COP888GW Features and Applications

National Semiconductor
Application Note 982
Martin Embacher
April 1995

INTRODUCTION

The COP888GW is a member of National Semiconductor's COP888 family of microcontrollers fabricated in M²CMOS™ technology. The device was established using CCM (Configurable Controller Methodology) design techniques which provide a fast and reliable way to create new derivatives for a fast growing and demanding controller market. In addition to the COP888 feature core this controller includes a math unit to allow fast multiply/divide operations. The controller has special timers for motor control allowing it to be used in applications where enhanced processing power and motor control capabilities are required (as in plotters, robot-arms or information systems.)

This note describes the COP888GW microcontroller emphasizing the powerful new features. The reader will be given easy to use macros to take full advantage of the new CCM blocks.

COP888GW KEY FEATURES

- Multiply/Divide Unit
- Two 16-bit capture modules with 8-bit prescalers
- Four pulse train generators with 16-bit prescalers
- Full duplex UART
- MICROWIRE/PLUS™ serial port with interrupt
- 16 kbytes of on-board ROM
- 512 bytes of on-board RAM
- Multi-Input Wakeup pins (8) optionally usable hardware interrupts either on falling or rising edge
- Two 16-bit timers, each with two 16-bit autoreload/capture registers supporting:
 - Processor independent PWM mode
 - External Event counter mode
 - Input Capture mode
- Low EMI
- Two power saving modes: HALT and IDLE
- Fourteen multi-source vectored interrupts
- Software selectable I/O options
- Package:
 - 68 PLCC with 56 I/O pins

CAPTURE TIMERS

With its two high speed, high resolution capture timers, the COP888GW is ideally suited high resolution frequency measurement. To give a feeling for the capabilities, *Table 1* shows the capture timers resolution versus the measured signal frequency with a processor clock (CKI) of 10 MHz. The sampling rate is CKI divided by a 8-bit prescaler. In the table, the prescaler is set to 1 to allow maximum performance. This results in a maximum resolution of 100 ns.

TABLE 1. Capture Timer Resolution vs Signal Frequency

Resolution/ Bits	16	14	12	10	8
Max. Frequency	152 Hz	610 Hz	2.4 kHz	9.6 kHz	39 kHz

The capture timer can be used for a closed loop control in a DC motor. One of the standard COP888 timers (T1 or T2) generates a PWM signal to control the motor. One of the capture timer modules measures the actual RPM of the motor. A simple algorithm is used to adjust the motor's speed to the desired value.

Figure 1 shows a block diagram of a closed loop DC motor control with one capture and one PWM timer. The MOSFET X1 acts as a low-side driver for the motor and controls the current flow. The current through the motor is proportional to the duty cycle of the PWM signal, generated by T1, at the gate of X1. An optical disk, in conjunction with an LED/photo transistor senses the motor's RPM. The pulses generated by the photo transistor are directly fed to the capture timer's input. The capture timer inputs are alternate functions of Port-L. This I/O-port features integrated schmitt trigger inputs eliminating the need for external signal conditioning of the input signals.

FIGURE 1. Closed Loop DC Motor Control Block Diagram

SOFTWARE MODULES

The following section provides a guide to general purpose macros and subroutines to set-up the capture timer and the standard timers T1 to T2. The functions are written as of macros so the user can easily include them in the application software.

CAPTURE TIMERS

Capture Timers Setup Routine

This routine sets the capture timer module CCM1 or CCM2 to allow input capture of a signal on the respective port pin.

Additionally the I/O pins Port L6 for CCM1 and Port L7 for CCM2 are configured as inputs. This macro should be placed in a separate macro file and included in the source code after the processor specific include file. *Figure 2* shows the source code to include the macros in the applications program.

```
.includ cop888gw.inc
.includ gw_macros.inc
.sect main_prog,rom
..
..
.end
```

FIGURE 2. Including a Macro Into Source Code

The macro is called in the source code as:

```
__CT_SETUP , __MODULE, __PRESCALER, __EDGE,
__INTR
```

__MODULE is the capture module number

1 = capture module 1

2 = capture module 2

__PRESCALER is the prescaler value the range is 0 to 255.

EDGE selects the input capture edge

0 = rising edge

1 = falling edge

__INTR select if capture interrupt is used

0 = disable capture interrupt

1 = enable capture interrupt

The macro will check that all values are in the acceptable range and warn the user if this is not the case.

An example of the generated code is shown below. The macro is called to setup capture timer 1 with a prescaler of 100 (dec) to capture signals on a falling edge without the generation of an interrupt.

```
__CT_SETUP 1 100 1 0
```

```
ld    b, #CCMR1 ; point to capture con
ld    [b], #0 ; stop capture, clear
rbit  6, portlc ; cm 1 input on port L
ld    cm1psc, #100 ; load prescaler of c
ld    [b], #ZZ0000 ; start capture
```

AN012376-2

FIGURE 3. __CT_SETUP Resulting Code

Special attention is needed if the interrupts are enabled in the macro by setting the **__INTR** directive to one. An appropriate interrupt handler must be placed elsewhere in the code. The macro will allow the capture timer to generate interrupts, however it will not provide the respective interrupt service routine.

Capture Timer Read Macro

```
__CT_READ __MODULE __VARIABLE
```

__MODULE is the capture module number

1 = capture module 1

2 = capture module 2

__VARIABLE is a variable to hold the contents of the capture register

Standard Timer Setup for PWM Output

```
__TIM_SETUP __NUMBER __CYCLE __TON __INIT
```

__NUMBER is the timer number

1 = timer 1

2 = timer 2

3 = timer 3

__CYCLE is the cycle time of the PWM signal the range is 0 to 65535

__TON is on time of the PWM signal

__INIT is the initialization value

0 = start with low

1 = start with high

Standard Timer Glitch Free PWM Output

This macro is used to provide a glitch free switched PWM output with the standard COP8 PWM timer. In the macro interrupts are disabled to wait until a PWM cycle is completed and then reload the registers are re-written. This produces—in difference to an interrupt driven routine—a glitch free output of the PWM signal.

```
__TIM_PWM __NUMBER __CYCLE __TON
```

__NUMBER is the timer number

1 = timer 1

2 = timer 2

3 = timer 3

__CYCLE is the cycle time of the PWM signal the range is 0 to 65535

__TON is on the time of the PWM signal

Note: The source of the macros is found in Section Capture Module Macros on page 5.

DC Motor Control Example

An example for the application of the macros is basic DC motor closed loop control. The motor drive consists of the phases start and run. During start, the motor's speed increases up to the maximum speed set by `speed__max`. During run, the speed is kept around `speed__max`. The slope of speed increase is set by `speed__plus` and the maximum allowable speed increase or decrease during run is set by `adj__speed`. The speed update cycle time may be controlled by the IDLE timer, generating an interrupt every $4096 t_c$.

Figure 4 shows the flowchart of a simple closed loop DC-motor control. The macros can be used to setup the times and to read the current speed value.

FIGURE 4. Basic DC Motor Control Loop Flowchart

Pulse Train Generators

The COP888GW contains four independent pulse train generators designed for stepper motor control. The pulse train generator provides a programmable number of 50 duty cycle pulses on the output pin. Depending on the external sequencer logic these timers can be used for regular step control or for microstep driving.

If the user does not require pulse train outputs on all pins the pulse train generators can be used as four independent timers with interrupt capability.

FIGURE 5. Standard Stepper Motor Control Waveform (Two Phases On)

Microstepping is used in applications where the step sizes have to be very small to allow smooth transitions from one state to another. Special microstep drivers and motors have

been developed. These devices turn the applied pulses into current steps to run the motor. The standard input of these drivers is a pulse train as generated by the COP888GW microcontrollers. To show the basic stepper motor control circuit a standard stepper motor drive circuit is discussed based on a four-phase motor. Figure 5 shows the waveform required to control a standard motor. CLK is the pulse train generated by the pulse train generator, PH1–PH4 are the outputs to the motor drivers. These signals can be generated by using a simple shift/rotate register.

FIGURE 6. Simple Stepper Motor Sequencer

Figure 6 shows an application circuit for a bidirectional stepper motor. The shift register is loaded under software control and then the pulse train is started. More than one motor can be connected in the same manner. Each motor gets its own sequencer the setup bus signals are common for every sequencer. Two control signals, unique for every motor, select the direction and the mode of the sequencer. Mode can be load new pattern, shift left and shift right. The circuit shown above is capable of controlling low current stepper motors used in some applications, if a higher output drive is required appropriate driver stages should be used.

As stepper motors usually have some inertia the pulse train starts up slowly and increases its frequency, under software control, up to full step speed. The same scheme as shown in Figure 4 can be applied if increase speed is replaced by increase pulse train frequency and decrease speed accordingly to decrease pulse train frequency.

Pulse Train Generator Routines

The first routine sets up the pulse train generators PT1–PT4. Additionally the respective output pins Port E0 for PT1, Port E1 for PT2, Port E2 for PT3 and Port E3 for PT4 can be configured if the user needs to output the data.

Pulse Train Generator Setup

`__PT_SETUP __MODULE, __PRESCALER, __PULSES, __OUT, __INTR, __RUN`

`__MODULE` is the pulse train module number

- 1 = pulse train module 1
- 2 = pulse train module 2
- 3 = pulse train module 3
- 4 = pulse train module 4

`__PRESCALER` is the prescaler value the range is 0 to 65535. `__PULSES` selects the number of pulses: 0 to 65535.

`__OUT` enables or disables pulse output

- 0 = output disabled
- 1 = output enabled

__INTR select if an interrupt is generated on completion of the pulse generation

- 0 = disable interrupt
- 1 = enable interrupt

__RUN selects if the pulses are output directly after initialization or at a later time.

- 0 = don't start pulse train generator
- 1 = start pulse train generator

The macro will check that all values are in the acceptable range and warn the user if this is not the case.

Pulse train output:

The second routine loads a new number of pulses into the pulse train registers and starts the generation. Setting regarding interrupts and output are not affected. The macro is called in the source code as:

__PT __CHANGE __MODULE, __PULSES

__MODULE is the pulse train module number

- 1 = pulse train module 1
- 2 = pulse train module 2
- 3 = pulse train module 3
- 4 = pulse train module 4

__PULSES selects the number of pulses: 0 to 65535.

MULTIPLE/DIVIDE

The device contains a multiply/divide block to speed up the multiply/divide operations. To give an idea about the speed increase, *Table 2* shows a comparison of the standard multiply/divide operations done in software with the same operation performed using the MUL/DIV unit.

TABLE 2. Multiply/Divide Operation Speed

Type of Operation	MUL/DIV Operation in Software	MUL/DIV Block
Multiply 8 x 8	129 t_C	11 t_C
Multiply 8 x 16	243 t_C	11 t_C
Divide 8 x 8	208 t_C	14 t_C
Divide 24 x 8	827 t_C	14 t_C

Note 1: Comparisons include loading the registers for the MUL/DIV block and accordingly the RAM cells used for software multiply/divide on standard COP8 microcontrollers. The actual 16 x 8 multiply operation takes one t_C and a 24 x 16 divide takes 2 t_C . However for accurate comparison the register setup times have to taken into account.

The following section provides software modules used to set up the multiply/divide unit and to load the respective registers. Although the MUL/DIV block does not allow signed arithmetic it can be used with some additional software to perform signed operations. The signed operations check for a sign in every number to be divided or multiplied—performs a sign conversion if negative—does the operation and adjusts the output accordingly.

Note: These software modules use constants to show the basic operation example of loading the MUL/DIV registers. These need to be customized in the application software.

Macro for unsigned 8 x 16 multiply

__MUL816U __MUL1 __MUL2

__MUL1 is the 8-bit unsigned multiplier

__MUL2 is the 16-bit unsigned multiplicand

Macro for unsigned 16 x 16 divide

__DIV1616U __DIV1 __DIV2

__DIV1 is the 16-bit unsigned dividend

__DIV2 is the 16-bit unsigned divisor

Macro for signed 6 x 16 multiply

__MUL816S __MUL1 __MUL2

__MUL1 is the 8-bit signed multiplier

__MU21 is the 16-bit signed multiplicand

Macro for signed 16 x 16 divide

__DIV1616S __DIV1 __DIV2

__DIV1 is the 16-bit signed dividend

__DIV2 is the 16-bit signed divisor

FURTHER APPLICATION HINTS

It was shown that the COP888GW with its new and enhanced functions can operate as a system controller in various applications. Due to the large number of I/O lines additional features can be included in the system with minimal external hardware effort. For example it was shown in application note AN-673 how a simple two way multiplexed LCD control can be done with a COP8 microcontroller. The feature can be easily adopted to the COP888GW allowing system e.g. a simple plotter device to be controlled. Another application example is a climate control system, where COP888GW can be used to control the heating process. Control algorithms can be generated with National's NeuFuz™ software package. User interfaces can be done as described above with LCD drive. Diagnostics is possible with the on-chip UART.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
