Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	X	
24	CONFIG_ENABLE	R/W	1h	<p>When this bit is set to 0 in the EP mode, the Controller will generate a CRS Completion in response to Configuration Requests.</p> <p>When this bit is set to 1 in the EP mode, the Controller will generate SC/UR Completion in response to Configuration Requests based on the target function.</p> <p>In systems where the Controller configuration registers are loaded from RAM on power-up, this prevents the Controller from responding to Configuration Requests before all the registers are loaded.</p> <p>This bit is unused in RP Mode.</p> <p>The default value of this bit will be 1 in EP mode and 0 in RP mode</p>

Table 9-3623. PCIE_USER_INITCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-22	VC_COUNT	R/W	3h	Number of VCs configured. 00 = 1 VC 01 = 2 VCs, 10 = 3 VCs, 11 = 4 VCs, .. and so on
21-15	MAX_EVAL_ITERATION	R/W	8h	Denotes the maximum number of iterations to be performed during the DirectionChange Feedback Link Equalization in case the direction change feedback does not converge to 00. Supported values are 8-63. Recommended Value is from 8-16 to avoid the 24ms timeout as defined in PCIe spec.
14	BYPASS_PHASE23	R/W	0h	This MMR should be programmed during system boot or initialization. This is used only in Root Port Mode of the PCIe Core. If BYPASS_PHASE23== 1: * Phase 2 AND Phase 3 of Link Equalization are bypassed during link equalization If BYPASS_PHASE23== 0: * Phase 2 AND Phase 3 of Link Equalization are performed during link equalization
13	BYPASS_REMOTE_TX_EQUALIZATION	R/W	0h	This MMR should be programmed during system boot or initialization. IF BYPASS_REMOTE_TX_EQUALIZATION== 1: * In End-Point mode, Phase 2 of link equalization is bypassed * In Root-Port mode, Phase 3 of link equalization is bypassed IF BYPASS_REMOTE_TX_EQUALIZATION== 0: * Remote TX Equalization is performed during link equalization
12-2	SUPPORTED_PRESET	R/W	7FFh	This MMR should be programmed during system boot or initialization. SUPPORTED_PRESET[i]=1. Indicates Preset #i supported by PHY. SUPPORTED_PRESET[i]=0. Indicates Preset #i is not supported by PHY. * For Full Swing, all presets [P0 - P10] must be supported. * For Reduced Swing, [P4, P1, P9, P5, P6, P3] must be supported, others are optional as per PCIe spec.

Table 9-3623. PCIE_USER_INITCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DISABLE_GEN3_DC_BALANCE	R/W	0h	<p>This bit it is used to disable the transmission of special DC Balance symbols in TS1 training sequences for improving the DC balance of the bit stream at 8.0 GT/s or higher speed.</p> <p>This feature was introduced in the 0.71 version of the Gen3 spec. Setting this input to 1 disables the transmission of the special DC Balance symbols by the Controller.</p> <p>Note that the Controller can decode received training sequences with the special DC balance symbols in them correctly regardless of the setting of this input.</p>
0	SRIS_ENABLE	R/W	1h	<p>Should be set as per the System Reference Clocking Implementation.</p> <p>0 = Separate Tx and Rx Reference Clocks with No Spread Spectrum Clocking - SRNS Mode</p> <p>1 = Separate Tx and Rx Reference Clocks with Spread Spectrum Clocking - SRIS Mode.</p> <p>This is the default setting.</p> <p>Note that the common Refclk architecture utilizes the same Refclk for Tx and Rx and so does not introduce any difference between the Tx and Rx Refclk rates.</p> <p>SRIS_ENABLE should be tied to 0 in this case also.</p>

10 USB Registers

Note

Details on the USB controller registers are not provided in this TRM. The existing Linux or RTOS drivers should be used for proper USB operation. For those who do wish to substantially modify the existing Linux or RTOS USB driver(s), or create new drivers, contact TI for more information on how to obtain the third-party documentation under NDA.

10.1 USB_ECC_AGGR_CFG Registers

Table 10-2 lists the memory-mapped registers for the USB_ECC_AGGR_CFG registers. All register offset addresses not listed in Table 10-2 should be considered as reserved locations and the register contents should not be modified.

Table 10-1. USB_ECC_AGGR_CFG Instances

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 10-65. USB3P0SS_W1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	Reserved
19	USB2_ONLY_MODE	R/W	0h	Selects USB2 only mode. Has to be written before setting PWRUP_RST_N bit. This bit has to be set when SERDES is not assigned to this USB instance. For example, when the Wiz is configured to allocate the serdes lanes for another function, like PCIe. Without setting this bit in those cases, the Controller will not function even at USB2 speeds, or may be erratic.
18-17	MODESTRAP	R/W	0h	Modestrap input to the Controller. Has to be written before setting PWRUP_RST_N bit. 00 - Controller not configured as Host or Device, 01 - Controller is initially configured as Host, 10 - Controller is initially configured as Device.
16	OVERCURRENT_N	R/W	1h	Overcurrent indicator to the controller. Software writes 0 when overcurrent was detected by external circuitry.
15-10	RESERVED	R	0h	Reserved
9	MODESTRAP_SEL	R/W	0h	This bit has to be always set to 1. Has to be written before setting PWRUP_RST_N bit.

Table 10-65. USB3P0SS_W1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	OVERCURRENT_SEL	R/W	0h	Overcurrent select. Has to be written before setting PWRUP_RST_N bit. 0 - OVERCURRENT_N bit in not functional 1 - OVERCURRENT_N bit can be used
7-1	RESERVED	R	0h	Reserved
0	PWRUP_RST_N	R/W	0h	Power up reset for the controller. This bit has to be set in order to release controller from reset.

10.4.3 USB3P0SS_STATIC_CONFIG Register (Offset = 8h) [reset = 80h]

USB3P0SS_STATIC_CONFIG is shown in [Figure 10-30](#) and described in [Table 10-67](#).

Return to [Summary Table](#).

Wrapper register containing static settings. All bits in this register have to be written before setting PWRUP_RST_N bit in USB3P0SS_W1 register.

0	DEV_WAKEUP	R/W	0h	Set this bit to trigger device wakeup interrupt on IRQ[7]

11 2-L SerDes Registers

Table 11-2 lists the memory-mapped registers for the SERDES_16G registers. All register offset addresses not listed in Table 11-2 should be considered as reserved locations and the register contents should not be modified.

This is the register region for the SERDES_16G component. WIZ registers are overlaid and placed in the 0x400-0x7FF range.

Table 11-1. SERDES_16G Instances

Instance	Base Address
SERDES_16G0	0500 0000h
SERDES_16G1	0501 0000h
SERDES_16G2	0502 0000h
SERDES_16G3	0503 0000h

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	CMN_PLLLC_FBDIVINT_PREG	R/W	32h	This value sets the mode dependent PLLCMNLC fbdivint value.
15-14	RESERVED	R/W	X	
13	CMN_PLLLC_LOCKED_OVRD_EN_PREG	R/W	0h	PLLCMNLC locked active high override enable: Note this register is for diagnostic purposes only.
12	CMN_PLLLC_LOCKED_OVRD_PREG	R/W	0h	PLLCMNLC locked signal force: When cmn_plllic_locked_ovrd_en_preg is asserted high, this value overrides lock flag from PLLCMNLC. Note this register is for diagnostic purposes only.
11-10	RESERVED	R/W	X	
9	CMN_PLLLC_PLL_REG_ISO_OVRD_EN_PREG	R/W	0h	PLLCMNLC regulator isolation active high override enable Note this register is for diagnostic purposes only.

Table 11-47. CMN_PLLLC_FBDIV_INT_PREG__CMN_PLLLC_GEN_PREG Register Field Descriptions
(continued)

Bit	Field	Type	Reset	Description
8	CMN_PLLLC_PLL_REG_ISO_OVRD_PREG	R/W	0h	When cmn_pll_reg_iso_ovrd_en_preg is asserted high, overrides the state dependent PLLCMNLC regulator isolation value. Note this register is for diagnostic purposes only.
7	CMN_PLLLC_LOCK_HOLD_OVRD_EN_PREG	R/W	0h	Lock detection hold function active high override enable. Note this register is for diagnostic purposes only.
6	CMN_PLLLC_LOCK_HOLD_OVRD_PREG	R/W	0h	When cmn_pll_lock_hold_ovrd_en_preg is asserted high, overrides the state dependent lock detect function value. Note this register is for diagnostic purposes only.
5	CMN_PLLLC_PLL_EN_OVRD_EN_PREG	R/W	0h	PLLCMNLC enable active high override enable. Note this register is for diagnostic purposes only.
4	CMN_PLLLC_PLL_EN_OVRD_PREG	R/W	0h	When cmn_pll_en_ovrd_en_preg is asserted high, overrides the state dependent PLLCMNLC enable value. Note this register is for diagnostic purposes only.
3	CMN_PLLLC_PLL_RESET_N_OVRD_EN_PREG	R/W	0h	PLLCMNLC active high reset override enable. Note this register is for diagnostic purposes only.
2	CMN_PLLLC_PLL_RESET_N_OVRD_PREG	R/W	0h	When cmn_pll_reset_n_ovrd_en_preg is asserted high, overrides the state dependent PLLCMNLC active low reset value. Note this register is for diagnostic purposes only.
1	CMN_PLLLC_PFDCLK1_SEL_PREG	R/W	0h	When asserted the pfdclk1 is used as the reference clock, When deasserted, pfdclk is used.
0	RESERVED	R/W	X

Table 11-167. CMN_PLLLC1_DCOCAL_CTRL_PREG__CMN_PLLLC1_FBDIV_FRAC_PREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25	CMN_PLLLC1_DCOCAL_START_OVRD_EN_PREG	R/W	0h	DCO calibration start active high override enable.
24	CMN_PLLLC1_DCOCAL_START_OVRD_PREG	R/W	0h	When cmn_pll1c1_dcocal_start_ovrd_en_preg is asserted high, this value overrides the mode dependent DCO calibration start value.
23-22	RESERVED	R/W	X	
21-16	CMN_PLLLC1_DCOCAL_STARTVAL_PREG	R/W	12h	This value sets the DCO calibration startval value. Note: This must be set to a value that is always at least one step size away from the minimum and maximum calibration codes. For example, if the initial step size is 8 (cmn_pll1c1_dcocal_initstep_preg = 3'b011), this value must be at least 6'h08 and less than 6'h37.

Table 11-224. SERDES_RST Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PHY_RESET_N	R/W	0h	The PHY reset : Asserting this signal low will reset all PHY logic for the entire PHY with the exception of the APB registers and TAP controller. Note: Upon de-assertion, all PHY inputs must be driven as described in the PIPE specification for a PIPE reset.
30	PHY_EN_REFCLK	R/W	0h	The PHY reference clock enable: When cmn_refclk_<p/m> is configured as a reference clock output, 1 = glitch-less enable of the reference clock output. 0 = glitch-less turn off reference clock output. Used in L1.x entry/exit protocol. Note: When outputting a derived reference clock from the PLL, it is recommended to drive phy_en_refclk low until the PHY has completed start-up and de-asserted pipe_l*_reset_n for PIPE operation or asserted cmn_ready for Raw SERDES operation.. The clock will not be 'good' until the PHY has completed initial start-up.

Table 11-224. SERDES_RST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	PLL1_REFCLK_SEL	R/W	0h	The PMA common PLL1 reference clock source select - 0 - Selects cmn_refclk1_<m/p> as reference clock source 1 - Selects cmn_refclk1_int as reference clock source. Note: This field is write protected when register field PHY_RESET_N is a '1'.
28	PLL0_REFCLK_SEL	R/W	0h	The PMA common PLL0 reference clock source select - 0 - Selects cmn_refclk_<m/p> as reference clock source 1 - Selects cmn_refclk_int as reference clock source. Note: This field is write protected when register field PHY_RESET_N is a '1'.
27	REFCLK_TERM_DIS	R/W	0h	The PMA common differential reference clock termination disable - enables/disables termination for difference reference clock input (cmn_refclk_<p/m>). Must be set before the de-assertion of apb_preset_n/phy_reset_n. 1 = termination disabled 0 = termination enabled. Note: This field is write protected when register field PHY_RESET_N is a '1'.
26	RESERVED	R/W	X	
25-24	REFCLK_DIG_SEL	R/W	0h	The Reference clock digital source select - Selects the reference clock source for the reference clock used in the PHY and PMA digital logic. 2'b 00 - cmn_refclk_<p/m> 2'b 01 - cmn_refclk_int 2'b 10 - cmn_refclk1_<p/m> 2'b 11 - cmn_refclk1_int. Note: This field is write protected when register field PHY_RESET_N is a '1'.

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	X	
17-16	PSTG_STATE	R	0h	Power State Token Generator FSM state vector.
15-4	RESERVED	R/W	X	
3-0	PSTG_STAGGER_DLY_PREG	R/W	0h	Lane to Lane power state enable/disable stagger time: This specifies the number of cmn_psmclk cycles between each lane recognizing a change in power state. The circuits from lane to lane are thus enabled or disabled in a staggered fashion to control in-rush currents. Note: This value must always be the same for all lanes within the Macro.

Table 11-377. TX_DIAG_SFIFO_TMR__TX_DIAG_SFIFO_CTRL_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R/W	X	
29-24	TX_SFIFO_ALIGN_SETTLE_DEL_PREG	R/W	6h	FIFO alignment settle delay: This field specifies the number of clocks to wait for a prior change to the enqueue pointer to complete before initiating the check phase of the alignment procedure in the sync FIFO. It drives the fifo_align_settle_del pin of the FIFO.
23-22	RESERVED	R/W	X	
21-16	TX_SFIFO_ALIGN_DETECT_DEL_PREG	R/W	Ch	FIFO alignment detect delay: This field specifies the number of clocks to wait in the delay state for each phase of the alignment procedure in the sync FIFO. It drives the fifo_align_detect_del pin of the FIFO.
15-8	RESERVED	R/W	X	
7	TX_SFIFO_SYNC_REG_MODE_EN_PREG	R/W	0h	1'b 0 : Normal FIFO operation. 1'b 1 : Sync reg mode, where the FIFO is implemented as a single register clocked by the enq_clk.

Table 11-377. TX_DIAG_SFIFO_TMR_TX_DIAG_SFIFO_CTRL_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	TX_SFIFO_ERROR_STICKY_BIT	R	0h	Sticky FIFO alignment error: This bit asserts anytime fifo_error (bit3 below) is asserted and remains set until fifo_error_sticky_bit_clr_preg is written high or the link is reset. Note: When this is observed asserted, it is recommended to clear this bit first and then read again as it may be set during fifo alignment process.
5	TX_SFIFO_ERROR_STICKY_BIT_CLR_PREG	W	0h	Sticky FIFO alignment error clear: Writing this bit high clears the fifo_error_sticky_bit above.
4	TX_SFIFO_ENQ_PTR_BUMP_PREG	R/W	0h	FIFO enqueue pointer bump: This bit can be used to decrement the enqueue pointer relative to the dequeue pointer, for diagnostic purposes. Changing this bit from a value of 1'b0 to 1'b1 will trigger a single decrement of the enqueue pointer.
3	TX_SFIFO_ERROR	R	1h	FIFO alignment error: This bit indicates if a FIFO overflow or FIFO underflow condition currently exists. Note that during the FIFO alignment process, this bit will toggle. This bit is driven directly by the fifo_error pin of the FIFO. Note that this bit is 1'b0 in reset because the FIFO alignment process has not been initiated, and the enqueue and dequeue pointers are set to the same value at this time.
2	TX_SFIFO_ALIGN_ACK	R	0h	FIFO alignment acknowledge: This bit indicates that the FIFO alignment process is complete, as initiated either automatically by the hardware of the FIFO alignment enable override bits in this register. This bit is driven directly by the fifo_align_ack pin of the FIFO.
1	TX_SFIFO_ALIGN_EN_OVERRIDE_PREG	R/W	0h	FIFO alignment enable override enable: This bit enables the FIFO alignment enable override register to drive the fifo_align_en pin of the FIFO directly for diagnostic purposes. 1'b 1: Override enabled 1'b 0: Override disabled
0	TX_SFIFO_ALIGN_EN_OVERRIDE_PREG	R/W	0h	FIFO alignment enable override: When enabled by the FIFO alignment enable override enable bit in this register, this bit directly controls the fifo_align_en pin of the FIFO to provide a means of running the FIFO alignment function for diagnostic purposes.

31-26	RESERVED	R/W	X	

**Table 11-425. LANE_TX_BIST_UDD_PREG__TX_BIST_CONTROLS_PREG_j Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
25-16	TX_UDD_FIFO_WR_DATA	W	0h	Transmit BIST user defined data: Writing a data word to this field will result in that data word being placed in the next available position in the transmitter BIST user defined data FIFO. Note: xcvr_data_width_in_{15:0}=16bit data: Only bits [7:0] used. Two FIFO words consumed per clock period. xcvr_data_width_in_{15:0}=20bit data: All bits used. Two FIFO words consumed per clock period. xcvr_data_width_in_{15:0}=32bit data: Only bits [7:0] used. Four FIFO words consumed per clock period.
15-10	RESERVED	R/W	X	
9	TX_BIST_UDD_WR_CLEAR_PREG	R/W	0h	Transmit BIST User Defined Data (UDD) FIFO write pointer clear: Writing a logic 1 resets the FIFO write pointer to 0. Note it does not clear the content of the user defined data FIFO. Note this register bit must be written back low for BIST operation.
8	TX_BIST_FORCE_ERROR_PREG	W	0h	Transmit BIST force error toggle bit: When written high, the transmit BIST controller will force a single bit error to be transmitted from the BIST logic. Writing it low does not trigger an error. Note due to the nature of this (T)oggle bit, writing the bit is not retained, and there is no requirement to write this bit back low.
7-5	TX_BIST_PRBS_SEED_PREG	R/W	0h	Transmit BIST PRBS seed: When the transmit BIST is in PRBS mode, this field provides a seed for the PRBS LFSR.
4-1	TX_BIST_MODE_PREG	R/W	0h	Transmit BIST mode: Selects which pattern the BIST will generate. Pattern 4'b0000 User Defined Data (UDD) FIFO 4'b0001 - 4'b0111 Reserved 4'b1000 27 order PRBS (Polynomial x^7+x^6+1) 4'b1001 215 bit PRBS (Polynomial $x^{15}+x^{14}+1$) 4'b1010 223 bit PRBS (Polynomial $x^{23}+x^{18}+1$) 4'b1011 231 bit PRBS (Polynomial $x^{31}+x^{28}+1$) 4'b 1100 - 4'b1111 Reserved Note the value must match the corresponding field for the receive BIST controller.
0	TX_BIST_EN_PREG	R/W	0h	Transmit BIST active high enable.

Table 11-533. RX_DEQ_COEF_FIFO_PREG_DEQ_FAST_MAINT_CYCLES_PREG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	X	
27-24	RX_DEQ_COEF_FIFO_OUTDAT	R	0h	Receive data path equalization emulation mode FIFO output data: Current dequeued data from the emulation FIFO. bit [3] - pre cursor increment bit [2] - pre cursor decrement bit [1] - post cursor increment bit [0] - post cursor decrement Note: Not valid when rx_deq_coef_fifo_empty is asserted.
23	RX_DEQ_COEF_FIFO_EMPTY	R	1h	Receive data path equalization emulation mode FIFO empty : Indicates that the FIFO is empty. Note: This signal is valid only when rx_deq_coef_fifo_ovrd_en_preg is asserted.

Table 11-533. RX_DEQ_COEF_FIFO_PREG_DEQ_FAST_MAINT_CYCLES_PREG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	RX_DEQ_COEF_FIFO_OVRD_EN_PREG	R/W	0h	Receive data path equalization emulation mode FIFO output active high enable: Asserting this bit enables emulation data to be dequeued from the FIFO onto the rx_eq_eval interface. Note: This bit should be asserted only after emulation FIFO has been loaded. Note: When current emulation run is complete, i.e. all emulation FIFO contents have been dequeued, and the rx_deq_coef_fifo_empty is asserted, this bit should be deasserted before reloading the emulation FIFO.
21	RX_DEQ_COEF_FIFO_ENQ_CLR	W	0h	Receive data path equalization emulation mode FIFO enqueue pointer clear: Writing a 1 to this toggle bit resets the enqueue pointer to zero.
20	RX_DEQ_COEF_FIFO_ENQ_EN	W	0h	Receive data path equalization emulation mode FIFO enqueue enable : Writing a 1 to this bit will result in the rx_deq_coef_fifo_enq_data_preg field being enqueued into the next FIFO pointer position.
19-16	RX_DEQ_COEF_FIFO_ENQ_DATA	W	0h	Receive data path equalization emulation mode FIFO write data : The emulation data which will be enqueued to the FIFO if rx_deq_coef_fifo_enq_en_preg is written high. The order of the data is bit [3] - pre cursor increment bit [2] - pre cursor decrement bit [1] - post cursor increment bit [0] - post cursor decrement Note: All emulation data should be loaded into the FIFO (maximum of 8 entries) prior to asserting rx_deq_coef_fifo_ovrd_en_preg.
15-8	RESERVED	R/W	X	
7-0	DEQ_FAST_MAINT_CYCLES_PREG	R/W	48h	Receive data path equalization (deq) fast maintenance cycle count: This field determines the number of deq maintenance periods which use the fast_maint_time_preg cycle hold off and associated fast TAU iterations supported out of the deq_tau_ctrl1_fast_maint_preg register. Note: If set to a value of 0, no fast cycles are performed. Slow maintenance begins immediately after acquisition.

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20-16	LFPSFILT_MD_COUNT_PREG	R/W	5h	Minimum pulse distance counter value (MD): Specifies the minimum pulse distance for a valid LFPS sequence. MD usually represents the minimum number of cycles between two rising edges of the same type (i.e., high or low). MD is equal to lfpsfilt_md_count_preg + 2. Note that MD is usually set to a value that is greater than MP, unless it would be desired to ignore MD for debugging purposes. The minimum value for lfpsfilt_md_count_preg is 0 (MD = 2) and the maximum is 31 (MD = 33). A value of 5 thus requires 7 cycles between rising edges.
15-13	RESERVED	R/W	X	
12	LFPSFILT_DISABLE_PULSE_NONE_MD_CHK_PREG	R/W	0h	When asserted the MD check using pulse_none is disabled.

Table 11-809. SMPCAL_INIT_PREG__SMPCAL_CTRL_PREG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	SMPCAL_INIT_WAIT_PREG	R/W	0h	Data path sampler offset calibration initial wait timer. Provides a analog circuit settling period at the initiation of the calibration sequence for both even and odd slicers. Note: This value is in rx_rd_clk clock periods. Note: The delay is smpcal_init_wait_preg + 1 rx_rd_clk periods. Note: The same value is applied to both even and odd slicers.
15	SMPCAL_RUN_PREG	R/W	0h	Data path sampler offset calibration manual start signal. Note: The user must write this bit from low to high to initiate a new calibration sequence.
14	SMPCALMEM_POSOFF_INVERT	R/W	0h	Data path sampler offset calibration positive offset correction inversion. Note: This bit is for diagnostic purposes only.

Table 11-809. SMPCAL_INIT_PREG__SMPCAL_CTRL_PREG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	SMPCAL_NO_ANA_RESP	R	0h	Data path sampler offset calibration no analog response flag. Indicates that the odd slicer calibration function has exhausted the entire offset correction range and concluded with no data greater or equal to 25% ones. Note: This signal is valid when smpcal_odddone is asserted, and cleared when smpcal_run or smpcal_run_preg is asserted.
12	SMPCAL_ERROR	R	0h	Data path sampler offset calibration error flag. This error status bit will be asserted if the captured data is not all zeroes when the even and odd comparators are set to their maximum positive offset correction values. Note: This signal is valid when smpcal_odddone is asserted, and cleared when smpcal_run or smpcal_run_preg is asserted.
11-6	RESERVED	R/W	X	
5-4	SMPCAL_SCALE_PREG	R/W	0h	Data path sampler offset calibration scale register. Setting this register to a non-zero value will reduce the number of offset correction codes by forcing the LSBs to zero. 2'b 00: Max. 8-bit signed correction code 2'b 01: Correction code LSB zeroed out 2'b 10: Correction code 2 LSBs zeroed out 2'b 11: Correction code 3 LSBs zeroed out Note: The smpcal_start_preg value will be right-shift by smpcal_scale_preg to shorten the calibration accordingly. Note: The same value is applied to both even and odd slicers.
3	RESERVED	R/W	X	
2	SMPCAL_DONE_OVR_PREG	R/W	0h	Data path sampler offset calibration done override. When this is asserted, the calibration process will be skipped, and the smpcal_done pulse to the PSM will be asserted.
1	SMPCAL_EN_OVR_PREG	R/W	0h	Data path sampler offset calibration enable active high override enable. When asserted, forces the smpcal_en_ovrval_preg value on rxda_smp_calen.
0	SMPCAL_EN_OVRVAL_PREG	R/W	0h	Data path sampler offset calibration enable active high override value. When smpcal_en_ovr_preg is asserted high, this value drives out on rxda_smp_calen.

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	X	
25-16	SMPCAL_NUM_WORDS_PREG	R/W	100h	Data path sampler offset calibration accumulation period timer. Sets the time period to accumulate measurement data before making a decision about the current offset correction code. Note: This value is delineated in 16-bit or 20 bit words. If 32-bit data mode is selected using xcvr_data_width, this value will be internally halved to correspond to 16-bit words. Note: The same value is applied to both even and odd slicers.
15-10	RESERVED	R/W	X	
9-0	SMPICAL_ITER_WAIT_PREG	R/W	4h	Data path sampler offset calibration iteration wait timer. Provides delay for analog settling between each offset adjustment level change. Note: This value is in rx_rd_clk clock periods. Note: The delay is smpcal_iter_wait_preg + 1 rx_rd_clk periods. Note: The same value is applied to both even and odd slicers.

Table 11-827. DEQ_BMPR_TAU_CTRL2_PREG__DEQ_BMPR_TAU_CTRL1_PREG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13-12	BMPR_TAU_PING_PONG_EN_PREG	R/W	0h	Bumper TAU ping pong enable register. Direction 2'b0x Ping pong mode disabled. The bumper TAU algorithm will always start shifting in the direction set by bmpr_tau_dir_preg. 2'b10 Ping pong alternate mode. If the bumper TAU algorithm does not find any errors that surpass the threshold in both ST_BMPR_TAU_ACCUM_A and ST_BMPR_TAU_ACCUM_B states, the initial direction of the algorithm will swap in the subsequent bumper TAU iteration. 2'b11 Ping pong always mode. The initial direction of the algorithm will always swap in the subsequent bumper TAU iteration.
11-4	RESERVED	R/W	X	
3-0	BMPR_TAU_EPIOFFSET_PREG	R/W	5h	Bumper TAU algorithm 4 bit signed offset for EPI.

Table 11-848. PHY_PIPE_CMN_CTRL2__PHY_PIPE_CMN_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	PHY_PIPE_CMN_CTRL2_15_12	R/W	Bh	USB SuperSpeed Tx LFPS Stretch: Minimum number of data rate clock cycles in which PMA tx_lfps_en signal is asserted for USB SuperSpeed rate. Number of data rate clock cycles must be X 1 PMA RefClk cycle.
27-24	PHY_PIPE_CMN_CTRL2_11_8	R/W	Dh	USB SuperSpeedPlus Tx LFPS Stretch: Minimum number of data rate clock cycles in which PMA tx_lfps_en signal is asserted for USB SuperSpeedPlus rate. Number of data rate clock cycles must be X 1 PMA RefClk cycle.
23	PHY_PIPE_CMN_CTRL2_7	R/W	0h	PCIe PIPE Gen 4 Rx mode: 0 = PCIe Gen4 v0.7 mode, 1 = PCIe Gen4 v0.5 mode. Selects the EIEOS format used for block alignment performed. 0.7 = 0x0000, 0xFFFF, 0x0000, 0xFFFF... 0.5 = 0xFF00, 0xFF00,...
22	PHY_PIPE_CMN_CTRL2_6	R/W	1h	TX electrical idle pre release: When this bit is set, the TX electrical idle release to the PMA is advanced 1 cycle to allow the adjustment of the data path timing

Table 11-848. PHY_PIPE_CMN_CTRL2_PHY_PIPE_CMN_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21	PHY_PIPE_CMN_CTRL2_5	R/W	0h	RX equalizer complete mask: When this bit is cleared, the PHY will return direction change of 0 when PMA indicates evaluation complete. Subsequent evaluation requests would clear the PMA iteration counters. When set high, the PMA equalization complete signal is ignored.
20	PHY_PIPE_CMN_CTRL2_4	R/W	1h	PCIe Gen 1/2 EIOS cycle error mask: When this bit is enabled and the pipe rx interface is outputting a PCIe Gen 1/2 EIOS symbol, decode errors will be masked out.
19	PHY_PIPE_CMN_CTRL2_3	R/W	0h	USB Gen 2 Bit Error Correction Disable: When this bit is high, bit error correction on SKP and SDS symbols is disabled.
18	PHY_PIPE_CMN_CTRL2_2	R/W	0h	USB PIPE3 Compatibility Mode enable: When this bit is set to 1, USB PIPE3 compatibility mode is enabled. In this mode, when operating in nominal empty Elasticity Buffer mode, when the EB buffer goes empty, instead of de-asserting PIPE RxDataValid, a USB SKIP OS is inserted into the data stream. This is the behavior as defined in PIPE version 3. When this bit is low, PIPE RxDataValid is de-asserted when the EB buffer goes empty, as recommended by PIPE version 4.
17	PHY_PIPE_CMN_CTRL2_1	R/W	0h	USB Loopback Slave Error Count disable: When this bit is set to 1, disables the error count for US loopback slave, such that the error count is not inserted into the BCNT OS.
16	PHY_PIPE_CMN_CTRL2_0	R/W	1h	USB Elasticity Buffer Re-align enable: When this bit is set to 1, when Rx for a USB link is initially started, the elasticity buffer is re-aligned to its idle point upon seeing 3 consecutive COMMAAs (i.e. from TS1/TS2s) in the same relative bit position. The purpose of this is to re-align the elasticity buffer (i.e. CTC) after receiving the TSEQ data, which contains no SKIP OSs.
15-13	PHY_PIPE_CMN_CTRL1_15_13	R	0h	Reserved
12	PHY_PIPE_CMN_CTRL1_12	RC	0h	PHY APB access timeout: When set, an APB read/write request to PHY registers failed (i.e. timed out). When set, this bit is cleared upon read.
11	PHY_PIPE_CMN_CTRL1_11	R	0h	Reserved
10	PHY_PIPE_CMN_CTRL1_10	R/W	1h	Comma realign: This field controls the comma alignment state machine to re-align to new bit position without going to loss of sync state for Gen1/2. The requirement of the new bit position should meet the number of COM as per Symbol lock count register definition. When new bit position is identified the comma alignment state machine remains in sync state with the alignment now locked to the new bit position. This field needs to be programmed during the PHY initialization routine before training sequences are received.
9	PHY_PIPE_CMN_CTRL1_9	R/W	0h	Block alignment clear on EIOS Gen4: When this bit is enabled and the Gen 3/4 block alignment sees an EIOS, then the block alignment will automatically reset regardless of signal detect from the PMA.

Table 11-848. PHY_PIPE_CMN_CTRL2__PHY_PIPE_CMN_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PHY_PIPE_CMN_CTRL1_8	R/W	0h	Comma alignment clear on EIOS Gen2: When this bit is enabled and the Gen 1/2 comma alignment sees an EIOS, then the COMMA alignment will automatically reset regardless of signal detect from the PMA.
7	PHY_PIPE_CMN_CTRL1_7	R/W	0h	Block alignment ignore rx_sigdetect Gen4: When this signal is enabled, the PCS receive path block alignment will not clear due to loss of signal detection from the PMA in Gen 3/4 mode.
6	PHY_PIPE_CMN_CTRL1_6	R/W	0h	Comma alignment ignore rx_sigdetect Gen2: When this signal is enabled, the PCS receive path COMMA alignment will not clear due to loss of signal detection from the PMA in Gen 1/2 mode.
5-4	PHY_PIPE_CMN_CTRL1_5_4	R/W	0h	RX signal detect delay: Controls how much delay to add to the PMA signal detect to delay when the bit alignment blocks should be reset after losing signal.
3-0	PHY_PIPE_CMN_CTRL1_3_0	R	0h	Reserved

Table 11-857. PHY_PIPE_RX_ELEC_IDLE_DLY__PHY_PIPE_RCV_DET_INH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	PHY_PIPE_RX_ELEC_IDLE_DLY_15_10	R/W	Fh	L1.x exit Rx electrical idle force fast count: Counter load value to hold PIPE Rx Electrical Idle high upon exit from L1.x. Counter is loaded and starts counting down after phy_l*_rx_elec_idle_det_en is asserted high. Default is 500 nsec. This counter runs on cmn_refclk_gated PMA output and accounts for time to power on just the analog Rx signal detect block.
25-16	PHY_PIPE_RX_ELEC_IDLE_DLY_9_0	R/W	96h	L1.x exit Rx electrical idle force full count: Counter load value to hold PIPE Rx Electrical Idle high upon exit from L1.x when the PMA common was powered down. Counter is loaded and starts counting down upon de-assertion of PMA cmn_ref_clk_disable (triggered by de-assertion of phy_l*_ent_l1_x for first link to signal exit from L1.x). Default is 6 usec. This counter accounts for time to power on the bias and decap and only takes effect if the PMA had been suspended.

19	PHY_AUTO_CFG_CTRL_3	R	0h	Auto-configuration complete: 1 = auto-configuration is complete, 0 = not complete. This bit is only functional when PHY is configured to include the auto-configuration logic. Otherwise, this bit is reserved

Table 11-866. PHY_AUTO_CFG_CTRL_PHY_PLL_CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	PHY_AUTO_CFG_CTRL_2	R/W	0h	Auto-configuration stall: 1 = .upon completion of PHY auto-configuration, release (de-assertion) of cmn_reset_n to the PMA is prevented until this bit is cleared. This allows registers to be written after auto-configuration has completed as indicated by bit [3]. 0 = reset to PMA is released. Do not set high is bit [0] = 1. This bit is only functional when PHY is configured to include the auto-configuration logic. Otherwise, this bit is reserved.
17	PHY_AUTO_CFG_CTRL_1	R	0h	Reserved
16	PHY_AUTO_CFG_CTRL_0	R/W	0h	Auto-configuration disable: 1 = disables the PHY auto-configuration logic, such that register writes are not performed. 0 = normal operatoin of PHY auto-configuration logic. This bit is only functional when PHY is configured to include the auto-configuration logic. Otherwise, this bit is reserved
15-10	PHY_PLL_CFG_15_10	R	0h	Reserved
9	PHY_PLL_CFG_9	R/W	0h	RefClk1 disable override: When set to 1, overrides asserting cmn_refclk1_disable to the PMA high when the PMA is suspended (i.e. all links in low power state). 0 = normal operation.
8	PHY_PLL_CFG_8	R/W	0h	RefClk disable override: When set to 1, overrides asserting cmn_refclk_disable to the PMA high when the PMA is suspended (i.e. all links in low power state). 0 = normal operation.
7-4	PHY_PLL_CFG_7_4	R/W	1h	Dual port mode port 1 lane number: When configured for dual port mode, this field selects the master lane for port/link 1. (The master lane for port/link 0 is fixed to be lane 0.) Only valid with bit [2] is set.
3	PHY_PLL_CFG_3	R	0h	Reserved
2	PHY_PLL_CFG_2	R/W	0h	Dual port mode enable: 1 = PHY configured for dual port mode. 0 = PHY configured for normal operation (i.e. non-dual port mode).
1	PHY_PLL_CFG_1	R/W	0h	PLL LC only: 0 = PHY configured to only use PLL LC. PLL LC1 disabled. 1 = PHY configured to use both PLL LC and LC1.
0	PHY_PLL_CFG_0	R/W	1h	Single link PCIe configuration: 1 = PHY configured such that there is only 1 PCIe link (1xN). All other links are not PCIe and do not use PLL LC. 0 = All other PHY configurations. Static configuration. Can only be changed while PHY is in reset.

Table 11-974. PHY_PMA_ISO_DATA_HI__PHY_PMA_ISO_DATA_LO_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PHY_PMA_ISO_DATA_HI_15_0	R	0h	Current value of rx_rd[31:16] PMA output for the current lane. (Not re-synchronized to apb_pclk). This register can be written and the value will drive tx_td[31:16] for the associated lane when in PMA isolation mode.
15-0	PHY_PMA_ISO_DATA_LO_15_0	R	0h	Current value of rx_rd[15:0] PMA output for the current lane. (Not re-synchronized to apb_pclk). This register can be written and the value will drive tx_td[15:0] for the associated lane when in PMA isolation mode.

Table 12-2 lists the memory-mapped registers for the SERDES_10G registers. All register offset addresses not listed in Table 12-2 should be considered as reserved locations and the register contents should not be modified.

The WIZ registers are overlayed starting at offset 0x400.

Table 12-31. CMN_SSM_BANDGAP_TMR_CMN_SSM_SM_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	CMN_SSM_BANDGAP_TMR_15_5	R	0h	Reserved
20-16	CMN_SSM_BANDGAP_TMR_4_0	R/W	1h	Bandgap enable state timer value : Value used for the timer when the startup state machine is in the bandgap enable state. This timer delay is specified as the number of reference clocks to count. This value creates a delay of 40 nSec. Note, when exiting common suspend mode, a total of 1000 nSec is required for the bandgap to be enabled. This total delay is what is ultimately used to determine what the delay needs to be in the bandgap enable state. Of this total time, 960 nSec of this time is accounted for in the suspend recovery state. The remainder is accounted for here.
15-8	CMN_SSM_SM_CTRL_15_8	R	0h	Reserved
7	CMN_SSM_SM_CTRL_7	R/W	0h	Bandgap enable override enable : When active (1'b1), the bandgap enable override bit in this register will drive the ssmda_bandgap_en pin from the SSM directly.

Table 12-31. CMN_SSM_BANDGAP_TMR__CMN_SSM_SM_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	CMN_SSM_SM_CTRL_6	R/W	0h	Bandgap enable override : When enabled by the bandgap enable override enable bit in this register, this bit will drive the ssmda_bandgap_en pin from the SSM directly. Note: The bandgap enable hold enable bit in the Startup state machine user defined control register on page 69 must also be set to 1'b0 in order for this register to function correctly.
5	CMN_SSM_SM_CTRL_5	R/W	0h	Bias enable override enable : When active (1'b1), the bias enable override bit in this register will drive the ssmda_bias_en pin from the SSM directly.
4	CMN_SSM_SM_CTRL_4	R/W	0h	Bias enable override : When enabled by the bias enable override enable bit in this register, this bit will drive the ssmda_bias_en pin from the SSM directly.
3-2	CMN_SSM_SM_CTRL_3_2	R	0h	Reserved
1	CMN_SSM_SM_CTRL_1	R/W	1h	Skip post bandgap enable re-calibration : When this bit is active (1'b1), the post bandgap enable calibration state will be skipped if it was previously run, unless the macro is disabled or reset.
0	CMN_SSM_SM_CTRL_0	R/W	1h	Skip auto re-calibration : When this bit is active (1'b1), the auto calibration state will be skipped if it was previously run, unless the macro is disabled or reset.

**Table 12-64. CMN_CDIAG_CDB_PWRI_OVRD__CMN_CDIAG_PWRI_TMR Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
27	CMN_CDIAG_CDB_PWRI_OVRD_11	R/W	0h	Power suspend request override: When enabled, this bit will override the power_suspend_req input of the power island control state machine. Note that, whenever changing the state of this bit, no other CDB register access should be initiated for 1 uSec, to keep the CDB clock off while the power island state change transition is in progress.
26	CMN_CDIAG_CDB_PWRI_OVRD_10	R	0h	Power suspend acknowledge: This is the current state of the power_suspend_ack output from the power island control state machine. Note that this bit will always be set to 1'b1 after the power island is enabled, as a function of the power island controller input override enable bit in this register.
25	CMN_CDIAG_CDB_PWRI_OVRD_9	R/W	0h	Power recover request override: When enabled, this bit will override the power_recover_req input of the power island control state machine. Note that, whenever changing the state of this bit, no other CDB register access should be initiated for 1 uSec, to keep the CDB clock off while the power island state change transition is in progress.
24	CMN_CDIAG_CDB_PWRI_OVRD_8	R	1h	Power recover acknowledge: This is the current state of the power_recover_ack output from the power island control state machine. Note that this bit will always be set to 1'b1 after the power island is enabled, as a function of the power island controller input override enable bit in this register.
23-16	CMN_CDIAG_CDB_PWRI_OVRD_7_0	R/W	24h	Power island controller output override: When enabled, the bits in this field will override the output signals from the power island control state machine. The following are the power island control state machine output signals, and the bits in this field that they are associated with. Bit 7: state_sandh Bit 6: state_ret_save Bit 5: state_ret_restore (active low) Bit 4: power_en_ph_1 Bit 3: power_en_ph_2 Bit 2: power_isolation Bit 1: power_por_reset_n Bit 0: power_rstr_reset_n The default value of the bits in this register are such that the power island is not forced to be switched on when the power island controller output override enable bit in this register is enabled. When using this register to switch this power island on and off, the bits in this field are required to change in a specific order with individual register writes. The writes must happen in the order specified below. 8'b00100100 : Power island is not being forced on 8'b10100100
15-11	CMN_CDIAG_PWRI_TMR_15_11	R	0h	Reserved

**Table 12-64. CMN_CDIAG_CDB_PWRI_OVRD__CMN_CDIAG_PWRI_TMR Register Field Descriptions
(continued)**

Bit	Field	Type	Reset	Description
10-8	CMN_CDIAG_PWRI_TMR_10_8	R/W	1h	Power enable phase 2 timer value: This specifies the number of reference clock cycles the power island control state machines in common will wait in the power phase 2 enable states, in order to allow enough time for the second phase of the switched domain to power up, before deactivating the isolation functions. The default value of this register corresponds to a delay of 40 nSec. Note that a value of 0 in this field is not valid, and will result in a delay of 1 clock cycle.
7-3	CMN_CDIAG_PWRI_TMR_7_3	R	0h	Reserved
2-0	CMN_CDIAG_PWRI_TMR_2_0	R/W	1h	Power enable phase 1 timer value: This specifies the number of reference clock cycles the power island control state machines in common will wait in the power phase 1 enable states, in order to allow enough time for the first phase of the switched domain to power up, before enabling the second phase of the power up. The default value of this register corresponds to a delay of 40 nSec. Note that a value of 0 in this field is not valid, and will result in a delay of 1 clock cycle.

Table 12-88. CMN_CDIAG_REFCLK_DRV0_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15-10	CMN_CDIAG_REFCLK_DRV0_CTRL_15_10	R	0h	Reserved
9-8	CMN_CDIAG_REFCLK_DRV0_CTRL_9_8	R/W	2h	Clock driver drive current tune: Controls the amplitude of the reference clock driver, by controlling the cmnda_ref_clk0_itune signal going to the analog. The following is the encoding of this field. 2'b 00: 300mV pk-pk differential 2'b 01: 350mV pk-pk differential 2'b 10: 400mV pk-pk differential 2'b 11: 450mV pk-pk differential
7	CMN_CDIAG_REFCLK_DRV0_CTRL_7	R	0h	Reserved
6	CMN_CDIAG_REFCLK_DRV0_CTRL_6	R/W	1h	Reference clock driver high Z: When the reference clock driver is disabled, this controls if the driver outputs are high Z or pulled low, by controlling the cmnda_ref_clk0_drv_highz signal going to the analog. 1'b 0: Driver outputs pulled low 1'b 1: Driver outputs high Z

Table 12-88. CMN_CDIAG_REFCLK_DRV0_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	CMN_CDIAG_REFCLK_D RV0_CTRL_5	R/W	0h	Clock driver termination: Enables the termination in the reference clock driver, by controlling the cmnda_ref_clk0_termination signal going to the analog. 1'b 0: Disabled 1'b 1: Enabled
4	CMN_CDIAG_REFCLK_D RV0_CTRL_4	R/W	0h	Clock select: Selects which reference clock that will be driven by the reference clock driver, by controlling the cmnda_ref_clk0_clk_select signal going to the analog. 1'b 0: Received reference clock 1'b 1: Derived reference clock
3	CMN_CDIAG_REFCLK_D RV0_CTRL_3	R/W	0h	Clock gate enable override enable: This bit enables the clock gate enable override bit in this register to override the clock gate of the reference clock driver.
2	CMN_CDIAG_REFCLK_D RV0_CTRL_2	R/W	0h	Clock gate enable override: When enabled by the clock gate enable override enable bit in this register, this bit can be used to directly control the clock gate enable of the reference clock driver by controlling the cmnda_ref_clk0_clk_gate_en signal going to the analog.
1	CMN_CDIAG_REFCLK_D RV0_CTRL_1	R/W	1h	Driver enable override enable: This bit enables the driver enable override bit in this register to override the enable of the reference clock driver. Note that this driver must not be enabled when a reference clock signal is being driven to the reference clock 0 bumps.
0	CMN_CDIAG_REFCLK_D RV0_CTRL_0	R/W	0h	Driver enable override: When enabled by the driver enable override enable bit in this register, this bit can be used to directly control the enable of the reference clock driver by controlling the cmnda_ref_clk0_drv_en signal going to the analog. Note that this driver must not be enabled when a reference clock signal is being driven to the reference clock 0 bumps.

Bit	Field	Type	Reset	Description
31	CMN_BGCAL_OVRD_15	R/W	0h	Bandgap code override enable: Activation (1'b1) of this register bit allows the bandgap codes determined during the automatic calibration process to be overridden. The override value is specified using the bandgap code override value field of this register. Note: The value of this field must not be changed while the calibration function is running.
30	CMN_BGCAL_OVRD_14	R/W	0h	Analog calibration enable override: Activation (1'b1) of this register bit will force the analog calibration circuits to be enabled by activating the cmnda_bias_bgcal_en enable. Note: The value of this field must not be changed while the calibration function is running.
29-22	CMN_BGCAL_OVRD_13_6	R	0h	Reserved

Table 12-97. CMN_BGCAL_OVRD__CMN_BGCAL_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-16	CMN_BGCAL_OVRD_5_0	R/W	0h	<p>Bandgap code override value: These bits are used to override the bandgap code determined during the automatic calibration process. The code written to these bits is valid when the bandgap code override enable bit in this register is active.</p> <p>The codes in this field correspond to those described in the bandgap calibration code field in the Bandgap calibration control register on page 91.</p> <p>Note: The value of this field must not be changed while the calibration function is running.</p>
15	CMN_BGCAL_CTRL_15	R/W	0h	<p>Start bandgap calibration: Activating (1'b1) this bit will start the bandgap calibration process.</p> <p>This signal must remain active until the calibration process is complete.</p> <p>To start another calibration process, this register must first be set inactive (1'b0) until the bandgap calibration process done bit in this register is cleared.</p> <p>Note: This bit is intended to be for diagnostics purposes only.</p> <p>This calibration process is automatically activated internally by the startup state machine.</p> <p>When using this bit, the user must wait until after the internally activated process completes.</p>
14	CMN_BGCAL_CTRL_14	R	0h	<p>Bandgap calibration process done: This bit will be set to 1'b1 when the bandgap calibration process is complete.</p> <p>It will be cleared by cmn_reset_n, or by the deactivation of the start bandgap calibration bit in this register after calibration is complete.</p> <p>Note: This bit is intended to be for diagnostics purposes only.</p> <p>Note: This bit is not likely to be observed as being set after internal automatic calibration is complete, because the internally generated run signal will be driven inactive immediately after the done signal is activated, and therefore the internal done signal will be cleared.</p> <p>Note: Three cmn_ref_clk cycles are required after the start of the calibration process to clear this signal.</p>
13	CMN_BGCAL_CTRL_13	R	0h	<p>No analog calibration response : This signal indicates that the calibration function has gone through the entire calibration process, reached the final calibration value, and the analog has not responded indicating that a valid calibration value has been reached.</p> <p>Note: Due to the nature of the calibration process, it is not possible to determine if the analog responded or not for the lowest code of 5'b10001.</p> <p>The reason for this is, when sequencing to lower codes, the calibration function is looking for the analog response to transition from 1'b1 to 1'b0.</p> <p>If the lowest calibration code is the correct code, the analog will respond with 1'b1, and the algorithm can't sequence to a lower code to look for the transition from 1'b1 to 1'b0.</p> <p>Similarly, if the analog is not responding, it is not possible to sequence to a lower code to detect this.</p> <p>Therefore, even when the calibration function selects this calibration code as valid, this bit will be set.</p>

Table 12-106. CMN_IBCAL_OVRD__CMN_IBCAL_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	CMN_IBCAL_CTRL_13	R	0h	<p>No analog calibration response : This signal indicates that the calibration function has gone through the entire calibration process, reached the final calibration value, and the analog has not responded indicating that a valid calibration value has been reached. Note: Due to the nature of the calibration process, it is not possible to determine if the analog responded or not for the lowest code of 7'b000000.</p> <p>The reason for this is, when sequencing to lower codes, the calibration function is looking for the analog response to transition from 1'b1 to 1'b0.</p> <p>If the lowest calibration code is the correct code, the analog will respond with 1'b1, and the algorithm can't sequence to a lower code to look for the transition from 1'b1 to 1'b0.</p> <p>Similarly, if the analog is not responding, it is not possible to sequence to a lower code to detect this.</p> <p>Therefore, even when the calibration function selects this calibration code as valid, this bit will be set.</p>
12	CMN_IBCAL_CTRL_12	R	0h	<p>Current analog comparator response: This is the current state of the analog comparator response signal (cmnda_ibiascal_comp). This signal is not synchronized, and is provided for diagnostic purposes only.</p>
11-7	CMN_IBCAL_CTRL_11_7	R	0h	Reserved
6-0	CMN_IBCAL_CTRL_6_0	R	0h	<p>Calibration code: This is the calibration code that was determined by the calibration process.</p> <p>The following are the values for the code:</p> <p>7'b 0000000: Minimum value.</p> <p>7'b0000001</p> <p>7'b0000010</p> <p>7'b0000011</p> <p>...</p> <p>7'b0111110</p> <p>7'b 0111111: Maximum value.</p> <p>Note that the most significant bit is the calibration code sign bit, and is always 1'b0 in this application.</p> <p>Note: The reset value for this field is with the common calibration power island switched off.</p> <p>In cases where this power island is switched on, the reset value be 7'b0011111.</p>

Bit	Field	Type	Reset	Description
31-28	CMN_PLL1_LOCK_PLLCNT_THR_15_12	R	0h	Reserved
27-16	CMN_PLL1_LOCK_PLLCNT_THR_11_0	R/W	3h	PLL lock counter threshold value : This is the value used by the PLL lock detection logic to determine if the PLL has locked. If the two counters in the PLL lock detection logic differ by less than this value, the PLL is considered locked. For a 100 MHz feedback divider clock, this should be set to 3. For other clock rates, this value should scale proportionally to that ratio.
15-12	CMN_PLL1_LOCK_PLLCNT_START_15_12	R	0h	Reserved
11-0	CMN_PLL1_LOCK_PLLCNT_START_11_0	R/W	C8h	PLL lock PLL counter start value : This is the value that is loaded into the PLL lock detect PLL counter as the starting point for that counter, when checking for PLL lock. When programming this register, it is important to understand how the frequency of the cmnda_pll1_fb_divider_clk is calculated relative to the reference clock. This is described in section 10.4 Dual VCO PLL on page 422.

Bit	Field	Type	Reset	Description
31	CMN_TXPUCAL_OVRD_15	R/W	0h	Resistor code override enable: Activation (1'b1) of this register bit allows the resistor codes determined during the automatic resistor calibration process to be overridden. The override value is specified using the resistor code override value field of this register.
30	CMN_TXPUCAL_OVRD_14	R/W	0h	Analog calibration enable override: Activation (1'b1) of this register bit will force the analog calibration circuits to be enabled by activating the cmnda_rescal_en_tx_useg enable and the cmnda_rescal_clk_tx_useg clock.
29-23	CMN_TXPUCAL_OVRD_13_7	R	0h	Reserved

Table 12-211. CMN_TXPUCAL_OVRD__CMN_TXPUCAL_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22-16	CMN_TXPUCAL_OVRD_6_0	R/W	0h	<p>Resistor code override value: These bits are used to override the resistor code determined during the automatic resistor calibration process.</p> <p>The resistor code written to these bits is valid when the resistor code override enable bit in this register is active.</p> <p>The following are the values for the code.</p> <p>7'b 0000000: No resistors active.</p> <p>7'b 0000001: 1 resistor active.</p> <p>7'b 0000010: 2 resistors active.</p> <p>7'b 0000011: 3 resistors active.</p> <p>7'b 0000100: 4 resistors active.</p> <p>...</p> <p>7'b 0111100: 60 resistors active.</p> <p>Note that the most significant bit is the calibration code sign bit, and is always 1'b0 in this application.</p>
15	CMN_TXPUCAL_CTRL_15	R/W	0h	<p>Start resistor calibration: Activating (1'b1) this bit will start the resistor calibration process.</p> <p>This signal must remain active until the resistor calibration process is complete.</p> <p>To start another resistor calibration process, this register must first be set inactive (1'b0) until the resistor calibration process done bit in this register is cleared.</p> <p>Note: This signal is intended to be for diagnostics purposes only.</p> <p>This calibration process is automatically activated internally by the startup state machine.</p> <p>When using this bit, the user must wait until after the internally activated process completes.</p>
14	CMN_TXPUCAL_CTRL_14	R	0h	<p>Resistor calibration process done: This bit will be set to 1'b1 when the resistor calibration process is complete.</p> <p>It will be cleared by cmn_reset_n, or by the deactivation of the start resistor calibration bit in this register after calibration is complete.</p> <p>Note: This bit is intended to be for diagnostics purposes only.</p> <p>Note: This bit is not likely to be observed as being set after internal automatic calibration is complete, because the internally generated run signal will be driven inactive immediately after the done signal is activated, and therefore the internal done signal will be cleared.</p> <p>Note: Three cmn_ref_clk cycles are required after the start of the resistor calibration process to clear this signal.</p>

Table 12-211. CMN_TXPUCAL_OVRD__CMN_TXPUCAL_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	CMN_TXPUCAL_CTRL_1_3	R	0h	<p>No analog calibration response : This signal indicates that the calibration function has gone through the entire calibration process, reached the final calibration value, and the analog has not responded indicating that a valid calibration value has been reached. Note: Due to the nature of the calibration process, it is not possible to determine if the analog responded or not for the lowest code of 7'b00000000.</p> <p>The reason for this is, when sequencing to lower codes, the calibration function is looking for the analog response to transition from 1'b1 to 1'b0.</p> <p>If the lowest calibration code is the correct code, the analog will respond with 1'b1, and the algorithm can't sequence to a lower code to look for the transition from 1'b1 to 1'b0.</p> <p>Similarly, if the analog is not responding, it is not possible to sequence to a lower code to detect this.</p> <p>Therefore, even when the calibration function selects this calibration code as valid, this bit will be set.</p>
12	CMN_TXPUCAL_CTRL_1_2	R	0h	<p>Current analog comparator response: This is the current state of the analog comparator response signal (cmnda_rescal_comp_tx_useg). This signal is not synchronized, and is provided for diagnostic purposes only.</p>
11-7	CMN_TXPUCAL_CTRL_1_1_7	R	0h	Reserved
6-0	CMN_TXPUCAL_CTRL_6_0	R	0h	<p>Resistor calibration code: This is the calibration code that was determined by the resistor calibration process.</p> <p>The following are the values for the code.</p> <p>7'b 0000000: No resistors active.</p> <p>7'b 0000001: 1 resistor active.</p> <p>7'b 0000010: 2 resistors active.</p> <p>7'b 0000011: 3 resistors active.</p> <p>7'b 0000100: 4 resistors active.</p> <p>...</p> <p>7'b 0111100: 60 resistors active.</p> <p>Note that the most significant bit is the calibration code sign bit, and is always 1'b0 in this application.</p> <p>Note: The reset value for this field is with the common calibration power island switched off.</p> <p>In cases where this power island is switched on, the reset value be 7'b0101101.</p>

Table 12-283. CMN_PDIAG_PLL1_CLK_SEL_M0__CMN_PDIAG_PLL1_CTRL_M0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CMN_PDIAG_PLL1_CLK_SEL_M0_15	R/W	0h	PLL 1 clock 1 divider enable: This bit enables the divider used to generate the cmnda_pll1_clk_1, from the PLL high speed clock.
30-28	CMN_PDIAG_PLL1_CLK_SEL_M0_14_12	R/W	0h	PLL 1 clock 1 divider select: This field selects the divider value used to generate the cmnda_pll1_clk_1, from the PLL high speed clock, by driving the cmnda_pll1_clk_1_div_sel signal to the analog. The encoding of this signal is as follows. All codes currently result in divide by 16.
27-24	CMN_PDIAG_PLL1_CLK_SEL_M0_11_8	R/W	4h	PLL 1 clock 0 and derived reference clock divider select: This field selects the divider value used to generate the cmnda_pll1_clk_0 and derived reference clock, from the PLL high speed clock, by driving the cmnda_pll1_clk_0_div_sel signal to the analog. The encoding of this signal is as follows. Note that there are different divider values per bit for associated with each clock.

Table 12-283. CMN_PDIAG_PLL1_CLK_SEL_M0__CMN_PDIAG_PLL1_CTRL_M0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23-18	CMN_PDIAG_PLL1_CLK_SEL_M0_7_2	R	0h	Reserved
17-16	CMN_PDIAG_PLL1_CLK_SEL_M0_1_0	R/W	0h	PLL 1 clock select: This field selects one of 3 possible high speed output clocks from PLL 1, to drive on the high speed analog clock 1, by driving the cmnda_pll1_clk_sel signal to the analog. The encoding for this is as follows. 2'b 00: Divide by 1 2'b 01: Divide by 2 2'b 10: Divide by 4 2'b 11: Reserved
15-12	CMN_PDIAG_PLL1_CTRL_M0_15_12	R/W	1h	This field controls the Ring VCO Frequency drift with temperature. It controls the mix of vtref bias and external bias to keep the temperature drift for the ring low, by driving the cmnda_pll1_vco_ring_cmos_sel signal going into the common analog.
11-9	CMN_PDIAG_PLL1_CTRL_M0_11_9	R	0h	Reserved
8	CMN_PDIAG_PLL1_CTRL_M0_8	R/W	0h	PLL VCO select: Selects the VCO mode of operation, by driving the cmnda_pll1_vco_sel signal going into the common analog. 1'b 0: LC tank mode 1'b 1: Ring oscillator mode
7-6	CMN_PDIAG_PLL1_CTRL_M0_7_6	R	0h	Reserved
5	CMN_PDIAG_PLL1_CTRL_M0_5	R/W	0h	PLL feedback divider clock select: This signal selects which internal PLL clock will be used to drive the cmnda_pll1_fb_divider_clk, driving the cmnda_pll1_fb_divider_clk_sel signal going into the common analog. 1'b 0: Feedback divider clock 1'b 1: PLL digital rate clock
4	CMN_PDIAG_PLL1_CTRL_M0_4	R/W	1h	PLL feedback divider pre-scale: controls the feedback divider pre-scale, by driving the cmnda_pll1_div24_sel signal going into the common analog. One should read the description of the PLL in section 10.4 Dual VCO PLL on page 422 for detailed information about the function of this divider control. 1'b 0: Divide by 2 - When using the delta sigma modulator, this setting results in lower noise on the PLL output clock, but higher power. 1'b 1: Divide by 4 - When using the delta sigma modulator, this setting results in higher noise on the PLL output clock, but lower power. This setting is ideal for cases when the delta sigma modulator is not used, because it results in both lower noise and lower power.
3-2	CMN_PDIAG_PLL1_CTRL_M0_3_2	R	0h	Reserved

Table 12-283. CMN_PDIAG_PLL1_CLK_SEL_M0__CMN_PDIAG_PLL1_CTRL_M0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	CMN_PDIAG_PLL1_CTRL_M0_1_0	R/W	2h	<p>PLL PFD reset delay: Controls the minimum reset pulse width for the PFD.</p> <p>This drives the cmnda_pll1_pfd_rst_dly signal going into the common analog.</p> <p>The following lists the reset pulse width values for typical conditions for each of the possible values for this field.</p> <p>2'b 00 : Delay = 257.5 pSec (minimum)</p> <p>2'b 01 : Delay = 337.4 pSec</p> <p>2'b 10 : Delay = 415.2 pSec</p> <p>2'b 11 : Delay = 493.2 pSec (maximum)</p>

Table 12-514. DRV_DIAG_TX_DRV_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15-8	DRV_DIAG_TX_DRV_15_8	R	0h	Reserved
7	DRV_DIAG_TX_DRV_7	R/W	1h	TX boost enable: Increases the transmitter amplitude for fast data transitions, by controlling the txda_drv_boost_en signal going to the analog.
6	DRV_DIAG_TX_DRV_6	R	0h	Reserved
5-4	DRV_DIAG_TX_DRV_5_4	R/W	2h	TX boost tune: Controls the transmitter boost amplitude when the transmitter boost function is enabled using the TX boost enable bit in this register, by controlling the txda_drv_boost_tune signal going to the analog. The following specifies the encoding of this field. 2'b 00: Minimum Boost 2'b 01: 2'b 10: 2'b 11: Maximum Boost
3-2	DRV_DIAG_TX_DRV_3_2	R	0h	Reserved

Table 12-514. DRV_DIAG_TX_DRV_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DRV_DIAG_TX_DRV_1	R/W	1h	TX pre-driver pull up control: When the pre-driver is disabled, this bit controls the state of the pre-driver output, by controlling the txd_drv_predrv_pullup signal going to the analog. 1'b 0 : Pulled low 1'b 1 : Pulled high
0	DRV_DIAG_TX_DRV_0	R/W	1h	TX driver margin type: Selects the margining type the driver will operate in, by controlling the txd_drv_margin_type signal going to the analog. 1'b 0 : Classical margining - High power margining that complies with the driver differential and common-mode output impedance specs. 1'b 1 : Low-Power margining - Low power margining that complies with the driver differential output impedance spec. However, this violates the driver common-mode output impedance spec to save power whenever a reduced swing driver configuration is used. Note that when fast establishment of common mode is active, the analog signal that this drives will be forced to 1'b0.

15-12	TX_PSC_A0_15_12	R	0h	Reserved

Table 12-541. TX_PSC_A1__TX_PSC_A0_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TX_PSC_A0_11	R/W	0h	TX driver common mode enable extend control: Specifies which power states the tx_cm_n_mode_en_ext signal is considered valid in and can be used to force the driver to continue to be in the common mode state.
10	TX_PSC_A0_10	R/W	0h	Force txda_lfps_sel active: Setting this bit forces the txda_lfps_sel signal going to the analog to be driven active. Note that this function is implemented for additional power savings. In the analog, this signal controls a MUX select associated with the driver. Setting this bit to 1'b1 will force the MUX to select the LFPS data path. By selecting this path in low power states, instead of the serializer path, the driver inputs will be driven to 1'b0, instead of having the potential to toggle.
9	TX_PSC_A0_9	R/W	0h	LFPS clock gate enable: Enables the LFPS clock gate when an LFPS clock is required.
8	TX_PSC_A0_8	R/W	0h	Reserved - spare
7	TX_PSC_A0_7	R/W	1h	Transmitter low current mode: Enables a low current consumption mode within the common mode voltage circuit in the driver, via the txda_drv_idle_lowi_en signal going to the analog.
6	TX_PSC_A0_6	R/W	1h	Transmitter mission mode enable: Enables the analog circuits in the driver required to run in mission mode, via the txda_drv_mission_en signal going to the analog.
5	TX_PSC_A0_5	R/W	1h	TX driver common mode enable: Enables the common mode voltage circuits in the driver.
4	TX_PSC_A0_4	R/W	1h	TX driver enable: Enables the transmitter driver, via the H bridge driver controller.
3	TX_PSC_A0_3	R/W	1h	TX post-emphasis enable (C+1): Enables the transmitter circuits related to the post-emphasis function.
2	TX_PSC_A0_2	R/W	1h	TX pre-emphasis enable (C-1): Enables the transmitter circuits related to the pre-emphasis function.
1	TX_PSC_A0_1	R/W	1h	TX pre-driver enable: Enables the transmitter pre-driver, driver data selection MUX, and receiver detect.
0	TX_PSC_A0_0	R/W	1h	TX serializer enable: Enables the serializer and related clock divider circuits.

Table 12-631. RX_SLC_INIT_TMR_RX_SLC_EPM_OVRD_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RX_SLC_INIT_TMR_15_0	R/W	10h	RX sampler latch calibration initialization timer value : This is the value that will be used for the RX sampler latch calibration initialization timer, which controls the time the rxda_sampler_latch_cal_en is held active prior to the individual calibration processes being kicked off. Note that this register should not be set to 16'h0000.
15	RX_SLC_EPM_OVRD_15	R/W	0h	e even latch receiver sampler calibration DAC override enable: When this bit is active (1'b1), the value in the e even latch receiver sampler calibration DAC override value field of this register will override the calibrated value for the e even sampler latch.
14-8	RX_SLC_EPM_OVRD_14_8	R/W	0h	e even latch receiver sampler calibration DAC override value: This field contains the value that can be used to override the calibrated value for the e even sampler latch. Note that the value of this field is a signed magnitude number with a range of 5'b11111 (min) to 5'b01111 (max). A value of 5'b10000 (-0) is not valid.

Table 12-634. RX_SLC_DIAG_CTRL__RX_SLC_RUN_TMR_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RX_SLC_DIAG_CTRL_15	R/W	0h	Diagnostic control enable : This bit enables the selected RX sampler latch calibration data sub module for diagnostic purposes. Note that the diagnostic control override select field must be set to select the desired RX sampler latch calibration data sub module when this bit is set. This bit MUST also be cleared before changing the value of the diagnostic control override select field. Note that when these diagnostic features are used, the user must disable the respective automatic calibration functions in the RX sampler latch calibration disable register on page 238. Due to the way this is implemented, if a given i sampler latch calibration function is being controlled by the diagnostic features here, all of the i sampler calibration functions must be disabled in the RX sampler latch calibration disable register on page 238. The same is required for both the e and q sampler latch calibration functions.
30-23	RX_SLC_DIAG_CTRL_14_7	R	0h	Reserved

Table 12-634. RX_SLC_DIAG_CTRL_RX_SLC_RUN_TMR_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	RX_SLC_DIAG_CTRL_6	R/W	0h	<p>Voter override neg : When enabled using the voter override enable bit in this register, writing a 1'b1 in this register bit will force the voter in the selected RX sampler latch calibration data sub module to activate the voter neg signal for a single clock cycle.</p> <p>Note : This bit must be cleared after each time it is enabled, in order to perform follow on voter override functions with this bit.</p> <p>Note : It is not valid to activate both the voter override neg and voter override pos at the same time.</p>
21	RX_SLC_DIAG_CTRL_5	R/W	0h	<p>Voter override pos : When enabled using the voter override enable bit in this register, writing a 1'b1 in this register bit will force the voter in the selected RX sampler latch calibration data sub module to activate the voter pos signal for a single clock cycle.</p> <p>Note : This bit must be cleared after each time it is enabled, in order to perform follow on voter override functions with this bit.</p> <p>Note : It is not valid to activate both the voter override neg and voter override pos at the same time.</p>
20	RX_SLC_DIAG_CTRL_4	R/W	0h	<p>Voter override enable : Setting this bit to a 1'b1 will enable the voter override function in the selected RX sampler latch calibration data sub module.</p> <p>Note : This function is intended to be for diagnostic and verification purposes only.</p> <p>Note : Both the voter override neg and voter override pos bits in this register must be set to 1'b0 when this bit is initially set to 1'b1 when enabling this function.</p>
19-16	RX_SLC_DIAG_CTRL_3_0	R/W	0h	<p>Diagnostic control override select : Selects the RX sampler latch calibration data sub module to enable for diagnostic and verification purposes.</p> <p>This field also selects which sub module's rx_sampler_latch_cal_diag output port will be routed to the top level rx_sampler_latch_cal_diag output port.</p> <p>The following are the values used to select the required RX sampler latch calibration data sub module.</p> <p>4'b 0000 : i odd positive coefficient.</p> <p>4'b 0001 : q odd positive coefficient.</p> <p>4'b 0010 : e odd positive coefficient.</p> <p>4'b 0011 : Reserved.</p> <p>4'b 0100 : i odd negative coefficient.</p> <p>4'b 0101 : q odd negative coefficient.</p> <p>4'b 0110 : e odd negative coefficient.</p> <p>4'b 0111 : Reserved.</p> <p>4'b 1000 : i even positive coefficient.</p> <p>4'b 1001 : q even positive coefficient.</p> <p>4'b 1010 : e even positive coefficient.</p> <p>4'b 1011 : Reserved.</p> <p>4'b 1100 : i even negative coefficient.</p> <p>4'b 1101 : q even negative coefficient.</p> <p>4'b 1110 : e even negative coefficient.</p> <p>4'b 1111 : Reserved.</p>

Table 12-640. RX_CDRLF_CNFG2__RX_CDRLF_CNFG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RX_CDRLF_CNFG2_15	R	0h	Reserved
30	RX_CDRLF_CNFG2_14	R/W	0h	CDRLF second order loop integrator max clear enable: This signal enables the function in the CDRLF where the second order loop integrator is cleared when it reaches the maximum value.
29	RX_CDRLF_CNFG2_13	R	0h	CDRLF fast phase lock locked detected: This register bit is the current status of the fphl_locked pin on the CDRLF, and indicates the fast phase lock process is complete.
28	RX_CDRLF_CNFG2_12	R/W	0h	CDRLF fast phase lock diagnostic enable: This register bit can control the fphl_start pin on the CDRLF. for diagnostic purposes. If the CDRLF fast phase lock enabled by signal detect bit in this register is enabled, then either signal detect or this bit will activate the fphl_start pin.
27	RX_CDRLF_CNFG2_11	R/W	1h	CDRLF fast phase lock enabled by signal detect: When active, signal detect will control the fphl_start pin on the CDRLF. This will cause fast phase lock to be enabled whenever the macro detects a transition from electrical idle to high speed data.

Table 12-640. RX_CDRLF_CNFG2_RX_CDRLF_CNFG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	RX_CDRLF_CNFG2_10	R/W	0h	CDRLF reset on CDRLF PM Accumulator Max: Activating (1'b1) this bit will force the CDRLF to be reset when the PM accumulator in the CDRLF reaches is maximum absolute value (the largest positive or negative value).
25	RX_CDRLF_CNFG2_9	R/W	1h	CDRLF freeze on electrical idle detect: Activating (1'b1) this bit will force the CDRLF to be freeze in its current state when the receiver signal detect detects an electrical idle. When high speed data is detected, the freeze will be released.
24	RX_CDRLF_CNFG2_8	R/W	0h	CDRLF reset on electrical idle detect: Activating (1'b1) this bit will force the CDRLF to be reset when the receiver signal detect detects an electrical idle. When high speed data is detected, the reset will be released.
23-22	RX_CDRLF_CNFG2_7_6	R	0h	Reserved
21-16	RX_CDRLF_CNFG2_5_0	R/W	33h	CDRLF second order loop integrator threshold : This value is the maximum magnitude the CDRLF second order loop integrator will be allowed to go to. Note that this field must never be set to a value less than 2 (6'b000010).
15	RX_CDRLF_CNFG_15	R/W	0h	CDRLF reset hold: When active (1'b1), the CDRLF will be held in reset beyond the time that it would normally be released by its asynchronous release signals. The CDRLF will be held in reset until this bit is deactivated (1'b0). Note: This signal is intended be for verification purposes only. It should be set to 1'b0 for normal operation.
14-12	RX_CDRLF_CNFG_14_12	R/W	0h	CDRLF diagnostic mode control: This field controls the information driven on the rx_pi_val_ln_{15:0}[7:0] signal, when in diagnostics mode.
11	RX_CDRLF_CNFG_11	R/W	0h	CDRLF second order loop disable: Activating (1'b1) this bit will disable the CDRLF second order loop. Note: This signal is intended be for verification purposes only. It should be set to 1'b0 for normal operation.
10-6	RX_CDRLF_CNFG_10_6	R/W	6h	CDRLF second order loop sigma delta update rate: This is the value that is added to or subtracted from the second order loop accumulator register when the serial data sample clock is detected as being out of phase with the serial data on a given parallel data word cycle. This is part of the CDRLF averaging function.
5	RX_CDRLF_CNFG_5	R/W	0h	CDRLF first order loop disable: Activating (1'b1) this bit will disable the CDRLF first order loop. Note: This signal is intended to be for verification purposes only. It should be set to 1'b0 for normal operation.
4-0	RX_CDRLF_CNFG_4_0	R/W	Ch	CDRLF first order loop sigma delta update rate: This is the value that is added to or subtracted from the first order loop accumulator register when the serial data sample clock is detected as being out of phase with the serial data on a given parallel data word cycle. This is part of the CDRLF averaging function.

Bit	Field	Type	Reset	Description
31-22	RX_SIGDET_LH_DLY_TMR_15_6	R	0h	Reserved
21-16	RX_SIGDET_LH_DLY_TMR_5_0	R/W	0h	Signal detect filter low to high min timer value: This is the value loaded into the min timer in the signal detect low to high filter circuit.
15-6	RX_SIGDET_LH_FILT_TMR_15_6	R	0h	Reserved
5-0	RX_SIGDET_LH_FILT_TMR_5_0	R/W	4h	Signal detect filter low to high filter timer value: This is the value loaded into the filter timer in the signal detect low to high filter circuit. This should be set to 5 less than the number of clocks of desired filter time. This takes into account the synchronizing of the signal to be filtered (4 clocks) and the time to load the filter timer (1 clock). Therefore, the smallest granularity of filtering available here is 5 clocks. This is more of an issue of latency through the filter circuit as the signal initially rises.

Table 12-685. RX_BIST_SYNCCNT__RX_BIST_CTRL_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RX_BIST_SYNCCNT_15_0	R/W	0h	Receiver BIST sync count: This field controls the value of the RX BIST sync count. The sync count indicates the number of consecutive received data words with no BIST bit errors that must be received in order for the RX BIST module to be considered synced to the input data stream. It is recommended that, when using a clean channel, this register be set to 16'h00FA. This will require the RX BIST to receive 250 consecutive words of data to confirm a BIST sync, which is enough time to allow the CDRLF to lock.
15-12	RX_BIST_CTRL_15_12	R	0h	Reserved

Table 12-685. RX_BIST_SYNCCNT__RX_BIST_CTRL_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11-8	RX_BIST_CTRL_11_8	R/W	0h	Receiver BIST mode: Controls which mode the BIST will operate in. The value of this field must match the corresponding field for the receive BIST controller. The following are the values used for this field, and what BIST mode they correspond to. 4'b 0000 : User defined data FIFO 4'b 0001 - 4'b 0111 : Reserved 4'b 1000 : PRBS7 : 7 bit LFSR 4'b 1001 : PRBS15 : 15 bit LFSR 4'b 1010 : PRBS23 : 23 bit LFSR 4'b 1011 : PRBS31 : 31 bit LFSR 4'b 1100 - 4'b 1111 : Reserved
7-5	RX_BIST_CTRL_7_5	R	0h	Reserved
4	RX_BIST_CTRL_4	R/W	0h	Receiver BIST error reset: Writing this bit is set to a 1'b1 will hold the error indicators in the receive BIST logic in reset. When this signal goes active, the rx_bist_status pin, rx_bist_err_toggle pin, and receive BIST error count field in this register will be cleared. When this bit is cleared, these error indicators will be released from reset and operate normally.
3-2	RX_BIST_CTRL_3_2	R	0h	Reserved
1	RX_BIST_CTRL_1	W	0h	Receiver BIST user defined data FIFO clear: Writing a 1'b1 to this bit will clear the receiver BIST user defined data FIFO. Note : This bit is automatically cleared after it is written to. Note : This clear function simply resets the FIFO pointers. It does not clear the contents of the FIFO.
0	RX_BIST_CTRL_0	R/W	0h	Receiver BIST enable: This bit enables the receiver BIST function. Note : The remaining bits in this register must be stable when changing this bit. Therefore, it is best to enable and disable this function using a read / modify / write of this bit.

W-0h							

LEGEND: R = Read Only; W = Write Only; -n = value after reset

Table 12-688. RX_BIST_ERRCNT__RX_BIST_UDDWR_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RX_BIST_ERRCNT_15_0	R	0h	Receiver BIST error count: Indicates the number of BIST errors that have been observed by the receive BIST logic, since the last time the BIST error indicator logic was reset or restarted. This counter increments up to a maximum value of 16'hFFFF. Note : Due to the nature of the BIST PRBS error detection logic, when a bit error occurs in PRBS mode, two or three errors will be counted.
15-10	RX_BIST_UDDWR_15_10	R	0h	Reserved
9-0	RX_BIST_UDDWR_9_0	W	0h	Receiver BIST user defined data: Writing a data word to this field will result in that data word being placed in the next available position in the receiver BIST user defined data FIFO. Note, when in 20 bit mode, all 10 of these bits are used. When in 16 bit mode, only the least significant 8 bits are used. Note that the FIFO in this implementation is 18 words deep. It is up to the user to not write more than 18 words of data into this FIFO. Exceeding this amount of data will generate unpredictable results.

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15-0	RX_REE_ANAENSM_DE L_TMR_15_0	R/W	64h	Analog enable delay timer value : The number of clock cycles the state machine will wait in the Analog Enable Delay state. The time specified here is the number of clock cycles to wait between when the analog enable signal (ana_en) is initially driven active, until the ana_en_ack signal is driven active. The intention of this timer is to provide for the necessary amount of time between when the analog enable is driven active until when data controlled by the analog enable is considered valid.
