned TLP targeted at this VF. The Parity Error Response enable bit [bit 6] in the PCI Command Register of the associated PF has no effect on the setting of this bit. STICKY.
30	SSE	R/W1C	0h	If the SERR enable bit in the PCI Command Register of the associated Physical Function is 1, this bit is set when this VF has sent out a fatal or non-fatal error message on the link to the Root Complex. If the SERR enable bit is 0, this bit remains 0. This field can also be cleared from the local management bus by writing a 1 into this bit position. STICKY.
29	RMA	R/W1C	0h	This bit is set when this VF has received a completion from the link with the Unsupported Request status. This field can also be cleared from the local management bus by writing a 1 into this bit position. STICKY.

Table 9-563. PCIE_CORE_VFm_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	RTA	R/W1C	0h	This bit is set when this Virtual Function has received a completion from the link with the Completer Abort status. This field can also be cleared from the local management bus by writing a 1 into this bit position. STICKY.
27	STA	R/W1C	0h	This bit is set when the core has sent a completion from this VF to the link with the Completer Abort status. This field can also be cleared from the local management bus by writing a 1 into this bit position. STICKY.
26-25	R5	R	0h	Reserved
24	MDPE	R/W1C	0h	When the Parity Error Response enable bit in the PCI Command Register of the associated Physical Function is set, the core sets this bit when it detects the following error conditions: [i] The core receives a Poisoned Completion TLP from the link in response to a request from this VF. [ii] The core sends out a poisoned write request on the link from this VF. [This bit remains 0 when the Parity Error Response enable bit in the PCI Command Register of the associated Physical Function is 0]. This field can also be cleared from the local management bus by writing a 1 into this bit position. STICKY.
23-21	R4	R	0h	Reserved
20	CL	R	1h	Indicates the presence of PCI Extended Capabilities registers. This bit is hardwired to 1.

Table 9-611. PCIE CORE VFm I PWR MGMT CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PSDCS	R	0h	Indicates whether the Function is capable of sending PME messages when in the D3cold state. Because the device does not have aux power, this bit is hardwired to 0.
30	PSDHS	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D3hot state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
29	PSD2S	R	0h	Indicates whether the Function is capable of sending PME messages when in the D2 state. This bit is hardwired to 0 because D2 state is not supported.

Table 9-611. PCIE_CORE_VFm_I_PWR_MGMT_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	PSD1S	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D1 state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
27	PSD0S	R/W	1h	Indicates whether the Function is capable of sending PME messages when in the D0 state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
26	D2S	R	0h	Set if the Function supports the D2 power state. Currently hardwired to 0.
25	D1S	R/W	1h	Set if the Function supports the D1 power state. This bit can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
24-22	MCRAPS	R	0h	Specifies the maximum current drawn by the device from the aux power source in the D3cold state. This field is not implemented in devices not supporting PME notification when in the D3cold state, and is therefore hardwired to 0.
21	DSI	R	0h	This bit, when set, indicates that the device requires additional configuration steps beyond setting up its PCI configuration space, to bring it to the D0active state from the D0uninitialized state. This bit is hardwired to 0.
20	R0	R	0h	Reserved
19	PC	R	0h	Not applicable to PCI Express. This bit is hardwired to 0.
18-16	VID	R/W	3h	Indicates the version of the PCI Bus Power Management Specifications that the Function implements. This field is set by default to 011 [Version 1.2]. It can be re-written independently for each Function from the local management bus.
15-8	CP	R/W	90h	Contains pointer to the next PCI Capability Structure. The core sets it to the value defined in the RTL file reg_defaults.h. By default, this points to the MSI Capability Structure. This field can be re-written independently for each Function from the local management bus.
7-0	CID	R/W	1h	Identifies that the capability structure is for Power Management. This field is set by default to 01 hex. It can be re-written independently for each Function from the local management bus.

Table 9-614. PCIE_CORE_VFm_I_PWR_MGMT_CTRL_STAT_REP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	DR	R	0h	This optional register is not implemented in the PCIe core. This field is hardwired to 0.
23-16	R1	R	0h	Reserved
15	PMES	R/W	0h	When PME notification is enabled, writing a 1 into this bit position from the local management bus sets this bit and causes the core to send a PME message from the associated Function. When the Root Complex processes this message, it will turn off this bit by writing a 1 into this bit position through a Config Write. This bit can be set or cleared from the local management bus, by writing a 1 or 0, respectively. It can only be cleared from the configuration path [by writing a 1].
14-9	R2	R	0h	Reserved

Table 9-614. PCIE_CORE_VFm_I_PWR_MGMT_CTRL_STAT_REP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PE	R/W	0h	Setting this bit enables the notification of PME events from the associated Function. This bit can be set also by writing into this register from the local management bus.
7-4	R3	R	0h	Reserved
3	NSR	R/W	1h	When this bit is set to 1, the Function will maintain all its state in the PM state D3hot. The software is not required to re-initialize the Function registers on the transition back to D0. This bit is set to 1 by default, but can be modified independently for each VF from the local management bus.
2	R4	R	0h	Reserved
1-0	PS	R/W	0h	Indicates the power state this Function is currently in. This field can be read by the software to monitor the current power state, or can be written to cause a transition to a new state. The valid settings are 00 [state D0], 01 [state D1] and 11 [state D3hot]. The software should not write any other value into this field. This field can also be written from the local management bus independently for each VF Function.

Table 9-620. PCIE_CORE_VFm_I_MSI_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	R0	R	0h	Reserved
24	MC	R/W	1h	can be modified using localmanagement interface
23	AC64	R/W	1h	Set to 1 to indicate that the device is capable of generating 64-bit addresses for MSI messages.
22-20	MME	R/W	0h	Encodes the number of distinct messages that the core is programmed to generate for this Function [000 = 1, 001 = 2, 010 = 4, 011 = 8, 100 = 16, 101 = 32]. This setting must be based on the number of interrupt inputs of the core that are actually used by this Function. This field can be written from the local management bus.

Table 9-620. PCIE_CORE_VFm_I_MSI_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19-17	MMC	R/W	0h	Encodes the number of distinct messages that the core is capable of generating for this Function [000 = 1, 001 = 2, 010 = 4, 011 = 8, 100 = 16, 101 = 32]. Thus, this field defines the number of the interrupt vectors for this Function. The core allows up to 32 distinct messages, but the setting of this field must be based on the number of interrupt inputs of the core that are actually used by the client. For example, if the client logic uses 8 of the 32 distinct MSI interrupt inputs of the core for this Function, then the value of this field must be set to 011. This field can be written from the local management bus. Please see the define <code>den_db_VF_MSI_MULTIPLE_MSG_CAPABLE</code> for default value in the <code>reg_defaults.v</code> files.
16	ME	R/W	0h	Set by the configuration program to enable the MSI feature. This field can also be written from the local management bus.
15-8	CP	R	B0h	Pointer to the next PCI Capability Structure. The value read from this read-only field is the corresponding pointer in the MSI Capability Structure of the Physical Function this VF is attached to. The setting is common across all the Virtual Functions.
7-0	CID	R	5h	Specifies that the capability structure is for MSI. Hardwired to 05 hex.

9.3.24 PCIE_CORE_VFm_I_MSI_MSG_DATA Register (Offset = 609Ch + formula) [reset = 0h]

PCIE_CORE_VFm_I_MSI_MSG_DATA is shown in [Figure 9-207](#) and described in [Table 9-629](#).

Return to the [Summary Table](#).

This register contains the write data to be used in the MSI messages to be generated for the associated PCI Function. When the number of distinct messages programmed in the MSI Control Register is 1, the 32-bit value from this register is used as the data value in the MSI packets generated by the core for this Function. If the number of distinct messages is more than 1, the least significant bits of the programmed value are replaced with the encoded interrupt vector [31:0] of the specific message to generate the write data value for the message.

Offset = 609Ch + (m * 1000h); where m = 0h to Fh

9.3.29 PCIE_CORE_VFm_I_MSIX_TBL_OFFSET Register (Offset = 60B4h + formula) [reset = 0h]

PCIE_CORE_VFm_I_MSIX_TBL_OFFSET is shown in Figure 9-212 and described in Table 9-644.

Return to the [Summary Table](#).

This register is used to specify the location of the MSI-X Table in memory. All of the 32 bits of this register can be re-written independently for each Virtual Function from the local management bus.

Offset = 60B4h + (m * 1000h); where m = 0h to Fh

Bit	Field	Type	Reset	Description
31	R0	R	0h	Reserved
30	TRS	R	0h	When set to 1, this bit indicates that the device supports routing of Trusted Configuration Requests. Not valid for Endpoints. Hardwired to 0.
29-25	IMN	R	0h	Identifies the MSI or MSI-X interrupt vector for the interrupt message generated corresponding to the status bits in the Slot Status Register, Root Status Register, or this capability structure. This field must be defined based on the chosen interrupt mode - MSI or MSI-X. This field is hardwired to 0.
24	SS	R	0h	Set to 1 when the link connected to a slot. Hardwired to 0.
23-20	DT	R	0h	Indicates the type of device implementing this Function. This field is hardwired to 0 in the EP mode.
19-16	CV	R	2h	Identifies the version number of the capability structure. This field is set to 2 by default to indicate that the Controller is compatible to PCI Express Base Specification Revision 3.0.
15-8	NCP	R	0h	Points to the next PCI capability structure. Set to 0 because this is the last capability structure.

Table 9-653. PCIE_CORE_VFm_I_PCIE_CAP_LIST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	CID	R	10h	Specifies Capability ID assigned by PCI SIG for this structure. This field is hardwired to 10 hex.

Table 9-662. PCIE_CORE_VFm_I_LINK_CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PN	R	0h	Specifies the port number assigned to the PCI Express link connected to this device.
23	R5	R	0h	Reserved
22	AOC	R	1h	Setting this bit indicates that the device supports the ASPM Optionality feature. It can be turned off by writing a 0 to this bit position through the local management bus.
21	LBNC	R	0h	A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. Reserved for Endpoint.
20	DLLARC	R	0h	Set to 1 if the device is capable of reporting that the DL Control and Management State Machine has reached the DL_Active state. This bit is hardwired to 0, as this version of the core does not support the feature.

Table 9-662. PCIE_CORE_VFm_I_LINK_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	SDERC	R	0h	Indicates the capability of the device to report a Surprise Down error condition. This bit is hardwired to 0, as this version of the core does not support the feature.
18	CPM	R	0h	Indicates that the device supports removal of reference clocks. It is set by default to the value of the define in reg_defaults.h. It can be re-written independently for each function from the local management bus.
17-15	L1EL	R	3h	Specifies the exit latency from L1 state. This parameter is dependent on the Physical Layer implementation. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
14-12	LOSEL	R	2h	Specifies the time required for the device to transition from LOS to L0. This parameter is dependent on the Physical Layer implementation. It is set by default to the value define in reg_defaults.h. It can be re-written independently for each Function from the local management bus.
11-10	ASPM	R	3h	Indicates the level of ASPM support provided by the device. This field can be re-written independently for each Function from the local management bus. When SRIS is enabled in local management register bit, L0s capability is not supported and is forced low.
9-4	MLW	R	2h	Indicates the maximum number of lanes supported by the device. This field is hardwired based on the setting of the LANE_COUNT_IN strap input.
3-0	MLS	R	4h	Indicates the maximum speed supported by the link. [2.5 GT/s, 5 GT/s, 8 GT/s, 16 GT/s per lane]. This field is hardwired to 0001 [2.5GT/s] when the strap input PCIE_GENERATION_SEL is set to 0, to 0010 [5 GT/s] when the strap is set to 1, and to 0011 [8 GT/s] when the strap input is set to 10, to 0100 [16 GT/s] when the strap input is set to 11.

Table 9-668. PCIE_CORE_VFm_I_PCIE_DEV_CAP_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	R14	R	0h	Reserved
23-22	MEEP	R	1h	Indicates the maximum number of End-End TLP Prefixes supported by the Function. The supported values are: 01b 1 End-End TLP Prefix 10b 2 End-End TLP Prefixes
21	EEPS	R	1h	Indicates whether the Function supports End-End TLP Prefixes. A 1 in this field indicates that the Function supports receiving TLPs containing End-End TLP Prefixes.
20	EXFS	R	1h	Indicates that the Function supports the 3-bit definition of the Fmt field in the TLP header. This bit is hardwired to 1 for all Physical Functions.
19-18	OPFFS	R	0h	A 1 in this bit position indicates that the Function supports the Optimized Buffer Flush/Fill [OBFF] capability using message signaling.
17	T10RS	R	0h	If set function supports 1-bit requester capability otherwise, the function does not. This field reflects the value in SRIOV capability register

Table 9-668. PCIE_CORE_VFm_I_PCIE_DEV_CAP_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	T10CS	R	1h	If set function supports 1-bit completer capability otherwise, the function does not. This field is identical to the PF value.
15-14	R13	R	0h	Reserved
13-12	TCS	R	0h	Hardwired to 0.
11	LMS	R	1h	A 1 in this bit position indicates that the Function supports the Latency Tolerance Reporting [LTR] Capability. This bit is set to 1 by default, but can be turned off for all Physical Functions by writing into PF 0.
10	R12	R	0h	Reserved
9	BAOCS128	R	0h	Hardwired to 0.
8	BAOCS64	R	0h	Hardwired to 0.
7	BAOCS32	R	0h	Hardwired to 0.
6	OPRS	R	0h	Atomic OP routing supported.
5	AFS	R	0h	ARI forwarding supported.
4	CTDS	R	1h	A 1 in this field indicates that the associated Function supports the capability to turn off its Completion timeout. This bit is set to 1 by default, but can be re-written independently for each Function from the local management bus.
3-0	CTR	R	2h	Specifies the Completion Timeout values supported by the device. This field is set by default to 0010 [10 ms - 250 ms]. The actual timeout values are in two programmable local management registers, which allow the timeout settings of the two sub-ranges within Range B to be programmed independently.

9.3.40 PCIE_CORE_VFm_I_UNCORR_ERR_STATUS Register (Offset = 6104h + formula) [reset = 0h]

PCIE_CORE_VFm_I_UNCORR_ERR_STATUS is shown in [Figure 9-223](#) and described in [Table 9-677](#).

Return to the [Summary Table](#).

This register provides the status of the various uncorrectable errors detected by the PCI Express core. Software may clear any error bit by writing a 1 into the corresponding bit position. The states of the bits in the Uncorrectable Error Mask Register have no effect on the status bits of this register. The setting of an uncorrectable error status bit causes the core to generate an ERR_FATAL message if the corresponding severity bit of the Uncorrectable Error Severity Register is 1. If the severity bit is 0, however, there are two separate ways the error could be processed: (i) In certain cases, the uncorrectable error is treated as an Advisory Non-Fatal Error. These cases are treated as similar to correctable errors, causing the core to generate an ERR_COR message instead of an ERR_NONFATAL message. For details on these special cases, refer to Section 6.2.3.2.4 of the PCI Express Base Specifications, Version 1.1. (ii) In all other cases, the core sends an ERR_NONFATAL message when the error is detected. In all cases, the sending of the error message can be suppressed by setting the bit corresponding to the error type in the Uncorrectable Error Mask Register. For errors that are not Function-specific, the error status bus is set in the registers belonging to all the Functions associated with the link, but only a single message is generated for the entire link. In the case of certain errors detected by the Transaction Layer, the associated TLP header is logged in the Shared VF Header Log Registers. All the RW1C bits can also be cleared from the local management bus by writing a 1 into the bit position.

Offset = 6104h + (m * 1000h); where m = 0h to Fh

Table 9-692. PCIE_CORE_VFm_I_ADVCD_ERR_CAP_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	R18	R	0h	Reserved
10	MHRE	R	0h	Setting this bit enables the Function to log multiple error headers in its Header Log Registers. It is hardwired to 0
9	MHRC	R	0h	This bit is set when the Function has the capability to log more than one error header in its Header Log Registers. It is hardwired to 0.
8	ECC	R	0h	Setting this bit enables ECRC checking on the receive side of the core. This bit is hardwired to 0. The setting of the corresponding bit in the Advanced Error Capabilities and Control Register of PF 0 applies to all Virtual Functions.

Table 9-692. PCIE_CORE_VFm_I_ADVCD_ERR_CAP_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	ECCAP	R	0h	This read-only bit indicates to the software that the device is capable of checking ECRC in packets received from the link. This bit is hardwired to 0. This setting of the corresponding bit in the Advanced Error Capabilities and Control Register of PF 0 applies to all Virtual Functions.
6	EEG	R	0h	Enables the ECRC generation on the transmit side of the core. This bit is hardwired to 0. The setting of the corresponding bit in the Advanced Error Capabilities and Control Register of PF 0 applies to all Virtual Functions.
5	EGC	R	0h	This read-only bit indicates to the software that the device is capable of generating ECRC in packets transmitted on the link. This bit is hardwired to 0. The setting of the corresponding bit in the Advanced Error Capabilities and Control Register of PF 0 applies to all Virtual Functions.
4-0	FER	R	0h	This is a 5-bit pointer to the bit position in the Uncorrectable Error Status Register corresponding to the error that was detected first. When there are multiple bits set in the Uncorrectable Error Status Register, this field informs the software which error was observed first. To prevent the field from being overwritten before software was able to read it, this field is not updated while the status bit pointed by it in the Uncorrectable Error Status Register remains set. After the software clears this status bit, a subsequent error condition that sets any bit in the Uncorrectable Error Status Register will update the First Error Pointer. Any uncorrectable error type, including the special cases where the error is reported using an ERR_COR message, will set the First Error Pointer [assuming the software has reset the error pointed by it in the Uncorrectable Error Status Register]. STICKY.

9.3.46 PCIE_CORE_VFm_I_HDR_LOG_0 Register (Offset = 611Ch + formula) [reset = 0h]

PCIE_CORE_VFm_I_HDR_LOG_0 is shown in [Figure 9-229](#) and described in [Table 9-695](#).

Return to the [Summary Table](#).

This is the first of a set of four registers used to capture the header of a TLP received by the core from the link upon detection of an uncorrectable error.

The Controller implements Shared Header Log for VFs.

All Virtual Functions associated with the same PF share the same Header Log.

When multiple bits are set in the Uncorrectable Error Status Registers of the VFs, the captured header corresponds to the error that was detected first, that is, the error pointed by the First Error Pointer, of the associated VF.

To prevent the captured header from being over-written before the software is able to read it, this register is not updated while the status bit pointed by the First Error Pointer in the Uncorrectable Error Status Register remains set. After the software clears this status bit, a subsequent error condition that sets any bit in the Uncorrectable Error Status Register will also cause the Header Log Registers to be updated. The doublewords of the TLP header are stored in the Header Log Registers with their bytes transposed. That is the byte containing the Type/Format fields of the header is stored at bit positions 31:24 of the Header Log Register 0.

Offset = 611Ch + (m * 1000h); where m = 0h to Fh

Table 9-723. Register Call Summary for PCIE_CORE_VFm_ATS_CAP_HEADER

PCIE_CORE_EP_VF Registers

- PCIE_CORE_VFm_ATS_CAP_HEADER Register (Offset = 65C0h + formula) [reset = 0001000Fh]: [0]
- PCIE_CORE_EP_VF Registers: [0] [1]

9.3.56 PCIE_CORE_VFm_ATS_CAP_CONTROL Register (Offset = 65C4h + formula) [reset = X]

PCIE_CORE_VFm_ATS_CAP_CONTROL is shown in Figure 9-239 and described in Table 9-725.

Return to the [Summary Table](#).

ATS Capability and Control Register

Offset = 65C4h + (m * 1000h); where m = 0h to Fh

Table 9-724.

Table 9-725. PCIE_CORE_VFm_ATS_CAP_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ATSEN	R/W	0h	When Set, the Function is enabled to cache translations. Default value is 0b.
30-21	R30	R	0h	Reserved
20-16	ATSSTU	R/W	0h	This value indicates to the Function the minimum number of 4096-byte blocks that is indicated in a Translation Completions or Invalidate Requests. This is a power of 2 multiplier and the number of blocks is 2STU. A value of 0 0000b indicates one block and a value of 1 1111b indicates 2 ³¹ blocks.
15-7	RESERVED	R/W	X	
6	ATSGIS	R/W	1h	If Set, the Function supports InvalidationRequests that have the Global Invalidate bit Set. If Clear, the Function ignores the Global Invalidate bit in all Invalidate Requests.
5	ATSPGALNREQ	R/W	1h	If Set, indicates the Untranslated Address is always aligned to a 4096 byte boundary.

Table 9-725. PCIE_CORE_VFm_ATS_CAP_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-0	ATSINVQD	R/W	1h	The number of Invalidate Requests that the Function can accept before putting backpressure on the upstream connection. If 0 0000b, the Function can accept 32 Invalidate Requests.

9.4 PCIE_CORE_LM Registers

Table 9-728 lists the PCIE_CORE_LM registers. All register offset addresses not listed in Table 9-728 should be considered as reserved locations and the register contents should not be modified.

PCIE core local management (LM) registers. The local management registers are used to configure various operational parameters associated with the core, and for a local processor to monitor its status. These registers are accessible only from the local management bus.

Table 9-731. PCIE_CORE_LM_I_PL_CONFIG_0_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MLE	R/W	0h	When the Controller is operating as a Root Port, setting this to 1 causes the LTSSM to initiate a loopback and become the loopback master. This bit is not used in the EndPoint Mode.
30	R0	R	0h	A 1 in this field indicates that the remote node advertised Linkwidth Upconfigure Capability in the training sequences in the Configuration.Complete state when the link came up. A 0 indicates that the remote node did not set the Link Upconfigure bit.
29-24	LTSSM	R	0h	Current state of the LTSSM. The encoding of the states is given in Appendix C.
23-16	RLID	R	0h	Link ID received from other side during link training.
15-8	RFC	R	0h	FTS count received from the other side during link training for use at the 2.5 GT/s link speed. The Controller transmits this many FTS sequences while exiting the LOS state, when operating at the 2.5 GT/s speed.
7	TSS	R/W	0h	This bit drives the PIPE_TX_SWING output of the Controller.

Table 9-731. PCIE_CORE_LM_I_PL_CONFIG_0_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	APER	R/W	0h	<p>This bit controls the reporting of Errors Detected by the PHY. The Errors Detected by the PHY include:-</p> <ul style="list-style-type: none"> - Received errors indicated on PIPE RxStatus interface, - 8.0 GT/s Invalid Sync Header received error, - 16.0 GT/s Invalid Sync Header received error, <p>If PHY Error Reporting bit is set to 0, the Controller will only report those errors that caused a TLP or DLLP to be dropped because of a Detected PHY Error. If PHY Error Reporting bit is set to 1, the Controller will report all Detected PHY Errors regardless of whether a TLP or DLLP was dropped.</p> <p>The following registers report PHY error in conjunction with this bit:</p> <ul style="list-style-type: none"> - Correctable Error Status Register, i_corr_err_status, bit-0, Receiver Error Status - Local Error and Status Register, PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_REGISTER, bit-7, Phy Error <p>In addition to the Errors Detected by the PHY[PCS], the Controller detects the following Physical Layer Protocol Framing Errors:</p> <ul style="list-style-type: none"> - Framing Errors in the received DLLP and TLP - Ordered Set Block Received Without EDS - Data Block Received After EDS - Illegal Ordered Set Block Received After EDS - Ordered Set Block Received After Skip OS <p>Note: These Errors are always reported independent of the setting of this bit.</p>
5	LTD	R	1h	<p>The state of this bit indicates whether the Controller completed link training as an upstream port[EndPoint][=0] or a downstream port[Root Port][=1]. Default value depends on CORE_TYPE strap pin.</p>
4-3	NS	R	0h	<p>Current operating speed of link</p> <p>[00 = 2.5G, 01 = 5G, 10 = 8G, 11 = 16G].</p>
2-1	NLC	R	1h	<p>Lane count negotiated with other side during link training</p> <p>[00 = x1, 01 = x2, 10 = x4, 11 = x8].</p>
0	LS	R	0h	<p>Current state of link</p> <p>[1 = link training complete, 0 = link training not complete].</p>

9.4.4 PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG Register (Offset = 0010000Ch) [reset = 02020080h]

PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG is shown in Figure 9-243 and described in Table 9-740.

Return to the [Summary Table](#).

This register contains the initial credit limits advertised by the Controller during the DL initialization. If the fields of this register are modified, the link must be re-trained to re-initialize the DL for the modified settings to take effect.

The credit limit fields in this register can be programmed to any value lesser than or equal to the respective default values.

The default values are set to advertise the full size of the receive buffers.

If a value of 0x00 is programmed, it implies infinite credit.

Note: This may result in receiver overflow if received data is back pressured on the Client interface.

LEGEND: R/W = Read/Write; -n = value after reset

Table 9-755. PCIE_CORE_LM_I_TRANSM_CRED_UPDATE_INT_CONFIG_1_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	MUI	R/W	3AAh	Maximum credit update interval for all transactions. If no new credit has become available since the last update, the Controller will repeat the last update after this interval. This is to recover from any losses of credit update packets. The value is in units of 16 ns. This field could be re-written by the internal logic when the negotiated link width or link speed changes, to correspond to the default values defined in defines.h. The user may override this default value by writing into this register field. The value written will be lost on a change in the negotiated link width/speed.
15-0	CUI	R/W	4h	Minimum credit update interval for Completion packets. The Controller follows this minimum interval between issuing completion credit updates on the link. This is to limit the bandwidth use of credit updates. If new credit becomes available in the receive FIFO since the last update was sent, the Controller will issue a new update only after this interval has elapsed since the last update. The value is in units of 16 ns. This parameter is not used when the Completion credit is infinity.

9.4.16 PCIE_CORE_LM_I_COMPLN_TMOUT_LIM_1_REG Register (Offset = 0010003Ch) [reset = 02FAF080h]

PCIE_CORE_LM_I_COMPLN_TMOUT_LIM_1_REG is shown in Figure 9-255 and described in Table 9-776.

Return to the [Summary Table](#).

This register contains the timeout value used to detect a completion timeout event for a request originated by the Controller from its master interface, when sub-range 2 is programmed in the Device Control 2 Register.

9.4.17 PCIE_CORE_LM_I_L1_ST_REENTRY_DELAY_REG Register (Offset = 00100040h) [reset = 0h]

PCIE_CORE_LM_I_L1_ST_REENTRY_DELAY_REG is shown in Figure 9-256 and described in Table 9-779.

Return to the [Summary Table](#).

This register specifies the time the Controller will wait before it re-enters the L1 state if its link partner transitions the link to L0 while all the Functions of the Controller are in D3 power state. The Controller will change the power state of the link from L0 to L1 if no activity is detected both on the transmit and receive sides before this interval, while all Functions are in D3 state and the link is in L0. Setting this register to 0 disables re-entry to L1 state if the link partner returns the link to L0 from L1 when all the Functions of the Controller are in D3 state. This register controls only the re-entry to L1. The initial transition to L1 always occurs when all of the Functions of the Controller are set to the D3 state.

Table 9-791. PCIE_CORE_LM_I_LINKWIDTH_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	EPLSCL	R/W	0h	Writing a 1 into this field results in the Controller re-training the link to change its speed. When setting this bit to 1, the software must also set the EP Target Link Speed field to indicate the speed that the EP desires to change on the link. The EP Controller will attempt to change the link to this speed. This bit is cleared by the internal logic of the Controller after the re-training has been completed and link has reached the L0 state. Software must wait for the bit to be clear before setting it again to change the link speed.
30-26	R2	R	0h	Reserved

Table 9-791. PCIE_CORE_LM_I_LINKWIDTH_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25-24	EPTLS	R/W	0h	This field contains the Link Speed that the EP intends to change to during the re-training. Client needs to ensure that this field is programmed to a speed which is lesser than or equal to the Target Link Speed field of PF0 Configuration Link Control 2 Register. Client also needs to ensure that this does not exceed PCIE_GENERATION_SEL strap input. Defined encodings of this field are: 00 - GEN1 01 - GEN2 10 - GEN3 11 - GEN4
23-17	R1	R	0h	Reserved
16	RL	R/W	0h	Writing a 1 into this field results in the Controller re-training the link to change its width. When setting this bit to 1, the software must also set the target lane-map field to indicate the lanes it desires to be part of the link. The Controller will attempt to form a link with this set of lanes. The link formed at the end of the retraining may include all of these lanes [if both nodes agree on them during re-training], or the largest subset that both sides were able to activate. This bit is cleared by the internal logic of the Controller after the re-training has been completed and link has reached the L0 state. Software must wait for the bit to be clear before setting it again to change the link width.
15-2	R0	R	0h	Reserved
1-0	TLM	R/W	3h	This field contains the bitmap of the lanes to be included in forming the link during the re-training. 01 - Retrain to a x1 link 11 - Retrain to a x2 link If the target lane map includes lanes that were inactive when retraining is initiated, then both the Controller and its link partner must support the LinkWidth Upconfigure Capability to be able to activate those lanes. In RC Mode, the user can check if the remote node has this capability by reading the Remote Link Upconfigure Capability Status bit in Physical Layer Configuration Register 0 after the link first came up.

9.4.24 PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG_VC1 Register (Offset = 00100080h) [reset = 02020080h]

PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG_VC1 is shown in Figure 9-263 and described in Table 9-800.

Return to the [Summary Table](#).

This register contains the initial credit limits advertised by the Controller during the DL initialization. If the fields of this register are modified, the link must be re-trained to re-initialize the DL for the modified settings to take effect.

The credit limit fields in this register can be programmed to any value lesser than or equal to the respective default values.

The default values are set to advertise the full size of the receive buffers.

If a value of 0x00 is programmed, it implies infinite credit.

Note: This may result in receiver overflow if received data is back pressured on the Client interface.

9.4.25 PCIE_CORE_LM_I_RCV_CRED_LIM_1_REG_VC1 Register (Offset = 00100084h) [reset = 20h]

PCIE_CORE_LM_I_RCV_CRED_LIM_1_REG_VC1 is shown in Figure 9-264 and described in Table 9-803.

Return to the [Summary Table](#).

This register contains the initial credit limits advertised by the Controller during the DL initialization. If the fields of this register are modified, the link must be re-trained to re-initialize the DL for the modified settings to take effect.

The credit limit fields in this register can be programmed to any value lesser than or equal to the respective default values.

The default values are set to advertise the full size of the receive buffers.

If a value of 0x00 is programmed, it implies infinite credit.

Note: This may result in receiver overflow if received data is back pressured on the Client interface.

9.4.32 PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG_VC3 Register (Offset = 001000A0h) [reset = 02020080h]

PCIE_CORE_LM_I_RCV_CRED_LIM_0_REG_VC3 is shown in Figure 9-271 and described in Table 9-824.

Return to the [Summary Table](#).

This register contains the initial credit limits advertised by the Controller during the DL initialization. If the fields of this register are modified, the link must be re-trained to re-initialize the DL for the modified settings to take effect.

The credit limit fields in this register can be programmed to any value lesser than or equal to the respective default values.

The default values are set to advertise the full size of the receive buffers.

If a value of 0x00 is programmed, it implies infinite credit.

Note: This may result in receiver overflow if received data is back pressured on the Client interface.

9.4.43 PCIE_CORE_LM_I_PM_CLK_FREQUENCY_REG Register (Offset = 00100140h) [reset = 19h]

PCIE_CORE_LM_I_PM_CLK_FREQUENCY_REG is shown in Figure 9-282 and described in Table 9-857.

Return to the [Summary Table](#).

This register should be programmed with the frequency of the PM_CLK input to the Controller.

The Controller supports the frequency range of 2MHz to 60MHz for PM_CLK.

The reset value reflects the PM_CLK frequency chosen during Controller configuration.

NOTE: PM_CLK will be timed at 60Mhz and the Controller SDC file will be generated accordingly.

If timing is to be closed at a different frequency, then the user needs to update the SDC accordingly.

Table 9-881. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	EFSRTCA	R/W	1h	Setting this bit to 0 causes all the enabled Functions to report an error when a Type-1 configuration access is received by the Controller, targeted at any Function. Setting it to 1 limits the error reporting to the type-0 Function whose number matches with the Function number specified in the request. If the Function number in the request refers to an unimplemented or disabled Function, all enabled Functions report the error regardless of the setting of this bit.
30	DOC	R/W	0h	Setting this bit to 1 disables the ordering check in the Controller between Completions and Posted requests received from the link.

Table 9-881. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	DFCUT	R/W	0h	When this bit is 0, the Controller will time out and re-train the link when no Flow Control Update DLLPs are received from the link within an interval of 128 us. Setting this bit to 1 disables this timeout. When the advertised receive credit of the link partner is infinity for the header and payload of all credit types, this timeout is always suppressed. The setting of this bit has no effect in this case. This bit should not be set during normal operation, but is useful for testing.
28	DEI	R/W	0h	Setting this bit to 1 disables the inferring of electrical idle in the L0 state. Electrical idle is inferred when no flow control updates and no SKP sequences are received within an interval of 128 us. This bit should not be set during normal operation, but is useful for testing.
27	DGLUS	R/W	0h	Setting this bit to 1 disables the update of the LFSRs in the Gen3 descramblers of the Controller, from the values received in SKP sequences. This bit should not be set during normal operation, but is useful for testing.
26	IEDPPE	R/W	0h	When set to 1, this bit inverts the parity bits generated by the Controller for end-to-end data protection. This will result in the inversion of parity bits for data payloads delivered through the HAL interface. This bit is to be used for diagnostics only, and should not be set during normal operation.
25	ESPC	R/W	0h	When this bit is set to 1, the Controller will capture the Slot Power Limit Value and Slot Power Limit Scale parameters from a Set_Slot_Power_Limit message received in the Device Capabilities Register. When this bit is 0, the capture is disabled. This bit is valid only when the Controller is configured as an EndPoint. It has no effect when the Controller is a Root Complex.
24	EFLT	R/W	0h	This bit is provided to shorten the link training time to facilitate fast simulation of the design, especially at the gate level. Enabling this bit has the following effects: 1. The 1 ms, 2 ms, 12 ms, 24 ms, 32 ms and 48 ms timeout intervals in the LTSSM are shortened by a factor of 500. 2. In the Polling.Active state of the LTSSM, only 16 training sequences are required to be transmitted [Instead of 1024] to make the transition to the Configuration state. This bit should not be set during normal operation of the Controller.

Table 9-881. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	DLUC	R/W	0h	<p>The user may set this bit to turn off the link upconfigure capability of the Controller.</p> <p>Setting this bit prevents the Controller from advertising the link upconfigure capability in training sequences transmitted in the Configuration.Complete state. In addition, setting this bit causes the Controller to put the unused lanes into Turn Off mode.</p> <p>When disable_link_upconfigure_capability==1:</p> <p>Controller drives PIPE_TX_ELEC_IDLE==1 AND PIPE_TX_COMPLIANCE==1 for the Unused upper lanes. The Unused upper lanes are put into Turn Off mode by the PHY as per PIPE specification.</p> <p>When disable_link_upconfigure_capability==0:</p> <p>Controller drives PIPE_TX_ELEC_IDLE==1 AND PIPE_TX_COMPLIANCE==0 for the Unused upper lanes. The Unused upper lanes are put into Electrical Idle by the PHY.</p>
22	DLRFE	R/W	0h	<p>When this bit is 1, the Controller will not transition its LTSSM into the Recovery state when it detects a Framing Error at 8 GT/s or 16 GT/s speed [as defined in Section 4.2.2.3.3 of the PCIe Base Specification 3.0].</p> <p>This bit must normally be set to 0 so that a Framing Error will cause the LTSSM to enter Recovery.</p> <p>The setting of this bit has no effect on the operation of the Controller at 2.5 and 5 GT/s speeds.</p>
21	DSHEC	R/W	0h	<p>When this bit is 0, the Controller will signal a framing error if it detects a sync header error in the received blocks at 8 GT/s or 16 GT/s speed [A 00 or 11 binary setting of the sync header on the received blocks in any lane constitutes a framing error].</p> <p>Setting this bit to 1 suppresses this error check.</p> <p>This bit should normally be set to 0, as the sync header check is mandatory in the PCIe 3.0 Specifications.</p>
20	DCIVMC	R/W	0h	<p>When this bit is 1, the Controller will not check for invalid message codes.</p> <p>This bit should normally be set to 0, as the invalid message code checking is mandatory in the PCIe 3.0 specifications.</p>
19	DIOAEFC	R/W	0h	<p>When this bit is 1, the Controller will not check for illegal OS after EDS as part of Gen3 Framing Error Checks.</p> <p>This bit should normally be set to 0, as this is a mandatory Gen3 Framing Error check in the PCIe 3.0 specifications.</p>
18	DOASFC	R/W	0h	<p>When this bit is 1, the Controller will not check for OS after SKIP OS as part of Gen3 Framing Error Checks.</p> <p>This bit should normally be set to 0, as this is a mandatory Gen3 Framing Error check in the PCIe 3.0 specifications.</p>
17	HPRSUPP	R/W	0h	<p>When this bit is 1, data path parity check is disabled on the TX side of the Controller.</p>
16	AWRPRI	R/W	0h	<p>When this bit is 1, the AXI bridge places a write request on the HAL Master interface in preference over a read request if both AXI write and AXI read requests are available to be asserted on the same clock cycle.</p>
15	FDS	R/W	0h	<p>Disable Scrambling/Descrambling in Gen1/Gen2.</p>
14	DSSPLM	R/W	0h	<p>Disable sending Set Slot Power Limit Message if the Slot Capabilitied register is configured</p>
13	R1313	R	0h	N/A

Table 9-881. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	R1212	R	0h	N/A
11	R1111	R/W	0h	When this bit is 1, Disable Client TX MUX Completion and PNP request arbitration,roundrobin priority logic added to prevent PNP requests from starving when completions are present
10	R1010	R	0h	Reserved
9	MSIVCMS	R/W	0h	Sets the mode of generating MSI_VECTOR_COUNT output for all functions. 0 - MSI_VECTOR_COUNT always outputs the configured value of MSI Multiple Message Enable [2:0] register. 1 - MSI_VECTOR_COUNT outputs the lesser of the MSI Multiple Message Enable [2:0] and MSI Multiple Message Capable [2:0] This mode can be used to handle any programming error form the Host software.
8	DIDBOC	R/W	0h	Setting this bit to 1 disables the ID Based Ordering check in the Controller between Completions and Posted requests received from the link.
7	R77	R/W	0h	This bit should be set to 0 for backward compatibility.
6-5	R6	R	0h	N/A
4-0	MS	R/W	0h	Bits 4:3 select the module and bits 2:0 select the group of signals within the module that are driven on the debug bus. The assignments of signals on the debug outputs of the Controller are given in Appendix B.

9.4.52 PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_REGISTER Register (Offset = 0010020Ch) [reset = 0h]

PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_REGISTER is shown in Figure 9-291 and described in Table 9-884.

Return to the [Summary Table](#).

This register contains the status of the various events, errors and abnormal conditions in the Controller. Any of the status bits can be reset by writing a 1 into the bit position. This register does not capture any errors signaled by remote devices using PCIe error messages when the Controller is operating in the RC mode. Unless masked by the setting of the Local Interrupt Mask Register, the occurrence of any of these conditions causes the Controller to activate the LOCAL_INTERRUPT output.

(continued)**

Bit	Field	Type	Reset	Description
25	MSIXMSKST	R/W1C	0h	This interrupt status bit is used when MSIX Function Mask Enhanced Interrupt Enable bit is set to 0 by the User. This status bit indicates that the MSIX Function Mask bit of any function, PF or VF, was programmed or configured by Local Firmware Or Host SW.
24-22	R24	R	0h	Reserved
21	HAWCD	R/W1C	0h	This interrupt status bit indicates that the Host toggled the Hardware Autonomous Width Change bit in the Link Control Register through a Config Write. Upon this interrupt, the Client firmware must read the Link Control Register to check the value set by Host in the Hardware Autonomous Width Change bit. The Host Software may disable autonomous width change by setting Hardware Autonomous Width Disable bit in the Link Control register. If disabled by the Host and if the Endpoint firmware had initiated an autonomous width downsizing prior to this interrupt, then the local Client firmware is responsible to upconfigure the Link to go to its full functional width by initiating the link_upconfigure_retrain_link within 1 ms of this interrupt.
20	R22	R	0h	Reserved
19	MMVC	R/W1C	0h	This status bit is set whenever the MSI mask register value in the MSI capability register changes value in ANY of the functions in the controller
18	UTC	R/W1C	0h	Unmapped TC error.
17	EEPE	R/W1C	0h	The Controller detected an End to End Parity Error

9.4.56 PCIE_CORE_LM_I_LTR_SNOOP_LAT_REG Register (Offset = 0010021Ch) [reset = 0h]

PCIE_CORE_LM_I_LTR_SNOOP_LAT_REG is shown in Figure 9-295 and described in Table 9-896.

Return to the [Summary Table](#).

This register contains the Snoop and No-Snoop Latency parameters used by the Controller when sending Latency Tolerance Reporting (LTR) Message. When the Controller is configured in the EndPoint mode, client software can program these fields to the desired latency settings and then set the Send LTR Message bit in the LTR Message Generation Control Register to send an LTR message to the Root Complex. The fields in this register should not be changed when the Send LTR Message bit in the LTR Message Generation Control Register is 1, which indicates that an LTR message is pending to be transmitted.

Bit	Field	Type	Reset	Description
31-13	RESERVED	R/W	X	
12	TMFPSC	R/W	1h	When this bit is set to 1, the Controller will automatically transmit an LTR message when all the Functions in the Controller have transitioned to a non-D0 power state, provided that the following conditions are both true: 1. The Controller sent at least one LTR message since the Data Link layer last transitioned from down to up state. 2. The most recent LTR message transmitted by the Controller had as least one of the Requirement bits set. The Controller will set the Requirement bits in this LTR message to 0. When this bit 12 is 0, the Controller will not, by itself, send any LTR messages in response to Function Power State changes. Client logic may monitor the FUNCTION_POWER_STATE outputs of the Controller and transmit LTR messages through the master interface, in response to changes in their states.

Table 9-899. PCIE_CORE_LM_I_LTR_MSG_GEN_CTL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TMLMET	R/W	1h	<p>When this bit is set to 1, the Controller will automatically transmit an LTR message whenever the LTR Mechanism Enable bit in the Device Control 2 Register changes from 0 to 1, with the parameters specified in the LTR Snoop/No-Snoop Latency Register.</p> <p>When this bit is 1, the Controller will also transmit an LTR message whenever the LTR Mechanism Enable bit is cleared, if the following conditions are both true:</p> <ol style="list-style-type: none"> 1. The Controller sent at least one LTR message since the LTR Mechanism Enable bit was last set. 2. The most recent LTR message transmitted by the Controller had as least one of the Requirement bits set. <p>The Controller will set the Requirement bits in this LTR message to 0.</p> <p>When this bit 11 is 0, the Controller will not, by itself, send any LTR messages in response to state changes of the LTR Mechanism Enable bit. Client logic may monitor the state of the LTR_MECHANISM_ENABLE output of the Controller and transmit LTR messages through the master interface, in response to its state changes.</p>
10	SLM	R	0h	<p>Setting this bit causes the Controller to transmit an LTR message with the parameters specified in the LTR Snoop/No-Snoop Latency Register [Section 8.4.2.9].</p> <p>This bit is cleared by the Controller on transmitting the LTR message, and stays set until then.</p> <p>Client software must read this register and verify that this bit is 0 before setting it again to send a new message.</p> <p>This field becomes writable when LTR mechanism is enabled in device control-2 register.</p>
9-0	MLI	R/W	FAh	<p>This field specifies the minimum spacing between LTR messages transmitted by the Controller in units of microseconds.</p> <p>The PCI Express Specifications recommend sending no more than two LTR messages within a 500 microsecond interval.</p> <p>The Controller will wait for the minimum delay specified by this field after sending an LTR message, before transmitting a new LTR message.</p> <p>NOTE: The LINK can be in low power states[L0s and L1] when send LTR Message is triggered.</p> <p>So, the user has to consider the exit latencies while programming this field.</p> <p>It is recommended to program this field with about 2 us higher than the required interval to account for the L0s/L1 exit latencies.</p>

9.4.58 PCIE_CORE_LM_I_PME_SERVICE_TIMEOUT_DELAY_REG Register (Offset = 00100224h) [reset = 000186A0h]

PCIE_CORE_LM_I_PME_SERVICE_TIMEOUT_DELAY_REG is shown in Figure 9-297 and described in Table 9-902.

Return to the [Summary Table](#).

This register stores the timeout delay parameter for the service timeout mechanism associated with the generation of PM_PME messages. In the EndPoint mode, the Controller will retransmit a PM_PME message after the expiration of this delay, if the Root Complex did not clear the PME Status bit in the Power Management Control and Status Register. This register is not used when the Controller is configured as Root Complex.

Table 9-911. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	R31	R	0h	Reserved
28	DFLRTRB	R/W	1h	1 : NP Termination due to FLR/Completion Timeout is delayed till the RX Completion FIFO is Empty. 0 : NP Termination due to FLR is done immediately on receiving FLR/Completion Timeout.
27	DTAE2EP	R/W	0h	By default, when End to End Parity error is detected on inbound/outbound data streams, then all the transmitted outbound packets will be Nullified by the Controller. This bit can be used to turn off nullifying Tx packets on End to End Parity Error.
26	R26	R	0h	Reserved

Table 9-911. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	MSIXMSKEN	R/W	0h	By default, the Controller provides a single status bit when any function's MSIX Function Mask is programmed or configured by Local firmware or Host SW. Controller also implements an enhanced MSIX Function Mask Interrupt mechanism, which provides per-function set/clear status when a function's MSIX Function Mask is updated by SW. This Local Management programmable bit allows user to choose between the Default and Enhanced MSIX Function Mask Change Interrupt mechanisms.
24	MSIMSKEN	R/W	0h	By default, the Controller provides a single status bit when any function's MSI Mask is programmed or configured by Local firmware or Host SW. Controller also implements an enhanced MSI Mask Interrupt mechanism, which provides per-function set/clear status when a function's MSI Mask is updated by SW. This Local Management programmable bit allows user to choose between the Default and Enhanced MSI Mask Change Interrupt mechanisms.
23	VARCCLKEN	R/W	0h	If this bit is set the CORE_CLK input can be driven with Variable Clock depending on the Link Speed, similar to the PIPE_PCLK.
22-13	MAXNPREQ	R/W	20h	The Controller supports 32 outstanding NP requests that can be initiated by the User. However, the number of split completion TLPs that can be stored in the Controller is limited to 128. The Completion FIFO will overflow if more than 128 split completion packets are pending. If the User interface can accept inbound Posted and Completion packets at the same rate as received from PCIe link, then the split completion FIFO will never reach the FULL condition. However, if the User cannot guarantee this, then this register needs to be programmed as described in the Programming Guide section of the Controller User guide. The Controller will limit the maximum number of outstanding NP requests to the value programmed in this register. Example: 8 : Controller will limit maximum number of outstanding NP requests to 8. 0-7 : Reserved Default Value is 32
12	AXINSPEN_RSVD	R	0h	RESERVED
11	CMPTOADV	R/W	1h	As per PCIe specification on Error Signaling, the Requester detecting a Completion Timeout is allowed to handle this as an Advisory Non Fatal Error. 1: Completion Timeout is handled as Advisory Non-Fatal Error. 0: Completion Timeout is handled as normally as a Non-Fatal Error.
10	PSNADV	R/W	0h	As per PCIe specification 2.7.2.2, the following Poisoned TLP requests must be handled as Uncorrectable and not as Advisory: I/O Write Request, Memory Write Request, or non-vendor-defined Message with data that target a Control structure. Since it is not possible for the Controller to determine if the target is a Control or a non-Control structure, the Controller implements this bit for the user to determine the required handling. 1: Poisoned TLP of type IOWr, MemWr, MsgD will be handled as Advisory Non-Fatal Error. 0: Poisoned TLP of type IOWr, MemWr, MsgD will be handled as Uncorrectable Error. Note: Poisoned CplD will always be reported as Advisory Non-Fatal and is not controlled by this register setting.

Table 9-911. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	MSIPIMS	R/W	0h	If the Client wishes to use the MSI_PENDING_STATUS_IN Signal to Update the MSI pending Bits register, this bit needs to be set to 1. Otherwise the Pending Bits register is updated via the APB Interface
8	ENG4REV05	R/W	0h	When operating in Gen4 16GT/s , This Enables Gen4 Spec Revision 0.5 EIEOS and SKP features. When disabled, the Gen4 1.0 features are enabled, by default this bit is ZERO. 1: Enable Gen4 0.5 Features 0: Disable Gen4 0.5 Features [This enabled the Gen4 1.0 Features] .
7-6	BLKALNWIN	R/W	1h	When in the data stream at Gen3 or higher speeds, the pipe_rx_valid is asserted by the PHY. If the block alignment is lost, then the PHY may deassert pipe_rx_valid. Controller reports loss of block alignment if pipe_rx_valid or pipe_rx_data_valid=0 for a period consecutive clock cycles as programmed in this field. 00: 8 CORE_CLK cycles 01: 16 CORE_CLK cycles 10: 64 CORE_CLK cycles 11: 256 CORE_CLK cycles
5	BLKALNCHK	R/W	0h	When in the data stream at Gen3 or higher speeds, the pipe_rx_valid is asserted by the PHY. If the block alignment is lost, then the PHY may deassert pipe_rx_valid. Block Alignment may be lost if the received sync header is invalid. Controller supports detecting loss of block alignment while in a data stream in Gen3. 0: Enable check for loss of Gen3 Block Alignment during data stream. 1: Disable check for loss of Gen3 Block Alignment.
4	ARICAPMOD	R/W	1h	As per SR IOC specification, ARI Capable Hierarchy bit is only present in the lowest numbered PF of a Device. The Controller has two modes to determine the lowest numbered PF. 0: the first PF which is enabled [PF0] is taken as the lowest numbered PF. 1: the first PF which has a non-zero TOTAL_VF_COUNT field is taken as the lowest numbered PF.[Default Mode]
3	ENLNCHK	R/W	0h	As per PCIe specification, LTSSM should transition to Disabled after any Lanes that are transmitting TS1 Ordered Sets receive two consecutive TS1 Ordered Sets with the Disable Link bit asserted. Similarly, LTSSM should transition to Loopback after all Lanes that are transmitting TS1 Ordered Sets, that are also receiving TS1 Ordered Sets, receive the Loopback bit asserted in two consecutive TS1 Ordered Sets. Controller ignores the Link and Lane Number in the Received TS1s with Loopback/Disable bit set. Setting this bit to 1 turns on the check for link number [assigned by RC in Recovery.Idle] and lane number [PAD in Config.LW.Start or as assigned by RC in Recovery.Idle]. This bit is recommended to be kept at the default value of 0.
2	DISSDSCHK	R/W	0h	As per PCIe specification, When using 128b/130b encoding, next state is L0 if eight consecutive Symbol Times of Idle data are received on all configured Lanes. The Controller checks to ensure that the Idle symbols of data are received in Data Blocks after SDS OS. This check is enabled by default. Setting this bit to 1 turns off this check. This bit is recommended to be kept at the default value of 0.

Table 9-911. PCIE_CORE_LM_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	EXTSNP	R/W	0h	This bit can be set if an extra clock cycle is required by the Client Application logic to respond with the Read Data on Configuration Snoop Interface. Please refer to the user guide section on Configuration Snoop Interface for timing diagrams.
0	DLFFS	R/W	0h	As per PIPE 4.2 specification, the LOCALLF, LOCALFS outputs from PHY can be sampled uponf PHYSTATUS pulse after Reset# OR upon the first PHYSTATUS pulse after speed change to GEN3. This bit can be set to 1 to disable sampling after speed change to GEN3 or higher

Table 9-914. PCIE_CORE_LM_I_PHY_STATUS_1_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	R31	R	0h	Reserved
8	LOSBLKALN	R/W1C	0h	This bit is set if the PHY Loses Block Alignment during data stream. This is detected based upon an unexpected PIPE_RX_VALID input deassertion during data stream. Write a 1 to clear this error.
7	INVSYNHR	R/W1C	0h	This bit is set if an invalid Sync Header is detected. 00 and 11 are Invalid Sync Headers. Write a 1 to clear this error.
6	OSAFSDS	R/W1C	0h	This bit is set if an SDS is received after an SDS. This is a framing error. Write a 1 to clear this error.
5	G3FRERR	R/W1C	0h	This bit is set if a framing error is detected while receiving a TLP in Gen3. Example, if an invalid token is received in a data stream, this error is flagged. Write a 1 to clear this error.
4	OSWOEDS	R/W1C	0h	This bit is set if an Ordered Set Block is received without an EDS. This is a framing error. Write a 1 to clear this error.
3	DATEDS	R/W1C	0h	This bit is set if a Data Block is received after an EDS. Write a 1 to clear this error.

Table 9-914. PCIE_CORE_LM_I_PHY_STATUS_1_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	ILOSEDS	R/W1C	0h	The Valid OS blocks after an EDS are EIOS, EIEOS and SKP. If any other OS blocks are received after EDS, then it is a framing error and this bit is asserted.
1	OSASKP	R/W1C	0h	This bit indicates that an Ordered Set BLock was received immediately after a SKIP OS. This is a framing error. Write a 1 to clear this field.
0	TLPPHYER	R/W1C	0h	This bit indicates that a PHY Error was detected on the PIPE_RX_STATUS within a TLP. Write a 1 to clear this field.

Table 9-926. PCIE_CORE_LM_I_PF_1_BAR_CONFIG_1_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ERBC	R/W	0h	Setting this bit to 1 enables the Resizable BAR Capability in the PCI Express Configuration Space of the associated Function. When the Resizable BAR Capability is enabled, the apertures of the memory BARs of the corresponding Function are no longer selected by the fields in this register, but by the setting of the registers in the Resizable BAR Capability Structure.
30-24	R24	R	0h	Reserved
23-16	R16	R	0h	Reserved
15-13	BAR5C	R/W	0h	Specifies the configuration of BAR5. The various encodings are: 000: Disabled 001: 32bit IO BAR 010-011: Reserved 100: 32bit memory BAR, non prefetchable 101: 32bit memory BAR, prefetchable 110-111: Reserved

9.4.90 PCIE_CORE_LM_I_GEN3_GEN4_LINK_EQ_TIMEOUT_2MS_REG Register (Offset = 00100364h) [reset = C001E848h]

PCIE_CORE_LM_I_GEN3_GEN4_LINK_EQ_TIMEOUT_2MS_REG is shown in [Figure 9-329](#) and described in [Table 9-998](#).

Return to the [Summary Table](#).

This register is used to tune the time spent for evaluation per TX Setting in Endpoint Phase 2 (RC Mode Phase 3) of GEN3, GEN4 Link Equalization.

The PCIe Spec defines a timeout of 2ms per TX setting and hence the default value for this register is set to 2ms.

This can be tweaked based on the total number of iterations done and the time required for the PHY to respond with feedback for RXEQEVAL request.

The total time taken in Endpoint Phase 2 (RC Mode Phase 3) must be less than 24 ms as defined by spec.

Guideline: (Total Number of iterations)*(link_eq_timeout_2ms_reg + max time required for PHY to respond to RXEQEVAL) less than 24ms

Table 9-997.

Table 9-998. PCIE_CORE_LM_I_GEN3_GEN4_LINK_EQ_TIMEOUT_2MS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RXEQABM	R/W	3h	When a 24ms timeout occurs in the LTSSM Equalization Phase 2, the Controller aborts Equalization Phase 2 and transitions to Recovery.Rcvr.Lock. In this case, the RxEqEval output on the PIPE Interface will be de-asserted immediately [if it was asserted]. The RxEqInProgress output will stay high and waits for PhyStatus pulse. Controller implements a timer to select an upper limit to wait for this PhyStatus pulse during an abort to de-assert RxEqInProgress. 00: Wait for a maximum of 4 PIPE_PCLK period. 01: Wait for a maximum of 8 PIPE_PCLK period. 10: Wait for a maximum of 16 PIPE_PCLK period. 11: Disabled. Wait till PhyStatus Pulse is received. Note: This register is used only if RxEqEval was asserted when LTSSM 24ms timeout occurred in Equalization.
29	RXEQABD	R/W	0h	In an unexpected case where the PIPE_PCLK stops due to error in equalization, this bit can be set to de-couple RxEqInProgress from the rest of the equalization state machine. This bit should not be set for normal usage.
28	R28	R	0h	Reserved
27-0	LEQT2MS	R/W	0001E848h	Time spent for evaluation per TX Setting in Endpoint Phase 2 [RC Mode Phase 3] of Link Equalization specified in multiples of 16ns. eg. the value 125000 will result in 125000*16ns = 2ms. Simulation with reduced time mode[PCIE_SIM define] will give a smaller value of 300 as power on reset value.

Table 9-1004. PCIE_CORE_LM_I_GEN4_DEFAULT_PRESET_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	R31	R	0h	Reserved
18-8	S16GPR	R/W	7FFh	This register can be used to program the Presets that are supported by local Transmitter at 16Gbps. Default value of this register is determined by the SUPPORTED_PRESET strap input. Note: At 8.0 GT/s and 16.0 GT/s all preset values must be supported for Full swing signaling. Reduced swing signaling must implement presets #4, #1, #9, #5, #6, and #3.
7	R7	R	0h	Reserved
6-4	GDRXPH	R/W	0h	Default Gen4 receiver preset hint value used for a lane that did not receive 16G EQ TS2 in Recovery.RcvrCfg LTSSM state
3-0	GDTXP	R/W	0h	Default Gen4 transmitter preset value used for a lane that did not receive 16G EQ TS2 in Recovery.RcvrCfg LTSSM state

**Table 9-1010. PCIE_CORE_LM_I_GEN3_GEN4_LINK_EQ_CTRL_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
9	QG16GT	R/W	0h	This bit can be used to program the Quiesce Guarantee bit of the TS2 in Recovery.Rcvr.Cfg state during 16GT/s Request Equalization.
8	QG8GT	R/W	0h	This bit can be used to program the Quiesce Guarantee bit of the TS2 in Recovery.Rcvr.Cfg state during 8GT/s Request Equalization.
7-6	RES6	R	0h	Reserved
5	EP16GRE	R/W	0h	Writing a 1 into this field results in the Controller to transition to Recovery. The Request Equalization bit and Equalization Request Data Rate bit in TS2 Ordered Sets will be set to 1 in Recovery.Rcvr.Cfg to request equalization at 16GTs. This bit is auto-cleared by the internal logic of the Controller after the re-training has been completed and link has reached the L0 state. This bit is also auto-cleared when not in Gen3 or Gen4. Device Firmware must wait for the bit to be clear before any subsequent requests.
4	EP8GRE	R/W	0h	This bit can be used by Endpoint Device FW to request for 8GT/s Equalization redo. This bit can be set at any time after the Link is Up. Writing a 1 into this field results in the Controller to transition to Recovery. The Request Equalization bit in TS2 Ordered Sets will be set to 1 in Recovery.Rcvr.Cfg to request equalization at 8GTs. This bit is auto-cleared by the internal logic of the Controller after the re-training has been completed and link has reached the L0 state. This bit is also auto-cleared when not in Gen3 or Gen4. Device Firmware must wait for the bit to be clear before any subsequent retrain requests.
3	RES3	R	0h	Reserved
2-0	MXECC	R/W	0h	Controls the number of consecutive RxEqEval iterations with direction change feedback of 00s before Equalization Convergence is inferred. 0 : Infer Convergence after 1 feedback of 000000 1 : Infer Convergence after 2 feedback of 000000 2 : Infer Convergence after 3 consecutive feedback of 000000 .. 7 : Infer Convergence after 8 consecutive feedback of 000000. Note: Each lane independently counts consecutive feedback of 000000. Note: Count is reset after a non-000000 feedback on each lane.

Table 9-1028. PCIe_CORE_LM_LOW_POWER_DEBUG_AND_CONTROL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	X	
27	L1DLEUP	R/W	0h	Pending Tlps trigger a L1 exit by default. This includes internally generated messages and internally blocked TLPs. Setting this bit changes the default behavior. This is required only for debug purpose.
26-25	L1EM	R	0h	This field shows the last entered L1 mode. This is useful for debug. bit 0 - Entry mode was ASPM. Bit 1 - Entry mode was PM. This is reset before any new L1 entry.

**Table 9-1028. PCIE_CORE_LM_LOW_POWER_DEBUG_AND_CONTROL0 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
24	L1DBRI	R/W	0h	Before entering L1, controller internally blocks all TLP and Register Request interface entering controller. interfaces are internally unblocked while exiting L1. This field control this behavior. '1' in this field makes the controller to do not perform any blocking to interfaces. '0' makes the controller behaves normally. This is required only for debug purpose. Power shutoff feature has to be disabled while using this field.
23-0	L1XDELAY	R/W	0h	Normally L1 substate entry process is initiated immediately after LTSSM enters L1. A delay in micro-seconds can be given in this field to delay L1 substate entry process. This timeout has 0-1us margin of error. Power on reset value of this register can be adjusted by modifying the define den_db_LP_DBG_CTRL_L1_SUBSTATE_ENTRY_DELAY

Table 9-1058. PCIE_CORE_LM_I_MARGINING_LOCAL_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	WAWTC	R/W	4h	When a WriteCommitted command is issued by the Controller, the PHY must respond with a Write_Ack response. The time for which the Controller waits before timing out is controlled by this register. 000: 10us 001: 100us 010: 1ms 011: 2ms 100: 10ms [default] 101: 20ms 110: 100ms 111: No Timeout
28-3	RES	R	0h	Reserved
2	DMSUSC	R/W	0h	By default, when a Step Margin command is received, the Controller will update Lane Margin status to Margining in Progress when an Error Count update Or a Sample Count update is received from PHY. Set this bit to 1 to not update Lane Margin Status on a Sample Count update from PHY.

**Table 9-1058. PCIE_CORE_LM_I_MARGINING_LOCAL_CONTROL_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
1	AMCNG4	R/W	0h	By default, the Controller will process a Margin Command only if it is received while in 16GT/s L0 State. If a Margin Command is received when the link is not in Gen 4-L0 state, then the command will be ignored. If this bit is set, then the Controller accepts and stores a margin command that is received when not in Gen4 L0 state. This command will be processed when the link reaches Gen4 L0 state.
0	MSR	R/W	0h	This bit can be used to reset the Margining internal registers and Margining state machines in the Controller. When asserted: [i] The State machines will be reset to their default values. [ii] All internal FIFOs will be cleared. [iii] All the P2M and M2P registers will be reset. [iv] This does not reset the Margining Configuration and Management Registers. Margining Status register will show the last recorded status. This bit will automatically self-clear after 32-CORE_CLK cycles.

9.4.113 PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_2_REGISTER Register (Offset = 00100D00h) [reset = 0h]

PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_2_REGISTER is shown in Figure 9-352 and described in Table 9-1067.

Return to the [Summary Table](#).

This is an extension of the Local Error and Status Register.

This register contains the status of the various events, errors and abnormal conditions in the Controller. Any of the status bits can be reset by writing a 1 into the bit position.

Unless masked by the setting of the Local Interrupt Mask 2 Register, the occurrence of any of these conditions causes the Controller to activate the LOCAL_INTERRUPT output.

5	IPHYMCR	R/W1C	0h	<p>This bit validates the 8-bit command stored in bits [7:0] and the Lane Number stored in bits [11:8] of the margining_error_status1_reg register.</p> <p>This bit is set upon receiving the first Error.</p> <p>Local firmware must clear this bit by writing a 1 to this bit before another error can be logged.</p>

Table 9-1067. PCIE_CORE_LM_I_LOCAL_ERROR_STATUS_2_REGISTER Register Field Descriptions
(continued)

Bit	Field	Type	Reset	Description
4	ISWMCRCR	R/W1C	0h	This bit validates the 16-bit command stored in bits [15:0] and the Lane Number stored in bits [19:16] of the margining_error_status1_reg register. This bit is set upon receiving the first Error. Local firmware must clear this bit by writing a 1 to this bit before another error can be logged.
3	MSIXMSKSETST	R/W1C	0h	This status bit indicates that the MSIX Function Mask of any function, PF or VF, was programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg. Note that this is a Read Only Status bit. The MSIX Function Mask Clear status per-function is captured in the msix_function_mask_set_status_register. Firmware has to clear the per-function bits in msix_function_mask_set_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.
2	MSIXMSKCLST	R/W1C	0h	This status bit indicates that the MSIX Function Mask of any function, PF or VF, was programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg. Note that this is a Read Only Status bit. The MSIX Function Mask Clear status per-function is captured in the msix_function_mask_cleared_status_register. Firmware has to clear the per-function bits in msix_function_mask_cleared_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.
1	MSIMSKSETST	R/W1C	0h	This status bit indicates that One or More bits of MSI Mask of any function, PF or VF, was programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg. Note that this is a Read Only Status bit. The MSI Mask Clear status per-function is captured in the msi_mask_set_status_register. Firmware has to clear the per-function bits in msi_mask_set_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.
0	MSIMSKCLST	R/W1C	0h	This status bit indicates that One or More bits of MSI Mask of any function, PF or VF, was programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg. Note that this is a Read Only Status bit. The MSI Mask Clear status per-function is captured in the msi_mask_cleared_status_register. Firmware has to clear the per-function bits in msi_mask_cleared_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.

Table 9-1070. PCIE_CORE_LM_I_LOCAL_INTRPT_MASK_2_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	R31	R	0h	Reserved
14	LEQRQINM	R/W	1h	Mask for Link Equalization Request Interrupt.
13-11	R13_11	R	0h	Reserved
10	R10	R	0h	Reserved
9	PCAIM	R/W	1h	Mask for PTM Context Auto Invalidated event.
8	NFTSTOM	R/W	0h	Mask for NFTS Timeout.
7	UPREM	R/W	0h	Unexpected PHY Response is detected by Controller if PHY writes to the Margin Status or the Margin NAK bits of RX Margin Status 0 Register when no change in Start Margin or Margin Offset issued by Controller or after the Write Ack Wait Timeout This bit can be used to Mask asserting the LOCAL_INTERRUPT output upon this error. 1: Error is masked. 0: Error is not masked.

Table 9-1070. PCIE_CORE_LM_I_LOCAL_INTRPT_MASK_2_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	WAWTEM	R/W	0h	When a WriteCommitted command is issued by the Controller, the PHY must respond with a Write_Ack within 10ms on the PIPE Message Bus Interface. However, if the Write_Ack is not received within 10ms, the Controller reports Timeout and stops waiting for the write_ack. This bit can be used to Mask asserting the LOCAL_INTERRUPT output upon this 10ms timeout. 1: Error is masked. 0: Error is not masked.
5	IPHYMEM	R/W	0h	When the Controller receives a Margining Command from PHY over the PIPE Interface, it checks if the command is valid. The error status is logged in local_error_status_2_register. This bit can be used to Mask asserting the LOCAL_INTERRUPT output when the Invalid PHY Margining Error Status is set. 1: Error is masked. 0: Error is not masked.
4	ISWMEM	R/W	0h	When the Controller receives a Margining Command from SW in its configuration register, it checks if the command is valid. The error status is logged in local_error_status_2_register. This bit can be used to Mask asserting the LOCAL_INTERRUPT output when the Invalid SW Margining Error Status is set. 1: Error is masked. 0: Error is not masked.
3	MSIXMSKSET	R/W	0h	Mask for MSIX Function Mask Cleared Status.
2	MSIXMSKCL	R/W	0h	Mask for MSIX Function Mask Set Status.
1	MSIMSKSET	R/W	0h	Mask for MSI Mask Set Status.
0	MSIMSKCL	R/W	0h	Mask for MSI Mask Cleared Status.

9.4.115 PCIE_CORE_LM_MSI_MASK_CLEARED_STATUS_1 Register (Offset = 00100D10h) [reset = 0h]

PCIE_CORE_LM_MSI_MASK_CLEARED_STATUS_1 is shown in Figure 9-354 and described in Table 9-1073.

Return to the [Summary Table](#).

This status register has one bit per function. Each function has a 32-bit MSI Mask.
If any bit in the function's MSI Mask register is configured from 1 to 0,
then the corresponding function's status bit in this register is set.
Local Firmware needs to clear this register by writing a 1.

Bit	Field	Type	Reset	Description
15	VF9MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF9 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
14	VF8MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF8 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
13	VF7MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF7 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
12	VF6MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF6 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
11	VF5MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF5 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

**Table 9-1073. PCIE_CORE_LM_MSI_MASK_CLEARED_STATUS_1 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
10	VF4MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF4 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
9	VF3MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF3 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
8	VF2MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF2 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
7	VF1MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF1 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
6	VF0MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF0 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

**Table 9-1073. PCIE_CORE_LM_MSI_MASK_CLEARED_STATUS_1 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
5	PF5MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF5 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
4	PF4MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF4 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
3	PF3MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF3 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
2	PF2MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF2 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
1	PF1MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF1 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1073. PCIE_CORE_LM_MSI_MASK_CLEARED_STATUS_1 Register Field Descriptions
(continued)

Bit	Field	Type	Reset	Description
0	PF0MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF0 MSI Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

9.4.116 PCIe_CORE_LM_MSI_MASK_SET_STATUS_1 Register (Offset = 00100D14h) [reset = 0h]

PCIe_CORE_LM_MSI_MASK_SET_STATUS_1 is shown in Figure 9-355 and described in Table 9-1076.

Return to the [Summary Table](#).

This status register has one bit per function. Each function has a 32-bit MSI Mask. If any bit in the function's MSI Mask register is configured from 0 to 1, then the corresponding function's status bit in this register is set. Local Firmware needs to clear this register by writing a 1.

21	VF15MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF15 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg. Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1076. PCIE_CORE_LM_MSI_MASK_SET_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	VF14MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF14 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
19	VF13MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF13 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
18	VF12MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF12 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
17	VF11MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF11 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
16	VF10MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF10 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1076. PCIE_CORE_LM_MSI_MASK_SET_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	VF9MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF9 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
14	VF8MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF8 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
13	VF7MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF7 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
12	VF6MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF6 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
11	VF5MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF5 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1076. PCIE_CORE_LM_MSI_MASK_SET_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	VF4MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF4 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
9	VF3MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF3 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
8	VF2MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF2 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
7	VF1MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF1 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
6	VF0MSIMSKCLST	R/W1C	0h	Each VF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in VF0 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1076. PCIE_CORE_LM_MSI_MASK_SET_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	PF5MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF5 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
4	PF4MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF4 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
3	PF3MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF3 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
2	PF2MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF2 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
1	PF1MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF1 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1076. PCIE_CORE_LM_MSI_MASK_SET_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	PF0MSIMSKCLST	R/W1C	0h	Each PF has a 32-bit MSI Mask. This status bit is set when any of the 32-bits in PF0 MSI Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSI Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

9.4.117 PCIE_CORE_LM_MSIX_FUNCTION_MASK_CLEARED_STATUS_1 Register (Offset = 00100D18h) [reset = 0h]

PCIE_CORE_LM_MSIX_FUNCTION_MASK_CLEARED_STATUS_1 is shown in Figure 9-356 and described in Table 9-1079.

Return to the [Summary Table](#).

This status register has one bit per function. Each function has a 1-bit MSIX Function Mask. If the function's MSIX Function Mask register is configured from 1 to 0, then the corresponding function's status bit in this register is set. Local Firmware needs to clear this register by writing a 1.

Bit	Field	Type	Reset	Description
15	VF9MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF9 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
14	VF8MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF8 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
13	VF7MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF7 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
12	VF6MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF6 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
11	VF5MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF5 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1079. PCIE_CORE_LM_MSIX_FUNCTION_MASK_CLEARED_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	VF4MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF4 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
9	VF3MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF3 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
8	VF2MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF2 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
7	VF1MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF1 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
6	VF0MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF0 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1079. PCIE_CORE_LM_MSIX_FUNCTION_MASK_CLEARED_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	PF5MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF5 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
4	PF4MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF4 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
3	PF3MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF3 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
2	PF2MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF2 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
1	PF1MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF1 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1079. PCIE_CORE_LM_MSIX_FUNCTION_MASK_CLEARED_STATUS_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	PF0MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF0 MSIX Function Mask is programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
18	VF12MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF12 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
17	VF11MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF11 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
16	VF10MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF10 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

**Table 9-1082. PCIE_CORE_LM_MSIX_FUNCTION_MASK_SET_STATUS_1 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
15	VF9MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF9 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
14	VF8MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF8 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
13	VF7MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF7 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
12	VF6MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF6 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
11	VF5MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF5 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

**Table 9-1082. PCIE_CORE_LM_MSIX_FUNCTION_MASK_SET_STATUS_1 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
10	VF4MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF4 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
9	VF3MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF3 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
8	VF2MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF2 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
7	VF1MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF1 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
6	VF0MSIXMSKCLST	R/W1C	0h	Each VF has a 1-bit MSIX Function Mask. This status bit is set when the VF0 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

**Table 9-1082. PCIE_CORE_LM_MSIX_FUNCTION_MASK_SET_STATUS_1 Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
5	PF5MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF5 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
4	PF4MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF4 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
3	PF3MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF3 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
2	PF2MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF2 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
1	PF1MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF1 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1082. PCIE_CORE_LM_MSIX_FUNCTION_MASK_SET_STATUS_1 Register Field Descriptions
(continued)

Bit	Field	Type	Reset	Description
0	PF0MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF0 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

Table 9-1088. PCIE_CORE_LM_RX_ELEC_IDLE_FILTER_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GFLCP	R/W	4h	This controls the glitch filter on PM Clock domain. This counter indicates the number of PM Clocks the glitch will be filtered out. The total delay of the glitch filter is calculated as [PM Clock Period * Number of PM Clocks] this delay should be same or close enough for both Core Clock[GFLCC] and PM Clock[GFLCP]
23-16	GFLCC	R/W	20h	This controls the glitch filter on CORE Clock domain. This counter indicates the number of CORE Clocks the glitch will be filtered out. The total delay of the glitch filter is calculated as [CORE Clock Period * Number of CORE Clocks] this delay should be same or close enough for both CORE Clock[GFLCC] and PM Clock[GFLCP]
15-2	RSVGFLD	R	0h	Reserved
1-0	GFLD	R/W	0h	By default controller enables glitch filter on all lanes. Setting this bit to one makes the controller to disable the glitch filter on that corresponding lanes in which the bit is set. When all bits are set to one the Glitch filter is completely bypassed, When any bit is zero glitch filter is enabled, and de-glitching is done only on the lanes that are set to zero

9.4.123 PCIE_CORE_LM_I_PTM_LATENCY_PARAMETERS_INDEX_REG Register (Offset = 00100DB0h) [reset = 0h]

PCIE_CORE_LM_I_PTM_LATENCY_PARAMETERS_INDEX_REG is shown in Figure 9-362 and described in Table 9-1097.

Return to the [Summary Table](#).

The latency parameters of the PHY may be different at different speeds of operation. Hence, the Controller implements multiple instances of the PTM Latency Parameters Register, one instance for each speed of operation.

This register is used to select the speed prior to programming the speed-specific delay parameter registers.

9.4.124 PCIE_CORE_LM_I_PTM_LATENCY_PARAMETERS_REG Register (Offset = 00100DB4h) [reset = 0h]

PCIE_CORE_LM_I_PTM_LATENCY_PARAMETERS_REG is shown in Figure 9-363 and described in Table 9-1100.

Return to the [Summary Table](#).

This register is used to define the PHY specific delay parameters.

This register also implements control bits to fine-tune timestamps that are captured by the Controller.

Internally, one instance of this register is implemented for each of the speeds supported by the Controller and is indexed by the PTM Latency Parameters Index Register.

9.4.136 PCIe_CORE_LM_I_ASF_INTRPT_STATUS Register (Offset = 00100DECh) [reset = 0h]

PCIe_CORE_LM_I_ASF_INTRPT_STATUS is shown in Figure 9-375 and described in Table 9-1136.

Return to the [Summary Table](#).

This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_fatal or asf_nonfatal signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register.

9.4.140 PCIE_CORE_LM_I_ASF_INTRPT_FATAL_NONFATAL_SEL Register (Offset = 00100DFCh) [reset = 3Fh]

PCIE_CORE_LM_I_ASF_INTRPT_FATAL_NONFATAL_SEL is shown in Figure 9-379 and described in Table 9-1148.

Return to the [Summary Table](#).

This register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. For each select bit, if it is set to one then a fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered. For either a Fatal or Non Fatal Interrupt to be triggered, the corresponding mask bit of the error needs to be zero.

Table 9-1172. PCIE_CORE_LM_I_ASF_PROTOCOL_FAULT_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	R2	R	0h	RESERVED
15	AXISLVDEC	R/W1C	0h	This bit is set when the AXI interface sends SLVERR or DECERR to the user
14	RPLTOM	R/W1C	0h	This bit is set when the replay timer in the Data Link Layer of the Controller times out.
13	RPLROL	R/W1C	0h	This bit is set when the replay count rolls over after three re transmissions of a TLP at the Data Link Layer of the Controller.
12	BADDLP	R/W1C	0h	This bit is set when an LCRC error is detected in a received DLLP
11	BADTLPM	R/W1C	0h	This bit is set when an error is detected in a received TLP by the Data Link Layer of the Controller.
10	PHRCVER	R/W1C	0h	This bit is set when an error is detected in the receive side of the Physical Layer of the Controller
9	USPREQ	R/W1C	0h	This bit is set when the Controller has received a request from the link that it does not support.

Table 9-1172. PCIE_CORE_LM_I_ASF_PROTOCOL_FAULT_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	ECRCERR	R/W1C	0h	This bit is set when the Controller has detected an ECRC error in a received TLP
7	MALTLPER	R/W1C	0h	This bit is set when the Controller receives a malformed TLP from the link.
6	RCVROVFL	R/W1C	0h	This bit is set when the Controller receives a TLP in violation of the receive credit currently available.
5	UNCMLRCV	R/W1C	0h	This bit is set when the Controller has received an unexpected Completion packet from the link
4	CMPLABT	R/W1C	0h	This bit is set when the Controller has returned the Completer Abort [CA] status to a request received from the link.
3	CPLTO	R/W1C	0h	This bit is set when the completion timer associated with an outstanding request times out.
2	FCPROER	R/W1C	0h	This bit is set when certain violations of the flow control protocol are detected by the Controller.
1	POTLRCV	R/W1C	0h	This bit is set when the Controller receives a poisoned TLP from the link.
0	DLPROT	R/W1C	0h	This bit is set when the Controller receives an Ack or Nak DLLP whose sequence number does not correspond to that of an unacknowledged TLP or that of the last acknowledged TLP

Table 9-1186. PCIe_CORE_RP_I_COMMAND_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DPE	R/W1C	0h	This bit is set when the Controller has received a poisoned TLP. The Parity Error Response enable bit [bit 6] has no effect on the setting of this bit. This field can also be cleared from the local management bus APB by writing a 1 into this bit position. This field can be forced to 1 from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

Table 9-1186. PCIE_CORE_RP_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	SSE	R/W1C	0h	<p>The Controller sets this bit [i]On receiving an error message from the link, if SERR-Enable in PCI Command Register is 1 and SERR-Enable in the Bridge Control Register is also 1.</p> <p>[ii]On any internal Fatal/Non-Fatal error detected, if SERR-Enable in PCI Command Register is 1.</p> <p>This field can also be cleared from the local management APB bus by writing a 1 into this bit position.</p> <p>This field can be forced to 1 from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>
29	RMA	R/W1C	0h	<p>This bit is set when the Controller has received a completion from the link with the Unsupported Request status.</p> <p>This field can also be cleared from the local management APB bus by writing a 1 into this bit position</p> <p>This field can be forced to 1 from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>
28	RTA	R/W1C	0h	<p>This bit is set when the Controller has received a completion from the link with the Completer Abort status.</p> <p>This field can also be cleared from the local management APB bus by writing a 1 into this bit position.</p> <p>This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>
27	STA	R/W1C	0h	<p>This bit is set when the Controller has sent a completion to the link with the Completer Abort status.</p> <p>This field can also be cleared from the local management APB bus by writing a 1 into this bit position.</p> <p>This field can be forced to 1 from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>
26-25	R6	R	0h	Reserved
24	MDPE	R/W1C	0h	<p>When the Parity Error Response enable bit is 1, the Controller sets this bit when it detects the following error conditions: [i] The Controller receives a poisoned request from the link.</p> <p>[ii] The Controller has sent a Poisoned Completion downstream to the link This bit remains 0 when the Parity Error Response enable bit is 0.</p> <p>This field can be forced to 1 from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>
23-21	R5	R	0h	Reserved
20	CL	R	1h	<p>Indicates the presence of PCI Extended Capabilities registers.</p> <p>This bit is hardwired to 1.</p>

Table 9-1186. PCIE_CORE_RP_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IS	R	0h	This bit is valid only when the Controller is configured to support legacy interrupts. Indicates that the Controller has a pending interrupt, that is, the Controller has sent an Assert_INTx message but has not transmitted a corresponding Deassert_INTx message.
18-16	R4	R	0h	Reserved
15-11	R3	R	0h	Reserved
10	IMD	R/W	0h	Enables or disables the transmission of INTx Assert and De-assert messages from the Controller. The setting of this bit has no effect on the operation of the Controller in the RC mode.
9	R2	R	0h	Reserved
8	SE	R/W	0h	Enables the reporting of fatal and non-fatal errors detected by the Controller to the Root Complex.
7	R1	R	0h	Reserved
6	PERE	R/W	0h	When this bit is 1, the Controller sets the Master Data Parity Error status bit when it detects the following error conditions: [i] The Controller receives a poisoned completion from the link in response to a request. [ii] The Controller sends out a poisoned write request on the link [this may be because an underflow occurred during the packet transfer at the host interface of the Controller.]. When this bit is 0, the Master Data Parity Error status bit is never set.
5-3	R0	R	0h	Reserved
2	BE	R/W	0h	For a Function with a Type 1 Configurations Space header[Controller in RP Mode], this bit controls forwarding of Memory or I/O Requests by a Port in the Upstream direction. Note: The Controller does not generate any response based on this bit. Client application logic must use this bit and respond to requests appropriately: - When this bit is '1', Client logic can process the Memory and IO Requests received from PCIe Link normally. - When this bit is '0', Client logic must handle Memory and IO Requests received from PCIe Link as Unsupported Requests.
1	MSE	R/W	0h	For a Function with a Type 1 Configuration Space header[Controller in RP Mode], this bit controls the response to Memory Space accesses received on its Primary Side. Note: The Controller does not generate any response based on this bit. - Client must check for this bit to be '1' before initiating any Memory requests on the pcie_master_AXI interface.

Table 9-1186. PCIE_CORE_RP_I_COMMAND_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ISE	R/W	0h	<p>For a Function with a Type 1 Configuration Space header [Controller in RP Mode] , this bit controls the response to I/O Space accesses received on its Primary Side.</p> <p>Note: The Controller does not generate any response based on this bit.</p> <p>- Client must check for this bit to be '1' before initiating any IO requests on the pcie_master_AXI interface.</p>

Table 9-1188. PCIE_CORE_RP_I_REVISION_ID_CLASS_CODE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	CC	R	0h	Identifies the function of the device. On power-up, the Controller sets it to the value defined in the RTL file reg_defaults.h. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
23-16	SCC	R	0h	Identifies a sub-category within the selected function. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
15-8	PIB	R	0h	Identifies the register set layout of the device. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
7-0	RID	R	0h	Assigned by the manufacturer of the device to identify the revision number of the device. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

9.5.4 PCIE_CORE_RP_I_BIST_HEADER_LATENCY_CACHE_LINE Register (Offset = Ch) [reset = 00010000h]

PCIE_CORE_RP_I_BIST_HEADER_LATENCY_CACHE_LINE is shown in [Figure 9-393](#) and described in [Table 9-1190](#).

Bit	Field	Type	Reset	Description
31-24	BR	R	0h	BIST control register. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
23	DT	R	0h	Identifies whether the device supports a single Function or multiple Functions. Hardwired to zero
22-16	HT	R	1h	Identifies format of header. This field is hardwired to 1.
15-8	LT	R	0h	This is an unused field and is hardwired to 0.
7-0	CLS	R/W	0h	Cache Line Size Register defined in PCI Specifications 3.0. This field can be read or written, both from the link and from the local management bus, but its value is not used.

9.5.5 PCIE_CORE_RP_I_RC_BAR_0 Register (Offset = 10h) [reset = 0h]

Table 9-1192. PCIE_CORE_RP_I_RC_BAR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	BAMRW	R/W	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in Root Complex BAR Configuration Register. All other bits are not writeable, and are read as 0's.
21-4	BAMR0	R	0h	This field defines the base address of the memory address range. The number of implemented bits in this field determines the BAR aperture configured in Root Complex BAR Configuration Register. All other bits are not writeable, and are read as 0's.
3	P0	R	0h	For memory BAR: This bit reads as 1 when BAR 0 is configured as a prefetchable BAR, and as 0 when configured as a non-prefetchable BAR. For IO BAR: This is bit 3 of the base address. The value read in this field is determined by the setting of Root Complex BAR Configuration Register.

Table 9-1192. PCIE_CORE_RP_I_RC_BAR_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	S0	R	0h	For memory BAR: This bit reads as 0 when BAR 0 is configured as a 32-bit BAR, and as 1 when configured as a 64-bit BAR. For IO BAR: This is bit 3 of the base address. The value read in this field is determined by the setting of Root Complex BAR Configuration Register.
1	R7	R	0h	This bit is hardwired to 0 for both memory and I/O BARs.
0	MSI0	R	0h	Specifies whether this BAR defines a memory address range or an I/O address range [0 = memory, 1 = I/O]. The value read in this field is determined by the setting of Root Complex BAR Configuration Register.

9.5.6 PCIE_CORE_RP_I_RC_BAR_1 Register (Offset = 14h) [reset = 0h]

Bit	Field	Type	Reset	Description
31-23	R23	R	0h	Reserved
22	BCRSBR	R/W	0h	This field can be read and written from the local management APB bus. When set, it initiates a hot reset on the link.
21	R21	R	0h	Reserved
20	VGA16D	R/W	0h	This field can be read and written from the local management APB bus, but its value is not used within the Controller.
19	VGAE	R/W	0h	This field can be read and written from the local management APB bus, but its value is not used within the Controller.
18	ISAE	R/W	0h	This field can be read and written from the local management APB bus, but its value is not used within the Controller.
17	BCSE	R/W	0h	This field can be read and written from the local management APB bus, but its value is not used within the Controller.
16	PERE	R/W	0h	This field can be read and written from the local management APB bus. It is used only to enable the Master Data Parity Error bit in the Secondary Status Register.

Table 9-1214. PCIE_CORE_RP_I_INTRPT_LINE_INTRPT_PIN Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-11	R5	R	0h	Reserved
10-8	IPR	R	1h	Identifies the interrupt input [A, B, C, D] to which this Functions interrupt output is connected to [01 = INTA, 02 = INTB, 03 = INTC, 04 = INTD]. The assignment of interrupt inputs to Functions is fixed when the Controller is configured. This field can be re-written independently for each Function from the local management bus. Default values - PF 0: 01 [INTA], PF 1: 02 [INTB].
7-0	ILR	R/W	FFh	This field can be read and written from the local management bus, but its value is not used within the Controller. The given reset value is for PF0.

9.5.17 PCIE_CORE_RP_I_PWR_MGMT_CAP Register (Offset = 80h) [reset = 5A039001h]

Table 9-1216. PCIE_CORE_RP_I_PWR_MGMT_CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PSDCS	R	0h	Indicates whether the Function is capable of sending PME messages when in the D3cold state. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
30	PSDHS	R	1h	Indicates whether the Function is capable of sending PME messages when in the D3hot state. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
29	PSD2S	R	0h	Indicates whether the Function is capable of sending PME messages when in the D2 state. This bit is hardwired to 0 because D2 state is not supported.

Table 9-1216. PCIE_CORE_RP_I_PWR_MGMT_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	PSD1S	R	1h	Indicates whether the Function is capable of sending PME messages when in the D1 state. This bit is set to 1 by default, but can be modified from the local management bus by writing into Function 0. All other Functions assume the value set in Function 0s Power Management Capabilities Register.
27	PSD0S	R	1h	Indicates whether the Function is capable of sending PME messages when in the D0 state. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
26	D2S	R	0h	Set if the Function supports the D2 power state. Currently hardwired to 0.
25	D1S	R	1h	Set if the Function supports the D1 power state. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
24-22	MCRAPS	R	0h	Specifies the maximum current drawn by the device from the aux power source in the D3cold state. This field is not implemented in devices not supporting PME notification when in the D3cold state, and is therefore hardwired to 0.
21	DSI	R	0h	This bit, when set, indicates that the device requires additional configuration steps beyond setting up its PCI configuration space, to bring it to the D0 active state from the D0 uninitialized state. This bit is hardwired to 0.
20	R0	R	0h	Reserved
19	PC	R	0h	Not applicable to PCI Express. This bit is hardwired to 0.
18-16	VID	R	3h	Indicates the version of the PCI Bus Power Management Specifications that the Function implements. This field is set by default to 011 [Version 1.2]. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
15-8	CP	R	90h	Contains pointer to the next PCI Capability Structure. The Controller sets it to the value defined in the RTL file reg_defaults.h. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

Table 9-1216. PCIE_CORE_RP_I_PWR_MGMT_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-0	CID	R	1h	Identifies that the capability structure is for Power Management. This field is set by default to 01 hex. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

9.5.18 PCIE_CORE_RP_I_PWR_MGMT_CTRL_STAT_REP Register (Offset = 84h) [reset = 8h]

31	MSIXE	R/W	0h	Set by the configuration program to enable the MSI-X feature. This field can also be written from the local management bus.
30	FM	R/W	0h	This bit serves as a global mask to all the interrupt conditions associated with this Function. When this bit is set, the Controller will not send out MSI-X messages from this Function. This field can also be written from the local management bus.
29-27	R0	R	0h	Reserved

Table 9-1232. PCIE_CORE_RP_I_MSIX_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26-16	MSIXTS	R	0h	Specifies the size of the MSI-X Table, that is, the number of interrupt vectors defined for the Function. The programmed value is 1 minus the size of the table [that is, this field is set to 0 if the table size is 1]. It can be re-written independently for each Function from the local management bus. Please see the define den_db_Fx_MSIX_TABLE_SIZE values [where x is the function number] for default values of each function in the reg_defaults.v files.
15-8	CP	R	C0h	Contains pointer to the next PCI Capability Structure. This is set to point to the PCI Express Capability Structure at 30 hex. This can be rewritten independently for each Function from the local management bus.
7-0	CID	R	11h	Identifies that the capability structure is for MSI-X. This field is set by default to 11 hex. It can be rewritten independently for each Function from the local management bus.

9.5.26 PCIE_CORE_RP_I_MSIX_TBL_OFFSET Register (Offset = B4h) [reset = 0h]

PCIE_CORE_RP_I_MSIX_TBL_OFFSET is shown in [Figure 9-415](#) and described in [Table 9-1234](#).

Return to [Summary Table](#).

Bit	Field	Type	Reset	Description
31	R0	R	0h	Reserved
30	TRS	R	0h	When set to 1, this bit indicates that the device supports routing of Trusted Configuration Requests. Not valid for Endpoints. Hardwired to 0.
29-25	IMN	R	0h	Identifies the MSI or MSI-X interrupt vector for the interrupt message generated corresponding to the status bits in the Slot Status Register, Root Status Register, or this capability structure. This field must be defined based on the chosen interrupt mode - MSI or MSI-X. This field is hardwired to 0.
24	SI	R	1h	When Set, this bit indicates that the Link associated with this Port is connected to a slot
23-20	DT	R	4h	Indicates the type of device implementing this Function. This field is hardwired to 4 in the RP mode.
19-16	PCV	R	2h	Identifies the version number of the capability structure. This field is set to 2 by default to indicate that the Controller is compatible to PCI Express Base Specification Revision 3.0. Can be modified using local management interface after asserting input signal MGMT_TYPE1_CONFIG_REG_ACCESS high.

Table 9-1238. PCIE_CORE_RP_I_PCIE_CAP_LIST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	NCP	R	0h	Points to the next PCI capability structure. Set to 0 because this is the last capability structure.
7-0	CID	R	10h	Specifies Capability ID assigned by PCI SIG for this structure. This field is hardwired to 10 hex.

9.5.29 PCIE_CORE_RP_I_PCIE_CAP Register (Offset = C4h) [reset = 8001h]

Bit	Field	Type	Reset	Description
31-29	R5	R	0h	Reserved
28	FLRC	R	0h	A value of 1b indicates the Function supports the optional Function Level Reset mechanism
27-26	CPLS	R	0h	Specifies the scale used by Slot Power Limit Value. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
25-18	CSP	R	0h	Specifies upper limit on power supplied by slot. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
17-16	R4	R	0h	Reserved
15	RER	R	1h	Enables role-based error reporting. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

Table 9-1240. PCIE_CORE_RP_I_PCIE_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-12	R3	R	0h	Reserved
11-9	AL1L	R	0h	Specifies acceptable latency that the Endpoint can tolerate while transitioning from L1 to PCIE_CORE_RP_L0. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
8-6	AL0L	R	0h	Specifies acceptable latency that the Endpoint can tolerate while transitioning from L0S to PCIE_CORE_RP_L0. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
5	ETFS	R	0h	hard coded to zero .
4-3	PFS	R	0h	This field is used to extend the tag field by combining unused Function bits with the tag bits. This field is hardwired to 00 to disable this feature.
2-0	MP	R	1h	Specifies maximum payload size supported by the device. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

9.5.30 PCIE_CORE_RP_I_PCIE_DEV_CTRL_STATUS Register (Offset = C8h) [reset = 2810h]

Table 9-1242. PCIE_CORE_RP_I_PCIE_DEV_CTRL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	R8	R	0h	N/A
21	TP	R	0h	Indicates if any of the Non-Posted requests issued by the RC are still pending.
20	APD	R	0h	Set when auxiliary power is detected by the device. This is an unused field.
19	URD	R/W1C	0h	Set to 1 by the Controller when it receives an unsupported request.
18	FED	R/W1C	0h	Set to 1 by the Controller when it detects a fatal error, regardless of whether the error is masked.
17	NFED	R/W1C	0h	Set to 1 by the Controller when it detects a non-fatal error, regardless of whether the error is masked.
16	CED	R/W1C	0h	Set to 1 by the Controller when it detects a correctable error, regardless of whether the error is masked.
15	R7	R	0h	Hardwired to 0.

Table 9-1242. PCIE_CORE_RP_I_PCIE_DEV_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-12	MRR	R/W	2h	Specifies the maximum size allowed in read requests generated by the device.
11	ENS	R/W	1h	If this bit is Set, the Function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency.
10	APPME	R	0h	Hardwired to 0
9	PFE	R	0h	Hardwired to 0
8	ETE	R	0h	extended tag not enabled. Hence hard coded to zero .
7-5	MP	R/W	0h	Specifies the maximum TLP payload size configured. The device must be able to receive a TLP of this maximum size, and should not generate TLP's larger than this value. Software must set this field based on the maximum payload size in the Device Capabilities Register, and the capability of the other side.
4	ERO	R/W	1h	When set, this bit indicates that the device is allowed to set the Relaxed Ordering bit in the Attributes field of transactions initiated from it., when the transactions do not require Strong Ordering.
3	EURR	R/W	0h	This bit is used to gate the CORRECTABLE_ERROR_OUT, NON_FATAL_ERROR_OUT, FATAL_ERROR_OUT output in Root Port mode on receiving unsupported requests. Note: Alternately, the SERR Enable bit in the Command Register can also be set to enable assertion of FATAL_ERROR_OUT on receiving uncorrectable unsupported requests.
2	EFER	R/W	0h	This bit is used to gate the FATAL_ERROR_OUT output of the Controller in Root Port mode. When an Uncorrectable, Unmasked Error with Uncorrectable Error Severity set to 1 is detected Internally or when a ERR_FATAL message is received by the Controller, in Root Port mode, this bit gates the assertion of FATAL_ERROR_OUT output. Note: Alternately, the SERR Enable bit in the Command Register can also be set to enable assertion of FATAL_ERROR_OUT.
1	ENFER	R/W	0h	This bit is used to gate the NON_FATAL_ERROR_OUT output of the Controller in Root Port mode. When an Uncorrectable, Unmasked Error with Uncorrectable Error Severity set to 0 is detected Internally or when a ERR_NON_FATAL message is received by the Controller, in Root Port mode, this bit gates the assertion of NON_FATAL_ERROR_OUT output. Note: Alternately, the SERR Enable bit in the Command Register can also be set to enable assertion of NON_FATAL_ERROR_OUT.

Table 9-1242. PCIE_CORE_RP_I_PCIE_DEV_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ECER	R/W	0h	<p>This bit is used to gate the CORRECTABLE_ERROR_OUT output of the Controller in Root Port mode.</p> <p>When a Correctable and Unmasked Error is detected Internally or when a ERR_CORR message is received by the Controller, in Root Port mode, this bit gates the assertion of CORRECTABLE_ERROR_OUT output.</p>

9.5.31 PCIE_CORE_RP_I_LINK_CAP Register (Offset = CCh) [reset = 0061AC24h]

Table 9-1244. PCIE_CORE_RP_I_LINK_CAP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PN	R	0h	Specifies the port number assigned to the PCI Express link connected to this device. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
23	R9	R	0h	Reserved
22	ASPMOC	R	1h	A 1 in this position indicates the device supports the ASPM Optionality feature. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
21	LBNC	R	1h	A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

Table 9-1244. PCIE_CORE_RP_I_LINK_CAP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	DARC	R	0h	Set to 1 if the device is capable of reporting that the DL Control and Management State Machine has reached the DL_Active state. This bit is hardwired to 0, as this version of the Controller does not support the feature.
19	SERC	R	0h	Indicates the capability of the device to report a Surprise Down error condition. This bit is hardwired to 0, as this version of the Controller does not support the feature.
18	CPM	R	0h	Indicates that the device supports removal of reference clocks. Not supported in this version of the Controller. Hardwired to 0.
17-15	L1EL	R	3h	Specifies the exit latency from L1 state. This parameter is dependent on the Physical Layer implementation. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
14-12	L0EL	R	2h	Specifies the time required for the device to transition from L0S to PCIE_CORE_RP_L0. This parameter is dependent on the Physical Layer implementation. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
11-10	ASPM	R	3h	Indicates the level of ASPM support provided by the device. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
9-4	MLW	R	2h	Indicates the maximum number of lanes supported by the device. This field is hardwired based on the setting of the LANE_COUNT_IN strap input.
3-0	MLS	R	4h	Indicates the speeds supported by the link [2.5 GT/s , 5 GT/s , 8 GT/s , 16 GT/s per lane]. This field is hardwired to 0001 [2.5GT/s] when the strap input PCIE_GENERATION_SEL is set to 0, to 0010 [5 GT/s] when the strap is set to 1 , and to 0011 [8 GT/s] when the strap input is set to 10 , and to 0100 [16 GT/s] when the strap input is set to 11 .

9.5.32 PCIE_CORE_RP_I_LINK_CTRL_STATUS Register (Offset = D0h) [reset = 00210000h]

PCIE_CORE_RP_I_LINK_CTRL_STATUS is shown in [Figure 9-421](#) and described in [Table 9-1246](#).

Table 9-1246. PCIE_CORE_RP_I_LINK_CTRL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LABS	R/W1C	0h	This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This triggers an interrupt to be generated through PHY_INTERRUPT_OUT if enabled. Hardwired to 0 if Link Bandwidth Notification Capability is 0.
30	LBMS	R/W1C	0h	This bit is Set by hardware to indicate that either link training has completed following write to retrain link bit, or when HW has changed link speed or width to attempt to correct unreliable link operation. This triggers an interrupt to be generated through PHY_INTERRUPT_OUT if enabled. Hardwired to 0 if Link Bandwidth Notification Capability is 0.
29	DA	R	0h	Indicates the status of the Data Link Layer. Set to 1 when the DL Control and Management State Machine has reached the DL_Active state. This bit is hardwired to 0 in this version of the Controller.

Table 9-1246. PCIE_CORE_RP_I_LINK_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SCC	R	0h	Indicates that the device uses the reference clock provided by the connector. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
27	LTS	R	0h	This bit is set to 1 when the LTSSM is in the Recovery or Configuration states, or if a 1 has been written to the Retrain Link bit but the link training has not yet begun.
26	R12	R	0h	Reserved
25-20	NLW	R	2h	Set at the end of link training to the actual link width negotiated between the two sides.
19-16	NLS	R	1h	Negotiated link speed of the device. The only supported speed ids are 2.5 GT/s per lane [0001], 5 GT/s per lane [0010], 8 GT/s per lane [0011], 16 GT/s per lane [0100].
15-12	R11	R	0h	Reserved
11	LABIE	R/W	0h	When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set. This enables an interrupt to be generated through PHY_INTERRUPT_OUT if triggered. Hardwired to 0 if Link Bandwidth Notification Capability is 0.
10	LBMIE	R/W	0h	When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This enables an interrupt to be generated through PHY_INTERRUPT_OUT if triggered. Hardwired to 0 if Link Bandwidth Notification Capability is 0.
9	HAWD	R/W	0h	When this bit is set, the local application must not request to change the operating width of the link, other than attempting to correct unreliable Link operation by reducing Link width.
8	ECPM	R	0h	This field is hardwired to 0 when the Controller is in the RC mode.
7	ES	R/W	0h	Set to 1 to extend the sequence of ordered sets transmitted while exiting from the LOS state.
6	CCC	R/W	0h	A value of 0 indicates that the reference clock of this device is asynchronous to that of the upstream device. A value of 1 indicates that the reference clock is common.

Table 9-1246. PCIE_CORE_RP_I_LINK_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	RL	R	0h	Setting this bit to 1 causes the LTSSM to initiate link training. This bit always reads as 0. This bit can be set by Host SW at any time independent of the LTSSM state. If the LTSSM is not in PCIE_CORE_RP_L0 state, the Controller will internally register the retrain command and initiate the link retrain immediately after the LTSSM reaches PCIE_CORE_RP_L0. For example, if the LTSSM is already in Recovery, the Controller will initiate Retrain Link after the LTSSM transitions back to PCIE_CORE_RP_L0 state.
4	LD	R/W	0h	Writing a 1 to this bit position causes the LTSSM to go to the Disable Link state. The LTSSM stays in the Disable Link state while this bit is set.
3	RCB	R	0h	Indicates the Read Completion Boundary of the Root Port [0 = 64 bytes, 1 = 128 bytes]. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
2	R10	R	0h	Reserved
1-0	ASPMC	R/W	0h	Controls the level of ASPM support on the PCI Express link associated with the function. The valid setting are 00: ASPM disabled 01: L0s entry enabled, L1 disabled 10: L1 entry enabled, L0s disabled 11: Both L0s and L1 enabled. Note that the ASPM Control bits can be enabled only if the corresponding ASPM Support [1:0] bit is 1 in the Link Capabilities Register.

9.5.33 PCIE_CORE_RP_I_SLOT_CAPABILITY Register (Offset = D4h) [reset = 0h]

PCIE_CORE_RP_I_SLOT_CAPABILITY is shown in [Figure 9-422](#) and described in [Table 9-1248](#).

Table 9-1248. PCIE_CORE_RP_I_SLOT_CAPABILITY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	PSN	R	0h	This field indicates the physical slot number attached to this Port. This field must be hardware initialized to a value that assigns a slot number that is unique within the chassis, regardless of the form factor associated with the slot. This field must be initialized to zero for Ports connected to devices that are either integrated on the system board or integrated within the same silicon as the Switch device or Root Port.
18	NCCS	R	0h	When Set, this bit indicates that this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller. This bit is only permitted to be Set if the hot-plug capable Port is able to accept writes to all fields of the Slot Control register without delay between successive writes.
17	EIP	R	0h	When Set, this bit indicates that an Electromechanical Interlock is implemented on the chassis for this slot.

Table 9-1248. PCIE_CORE_RP_I_SLOT_CAPABILITY Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16-15	SPLS	R	0h	Specifies the scale used for the Slot Power Limit Value . Range of Values: 00b = 1.0x 01b = 0.1x 10b = 0.01x 11b = 0.001x This register must be implemented if the Slot Implemented bit is Set. Writes to this register also cause the Port to send the Set_Slot_Power_Limit Message. The default value prior to hardware/firmware initialization is 00b.
14-7	SPLV	R	0h	In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by the slot [see Section 6.9] or by other means to the adapter. Power limit [in Watts] is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field except when the Slot Power Limit Scale field equals 00b [1.0x] and Slot Power Limit Value exceeds EFh, the following alternative encodings are used: F0h = 250 W Slot Power Limit F1h = 275 W Slot Power Limit F2h = 300 W Slot Power Limit F3h to FFh = Reserved for Slot Power Limit values above 300 W This register must be implemented if the Slot Implemented bit is Set. Writes to this register also cause the Port to send the Set_Slot_Power_Limit Message. The default value prior to hardware/firmware initialization is 0000 0000b.
6	HPC	R	0h	When Set, this bit indicates that this slot is capable of supporting hot-plug operations.
5	HPS	R	0h	When Set, this bit indicates that an adapter present in this slot might be removed from the system without any prior notification. This is a form factor specific capability. This bit is an indication to the operating system to allow for such removal without impacting continued software operation.
4	PIP	R	0h	When Set, this bit indicates that a Power Indicator is electrically controlled by the chassis for this slot.
3	AIP	R	0h	When Set, this bit indicates that an Attention Indicator is electrically controlled by the chassis.
2	MRLSP	R	0h	When Set, this bit indicates that an MRL Sensor is implemented on the chassis for this slot.
1	PCP	R	0h	When Set, this bit indicates that a software programmable Power Controller is implemented for this slot/adapter [depending on form factor].
0	ABPRSNT	R	0h	When Set, this bit indicates that an Attention Button for this slot is electrically controlled by the chassis.

9.5.34 PCIE_CORE_RP_I_SLOT_CTRL_STATUS Register (Offset = D8h) [reset = 002007C0h]

Bit	Field	Type	Reset	Description
31-25	RSCS2	R	0h	N/A
24	DLLSC	R/W1C	0h	This bit is Set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read the Data Link Layer Link Active bit of the Link Status register to determine if the Link is active before initiating configuration cycles to the hot plugged device.
23	EMIS	R	0h	If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock. Defined encodings are: 0b Electromechanical Interlock Disengaged 1b Electromechanical Interlock Engaged

Table 9-1250. PCIE_CORE_RP_I_SLOT_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	PDS	R	0h	<p>This bit indicates the presence of an adapter in the slot, reflected by the logical 'OR' of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor.</p> <p>Note that the in-band presence detect mechanism requires that power be applied to an adapter for its presence to be detected.</p> <p>Consequently, form factors that require a power controller for hot-plug must implement a physical pin presence detect mechanism.</p> <p>Defined encodings are:</p> <p>0b Slot Empty</p> <p>1b Card Present in slot.</p>
21	MRLSS	R	1h	<p>This bit reports the status of the MRL sensor if implemented.</p> <p>Defined encodings are:</p> <p>0b MRL Closed</p> <p>1b MRL Open</p>
20	CMDCMPL	R/W1C	0h	<p>If Command Completed notification is supported [if the No Command Completed Support bit in the Slot Capabilities register is 0b], this bit is Set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command.</p> <p>The Command Completed status bit is Set as an indication to host software that the Hot-Plug Controller has processed the previous command and is ready to receive the next command</p> <p>it provides no guarantee that the action corresponding to the command is complete.</p> <p>If Command Completed notification is not supported, this bit must be hardwired to 0b.</p>
19	PDC	R/W1C	0h	<p>This bit is set when the value reported in the Presence Detect State bit is changed.</p>
18	MRLSC	R/W1C	0h	<p>If an MRL sensor is implemented, this bit is Set when a MRL Sensor state change is detected.</p> <p>If an MRL sensor is not implemented, this bit must not be Set.</p>
17	PFD	R/W1C	0h	<p>If a Power Controller that supports power fault detection is implemented, this bit is Set when the Power Controller detects a power fault at this slot.</p> <p>Note that, depending on hardware capability, it is possible that a power fault can be detected at any time, independent of the Power Controller Control setting or the occupancy of the slot.</p> <p>If power fault detection is not supported, this bit must not be Set.</p>
16	ABPRSD	R/W1C	0h	<p>If an Attention Button is implemented, this bit is Set when the attention button is pressed.</p> <p>If an Attention Button is not supported, this bit must not be Set.</p>
15-13	RSCS1	R	0h	Reserved

Table 9-1250. PCIE_CORE_RP_I_SLOT_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	DLLSCE	R/W	0h	If the Data Link Layer Link Active Reporting capability is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed. If the Data Link Layer Link Active Reporting Capable bit is 0b, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.
11	EMIC	R	0h	If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. A write of 0b to this bit has no effect. A read of this bit always returns a 0b.
10	PCC	R/W	1h	If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. Reads of this bit must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write, if required to, without waiting for the previous command to complete in which case the read value is undefined. The defined encodings are: 0b Power On 1b Power Off
9-8	PIC	R/W	3h	If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state. Reads of this field must reflect the value from the latest write, Defined encodings are: 00b Reserved 01b On 10b Blink 11b Off
7-6	AIC	R/W	3h	If an Attention Indicator is implemented, writes to this field set the Attention Indicator to the written state. Reads of this field must reflect the value from the latest write, Defined encodings are: 00b Reserved 01b On 10b Blink 11b Off
5	HPIE	R/W	0h	When Set, this bit enables generation of an interrupt on enabled hot-plug events. If the Hot Plug Capable bit in the Slot Capabilities register is Clear, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.

Table 9-1250. PCIE_CORE_RP_I_SLOT_CTRL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	CCIE	R/W	0h	If Command Completed notification is supported [if the No Command Completed Support bit in the Slot Capabilities register is 0b], when Set, this bit enables software notification when a hot-plug command is completed by the Hot-Plug Controller. If Command Completed notification is not supported, this bit must be hardwired to 0b. Default value of this bit is 0b.
3	PDCE	R/W	0h	When Set, this bit enables software notification on a presence detect changed event. If the Hot-Plug Capable bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.
2	MSCE	R/W	0h	When Set, this bit enables software notification on a MRL sensor changed event If the MRL Sensor Present bit in the Slot Capabilities register is Clear, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.
1	PFDE	R/W	0h	When Set, this bit enables software notification on a power fault event If a Power Controller that supports power fault detection is not implemented, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.
0	ABPE	R/W	0h	When Set to 1b, this bit enables software notification on an attention button pressed event. If the Attention Button Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b. Default value of this bit is 0b.

9.5.35 PCIe_CORE_RP_I_ROOT_CTRL_CAP Register (Offset = DCh) [reset = 0h]

Bit	Field	Type	Reset	Description
31-24	R16	R	0h	Reserved
23-22	MEEP	R	1h	Indicates the maximum number of End-End TLP Prefixes supported by the Function. The supported values are: 01b 1 End-End TLP Prefix 10b 2 End-End TLP Prefixes. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write
21	EEPS	R	1h	Indicates whether the Function supports End-End TLP Prefixes. A 1 in this field indicates that the Function supports receiving TLPs containing End-End TLP Prefixes. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write
20	EXFS	R	1h	Indicates that the Function supports the 3-bit definition of the Fmt field in the TLP header. This bit is hardwired to 1 for all Physical Functions.
19-18	OBFF	R	0h	Hard coded to zero

Table 9-1256. PCIE_CORE_RP_I_PCIE_CAP_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	T10RS	R	0h	If set function supports 1-bit requester capability otherwise, the function does not. This bit can be disabled using local management register.
16	T10CS	R	1h	If set function supports 1-bit completer capability otherwise, the function does not. This field can be modified using local management interface.
15-14	R15	R	0h	Reserved
13	RESERVED	R	X	
12	TPHC	R	0h	Hardwired to 0.
11	LMS	R	1h	A value of 1b indicates support for the optional Latency Tolerance Reporting [LTR] mechanism. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
10	R14	R	0h	Reserved
9	ACS128	R	0h	Hardwired to 0.
8	ACS64	R	0h	Hardwired to 0.
7	ACS32	R	0h	Hardwired to 0.
6	AOPRS	R	0h	Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
5	AFS	R	1h	A 1 in this bit indicates that the device is able to forward TLPs with function number greater than 8. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.
4	CTDS	R	1h	A 1 in this field indicates that the associated Function supports the capability to turn off its Completion timeout. This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.

Table 9-1256. PCIE_CORE_RP_I_PCIE_CAP_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	CTR	R	2h	<p>Specifies the Completion Timeout values supported by the device. This field is set by default to 0010 [10 ms - 250 ms], but can be modified from the local management APB bus.</p> <p>The actual timeout values are in two programmable local management registers, which allow the timeout settings of the two sub-ranges within Range B to be programmed independently.</p> <p>This field can be written from the APB bus by setting [21] bit high of the pcie_mgmt_APB_ADDR during a local management register write.</p>

Bit	Field	Type	Reset	Description
31-15	R20	R	0h	N/A
14-13	OBFFE	R	0h	Enables the Optimized Buffer Flush/Fill [OBFF] capability in the device. Valid settings are 00 [disabled], 01 [Variation A], and 10 [Variation B].
12	T10RE	R	0h	10bit TAGs generation are not supported in this configuration.
11	R19	R	0h	Reserved
10	LTRME	R/W	0h	This must be set to 1 to enable the Latency Tolerance Reporting Mechanism. This bit is implemented only in PF 0. Its default value is 1, but can be modified from the local management bus. This bit is read-only in PF 1.
9	ICE	R/W	0h	When this bit is 1, the RC is allowed to set the ID-based Ordering [IDO] Attribute bit in the Completions it generates.

Table 9-1258. PCIE_CORE_RP_I_PCIE_DEV_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IRE	R/W	0h	When this bit is 1, the RC is allowed to set the ID-based Ordering [IDO] Attribute bit in the requests it generates.
7	R18	R	0h	Reserved
6	AORE	R	0h	This bit must be set to enable the generation of Atomic Op Requests. If the client logic attempts to send an Atomic Op when this bit is not set, logic in the Controller will nullify the TLP on its way to the link.
5	AFE	R/W	0h	A 1 in this field indicates that the port treats fields 7:0 of the ID as function number while converting a Type 1 config packet to type 0 config packet.
4	CTD	R/W	0h	Setting this bit disables the Completion Timeout in the device.
3-0	CTV	R/W	0h	Specifies the Completion Timeout value for the device. Allowable values are 0101 [sub-range 1] and 0110 [sub-range 2]. The corresponding timeout values are stored in the local management register's Completion Timeout Interval Registers 0 and 1, respectively. Value of 0 selects completion timeout from Completion-Timeout-Interval-Registers-0 in local management register.

9.5.39 PCIE_CORE_RP_I_LINK_CAP_2 Register (Offset = ECh) [reset = X]

PCIE_CORE_RP_I_LINK_CAP_2 is shown in [Figure 9-428](#) and described in [Table 9-1260](#).

Table 9-1262. PCIE_CORE_RP_I_LINK_CTRL_STATUS_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DMR	R	0h	DRS is not supported by the Controller and hence this field is not implemented.
30-28	DCP	R	0h	DRS is not supported by the Controller and hence this field is not implemented.
27-24	R21	R	0h	Reserved
23	TWRTP	R	0h	When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation.
22	RTP	R	0h	When set to 1b, this bit indicates that a Retimer was present during the most recent Link negotiation.

Table 9-1262. PCIE_CORE_RP_I_LINK_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21	LE	R/W1C	0h	This bit can be set by the software running on the EndPoint to force the Endpoint to perform link equalization. Setting this bit causes the LTSSM of the Controller to enter the Recovery state and request its link partner to perform equalization. This bit is cleared when the LTSSM enters the Recovery.Equalization state. It can also be cleared by writing a 1 to this bit position by the host, or writing a 0 from the LMI. STICKY
20	EP3S	R	0h	This bit, when set to 1, indicates that the Phase 3 of the Transmitter Equalization procedure has completed successfully. STICKY
19	EP2S	R	0h	This bit, when set to 1, indicates that the Phase 2 of the Transmitter Equalization procedure has completed successfully. STICKY
18	EP1S	R	0h	This bit, when set to 1, indicates that the Phase 1 of the Transmitter Equalization procedure has completed successfully. STICKY
17	EQC	R	0h	This bit, when set to 1, indicates that the Transmitter Equalization procedure has completed. STICKY
16	CDEL	R	1h	This status bit indicates the current operating de-emphasis level of the transmitter [0 = -6dB, 1 = -3.5dB].
15-12	CD	R/W	0h	This bit sets the de-emphasis level [for 5 GT/s operation] or the Transmitter Preset level [for 8 GT/s or 16 GT/s operation] when the LTSSM enters the Polling.Compliance state because of software setting the Enter Compliance bit in this register. It is used only when the link is running at 5 GT/s or 8 GT/s or 16 GT/s. At 5 GT/s, the only valid setting are 0 [-6 dB] and 1 [-3.5 dB]. STICKY
11	CS	R/W	0h	When this bit is set to 1, the device will transmit SKP ordered sets between compliance patterns. STICKY

Table 9-1262. PCIE_CORE_RP_I_LINK_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	EMC	R/W	0h	This field is intended for debug and compliance testing purposes only. If this bit is set to 1, the device will transmit the Modified Compliance Pattern when the LTSSM enters the Polling.Compliance substate. STICKY
9-7	TM	R/W	0h	This field is intended for debug and compliance testing purposes only. It controls the non-deemphasized voltage level at the transmitter outputs. Its encodings are: 000 = Normal operating range, 001 = 800 - 1200 mV for full swing and 400 - 700 mV for half swing, 010 - 111 = See PCI Express Base Specification 2.0. This field is reset to 0 when th LTSSM enters the Polling.Configuration substate during link training. STICKY.
6	SD	R/W	0h	This bit selects the de-emphasis level when the Controller is operating at 5 GT/s [0 = -6 dB, 1 = -3.5 dB].
5	HASD	R/W	0h	When this bit is set, the LTSSM is prevented from changing the operating speed of the link, other than reducing the speed to correct unreliable operation of the link. STICKY
4	EC	R/W	0h	This bit is used to force the Endpoint device to enter the Compliance mode. Software sets this bit to 1 and initiates a hot reset to force the device into the Compliance mode. The target speed for the Compliance mode is determined by the Target Link Speed field of this register. STICKY.

Table 9-1262. PCIE_CORE_RP_I_LINK_CTRL_STATUS_2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	TLS	R/W	4h	<p>This field sets the target speed when the software forces the link into Compliance mode by setting the Enter Compliance bit in this register</p> <p>[0001 = 2.5 GT/s, 0010 = 5 GT/s, 0100 = 8 GT/s, 1000 = 16 GT/s].</p> <p>The default value of this field is 0001 [2.5 GT/s] when the PCIE_GENERATION_SEL [1:0] strap pins of the Controller are set to 0, 0010 [5 GT/s] when the strap is set to 1, and 0011 [8 GT/s] when the strap pin is set to 10, and 0100 [16 GT/s] when the strap pin is set to 11.</p> <p>STICKY.</p>

Bit	Field	Type	Reset	Description
31-23	R28	R	0h	Reserved
22	UIE	R/W1C	0h	This bit is set when the Controller has detected an internal uncorrectable error [HAL parity error or an uncorrectable ECC error while reading from any of the RAMs]. This bit is also set in response to the client signaling an internal error through the input UNCORRECTABLE_ERROR_IN. This error is considered fatal by default.
21	R27	R	0h	Reserved

Table 9-1266. PCIE_CORE_RP_I_UNCORR_ERR_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	URE	R/W1C	0h	This bit is set when the Controller has received a request from the link that it does not support. This error is not Function-specific. This error is considered non-fatal by default, except for the special case outlined in PCI Express Base Specification 2.0. The header of the received request that caused the error is logged in the Header Log Registers.
19	EE	R/W1C	0h	This bit is set when the Controller has detected an ECRC error in a received TLP.
18	MT	R/W1C	0h	This bit is set when the Controller receives a malformed TLP from the link. This error is considered fatal by default. The header of the received TLP with error is logged in the Header Log Registers.
17	RO	R/W1C	0h	This bit is set when the Controller receives a TLP in violation of the receive credit currently available.
16	UC	R/W1C	0h	This bit is set when the Controller has received an unexpected Completion packet from the link.
15	CA	R/W1C	0h	This bit is set when the Controller has returned the Completer Abort [CA] status to a request received from the link. This error is considered non-fatal by default, except for the special cases outlined in PCI Express Base Specification 2.0. The header of the received request that caused the error is logged in the Header Log Registers.
14	CT	R/W1C	0h	This bit is set when the completion timer associated with an outstanding request times out. This error is considered non-fatal by default.
13	FCPE	R/W1C	0h	This bit is set when certain violations of the flow control protocol are detected by the Controller.
12	PT	R/W1C	0h	This bit is set when the Controller receives a poisoned TLP from the link. This error is considered non-fatal by default. The header of the received TLP with error is logged in the Header Log Registers.
11-5	R26	R	0h	Reserved
4	DLPE	R/W1C	0h	This bit is set when the Controller receives an Ack or Nak DLLP whose sequence does not correspond to that of an unacknowledged TLP or that of the last acknowledged TLP [for details, refer to the PCI Express Base Specifications].

Table 9-1272. PCIE_CORE_RP_I_CORR_ERR_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	R39	R	0h	Reserved
15	HLOS	R/W1C	0h	This bit is set on a Header Log Register overflow, that is, when the header could not be logged in the Header Log Register because it is occupied by a previous header.
14	CIES	R/W1C	0h	This bit is set when the Controller has detected an internal correctable error condition [a correctable ECC error while reading from any of the RAMs]. This bit is also set in response to the client signaling an internal error through the input CORRECTABLE_ERROR_IN.
13	ANES	R/W1C	0h	This bit is set when an uncorrectable error occurs, which is determined to belong to one of the special cases described in the PCI Express Base Specification 2.0. This causes the Controller to assert the CORRECTABLE_ERROR_OUT output in place of NON_FATAL_ERROR_OUT.

Table 9-1272. PCIE_CORE_RP_I_CORR_ERR_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	RTTS	R/W1C	0h	This bit is set when the replay timer in the Data Link Layer of the Controller times out, causing the Controller to re-transmit a TLP.
11-9	R38	R	0h	Reserved
8	RNRS	R/W1C	0h	This bit is set when the replay count rolls over after three re-transmissions of a TLP at the Data Link Layer of the Controller.
7	BDS	R/W1C	0h	This bit is set when an LCRC error is detected in a received DLLP, and no errors were detected by the Physical Layer.
6	BTS	R/W1C	0h	This bit is set when an error is detected in a received TLP by the Data Link Layer of the Controller the conditions causing this error are [1] an LCRC error, [2] the packet terminates with EDB symbol, but its LCRC field does not equal the inverted value of the calculated CRC.
5-1	R37	R	0h	Reserved
0	RES	R/W1C	0h	This bit is set when an error is detected in the receive side of the Physical Layer of the Controller [e.g. an 8b10b decode error].

9.5.46 PCIE_CORE_RP_I_CORR_ERR_MASK Register (Offset = 114h) [reset = E000h]

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 9-1276. PCIE_CORE_RP_I_ADV_ERR_CAP_CTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	R43	R	0h	Reserved
11	TPLP	R	0h	If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined. Default value of this bit is 0. This bit is RsvdP if the End-End TLP Prefix Supported bit is Clf Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	MHRE	R	0h	Setting this bit enables the RC to log multiple error headers in its Header Log Registers. It is hardwired to 0.

Table 9-1276. PCIE_CORE_RP_I_ADV_ERR_CAP_CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	MHRC	R	0h	This bit is set when the RC has the capability to log more than one error header in its Header Log Registers. It is hardwired to 0.
8	EEC	R/W	0h	Setting this bit enables ECRC checking on the receive side of the Controller. This bit is writable from the local management bus. STICKY.
7	ECC	R	1h	This read-only bit indicates to the software that the device is capable of checking ECRC in packets received from the link.
6	EEG	R/W	0h	Setting this bit enables the ECRC generation on the transmit side of the Controller. This bit is writable from the local management bus. STICKY.
5	EGC	R	1h	This read-only bit indicates to the software that the device is capable of generating ECRC in packets transmitted on the link.
4-0	FEP	R	0h	This is a 5-bit pointer to the bit position in the Uncorrectable Error Status Register corresponding to the error that was detected first. When there are multiple bits set in the Uncorrectable Error Status Register, this field informs the software which error was observed first. To prevent the field from being overwritten before the software is able to read it, this field is not updated while the status bit it points to in the Uncorrectable Error Status Register remains set. After the software clears this status bit, a subsequent error condition that sets any bit in the Uncorrectable Error Status Register will update the First Error Pointer. Any uncorrectable error type, including the special cases where the error is reported using an ERR_COR message, will set the First Error Pointer [assuming the software has reset the error pointed by it in the Uncorrectable Error Status Register]. STICKY.

Table 9-1294. PCIE_CORE_RP_I_DEV_SER_NUM_CAP_HDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	SNNCO	R	300h	Indicates offset to the next PCI Express capability structure. The default next pointer value is dynamic and is dependent on whether the strap or LMI bits are set.
19-16	DSNCV	R	1h	Specifies the SIG assigned value for the version of the capability structure. This field is set by default to 1, but can be modified from the local management bus by writing into Function 0 from the local management bus.
15-0	PECID	R	3h	This field is hardwired to the Capability ID assigned by PCI SIG to the PCI Express Device Serial Number Capability [0001 hex].

9.5.57 PCIE_CORE_RP_I_DEV_SER_NUM_0 Register (Offset = 154h) [reset = 0h]

PCIE_CORE_RP_I_DEV_SER_NUM_0 is shown in [Figure 9-446](#) and described in [Table 9-1296](#).

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	X	
23-19	R0	R	Dh	Along with the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register sets the time [in us] that this Port requires the port on the opposite side of Link to wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register. T Power On is the minimum amount of time that each component must wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. This is to ensure no device is ever actively driving into an unpowered component.
18	RESERVED	R	X

Table 9-1356. PCIE_CORE_RP_I_MARGINING_PORT_CAPABILITIES_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	R1	R	0h	Reserved
17	MSRDY	R	0h	When Margining uses Driver Software is Set, then this bit, when Set, indicates that the required software has performed the required initialization. The value of this bit is Undefined if Margining users Driver Software is Clear. The Controller implementation sets the default value of this bit to 0. The driver software must initialize the Rx Margining parameters in the Local Management Lane Margining Registers and then program this bit to 1.

Table 9-1356. PCIE_CORE_RP_I_MARGINING_PORT_CAPABILITIES_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	MRDY	R	0h	Indicates when the Margining feature is ready to accept margining commands. If the Margining uses Driver Software bit is 1, then the Controller sets this status bit when the Margining Software Ready bit is set and the Link is in Gen4 PCIE_CORE_RP_L0 state. If the Margining uses Driver Software bit is 0, then the Controller sets this status bit when the Link is in Gen4 PCIE_CORE_RP_L0 state.
15-1	R0	R	0h	Reserved
0	MARUDS	R	1h	If Set, indicates that Margining is partially implemented using Device Driver software. Margining Software Ready indicates when this software is initialized. If Clear, Margining does not require device driver software. The Controller implementation requires driver software to initialize the Rx Margining parameter values in Local Management Registers for Lane Margining. Hence, the default value of this bit is set to 1.

Bit	Field	Type	Reset	Description
31-5	R0	R	0h	Reserved
4	LE16	R/W1C	0h	This bit can be set by the software running on the EndPoint to force the Endpoint to request link equalization for 16.0 GT/s. Setting this bit causes the LTSSM of the Controller to enter the Recovery state and request its link partner to perform equalization. This bit is cleared when the LTSSM enters the Recovery.Equalization state. It can also be cleared by writing a 1 to this bit position by the host, or writing a 0 from the LMI. STICKY.
3	EP3S16	R	0h	This bit, when set to 1, indicates that the Phase 3 of the Transmitter Equalization procedure has completed successfully for 16.0 GT/s. STICKY.

Table 9-1368. PCIE_CORE_RP_I_PL_16GTS_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	EP2S16	R	0h	This bit, when set to 1, indicates that the Phase 2 of the Transmitter Equalization procedure has completed successfully for 16.0 GT/s. STICKY.
1	EP1S16	R	0h	This bit, when set to 1, indicates that the Phase 1 of the Transmitter Equalization procedure has completed successfully for 16.0 GT/s. STICKY.
0	EQC16	R	0h	This bit, when set to 1, indicates that the Transmitter Equalization procedure has completed for 16.0 GT/s. STICKY.

Table 9-1386. PCIE_CORE_RP_I_PL_CONFIG_0_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MLE	R/W	0h	When the Controller is operating as a Root Port, setting this to 1 causes the LTSSM to initiate a loopback and become the loopback master. This bit is not used in the EndPoint Mode.
30	R0	R	0h	A 1 in this field indicates that the remote node advertised Linkwidth Upconfigure Capability in the training sequences in the Configuration.Complete state when the link came up. A 0 indicates that the remote node did not set the Link Upconfigure bit.
29-24	LTSSM	R	0h	Current state of the LTSSM. The encoding of the states is given in Appendix C.
23-16	RLID	R	0h	Link ID received from other side during link training.

Table 9-1386. PCIE_CORE_RP_I_PL_CONFIG_0_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	RFC	R	0h	FTS count received from the other side during link training for use at the 2.5 GT/s link speed. The Controller transmits this many FTS sequences while exiting the LOS state, when operating at the 2.5 GT/s speed.
7	TSS	R/W	0h	This bit drives the PIPE_TX_SWING output of the Controller.
6	APER	R/W	0h	This bit controls the reporting of Errors Detected by the PHY. The Errors Detected by the PHY include:- - Received errors indicated on PIPE RxStatus interface, - 8.0 GT/s Invalid Sync Header received error, - 16.0 GT/s Invalid Sync Header received error, If PHY Error Reporting bit is set to 0, the Controller will only report those errors that caused a TLP or DLLP to be dropped because of a Detected PHY Error. If PHY Error Reporting bit is set to 1, the Controller will report all Detected PHY Errors regardless of whether a TLP or DLLP was dropped. The following registers report PHY error in conjunction with this bit: - Correctable Error Status Register, PCIE_CORE_RP_I_CORR_ERR_STATUS, bit-0, Receiver Error Status - Local Error and Status Register, PCIE_CORE_RP_I_LOCAL_ERROR_STATUS_REGISTER, bit-7, Phy Error In addition to the Errors Detected by the PHY[PCS], the Controller detects the following Physical Layer Protocol Framing Errors: - Framing Errors in the received DLLP and TLP - Ordered Set Block Received Without EDS - Data Block Received After EDS - Illegal Ordered Set Block Received After EDS - Ordered Set Block Received After Skip OS Note: These Errors are always reported independent of the setting of this bit.
5	LTD	R	1h	The state of this bit indicates whether the Controller completed link training as an upstream port[EndPoint][=0] or a downstream port[Root Port][=1]. Default value depends on CORE_TYPE strap pin.
4-3	NS	R	0h	Current operating speed of link [00 = 2.5G, 01 = 5G, 10 = 8G, 11 = 16G].
2-1	NLC	R	1h	Lane count negotiated with other side during link training [00 = x1, 01 = x2, 10 = x4, 11 = x8].
0	LS	R	0h	Current state of link [1 = link training complete, 0 = link training not complete].

Table 9-1430. PCIE_CORE_RP_I_SRIS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	R31	R	0h	Reserved
0	SRISE	R/W	1h	Setting this bit enables SRIS mode in the PHY layer. This bit should be changed before link training begins by holding the LINK_TRAINING_ENABLE input to 1'b0. When SRIS is disabled using this bit the Lower SKP OS Generation Supported Speeds Vector and Lower SKP OS Reception Supported Speeds Vector in the Link Capabilities Register 2 will be forced to ZERO. The default value of this register can be controlled using the SRIS_ENABLE strap input.

Table 9-1486. PCIe_CORE_RP_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	EFSRTCA	R/W	1h	Setting this bit to 0 causes all the enabled Functions to report an error when a Type-1 configuration access is received by the Controller, targeted at any Function. Setting it to 1 limits the error reporting to the type-0 Function whose number matches with the Function number specified in the request. If the Function number in the request refers to an unimplemented or disabled Function, all enabled Functions report the error regardless of the setting of this bit.
30	DOC	R/W	0h	Setting this bit to 1 disables the ordering check in the Controller between Completions and Posted requests received from the link.

Table 9-1486. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	DFCUT	R/W	0h	<p>When this bit is 0, the Controller will time out and re-train the link when no Flow Control Update DLLPs are received from the link within an interval of 128 us. Setting this bit to 1 disables this timeout.</p> <p>When the advertised receive credit of the link partner is infinity for the header and payload of all credit types, this timeout is always suppressed.</p> <p>The setting of this bit has no effect in this case.</p> <p>This bit should not be set during normal operation, but is useful for testing.</p>
28	DEI	R/W	0h	<p>Setting this bit to 1 disables the inferring of electrical idle in the PCIE_CORE_RP_L0 state.</p> <p>Electrical idle is inferred when no flow control updates and no SKP sequences are received within an interval of 128 us.</p> <p>This bit should not be set during normal operation, but is useful for testing.</p>
27	DGLUS	R/W	0h	<p>Setting this bit to 1 disables the update of the LFSRs in the Gen3 descramblers of the Controller, from the values received in SKP sequences.</p> <p>This bit should not be set during normal operation, but is useful for testing.</p>
26	IEDPPE	R/W	0h	<p>When set to 1, this bit inverts the parity bits generated by the Controller for end-to-end data protection.</p> <p>This will result in the inversion of parity bits for data payloads delivered through the HAL interface.</p> <p>This bit is to be used for diagnostics only, and should not be set during normal operation.</p>
25	ESPC	R/W	0h	<p>When this bit is set to 1, the Controller will capture the Slot Power Limit Value and Slot Power Limit Scale parameters from a Set_Slot_Power_Limit message received in the Device Capabilities Register.</p> <p>When this bit is 0, the capture is disabled.</p> <p>This bit is valid only when the Controller is configured as an EndPoint. It has no effect when the Controller is a Root Complex.</p>

Table 9-1486. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	EFLT	R/W	0h	<p>This bit is provided to shorten the link training time to facilitate fast simulation of the design, especially at the gate level.</p> <p>Enabling this bit has the following effects:</p> <ol style="list-style-type: none"> 1. The 1 ms, 2 ms, 12 ms, 24 ms, 32 ms and 48 ms timeout intervals in the LTSSM are shortened by a factor of 500. 2. In the Polling.Active state of the LTSSM, only 16 training sequences are required to be transmitted [Instead of 1024] to make the transition to the Configuration state. <p>This bit should not be set during normal operation of the Controller.</p>
23	DLUC	R/W	0h	<p>The user may set this bit to turn off the link upconfigure capability of the Controller.</p> <p>Setting this bit prevents the Controller from advertising the link upconfigure capability in training sequences transmitted in the Configuration.Complete state.</p> <p>In addition, setting this bit causes the Controller to put the unused lanes into Turn Off mode.</p> <p>When disable_link_upconfigure_capability==</p> <ol style="list-style-type: none"> 1: Controller drives PIPE_TX_ELEC_IDLE==1 AND PIPE_TX_COMPLIANCE==1 for the Unused upper lanes. The Unused upper lanes are put into Turn Off mode by the PHY as per PIPE specification. <p>When disable_link_upconfigure_capability==</p> <ol style="list-style-type: none"> 0: Controller drives PIPE_TX_ELEC_IDLE==1 AND PIPE_TX_COMPLIANCE==0 for the Unused upper lanes. The Unused upper lanes are put into Electrical Idle by the PHY.
22	DLRFE	R/W	0h	<p>When this bit is 1, the Controller will not transition its LTSSM into the Recovery state when it detects a Framing Error at 8 GT/s or 16 GT/s speed [as defined in Section 4.2.2.3.3 of the PCIe Base Specification 3.0.</p> <p>This bit must normally be set to 0 so that a Framing Error will cause the LTSSM to enter Recovery.</p> <p>The setting of this bit has no effect on the operation of the Controller at 2.5 and 5 GT/s speeds.</p>
21	DSHEC	R/W	0h	<p>When this bit is 0, the Controller will signal a framing error if it detects a sync header error in the received blocks at 8 GT/s or 16 GT/s speed [A 00 or 11 binary setting of the sync header on the received blocks in any lane constitutes a framing error].</p> <p>Setting this bit to 1 suppresses this error check.</p> <p>This bit should normally be set to 0, as the sync header check is mandatory in the PCIe 3.0 Specifications.</p>

Table 9-1486. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	DCIVMC	R/W	0h	When this bit is 1, the Controller will not check for invalid message codes. This bit should normally set to 0, as the invalid message code checking is mandatory in the PCIe 3.0 specifications.
19	DIOAEFC	R/W	0h	When this bit is 1, the Controller will not check for illegal OS after EDS as part of Gen3 Framing Error Checks. This bit should normally set to 0, as this is a mandatory Gen3 Framing Error check in the PCIe 3.0 specifications.
18	DOASFC	R/W	0h	When this bit is 1, the Controller will not check for OS after SKIP OS as part of Gen3 Framing Error Checks. This bit should normally set to 0, as this is a mandatory Gen3 Framing Error check in the PCIe 3.0 specifications.
17	HPRSUPP	R/W	0h	When this bit is 1, data path parity check is disabled on the TX side of the Controller.
16	AWRPRI	R/W	0h	When this bit is 1, the AXI bridge places a write request on the HAL Master interface in preference over a read request if both AXI write and AXI read requests are available to be asserted on the same clock cycle.
15	FDS	R/W	0h	Disable Scrambling/Descrambling in Gen1/Gen2.
14	DSSPLM	R/W	0h	Disable sending Set Slot Power Limit Message if the Slot Capabilitied register is configured

**Table 9-1488. PCIE_CORE_RP_I_LOCAL_ERROR_STATUS_REGISTER Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
21	HAWCD	R/W1C	0h	This interrupt status bit indicates that the Host toggled the Hardware Autonomous Width Change bit in the Link Control Register through a Config Write. Upon this interrupt, the Client firmware must read the Link Control Register to check the value set by Host in the Hardware Autonomous Width Change bit. The Host Software may disable autonomous width change by setting Hardware Autonomous Width Disable bit in the Link Control register. If disabled by the Host and if the Endpoint firmware had initiated an autonomous width downsizing prior to this interrupt, then the local Client firmware is responsible to upconfigure the Link to go to its full functional width by initiating the link_upconfigure_retrain_link within 1 ms of this interrupt.
20	R22	R	0h	Reserved
19	MMVC	R/W1C	0h	This status bit is set whenever the MSI mask register value in the MSI capability register changes value in ANY of the functions in the controller

Table 9-1506. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	R31	R	0h	Reserved
28	DFLRTRB	R/W	1h	1 : NP Termination due to FLR/Completion Timeout is delayed till the RX Completion FIFO is Empty. 0 : NP Termination due to FLR is done immediately on receiving FLR/Completion Timeout.
27	DTAE2EP	R/W	0h	By default, when End to End Parity error is detected on inbound/outbound data streams, then all the transmitted outbound packets will be Nullified by the Controller. This bit can be used to turn off nullifying Tx packets on End to End Parity Error.
26	R26	R	0h	Reserved

**Table 9-1506. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
25	MSIXMSKEN	R/W	0h	By default, the Controller provides a single status bit when any function's MSIX Function Mask is programmed or configured by Local firmware or Host SW. Controller also implements an enhanced MSIX Function Mask Interrupt mechanism, which provides per-function set/clear status when a function's MSIX Function Mask is updated by SW. This Local Management programmable bit allows user to choose between the Default and Enhanced MSIX Function Mask Change Interrupt mechanisms.
24	MSIMSKEN	R/W	0h	By default, the Controller provides a single status bit when any function's MSI Mask is programmed or configured by Local firmware or Host SW. Controller also implements an enhanced MSI Mask Interrupt mechanism, which provides per-function set/clear status when a function's MSI Mask is updated by SW. This Local Management programmable bit allows user to choose between the Default and Enhanced MSI Mask Change Interrupt mechanisms.
23	VARCCLKEN	R/W	0h	If this bit is set the CORE_CLK input can be driven with Variable Clock depending on the Link Speed, similar to the PIPE_PCLK.
22-13	MAXNPREQ	R/W	20h	The Controller supports 32 outstanding NP requests that can be initiated by the User. However, the number of split completion TLPs that can be stored in the Controller is limited to 128. The Completion FIFO will overflow if more than 128 split completion packets are pending. If the User interface can accept inbound Posted and Completion packets at the same rate as received from PCIe link, then the split completion FIFO will never reach the FULL condition. However, if the User cannot guarantee this, then this register needs to be programmed as described in the Programming Guide section of the Controller User guide. The Controller will limit the maximum number of outstanding NP requests to the value programmed in this register. Example: 8 : Controller will limit maximum number of outstanding NP requests to 8. 0-7 : Reserved Default Value is 32
12	AXINSPEN_RSVD	R	0h	RESERVED
11	CMPTOADV	R/W	1h	As per PCIe specification on Error Signaling, the Requester detecting a Completion Timeout is allowed to handle this as an Advisory Non Fatal Error. 1: Completion Timeout is handled as Advisory Non-Fatal Error. 0: Completion Timeout is handled as normally as a Non-Fatal Error.

**Table 9-1506. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
10	PSNADV	R/W	0h	As per PCIe specification 2.7.2.2, the following Poisoned TLP requests must be handled as Uncorrectable and not as Advisory: I/O Write Request, Memory Write Request, or non-vendor-defined Message with data that target a Control structure. Since it is not possible for the Controller to determine if the target is a Control or a non-Control structure, the Controller implements this bit for the user to determine the required handling. 1: Poisoned TLP of type IOWr, MemWr, MsgD will be handled as Advisory Non-Fatal Error. 0: Poisoned TLP of type IOWr, MemWr, MsgD will be handled as Uncorrectable Error. Note: Poisoned CpID will always be reported as Advisory Non-Fatal and is not controlled by this register setting.
9	MSIPIMS	R/W	0h	If the Client wishes to use the MSI_PENDING_STATUS_IN Signal to Update the MSI pending Bits register, this bit needs to be set to 1. Otherwise the Pending Bits register is updated via the APB Interface
8	ENG4REV05	R/W	0h	When operating in Gen4 16GT/s , This Enables Gen4 Spec Revision 0.5 EIEOS and SKP features. When disabled, the Gen4 1.0 features are enabled, by default this bit is ZERO. 1: Enable Gen4 0.5 Features 0: Disable Gen4 0.5 Features [This enabled the Gen4 1.0 Features] .
7-6	BLKALNWIN	R/W	1h	When in the data stream at Gen3 or higher speeds, the pipe_rx_valid is asserted by the PHY. If the block alignment is lost, then the PHY may deassert pipe_rx_valid. Controller reports loss of block alignment if pipe_rx_valid or pipe_rx_data_valid=0 for a period consecutive clock cycles as programmed in this field. 00: 8 CORE_CLK cycles 01: 16 CORE_CLK cycles 10: 64 CORE_CLK cycles 11: 256 CORE_CLK cycles
5	BLKALNCHK	R/W	0h	When in the data stream at Gen3 or higher speeds, the pipe_rx_valid is asserted by the PHY. If the block alignment is lost, then the PHY may deassert pipe_rx_valid. Block Alignment may be lost if the received sync header is invalid. Controller supports detecting loss of block alignment while in a data stream in Gen3. 0: Enable check for loss of Gen3 Block Alignment during data stream. 1: Disable check for loss of Gen3 Block Alignment.

**Table 9-1506. PCIE_CORE_RP_I_DEBUG_MUX_CONTROL_2_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
4	ARICAPMOD	R/W	1h	As per SR IOC specification, ARI Capable Hierarchy bit is only present in the lowest numbered PF of a Device. The Controller has two modes to determine the lowest numbered PF. 0: the first PF which is enabled [PF0] is taken as the lowest numbered PF. 1: the first PF which has a non-zero TOTAL_VF_COUNT field is taken as the lowest numbered PF.[Default Mode]
3	ENLNCHK	R/W	0h	As per PCIe specification, LTSSM should transition to Disabled after any Lanes that are transmitting TS1 Ordered Sets receive two consecutive TS1 Ordered Sets with the Disable Link bit asserted. Similarly, LTSSM should transition to Loopback after all Lanes that are transmitting TS1 Ordered Sets, that are also receiving TS1 Ordered Sets, receive the Loopback bit asserted in two consecutive TS1 Ordered Sets. Controller ignores the Link and Lane Number in the Received TS1s with Loopback/Disable bit set. Setting this bit to 1 turns on the check for link number [assigned by RC in Recovery.Idle] and lane number [PAD in Config.LW.Start or as assigned by RC in Recovery.Idle]. This bit is recommended to be kept at the default value of 0.
2	DISSDSCHK	R/W	0h	As per PCIe specification, When using 128b/130b encoding, next state is PCIE_CORE_RP_L0 if eight consecutive Symbol Times of Idle data are received on all configured Lanes. The Controller checks to ensure that the Idle symbols of data are received in Data Blocks after SDS OS. This check is enabled by default. Setting this bit to 1 turns off this check. This bit is recommended to be kept at the default value of 0.
1	EXTSNP	R/W	0h	This bit can be set if an extra clock cycle is required by the Client Application logic to respond with the Read Data on Configuration Snoop Interface. Please refer to the user guide section on Configuration Snoop Interface for timing diagrams.
0	DLFFS	R/W	0h	As per PIPE 4.2 specification, the LOCALLF, LOCALFS outputs from PHY can be sampled uponf PHYSTATUS pulse after Reset# OR upon the first PHYSTATUS pulse after speed change to GEN3. This bit can be set to 1 to disable sampling after speed change to GEN3 or higher

Table 9-1508. PCIE_CORE_RP_I_PHY_STATUS_1_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	R31	R	0h	Reserved
8	LOSBLKALN	R/W1C	0h	This bit is set if the PHY Loses Block Alignment during data stream. This is detected based upon an unexpected PIPE_RX_VALID input deassertion during data stream. Write a 1 to clear this error.
7	INVSYNHR	R/W1C	0h	This bit is set if an invalid Sync Header is detected. 00 and 11 are Invalid Sync Headers. Write a 1 to clear this error.
6	OSAFSDS	R/W1C	0h	This bit is set if an SDS is received after an SDS. This is a framing error. Write a 1 to clear this error.
5	G3FRERR	R/W1C	0h	This bit is set if a framing error is detected while receiving a TLP in Gen3. Example, if an invalid token is received in a data stream, this error is flagged. Write a 1 to clear this error.

Table 9-1508. PCIE_CORE_RP_I_PHY_STATUS_1_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	OSWOEDS	R/W1C	0h	This bit is set if an Ordered Set Block is received without an EDS. This is a framing error. Write a 1 to clear this error.
3	DATEDS	R/W1C	0h	This bit is set if a Data Block is received after an EDS. Write a 1 to clear this error.
2	ILOSEDS	R/W1C	0h	The Valid OS blocks after an EDS are EIOS, EIEOS and SKP. If any other OS blocks are received after EDS, then it is a framing error and this bit is asserted.
1	OSASKP	R/W1C	0h	This bit indicates that an Ordered Set BLock was received immediately after a SKIP OS. This is a framing error. Write a 1 to clear this field.
0	TLPPHYER	R/W1C	0h	This bit indicates that a PHY Error was detected on the PIPE_RX_STATUS within a TLP. Write a 1 to clear this field.

Table 9-1524. PCIe_CORE_RP_I_PF_3_BAR_CONFIG_1_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ERBC	R/W	0h	Setting this bit to 1 enables the Resizable BAR Capability in the PCI Express Configuration Space of the associated Function. When the Resizable BAR Capability is enabled, the apertures of the memory BARs of the corresponding Function are no longer selected by the fields in this register, but by the setting of the registers in the Resizable BAR Capability Structure.
30-24	R24	R	0h	Reserved
23-16	R16	R	0h	Reserved

Table 9-1524. PCIE_CORE_RP_I_PF_3_BAR_CONFIG_1_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-13	BAR5C	R/W	0h	Specifies the configuration of BAR5. The various encodings are: 000: Disabled 001: 32bit IO BAR 010- 011: Reserved 100: 32bit memory BAR, non prefetchable 101: 32bit memory BAR, prefetchable 110- 111: Reserved
12-8	BAR5A	R/W	5h	Specifies the aperture of the BAR 5 when it is configured as a 32-bit BAR. For 32-bit BAR 5, the valid encodings are: 00000 = 128 B, 00001 = 256 B, 00010 = 512 B, 00011 = 1 KB, 00100 = 2 KB, 00101 = 4 KB, 00110 = 8 KB, 00111 = 16 KB, 01000 = 32 KB, 01001 = 64 KB, 01010 = 128 KB, 01011 = 256 KB, 01100 = 512 KB, 01101 = 1 MB, 01110 = 2 MB, 01111 = 4 MB, 10000 = 8 MB, 10001 = 16 MB, 10010 = 32 MB, 10011 = 64 MB, 10100 = 128 MB, 10101 = 256 MB, 10110 = 512 MB, 10111 = 1 GB, 11000 = 2 GB
7-5	BAR4C	R/W	0h	Specifies the configuration of BAR4. The various encodings are: 000: Disabled 001: 32bit IO BAR 010- 011: Reserved 100: 32bit memory BAR, non prefetchable 101: 32bit memory BAR, prefetchable 110: 64bit memory BAR, non prefetchable 111: 64bit memory BAR, prefetchable

Table 9-1588. PCIE_CORE_RP_LOW_POWER_DEBUG_AND_CONTROL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	L1UPACR	R/W	1h	Setting this field make the state machine to consider LP_CTRL_POWER_RECOVER_ACK as Client system recovery Complete ACK instead of the Controller power stable ACK. This field is ignored if LP_CTRL_BYPASS_ENABLE unset. If this field is set, L 1-substate machines expect that the client system finishes power up of the controller within power_on time in the L 1-substate capability register and Controller will be waiting in recovery state for ACK. This ensure that the PHY PLL lock and client system initialization goes on in parallel. Default value of this register can be set with the define:den_db_LP_DBG_CTRL_RECOVER_ACK_AS_CLIENT_RECOVER_ACK. Setting this field gives the best system performance.

Table 9-1602. PCIe_CORE_RP_I_MARGINING_PARAMETERS_2_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES1	R	0h	Reserved
16-12	MML	R/W	0h	Maximum number of Lanes minus 1 that can be margined at the same time. It is recommended that this value be greater than or equal to the number of Lanes in the Link minus 1. Encoding Behavior is undefined if software attempts to margin more than MMaxLanes+1 at the same time. Note: This value is permitted to exceed the number of Lanes in the Link minus 1.
11-6	MSRT	R/W	0h	The ratio of bits tested to bits received during timing margining. A value of 0 is a ratio of 1:64 [1 bit of every 64 bits received], and a value of 63 is a ratio of 64:64 [all bits received].
5-0	MSRV	R/W	0h	The ratio of bits tested to bits received during voltage margining. A value of 0 is a ratio of 1:64 [1 bit of every 64 bits received], and a value of 63 is a ratio of 64:64 [all bits received].

Bit	Field	Type	Reset	Description
31-29	WAWTC	R/W	4h	When a WriteCommitted command is issued by the Controller, the PHY must respond with a Write_Ack response. The time for which the Controller waits before timing out is controlled by this register. 000: 10us 001: 100us 010: 1ms 011: 2ms 100: 10ms [default] 101: 20ms 110: 100ms 111: No Timeout
28-3	RES	R	0h	Reserved

**Table 9-1604. PCIe_CORE_RP_I_MARGINING_LOCAL_CONTROL_REG Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
2	DMSUSC	R/W	0h	By default, when a Step Margin command is received, the Controller will update Lane Margin status to Margining in Progress when an Error Count update Or a Sample Count update is received from PHY. Set this bit to 1 to not update Lane Margin Status on a Sample Count update from PHY.
1	AMCNG4	R/W	0h	By default, the Controller will process a Margin Command only if it is received while in 16GT/s PCIe_CORE_RP_L0 State. If a Margin Command is received when the link is not in Gen 4-PCIe_CORE_RP_L0 state, then the command will be ignored. If this bit is set, then the Controller accepts and stores a margin command that is received when not in Gen4 PCIe_CORE_RP_L0 state. This command will be processed when the link reaches Gen4 PCIe_CORE_RP_L0 state.
0	MSR	R/W	0h	This bit can be used to reset the Margining internal registers and Margining state machines in the Controller. When asserted: [i] The State machines will be reset to their default values. [ii] All internal FIFOs will be cleared. [iii] All the P2M and M2P registers will be reset. [iv] This does not reset the Margining Configuration and Management Registers. Margining Status register will show the last recorded status. This bit will automatically self-clear after 32-CORE_CLK cycles.

9.5.212 PCIE_CORE_RP_I_MARGINING_ERROR_STATUS1_REG Register (Offset = 00100CDCh) [reset = 0h]

10	R10	R	0h	Reserved
9	PTMCNTAINV	R/W1C	0h	<p>This status bit indicates that the Controller automatically invalidated PTM Context because of PCIe Link exit from PCIE_CORE_RP_L0 State.</p>
8	NFTSTOS	R/W1C	0h	<p>This status bit indicates that a NFTS Timeout occurred.</p> <p>This could occur if the PHY failed to achieve lock on the receive data before the NFTS Timeout during Rx_L0s.FTS state.</p> <p>Local Firmware should consider increasing the advertized NFTS values if this event occurs.</p>
7	UPRR	R/W1C	0h	<p>This bit indicates that the Controller received an unexpected PHY Response for Lane Margining.</p> <p>Unexpected PHY Response is detected by Controller if PHY writes to the Margin Status or the Margin NAK bits of the MAC RX Margin Status 0 Register when no change in Start Margin or Margin Offset issued by Controller or after the Write Ack Wait Timeou.</p>
6	WAWTE	R/W1C	0h	<p>This bit indicates that the Controller detected a 10ms timeout while waiting for Write Ack Lane Margining response from a PHY.</p> <p>The lane on which this timeout was detected is captured in bits 17:14 of the margining_error_status2_reg register.</p>

**Table 9-1610. PCIE_CORE_RP_I_LOCAL_ERROR_STATUS_2_REGISTER Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
5	IPHYMCR	R/W1C	0h	This bit validates the 8-bit command stored in bits [7:0] and the Lane Number stored in bits [11:8] of the margining_error_status1_reg register. This bit is set upon receiving the first Error. Local firmware must clear this bit by writing a 1 to this bit before another error can be logged.
4	ISWMCR	R/W1C	0h	This bit validates the 16-bit command stored in bits [15:0] and the Lane Number stored in bits [19:16] of the margining_error_status1_reg register. This bit is set upon receiving the first Error. Local firmware must clear this bit by writing a 1 to this bit before another error can be logged.
3	MSIXMSKSETST	R/W1C	0h	This status bit indicates that the MSIX Function Mask of any function, PF or VF, was programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Note that this is a Read Only Status bit. The MSIX Function Mask Clear status per-function is captured in the msix_function_mask_set_status_register. Firmware has to clear the per-function bits in msix_function_mask_set_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.
2	MSIXMSKCLST	R/W1C	0h	This status bit indicates that the MSIX Function Mask of any function, PF or VF, was programmed or configured from 1 to 0 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Note that this is a Read Only Status bit. The MSIX Function Mask Clear status per-function is captured in the msix_function_mask_cleared_status_register. Firmware has to clear the per-function bits in msix_function_mask_cleared_status_register in order to clear this status bit and to deassert LOCAL_INTERRUPT.

This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
3	PF3MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF3 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
2	PF2MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF2 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.
1	PF1MSIXMSKCLST	R/W1C	0h	Each PF has a 1-bit MSIX Function Mask. This status bit is set when the PF1 MSIX Function Mask is programmed or configured from 0 to 1 by Local Firmware Or Host SW. This bit is set only when the MSIX Function Mask Change Enhanced Interrupt Enable bit is set by the User in debug_mux_control_2_reg. When this status bit is set, the Controller asserts LOCAL_INTERRUPT if not masked in local_intrpt_mask_2_reg . Firmware has to clear this bit in order to deassert LOCAL_INTERRUPT.

DATA																															
R/W-0h																															

LEGEND: R/W = Read/Write; -n = value after reset

Table 9-2992. PCIE_CORE_RP_ADDR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DATA	R/W	0h	Bits [63:32] of AXI Address Register for BAR N

9.5.906 PCIe_CORE_RP_ADDR0 Register (Offset = 00400B58h) [reset = 0h]

PCIE_CORE_RP_ADDR0 is shown in [Figure 9-1295](#) and described in [Table 9-2994](#).

Return to [Summary Table](#).

N/A

Table 9-2993. PCIe_CORE_RP_ADDR0 Instances

Instance	Physical Address
PCIE0_CORE_DBN_CFG_PCIE_CORE	0D40 0B58h
