TPS3808 Low-Quiescent-Current, Programmable-Delay Supervisory Circuit

1 Features

- Power-on reset generator with adjustable delay time: 1.25ms to 10s
- Very low quiescent current: 2.4µA typical
- High threshold accuracy: 0.5% typical
- Fixed threshold voltages for standard voltage rails from 0.9V to 5V and adjustable voltage down to 0.4V are available
- Manual reset ($\overline{MR}$) input
- Open-drain $\overline{RESET}$ output
- Temperature range: –40°C to 125°C
- Small SOT-23 and 2mm × 2mm WSON packages

2 Applications

- DSP or microcontroller applications
- Notebook and desktop computers
- PDAs and handheld products
- Portable and battery-powered products
- FPGA and ASIC applications

3 Description

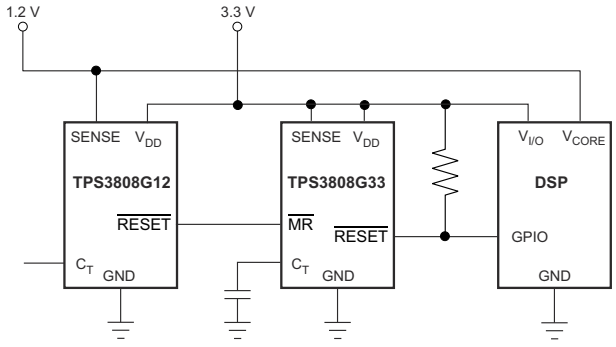

The TPS3808 family of microprocessor supervisory circuits monitors system voltages from 0.4V to 5V, asserting an open-drain $\overline{RESET}$ signal when the SENSE voltage drops below a preset threshold or when the manual reset ($\overline{MR}$) pin drops to a logic low. The $\overline{RESET}$ output remains low for the user-adjustable delay time after the SENSE voltage and manual reset ($\overline{MR}$) return above the respective thresholds.

The TPS3808 device uses a precision reference to achieve 0.5% threshold accuracy for $V_{IT} \leq 3.3V$. The reset delay time can be set to 20ms by disconnecting the C_T pin, 300ms by connecting the C_T pin to V_{DD} using a resistor, or can be user-adjusted from 1.25ms to 10s by connecting the C_T pin to an external capacitor. The TPS3808 device has a very low typical quiescent current of 2.4µA, so it is an excellent choice for battery-powered applications. TPS3808 is available in the SOT-23 and 2mm × 2mm WSON packages, and is fully specified over a temperature range from –40°C to 125°C (T_J).

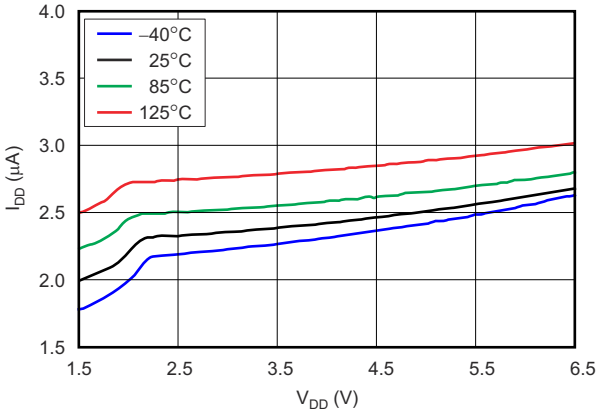

Package Information

PART NUMBER	PACKAGE(1)	PACKAGE SIZE(2)
TPS3808	DBV (SOT-23, 6)	2.90mm × 1.60mm
	DRV (WSON, 6)	2.00mm × 2.00mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Typical Application

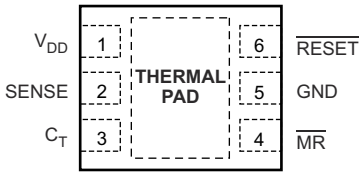

Figure 5-2. DRV Package 6-Pin (2.00mm × 2.00mm) WSON With Thermal Pad Top View

Table 5-1. Pin Functions

PIN			TYPE(1)	DESCRIPTION
NAME	SOT-23	WSON		
C_T	4	3	I	Reset period programming pin. Connecting this pin to V_{DD} through a 40kΩ to 200kΩ resistor or leaving it open results in fixed delay times (see *Section 6.5*). Connecting this pin to a ground referenced capacitor ≥ 100pF gives a user-programmable delay time. See *Section 7.3.2* for more information.
GND	2	5	—	Ground
$\overline{MR}$	3	4	I	Driving the manual reset pin ($\overline{MR}$) low asserts $\overline{RESET}$. $\overline{MR}$ is internally tied to V_{DD} by a 90kΩ pull-up resistor.
$\overline{RESET}$	1	6	O	$\overline{RESET}$ is an open-drain output that is driven to a low-impedance state when $\overline{RESET}$ is asserted (either the SENSE input is lower than the threshold voltage (V_{IT}) or the $\overline{MR}$ pin is set to a logic low). $\overline{RESET}$ remains low (asserted) for the reset period after both SENSE is above V_{IT} and $\overline{MR}$ is set to a logic high. A pull-up resistor from 10kΩ to 1MΩ should be used on this pin, and allows the reset pin to attain voltages higher than V_{DD}.
SENSE	5	2	I	This pin is connected to the voltage to be monitored. If the voltage at this terminal drops below the threshold voltage V_{IT}, then $\overline{RESET}$ is asserted.
V_{DD}	6	1	I	Supply voltage. It is good analog design practice to place a 0.1µF ceramic capacitor close to this pin.
Thermal Pad	—	Pad	—	Thermal Pad. Connect to ground plane to enhance thermal performance of package.

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
Voltage	V_{DD}	–0.3	7	V
	V_{CT}	–0.3	V_{DD} + 0.3	V
	V_{RESET}, V_{MR}, V_{SENSE}	–0.3	7	V
Current	$\overline{RESET}$ pin	–5	5	mA
Temperature	Operating junction, T_J (2)	–40	150	°C
	Storage, T_{stg}	–65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) As a result of the low dissipated power in this device, it is assumed that $T_J = T_A$.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD}	Input supply range	1.7		6.5	V
V_{SENSE}	SENSE pin voltage	0		6.5	V
$V_{(Ct)}$	C_T pin voltage			V_{DD}	V
$V_{\overline{MR}}$	$\overline{MR}$ pin voltage	0		6.5	V
$V_{\overline{RESET}}$	$\overline{RESET}$ pin voltage	0		6.5	V
$I_{\overline{RESET}}$	$\overline{RESET}$ pin current	0.0003		5	mA

7 Detailed Description

7.1 Overview

The TPS3808 microprocessor supervisory product family is designed to assert a $\overline{\text{RESET}}$ signal when either the SENSE pin voltage drops below V_{IT} or the manual reset ($\overline{\text{MR}}$) is driven low. The $\overline{\text{RESET}}$ output remains asserted for a user-adjustable time after both the manual reset ($\overline{\text{MR}}$) and SENSE voltages return above the respective thresholds.

7.2 Functional Block Diagram

Adjustable Voltage Version

Fixed Voltage Version

7.3 Feature Description

A broad range of voltage threshold and reset delay time adjustments are available for the TPS3808 device, allowing these devices to be used in a wide array of applications. Reset threshold voltages can be factory-set from 0.82V to 3.3V or from 4.4V to 5V, while the TPS3808G01 can be set to any voltage above 0.405V using an external resistor divider. Two preset delay times are also user-selectable: connecting the C_T pin to V_{DD} results in a 300ms reset delay, whereas leaving the C_T pin open yields a 20ms reset delay. In addition, connecting a capacitor between C_T and GND allows the designer to select any reset delay period from 1.25ms to 10s.

7.3.1 SENSE Input

The SENSE input provides a pin at which any system voltage can be monitored. If the voltage on this pin drops below V_{IT}, then $\overline{\text{RESET}}$ is asserted. The comparator has a built-in hysteresis to establish smooth $\overline{\text{RESET}}$ assertions and de-assertions. Good analog design practice is to put a from 1nF to 10nF bypass capacitor on the SENSE input to reduce sensitivity to transients and layout parasitics.

The TPS3808 device is relatively immune to short negative transients on the SENSE pin. Sensitivity to transients depends on threshold overdrive, as Figure 6-5 shows.

Use the TPS3808G01 to monitor any voltage rail down to 0.405 V using the circuit that Figure 7-1 shows.

Copyright © 2026 Texas Instruments Incorporated

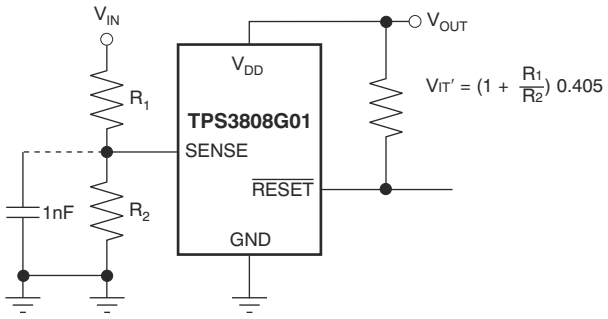

Figure 7-1. Using the TPS3808G01 to Monitor a User-Defined Threshold Voltage

7.3.2 Selecting the RESET Delay Time

The TPS3808 has three options for setting the $\overline{\text{RESET}}$ delay time as shown in Figure 7-2. Figure 7-2 (a) shows the configuration for a fixed 300ms typical delay time by tying C_T to V_{DD}; use a resistor from 40kΩ to 200kΩ. Resistor selection does not impact the supply current. Figure 7-2 (b) shows a fixed 20ms delay time by leaving the C_T pin open. Figure 7-2 (c) shows a ground referenced capacitor connected to C_T for a user-defined program time from 1.25ms to 10s.

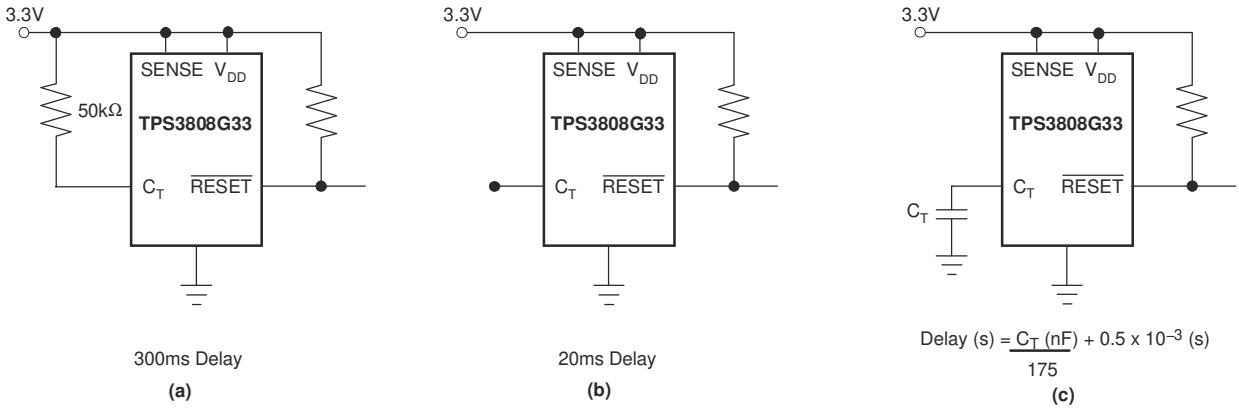

Figure 7-2. Configuration Used to Set the $\overline{\text{RESET}}$ Delay Time

The capacitor C_T must be ≥ 100pF nominal value for the TPS3808xxx to recognize that the capacitor is present. Calculate the capacitor value for a given delay time using Equation 1.

$$C_T(\text{nF}) = \left[t_D(\text{s}) - 0.5 \times 10^{-3}(\text{s})\right] \times 175 \quad (1)$$

The time an on-chip precision 220nA current source takes to charge the external capacitor to 1.23V determines the reset delay time. When a $\overline{\text{RESET}}$ is asserted, the capacitor is discharged. When the $\overline{\text{RESET}}$ conditions are cleared, the internal current source is enabled and begins to charge the external capacitor. When the voltage on this capacitor reaches 1.23V, $\overline{\text{RESET}}$ is deasserted. Note that a low-leakage type capacitor such as a ceramic must be used, and that stray capacitance around this pin can cause errors in the reset delay time.

7.3.3 Manual RESET ($\overline{\text{MR}}$) Input

The manual reset ($\overline{\text{MR}}$) input allows a processor or other logic circuits to initiate a reset. A logic low (0.3 V_{DD}) on $\overline{\text{MR}}$ causes $\overline{\text{RESET}}$ to assert. After $\overline{\text{MR}}$ returns to a logic high and SENSE is above its reset threshold, $\overline{\text{RESET}}$ is de-asserted after the user-defined reset delay expires. Note that $\overline{\text{MR}}$ is internally tied to V_{DD} using a 90kΩ resistor, so this pin can be left unconnected if $\overline{\text{MR}}$ is not used.

See Figure 7-3 for how to use $\overline{\text{MR}}$ to monitor multiple system voltages. Note that if the logic signal driving $\overline{\text{MR}}$ does not go fully to V_{DD}, there is some additional current draw into V_{DD} as a result of the internal pullup resistor on $\overline{\text{MR}}$. To minimize current draw, use a logic-level FET, as in Figure 7-4.

Copyright © 2026 Texas Instruments Incorporated

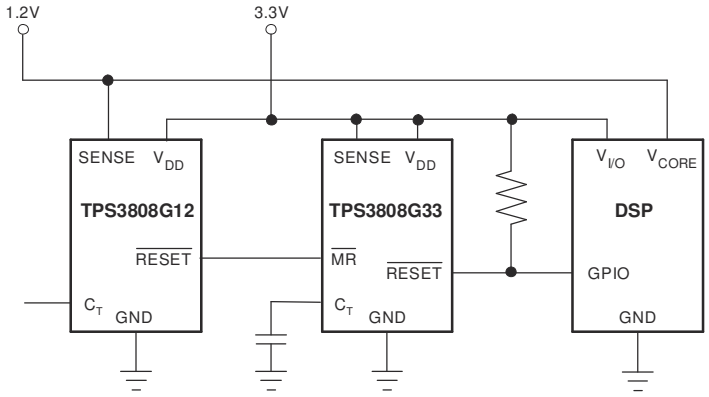

Figure 7-3. Using $\overline{MR}$ to Monitor Multiple System Voltages

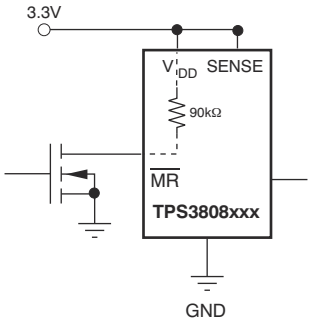

Figure 7-4. Using an External MOSFET to Minimize I_{DD} When $\overline{MR}$ Signal Does Not Go to V_{DD}

7.3.4 RESET Output

$\overline{RESET}$ remains high (unasserted) as long as SENSE is above its threshold (V_{IT}) and the manual reset ($\overline{MR}$) is logic high. If either SENSE falls below V_{IT} or $\overline{MR}$ is driven low, $\overline{RESET}$ is asserted, driving the $\overline{RESET}$ pin to a low impedance.

Once $\overline{MR}$ is again logic high and SENSE is above V_{IT} + V_{HYS} (the threshold hysteresis), a delay circuit is enabled that holds $\overline{RESET}$ low for a specified reset delay period. Once the reset delay has expired, the $\overline{RESET}$ pin goes to a high-impedance state. The pullup resistor from the open-drain $\overline{RESET}$ to the supply line can be used to allow the reset signal for the microprocessor to have a voltage higher than V_{DD} (up to 6.5V). The pullup resistor must be no smaller than 10kΩ as a result of the finite impedance of the $\overline{RESET}$ line.

7.4 Device Functional Modes

Table 7-1. Truth Table

$\overline{MR}$	SENSE > V_{IT}	$\overline{RESET}$
L	0	L
L	1	L
H	0	L
H	1	H

7.4.1 Normal Operation (V_{DD} > $V_{DD(min)}$)

When V_{DD} is greater than $V_{DD(min)}$, the voltage on the SENSE pin and the logic state of $\overline{MR}$ determine the $\overline{RESET}$ signal.

- $\overline{MR}$ high: When the voltage on V_{DD} is greater than 1.7V for a time of the selected t_D, the $\overline{RESET}$ signal corresponds to the voltage on SENSE relative to V_{IT}.
- $\overline{MR}$ low: in this mode, $\overline{RESET}$ is held low regardless of the value of the SENSE pin.

Copyright © 2026 Texas Instruments Incorporated

7.4.2 Above Power-On Reset but Less Than $V_{DD(min)}$ (V_{POR} < V_{DD} < $V_{DD(min)}$)

When the voltage on V_{DD} is less than the device $V_{DD(min)}$ voltage, and greater than the power-on reset voltage (V_{POR}), the $\overline{\text{RESET}}$ signal is asserted and low impedance, respectively, regardless of the voltage on the SENSE pin.

7.4.3 Below Power-On Reset (V_{DD} < V_{POR})

When the voltage on V_{DD} is lower than the required voltage (V_{POR}) needed to internally pull the asserted output to GND, $\overline{\text{RESET}}$ is undefined, do not rely on $\overline{\text{RESET}}$ for proper device function.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The following sections describe in detail how to properly use this device, depending on the requirements of the final application.

8.2 Typical Application

Figure 8-1 shows a typical application of the TPS3808G25 used with a 2.5V processor. The open-drain $\overline{\text{RESET}}$ output is typically connected to the $\overline{\text{RESET}}$ input of a microprocessor. Use a pullup resistor to hold this line high when $\overline{\text{RESET}}$ is not asserted. The $\overline{\text{RESET}}$ output is undefined for voltage below 0.8V, but this characteristic is normally not a problem because most microprocessors do not function below this voltage.

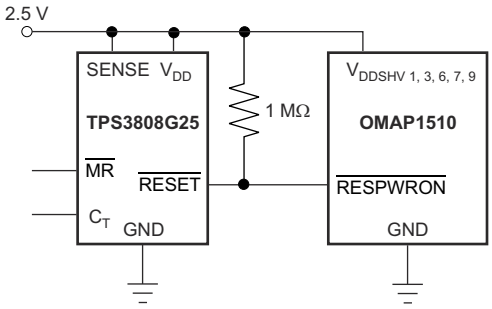

Figure 8-1. Typical Application of the TPS3808 With an OMAP™ Processor

8.2.1 Design Requirements

The TPS3808 is intended to drive the $\overline{\text{RESET}}$ input of a microprocessor. The $\overline{\text{RESET}}$ pin is pulled high with a 1MΩ resistor and the reset delay time is controlled by C_T depending on the reset requirement times of the microprocessor. In this case, C_T is left open for a typical reset delay time of 20ms.

8.2.2 Detailed Design Procedure

The primary constraint for this application is the reset delay time. In this case, because C_T is open, it is set to 20 ms. A 0.1µF decoupling capacitor connect to the V_{DD} pin and a 1MΩ resistor is used to pull up the $\overline{\text{RESET}}$ pin high. The $\overline{\text{MR}}$ pin can connect to an external signal if desired.

8.2.2.1 Immunity to SENSE Pin Voltage Transients

The TPS3808 is relatively immune to short negative transients on the SENSE pin. Sensitivity to transients depends on threshold overdrive. Threshold overdrive is defined by how much the V_{SENSE} exceeds the specified threshold, and is important to know because the smaller the overdrive, the slower the $\overline{\text{RESET}}$ response. Threshold overdrive is a percent of the threshold in question, as shown in Equation 2:

$$\text{Overdrive} = \left| \left(\frac{V_{SENSE}}{V_{IT}} - 1 \right) \times 100\% \right| \quad (2)$$

where

- V_{IT} is the threshold voltage.

Figure 8-2 shows this relationship.

Copyright © 2026 Texas Instruments Incorporated

8.2.3 Application Curve

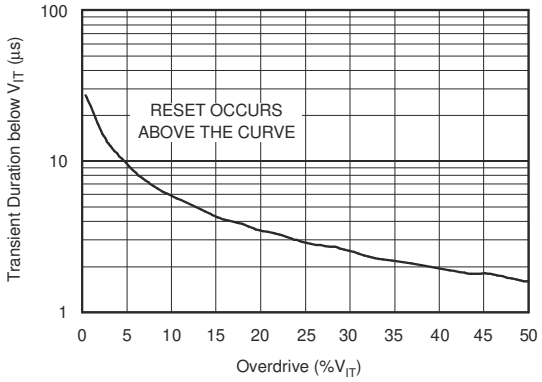

Figure 8-2. Maximum Transient Duration at SENSE vs SENSE Threshold Overdrive Voltage

8.3 Power Supply Recommendations

These devices are designed to operate from an input supply with a voltage range between 1.7V and 6.5V. Use a low-impedance power supply to eliminate inaccuracies caused by current changes during the voltage reference refresh.

8.4 Layout

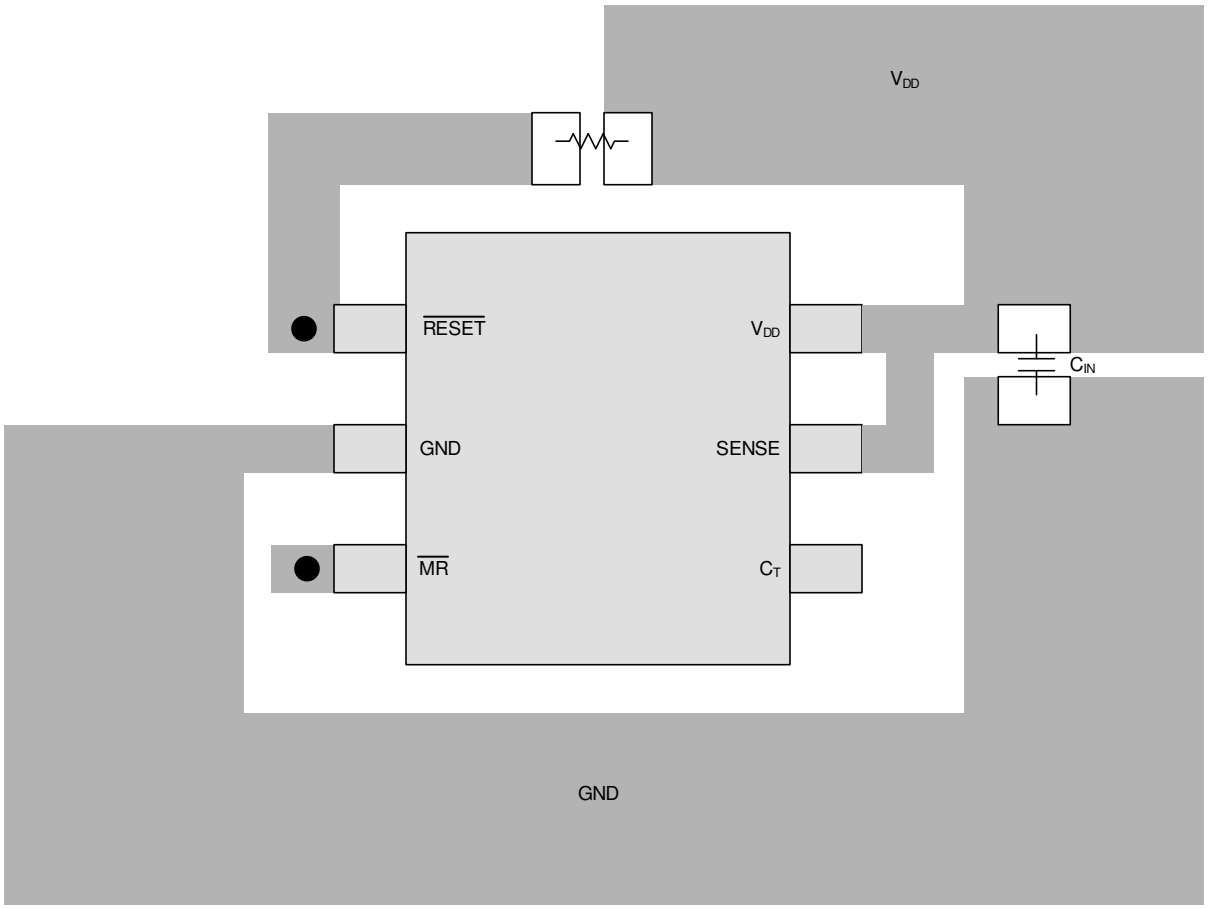

8.4.1 Layout Guidelines

Make sure the connection to the V_{DD} pin is low impedance. Place a 0.1-µF ceramic capacitor near the V_{DD} pin. If no capacitor is connected to the C_T pin, parasitic capacitance on this pin should be minimized so the $\overline{\text{RESET}}$ delay time is not adversely affected.

8.4.2 Layout Example

The layout example in Figure 8-3 shows how the TPS3808 is laid out on a printed circuit board (PCB) for a 20ms delay.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF TPS3808 :

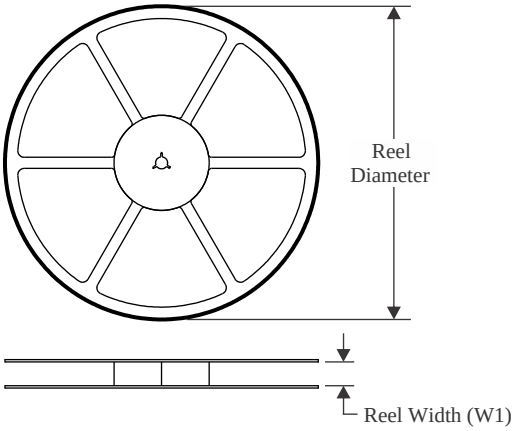

- Automotive : TPS3808-Q1
- Enhanced Product : TPS3808-EP

NOTE: Qualified Version Definitions:

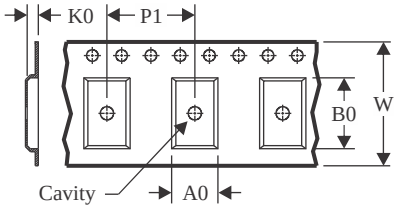

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects
- Enhanced Product - Supports Defense, Aerospace and Medical Applications

TAPE AND REEL INFORMATION

REEL DIMENSIONS

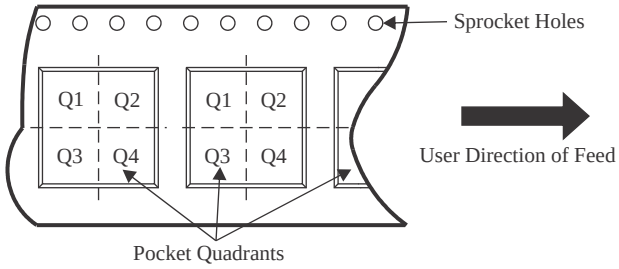

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

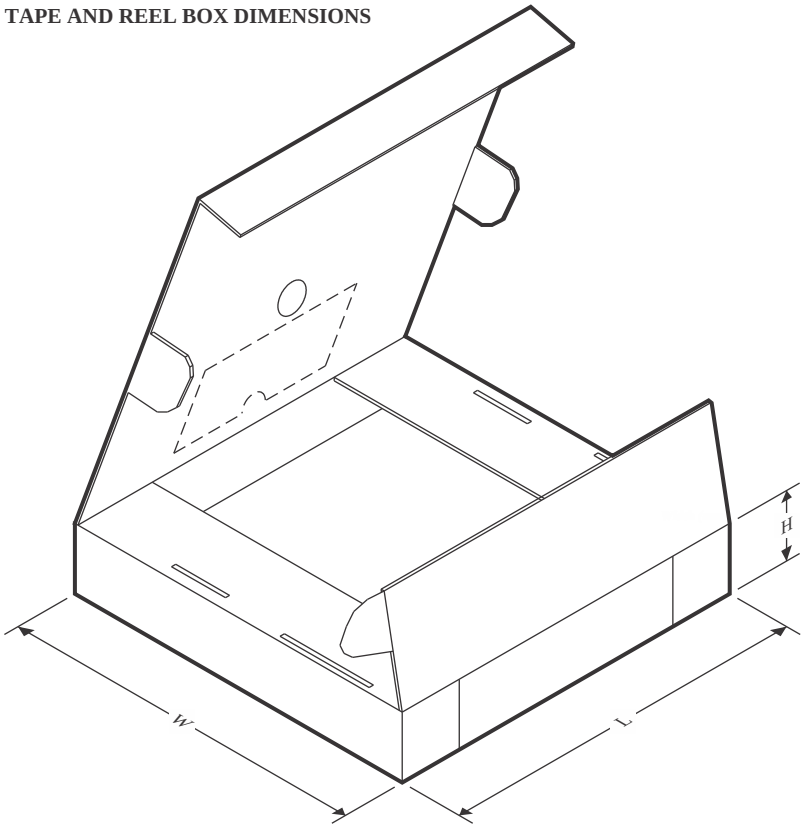

*All dimensions are nominal

DRV 6 WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

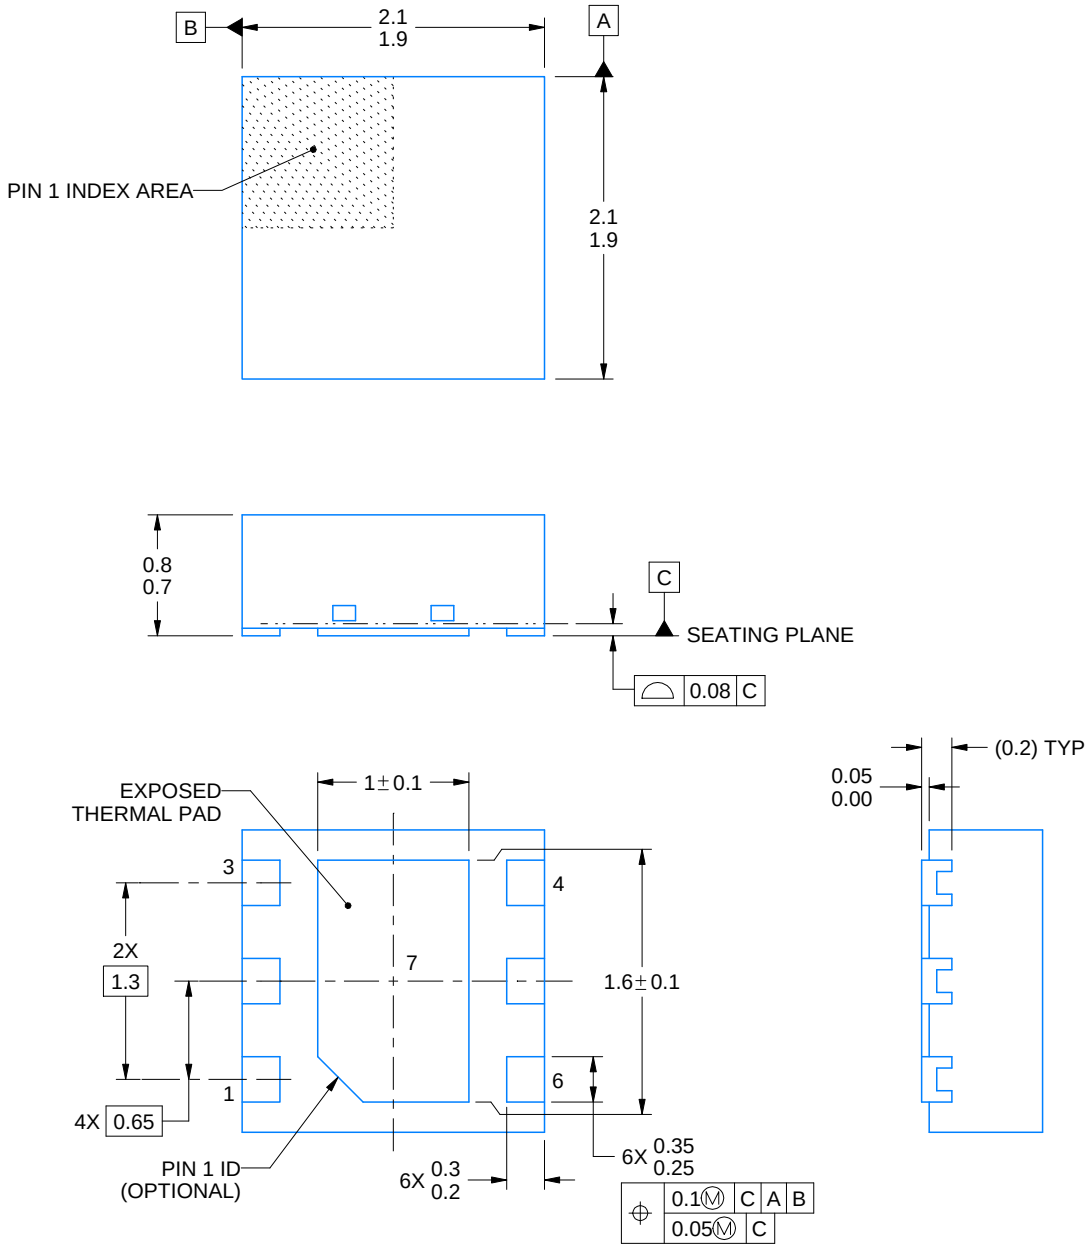

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

DRV0006D

PACKAGE OUTLINE

WSON - 0.8 mm max height

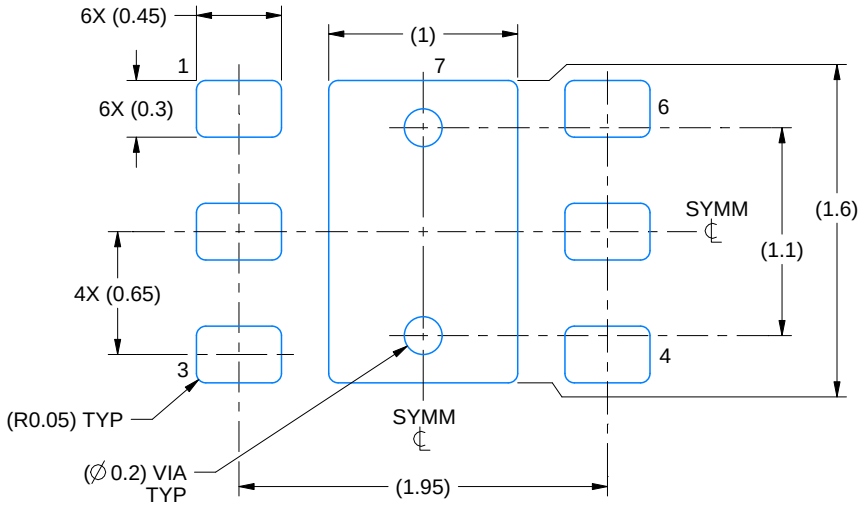

PLASTIC SMALL OUTLINE - NO LEAD

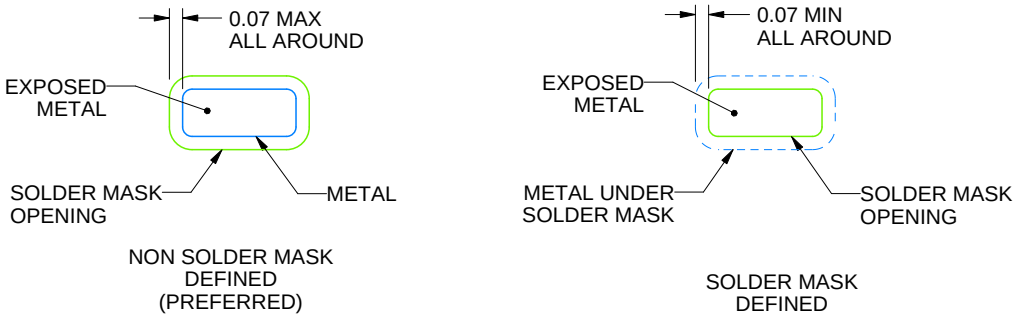

4225563/A 12/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:25X

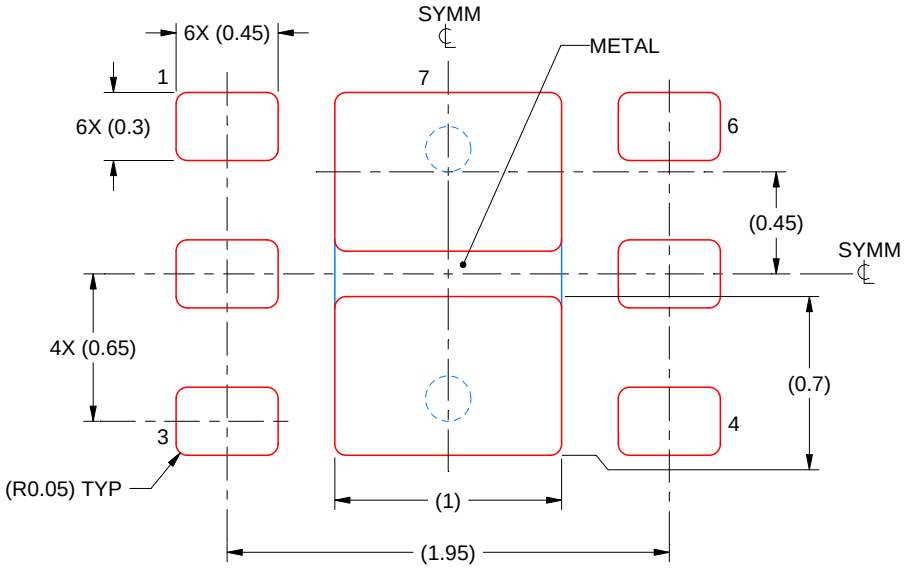

SOLDER MASK DETAILS

4225563/A 12/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD #7
88% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:30X

4225563/A 12/2019

NOTES: (continued)

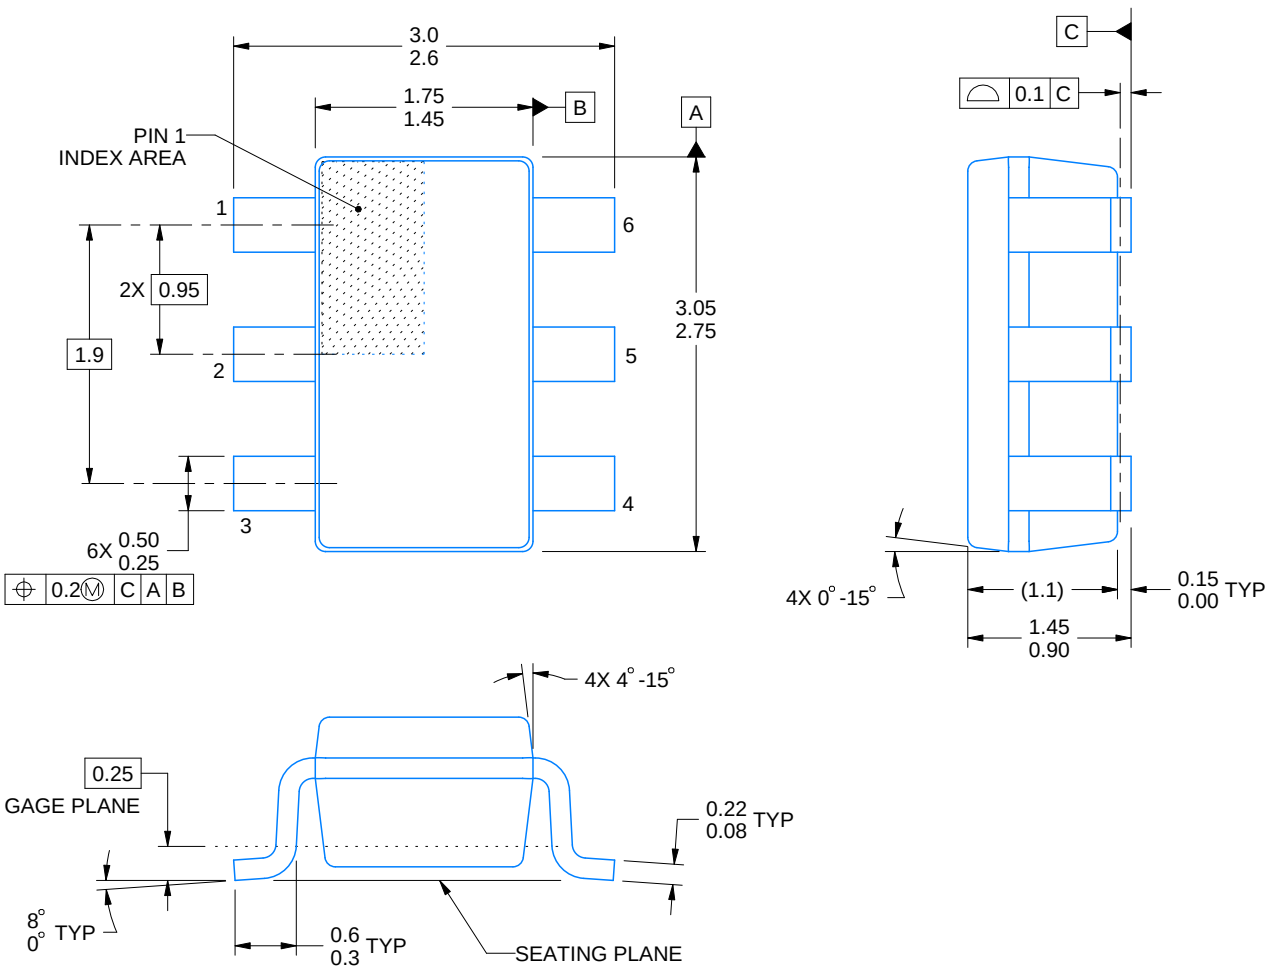

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

SOT-23 - 1.45 mm max height

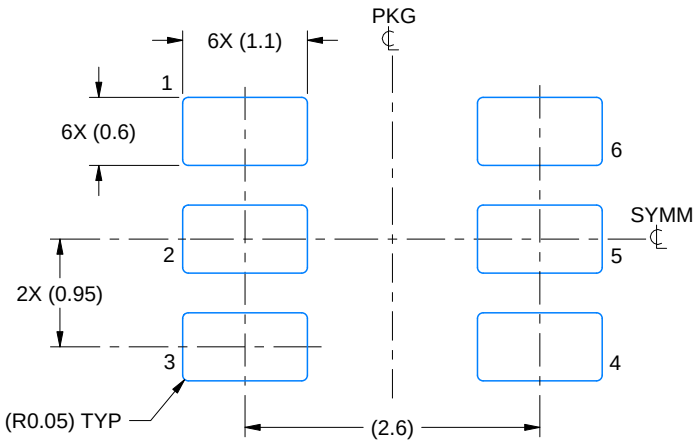

SMALL OUTLINE TRANSISTOR

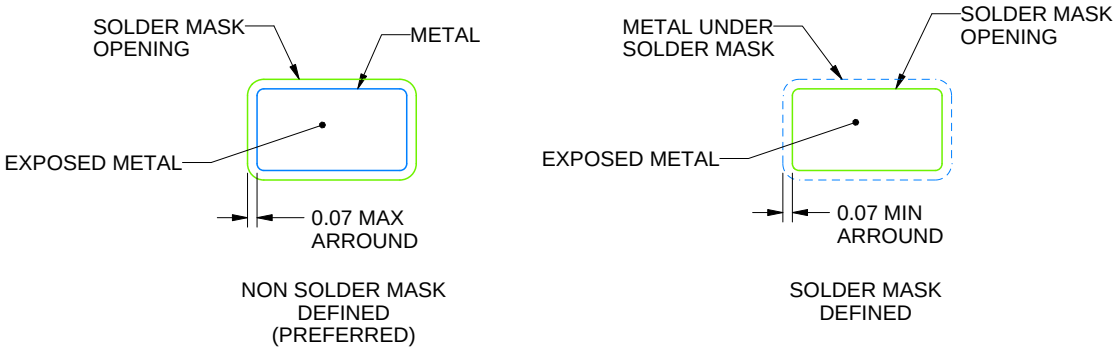

4214840/G 08/2024

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.25 per side.
4. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
5. Refernce JEDEC MO-178.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

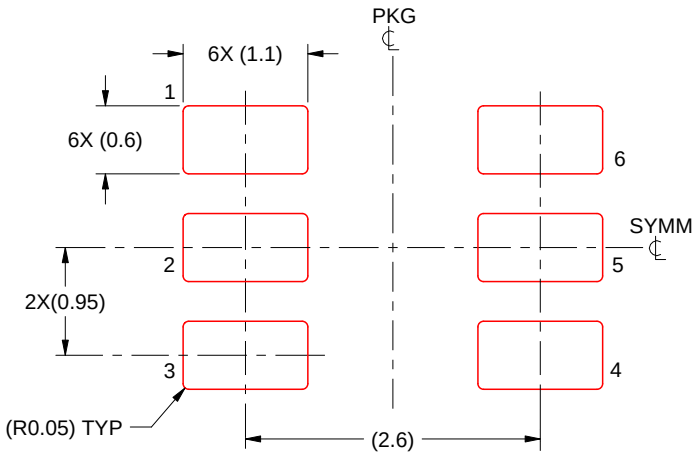

SOLDER MASK DETAILS

4214840/G 08/2024

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214840/G 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale, TI’s General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
