If a signal in the following table indicates that synchronization is not required, as the signal is already synchronous, then pipelining is required and must be enabled using the PIPE bit in the CLB_INPUT_FILTER register. This pipelining adds a 1 CLB clock cycle delay to the input. This is not to be mistaken with the PIPELINE_EN bit in the CLB_LOAD_EN register, which controls pipelining of the CLB operations in the HLC and counter blocks. This PIPELINE_EN bit is also used when the device is run above 100MHz. Having synchronization and pipelining both enabled or both disabled is not recommended. Enabling both synchronization and pipelining introduces a delay of more than 2-3 CLB clock cycles on the signal path. Disabling both allows the completely asynchronous signal to be routed as an input.

Table 9-4. Local Signals and Mux Selection

Select Value	CLB1 Input	CLB2 Input	CLB3 Input	CLB4 Input	Synchronization Requirement

The GPREG is accessible by the CPU and the bits of this register can be used as BOUNDARY INPUTs for the CLB Tiles. For example, CLB1s GPREG[0] can be used as BOUNDARY IN0 (Cell Input 0) for the corresponding CLB Tile.

To connect multiple tiles to each other, you can use the CLBx OUT4/5 and connect to CLBy BOUNDARY INz through the CLB X-BAR and the Global Signals Mux.

Another option is to connect the CLBx OUT0-7 to a GPIO and then use the INPUT X-BAR to bring the signal back in to the device and connect to the CLBy BOUNDARY INz through the CLB X-BAR and the Global Signals Mux.

To use GPIOs as inputs to the CLB, you must utilize the Input X-BAR and the CLB X-BAR. [Figure 9-5](#) shows how GPIOs can be used as inputs to the CLB tiles.

9.3.3 CLB Output Selection

The eight outputs of the CLB are replicated to create 32 output signals. Each of these 32 outputs has a separate enable bit defined in the CLB output enable register, CLB_OUT_EN. The CLB outputs go to the ePWM, eCAP, eQEP and the crossbar module in the device. This allows the user to enhance the functionality of these modules with the CLB. [Figure 9-9](#) shows the CLB outputs.

The user has the capability to disable updated to the CLB_OUT_EN register by blocking access to the register through setting the CLB_MISC_ACCESS_CTRL.BLKEN bit. The eight outputs are replicated to generate a total of 32 outputs (shown in [Figure 9-9](#)). Some of these new outputs can be used for TILE to TILE connection through the CLB Global Mux inputs.

Note

The output from OUTLUT0 is connected to OUT0, OUT8, OUT16, and OUT24. While the signal is the same, each OUTy has access to a different peripheral as shown in [Section 9.3.4](#). Likewise, OUTLUT1 is connected to OUT1, OUT9, OUT17, and OUT25, and are the same signal.

CLBx_OUT12 through CLBx_OUT15 are unregistered and asynchronous to the CLB clock.

Figure 9-9. CLB Outputs

9.3.4 CLB Output Signal Multiplexer

Each CLB output signal passes through an external multiplexer that intersects a specific peripheral signal, see [Figure 9-10](#). The output of the multiplexer is connected to the destination of the original peripheral signal and the default multiplexer setting is that the peripheral signal is passed through. The multiplexer is controlled by bit[n] in the CLB output enable register CLB_OUT_EN.

Figure 9-10. CLB Output Signal Multiplexer

For example, if the CLB1 OUT0 must override the EPWM1A signal, the OUPUT ENABLE bit for OUT0 must be set to 1.

[Table 9-6](#) and [Table 9-7](#) shows the allocation of peripheral signals and the CLB outputs.

Note

When not explicitly specified in the table above, refer to corresponding IP chapters for exact CLB Output destinations (that is, FSI, ECAP, XBAR connections).

9.4 CLB Tile

The purpose of the CLB tile is to provide the logic reconfiguration capability of the CLB. The CLB tile contains the following submodules:

- **Counter:** The counter submodule can be configured as an adder, a counter, or a shifter. When functioning as an adder, the counter submodule can either add or subtract. When functioning as a counter, the counter submodule can count up or count down. When functioning as a shifter, the counter submodule can shift left or shift right. The counter event inputs, as well as the reset input, can be freely connected to any of the other submodules in the same tile. Starting with CLB Type 2, the counter module can also operate as a serializer or linear feedback shift register. There are three counters in each tile.
- **LUT4:** The LUT4 submodule has a 4-input look-up table functionality and is capable of realizing any combinatorial Boolean equation of up to four inputs. There are three LUT4 submodules in each CLB tile.
- **FSM:** The Finite State Machine (FSM) submodule can be configured either as a single four-state finite state machine, or as two independent two-state finite state machines. The FSM accepts two external inputs, and generates two state outputs and one combination output. When not used as a state machine, the FSM submodule can accept two external inputs and function as a 4-input LUT. There are three FSM submodules in each CLB tile.
- **Output LUT:** The output LUT is a 3-input lookup table submodule capable of realizing any combinatorial Boolean equation of up to three inputs. There are eight such blocks in a CLB tile, each associated with one of the tile outputs.
- **Asynchronous Output Conditioning Block:** The primary purpose of the Asynchronous Output Conditioning (AOC) block is to provide asynchronous conditioning capabilities on the TILE outputs or directly on the inputs of the TILE.
- **High Level Controller:** The High Level Controller (HLC) submodule is an event-driven block that can handle up to four concurrent events. The event can be an activity on any of the other block outputs. A predefined set of operations is executed when each event occurs. The HLC also provides a data exchange and interrupt mechanism to the CPU subsystem. There are four working registers (R0, R1, R2, and R3) that can be used for basic operations, and to modify or set up values for the three counter blocks. Unlike the other submodules, there is only one HLC in each CLB tile.
- **Static Switch Block:** The static switch block provides dynamic connectivity between all of the blocks listed above. Submodules can be connected by the user, with the only restriction that the submodules must not form a combinational loop within the tile.

A CLB tile consists of three sets each of the counter block, FSM, and LUT4, one high-level controller, and eight output LUT blocks. The submodule numbering is shown in [Figure 9-11](#).

The functionality of the LUT submodules is configured using a register field containing the binary pattern of the output of the desired look-up table. For example, a 4-input LUT has 16 possible input permutations, each of which corresponds to a desired binary 0 or 1 at the output. The register field can, therefore, be 16-bits in length, with each bit representing the desired result of a binary pattern. Input pattern sequences start at 0000 and continue sequentially to 1111. A similar method is used to encode the 16-bit state equations in the FSM submodule.

Figure 9-11. CLB Tile Submodules

9.4.1 Static Switch Block

The Static Switch Block provides the configurable connectivity between the submodules in the CLB tile. The outputs of all the submodules and the eight external inputs are connected to a common internal bus inside the tile. Every input port has a 32-to-1 multiplexer and an associated 5-bit selection value that allows the user to select one of the inputs on the bus. The only restrictions are certain signals (described below) that are tied off in the design to prevent creation of accidental combinatorial loops.

Table 9-8. Output Table

Bit Position	Signal Connection	Comment
0	Always 0	This select value is used to tie an input to 0.
1	COUNTER_0 MATCH2	
2	COUNTER_0 ZERO	
3	COUNTER_0 MATCH1	
4	FSM_0 STATE_BIT_0	
5	FSM_0 STATE_BIT_1	
6	FSM_0 LUT output	
7	LUT4_0 output	
8	Always 1	This select value is used to tie an input to 1.
9	COUNTER_1 MATCH2	
10	COUNTER_1 ZERO	
11	COUNTER_1 MATCH1	
12	FSM_1 STATE_BIT_0	
13	FSM_1 STATE_BIT_1	
14	FSM_1 LUT output	
15	LUT4_1 output	
16	Always '0'	
17	COUNTER_2 MATCH2	
18	COUNTER_2 ZERO	
19	COUNTER_2 MATCH1	
20	FSM_2 STATE_BIT_0	
21	FSM_2 STATE_BIT_1	
22	FSM_2 LUT output	
23	LUT4_2 output	
24	External Input 0	
25	External Input 1	
26	External Input 2	
27	External Input 3	
28	External Input 4	
29	External Input 5	
30	External Input 6	
31	External Input 7	

Table 9-9. Input Table

Module Name	Port Name	Description
Counter Block	RESET	Acts as an active high reset when used as a counter
	MODE_0	Acts as an enable when used as a counter. The counter counts only when this input is 1.
	MODE_1	Acts as a direction control when used as a counter. If this input is 1, then the counter counts up; else, the counter counts down.
LUT	IN0	Input 0 of the 4-input LUT.
	IN1	Input 1 of the 4-input LUT.
	IN2	Input 2 of the 4-input LUT.
	IN3	Input 3 of the 4-input LUT.
FSM	EXT_IN0	Input 0 of the FSM block.
	EXT_IN1	Input 1 of the FSM block.
	EXTRA_EXT_IN0	Extra external input 0 of the FSM block. This input matters only if configured in the LUT mode.
	EXTRA_EXT_IN1	Extra external input 1 of the FSM block. This input matters only if configured in the LUT mode.

The static switch block allows the user to define the input connection of any submodule to come from any of the outputs in [Table 9-8](#). It is therefore easy to create a combinatorial loop. To prevent this, certain paths are broken in the input path of each submodule. These port positions are tied to 0, as shown in [Table 9-10](#).

Table 9-10. Ports Tied Off to Prevent Combinatorial Loops

Module Name	Ports of Input MUX Tied Off to 0 to Prevent Combinatorial Loops
LUT_0	LUT_0 , LUT_1, and LUT_2 output, FSM_0, FSM_1, and FSM_2 output.
FSM_0	LUT_1 and LUT_2 output, FSM_0, FSM_1, and FSM_2 output.
LUT_1	LUT_1 and LUT_2 output, FSM_1 and FSM_2 output.
FSM_1	LUT_2 output, FSM_1 and FSM_2 output.
LUT_2	LUT_2 output, FSM_2 output.
FSM_2	FSM_2 output.

9.4.2 Counter Block

9.4.2.1 Counter Description

The counter block is a complex functional submodule that can be configured either as a counter, an adder, or a shifter. Apart from the normal operational control, this block has a dedicated EVENT input, which can trigger an addition, subtraction or shift operation, or load data into the counter register. The inputs to the counter submodule are shown in [Figure 9-12](#).

Figure 9-12. Counter Block

9.4.2.2 Counter Operation

At the heart of the counter block is a 32-bit count register. This register can either be loaded statically before counting commences, or dynamically at run time. The operation of the counter submodule is determined by the inputs described below. Note that each of the inputs can be connected to the outputs of any of the other blocks in the CLB tile. These connections are made by configuring the static switch block.

The counter inputs are:

- **RESET:** This is the highest priority input and takes precedence over all other inputs. The input is level sensitive and as long as the input remains high, the counter resets to 0 on the next clock cycle.
- **MODE_0:** This input is an enable for the counter. The counter begins counting (up or down depending on the MODE_1 setting) only when this input is high. If this input is low, then no counting takes place.
- **MODE_1:** This input is the direction control for the counter. If this input is high, then the counter increments on every clock cycle where MODE_0 is high. If this input is low, then the counter decrements on every clock cycle where MODE_0 is high. The counter wraps around to 0x0000 0000 after 0xFFFF FFFF when counting up. The counter wraps around to 0xFFFF FFFF after 0x0000 0000 when counting down. The only exception to this is when an EVENT occurs at exactly the same time, causing a different value to be loaded into the counter.
- **EVENT:** This input is defined for the purpose of triggering actions in the counter based on certain events. The event can be any of the outputs of the other blocks or an external input to the tile. The counter's static control inputs define the behavior of the counter on an active event. An active event is defined as a rising edge on the EVENT input. The counter can be configured to perform one of the following actions:
 - Load a predefined 32-bit value from the LOAD VALUE register into the count register
 - Shift the contents of the counter register left or right by a predefined amount between 0 and 31
 - Add or subtract a predefined 32-bit value. Addition and subtraction are treated as 32-bit unsigned operations and there is no saturation.

Note that the effect of a rising edge on the EVENT input only lasts for one cycle. On the next cycle, the counter operation continues based on the MODE_0, MODE_1, and RESET inputs.

MATCH1 REF and MATCH2 REF are 32-bit reference values that are used to generate the MATCH1 and MATCH2 outputs. The MATCH1 output becomes active high whenever the counter register value matches the 32-bit MATCH1 REF value. MATCH2 behaves in a similar manner in relation to the MATCH2 REF register. The reference values for MATCH1 and MATCH2 can either be setup once before the start of operation, or can be modified dynamically. The High Level Controller can load desired values into the MATCH1 REF and MATCH2 REF registers.

Note that the counter load and match registers are not memory-mapped. For more information, see [Section 9.5.2](#).

The three logic outputs of the counter block are:

- **ZERO:** This output goes high whenever the counter register is 0.
- **MATCH1:** This output goes high whenever the counter register is equal to the MATCH1 REF input register.
- **MATCH2:** This output goes high whenever the counter register is equal to the MATCH2 REF input register.

The operation of the counter block is controlled by the CFG_MISC_CTRL register. The following three bits of this register are relevant for each counter. The “x” below refers to the counter instance; 0, 1, or 2. For more information, see the CLB_MISC_CONTROL register description located in [Section 9.10](#).

- COUNT_EVENT_CTRL_x: This bit defines whether the counter performs an addition or a shift on an event. A value of 0 means that on an event, the counter loads the static value; 1 means an add/shift operation is performed. This bit must be 0 for indirect loads and HLC loads of the counter to take effect.
- COUNT_ADD_SHIFT_x. 1 means add, 0 means shift.
- COUNT_DIR_x. 1 means left shift or add. 0 means right shift or subtract.

Table 9-11 shows the logical operation of the counter block in terms of the inputs and control register bits. Count up and down modes are the normal operation with EVENT = 0. The operations on the CNTVAL register are:

Load: $CNTVAL = EVENT_LOAD_VAL$

Shift right: $CNTVAL = CNTVAL \gg EVENT_LOAD_VAL$

Shift left: $CNTVAL = CNTVAL \ll EVENT_LOAD_VAL$

Subtract: $CNTVAL = CNTVAL - EVENT_LOAD_VAL$

Add: $CNTVAL = CNTVAL + EVENT_LOAD_VAL$

Table 9-11. Counter Block Operating Modes

EVENT	MODE_0	MODE_1	COUNT_EVENT_CTRL_x	COUNT_ADD_SHIFT_x	COUNT_DIR_x	Action on CNTVAL
0	0	0	X	X	X	None
0	0	1	X	X	X	None
0	1	0	X	X	X	Count down
0	1	1	X	X	X	Count up
1	X	X	0	X	X	Load
1	X	X	1	0	0	Shift right
1	X	X	1	0	1	Shift left
1	X	X	1	1	0	Subtract
1	X	X	1	1	1	Add

9.4.2.3 Serializer Mode

Starting with CLB Type 2, the Counter module can operate as a serializer. In this mode of operation, this module acts as a shift register (also referred to as a serializer). In serializer mode of operation, the EVENT input is used to shift one bit of data into the serializer. Either of MATCH1 and MATCH2 can be configured to send out the shift register data. Using the MATCH1/2_TAP_SEL bit of CLB_COUNT_MATCH_TAP_SEL, any bit position of the counter can be brought out on the MATCH1/MATCH2 outputs. The shifting and direction of the counter in this mode is controlled by MODE_0 (enable) and MODE_1 (direction).

To enable the Serializer mode, CLB_MISC_CONTROL.COUNT_SERIALIZER_0 (for Counter 0) must be set.

9.4.2.4 Linear Feedback Shift Register (LFSR) Mode

Starting with CLB Type 2, the Counter module operates as a linear feedback shift register. By configuring the characteristics of the LFSR, the counter module is used to compute the CRC on a serial bit stream. The polynomial for LFSR is in the MATCH2 reference register. The feedback bit position is in the MATCH1 reference register.

To enable the LFSR mode, CLB_MISC_CONTROL.COUNT_SERIALIZER_0 (for Counter 0) must be set along with COUNT0_LFSR_EN.

There are two types of LSFR that can be selected by changing the MODE1 value (0 or 1), as shown in [Figure 9-13](#).

Structure for LFSR Type 1 (MODE_1 = 0)

CNT_VAL is the 32-bit counter's active register
 CNT_VAL_next is the 32-bit value to be written into CNT_VAL on the next active cycle
 (clock edge when MODE_0 == 1)
 LFSR_MSB = CNT_VAL[MATCH1_REF[4:0]]
 Poly[31:0] is MATCH2_REF which acts as the CRC polynomial

Structure for LFSR Type 2 (MODE_1 = 1)

CNT_VAL is the 32-bit counter register
 CNT_VAL_next is the 32-bit value to be written into CNT_VAL on the next active cycle
 (clock edge when MODE_0 == 1)
 LFSR_MSB = CNT_VAL[MATCH1_REF[4:0]]
 Poly[31:0] is MATCH2_REF which acts as the CRC polynomial

Figure 9-13. LFSR Modes

9.4.3 FSM Block

The Finite State Machine (FSM) block provides the ability to build programmable finite state machines with up to four states. The FSM block has two register bits and two external inputs, and can be programmed either as two 2-state machines or as a single 4-state machine. For additional flexibility, there are two auxiliary inputs (EXTRA_EXT_IN0 and EXTRA_EXT_IN1) that can be used to create larger combinational functions by giving up a state functionality. The structure of the FSM is shown in [Figure 9-14](#).

Figure 9-14. FSM Block

The signals and functionality of the FSM block are:

- **EXT_IN0 and EXT_IN1:** These are the two external inputs that can be used to control the output FSM_LUT_OUT or either of the states S0 and S1.
- **S0 and S1** are two state bits that have independent state control equations.
- **16-bit S0 equation** defines a function (EXT_IN1, EXT_IN0, S1, S0). The four bits in the order defined are used as an index into the 16-bit register to decide the next state of S0.
- **16-bit S1 equation** defines a function (EXT_IN1, EXT_IN0, S1, S0). The four bits in the order defined are used as an index into the 16-bit register to decide the next state of S1.
- **16-bit output equation** defines a function (EXT_IN1, EXT_IN0, S1, S0). The four bits in the order defined are used as an index into the 16-bit register to decide the output value of FSM_LUT_OUT. An additional level of configurability is provided such that FSM_LUT_OUT can use extra inputs in case the states S0 and S1 are unused.

One extra bit is used to select EXTRA_EXT_IN0 instead of S0. One extra bit is used to select EXTRA_EXT_IN1 instead of S1. Using these, one can effectively build 3-input or a 4-input LUT for the FSM_LUT_OUT by giving up one or two state bits, respectively.

The CFG_MISC_CTRL register controls the operation of the FSM block. Two bits in this register are used for each FSM Block to determine whether the FSM output LUT function uses the state variable S0/S1, or the corresponding extra external input signal FSM_EXTRA_EXT_INx. A 0 means use the state bit, and a 1 means use the FSM_EXTRA_EXT_IN0 / FSM_EXTRA_EXT_IN1 signal.

Figure 9-15. FSM LUT Block

9.4.4 LUT4 Block

This is a simple four input Look-Up table (LUT) block with inputs IN0, IN1, IN2, and IN3 (see [Figure 9-16](#)). Any combinatorial Boolean equation using the four inputs can be realized by programming the 16-bit control register associated with each LUT4 block. For more information, see the LUT4 register descriptions located in [Section 9.10](#).

Figure 9-16. LUT4 Block

9.4.5 Output LUT Block

The output LUT block ([Figure 9-17](#)) is very similar in functionality to the LUT4 block, except that the output LUT block has three inputs. Unlike the other sub blocks, the outputs of these blocks are meant to go out of the tile and hence cannot be used by any other block within the tile. Any combinatorial function of the three inputs can be realized by the output LUT block. For more information, see the output LUT register descriptions located in [Section 9.10](#).

Figure 9-17. Output LUT Block

9.4.6 Asynchronous Output Conditioning (AOC) Block

The logic in the AOC block is organized into three stages with the inputs passing through different types of logic modification at each stage before proceeding to the next level. This is shown in [Figure 9-18](#).

There are 8 inputs to this block. Each of these 8 inputs can pick the corresponding BOUNDARY input to the CLB or the CLB TILE output (for example, the INPUT 0 of the AOC block can choose between CLB BOUNDARY INPUT0 and CLB TILE OUTPUT 0). If the CLB TILE OUTPUT 0 is selected, the CLB TILE OUTPUT 0 is always registered before being sent to the subsequent asynchronous signal conditioning stages. In each of the three stages, there is always an option to do nothing and just send the signal as is to the next stage (bypass).

Stage 1: The input signal can be inverted before sending the signal to the next stage.

Stage 2: The signal coming from Stage 1 can be GATED with a gating control signal. The gating control signal can either be from a software register or can be any of the CLB TILE outputs. The GATING function can be a logical AND, OR, or XOR.

Stage 3: The input signal can be used to either set or clear the output on the rising edge of the signal. This is a purely asynchronous set/clear that occurs without needing any clocks. The release control signal, when high, restores the output to the default state (HIGH if asynchronous clear is selected and LOW if asynchronous set is selected). The release control signal can be either from a software register or can be any of the CLB TILE outputs. Optionally, instead of any of the asynchronous set and clear operations, the input signal can just be delayed by a clock cycle.

The interaction of the CLB TILE and the AOC block is shown in [Figure 9-19](#).

Figure 9-18. AOC Block

Figure 9-19. AOC Block and The CLB TILE

Note

Only CLB_OUT12 to CLB_OUT15 can be used as ASYNC outputs. This is the same as CLB_OUT4_1 to CLB_OUT7_1. GPIO Output XBAR can be used to route the OUT4_1 and OUT5_1 ASYNC outputs to GPIOs.

9.4.7 High Level Controller (HLC)

The High Level Controller (HLC) is significantly more complex than the other blocks in the CLB tile. The HLC performs two main functions:

- Provides a means of communication and data exchange with the rest of the device. This is done through two methods: a global access path to four general purpose HLC registers (R0 through R3) and PUSH and PULL FIFOs between the CPU and the HLC. The general-purpose HLC registers are designed to only be written to during device configuration time. To avoid unexpected behavior, the HLC registers must not be written to during run-time operation. The PUSH and PULL FIFOs are the primary avenues of data exchange during run-time, refer to [Section 9.4.7.4](#) for more information.
- Provides a programmable, event-based action system, which performs computation, manipulation of logic functionality, and data movement. In other words, events can be configured to trigger a predefined set of actions in the CLB tile, or to initiate data exchange with the rest of the device.

The architecture of the HLC is shown in [Figure 9-20](#). The HLC is an event-based system capable of handling up to four simultaneous events that can be selected from any outputs of the other blocks within the tile or from an external input.

Figure 9-20. High Level Controller Block

9.4.7.1 High Level Controller Events

Each of the four HLC events has a dedicated address from which instructions are executed. Events are selected from the set of signals listed in [Table 9-12](#). The lowest numbered event (Event 0) has the highest priority, and the highest numbered event (Event 3) has the lowest priority.

Table 9-12. HLC Event List

Index	HLC Event Mux
0	Always 0
1	COUNTER_0 MATCH2
2	COUNTER_0 ZERO
3	COUNTER_0 MATCH1
4	FSM_0 STATE_BIT_0
5	FSM_0 STATE_BIT_1
6	FSM_0 LUT output

31	CLB_ASYNC_OUT_7.INVERTED

9.4.7.2 High Level Controller Instructions

The instruction memory supports up to eight instructions per event. Each instruction sequence gets triggered on the rising edge of the corresponding event. Starting with CLB Type 2, the option to trigger the execution of instructions using both falling edge and rising edge is available.

The HLC memory supports up to eight instructions per event, starting at the beginning of the fixed address range shown in [Table 9-14](#). An instruction sequence is triggered on the rising edge of the corresponding event. If two or more events occur simultaneously, the associated instruction sequences each are executed sequentially in priority order.

Table 9-14. HLC Instruction Address Ranges

Address	Instructions for
00000 to 00111	Event 0
01000 to 01111	Event 1
10000 to 10111	Event 2
11000 to 11111	Event 3

The HLC instruction format is shown in [Table 9-15](#).

Table 9-15. HLC Instruction Format

Last Instruction Bit	5-Bit Opcode	3-Bit Source	3-Bit Destination
This bit when set to 1 stops execution after the current instruction.	MOV 00000	Source can be R0, R1, R2, R3, C0, C1, C2.	Destination can be R0, R1, R2, R3, C0, C1, C2. Note that for ADD/SUB instructions, only R0, R1, R2, or R3 can be the destination.
	MOV_T1 00001		
	MOV_T2 00010		
	PUSH 00011		
	PULL 00100		
	ADD 00101		
	SUB 00110		
	INTR 00111		

R0, R1, R2, and R3 are four 32-bit general-purpose registers in the HLC. C0, C1, and C2 are three counter registers present in the CLB tile. <Src> is used to indicate the source and <Dest> is used to indicate the destination. [Table 9-16](#) describes the HLC instructions.

Table 9-16. HLC Instruction Description

Instruction	Description
ADD <Src>, <Dest>	This instruction performs an unsigned 32-bit addition. <Dest> = <Dest> + <Src>. The <Src> can be R0, R1, R2, R3, C0, C1, or C2. The <Dest> can only be R0, R1, R2, or R3.
INTR <6-bit constant>	This instruction flags an interrupt through the CPU interface. The 6-bit constant is stored in the interrupt flag register CLB_INTR_TAG_REG. If multiple INTR instructions are called consecutively, only the first one has an effect. When multiple INTR calls are needed, each can be separated by other HLC instructions to make sure the interrupt calls take effect.
Note Starting with CLB Type 2, NMI can be generated by the CLB. This feature is DISABLED by default and must be enabled (CLB_LOAD_EN.NMI_EN).	
MOV <Src>, <Dest>	This instruction moves <Src> to <Dest>. Both <Src> and <Dest> can be any of R0, R1, R2, R3, C0, C1, or C2. The COUNT_EVENT_CTRL_x bit must be configured to load (that is, 0) for indirect loads and HLC loads of the counter to take effect.

Table 9-16. HLC Instruction Description (continued)

Instruction	Description
MOV_T1 <Src>, <Dest>	This instruction moves <Src> to the Match1 register of the <Dest> counter. <Src> can be any of the registers R0, R1, R2, R3, or the counter values associated with C0, C1, or C2. <Dest> is the Match1 register of any of the counters C0, C1, or C2. Examples are: - This instruction moves the count value in C1 into register R0: MOV_T1 C1 R0 - This instruction moves the value in R2 into the Match1 register of counter C0: MOV_T1 R2 C0
MOV_T2 <Src>, <Dest>	This instruction is similar to MOV_T1. The instruction moves <Src> to the Match2 register of the <Dest> counter. <Src> can be any of the registers R0, R1, R2, R3, or the counter values associated with C0, C1, or C2. <Dest> is the Match2 register of any of the counters C0, C1, or C2.
PULL <Dest>	This instruction transfers data from the data exchange pull memory buffer in the CPU interface to the <Dest> register. <Dest> can be any of R0, R1, R2, or R3. The PULL instruction is used as seen from the High Level Controller and a PULL operation reads (pulls) data from an internal 4-word FIFO.
PUSH <Src>	This instruction transfers data from <Src> to the data exchange push memory buffer in the CPU interface. <Src> can be any of R0, R1, R2, R3, C0, C1, or C2. The PUSH instruction is used as seen from the High Level Controller and pushes data into an internal 4 word FIFO.
SUB <Src>, <Dest>	This instruction performs an unsigned 32-bit subtraction. <Dest> = <Dest> - <Src>. The <Src> can be R0, R1, R2, R3, C0, C1, or C2. The <Dest> can only be R0, R1, R2, or R3.

MOV, MOV_T1, MOV_T2, ADD, SUB, and INTR instructions take one cycle to execute. PUSH and PULL require two cycles to execute. Note that the PUSH and PULL instructions are pipeline protected, meaning that a register can be used immediately after a PUSH/PULL to that register.

For multiple events triggered simultaneously, if the last instruction in the higher priority event is a PUSH or a PULL, there is an additional cycle delay between the end of the higher priority event and the start of the next event. If the last instruction is not a PUSH or PULL, then there is no cycle delay between the events.

9.4.7.3 <Src> and <Dest>

Three bits are used to encode the <Src> and <Dest> registers as shown in [Table 9-17](#).

Table 9-17. HLC Register Encoding

Bits	Register
000	R0
001	R1
010	R2
011	R3
100	C0
101	C1
110	C2

9.4.7.4 Operation of the PUSH and PULL Instructions (Overflow and Underflow Detection)

The PUSH and PULL operations of the HLC are intended for data exchange with the host system. There are separate FIFO buffers for PUSH and PULL operations. For example, a series of PUSH operations write to successive locations in a linearly mapped-memory buffer. The PUSH buffer and the PULL buffer are mapped at address offsets shown in the *Registers* section.

The CPU can read from and write to the PUSH and PULL buffers, respectively, to exchange data with the HLC. Data pushed by the HLC is read by the CPU from the PUSH buffers. Data sent from the CPU to the HLC is written by the CPU to the PULL buffer and is read by the HLC using the PULL instruction.

Refer to *clb_ex13_push_pull* for guidance on properly using the PUSH and PULL buffers. To make use of one of the CLB inputs as a GPREG, have this input indicate when data is written to the FIFO by the CPU.

There are separate PUSH and PULL address pointers that increment each time the HLC performs a PUSH or PULL operation. These address pointers are also memory-mapped so that the CPU can determine the value. These address pointers are also writable and can be reset by the CPU at any time.

Overflow and underflow detection is done by simply reading the values of the PUSH and PULL address pointers.

In the CLB module of the device, the depth of the PUSH and PULL FIFOs is four 32-bit words each. If the CPU starts a fresh data transfer to the PULL buffers and sees the address pointer greater than four, then an underflow has occurred since the HLC has pulled more data than the number of words written by the CPU into the buffer.

9.5 CPU Interface

9.5.1 Register Description

There are three classes of registers that are used to control and configure the CLB tile. This specification only describes the offset addresses of the registers. The absolute register addresses are different for each CLB tile. The three instances of the various blocks (LUT4, FSM, and Counter Block) are numbered 0, 1, and 2.

- **Logic configuration registers (0x000 – 0x0FF):** These registers control the core reconfiguration logic for the tile. All registers in this group are EALLOW protected and also protected by the LOCK register.
- **Top level control registers (0x100 – 0x1FF):** These registers are used for top level and device related control of the CLB. These registers typically control mux selects for inputs, global enables, and so forth, and are accessible by normal memory mapped access. Some of these registers have EALLOW and LOCK protection.
- **Data exchange registers (0x200 – 0x3FF):** These registers are used to exchange data between the CLB and the rest of the device. The registers are accessible by normal memory-mapped access and no EALLOW or LOCK protection exists.

Note

EALLOW protection means that the write access to the register is enabled only when the EALLOW instruction has been executed prior to the write access. The complementary EDIS instruction disables access to all registers protected in this way. For more information, see [Section 9.10](#).

9.5.2 Non-Memory Mapped Registers

The memory-mapped CLB registers are described later in this chapter; however, many of the CLB resources including counters, the instruction memory of the High Level Controller, and the HLC general-purpose registers (R0 through R3) are only indirectly accessible through a local interface bus and are not memory-mapped. These registers are accessible through the two memory-mapped registers CLB_LOAD_DATA and CLB_LOAD_ADDR. Note that the general-purpose registers R0 through R3 must only be written to during configuration-time and are not intended to be written to during run-time. Writes during run-time can lead to unexpected behavior. If run-time data exchange is desired, refer to [Section 9.4.7.4](#).

Load the data to be written into the CLB_LOAD_DATA register, then load the appropriate address into CLB_LOAD_ADDR to determine where this data is written. Writing a 1 to bit position 0 in the CLB_LOAD_EN register then causes an internal write operation to be triggered. The address allocation for the CLB_LOAD_ADDR register is shown in [Table 9-18](#).

Note

The COUNT_EVENT_CTRL_x bit must be configured to load (that is, 0) for indirect loads and for HLC loads of the counter to take effect.

Table 9-18. Non-Memory Mapped Register Addresses

Address (Binary)	Resource
000000 to 000010	Counter 0 to 2 Load value
000100 to 000110	Counter 0 to 2 Match1 value
001000 to 001010	Counter 0 to 2 Match2 value
001100 to 001111	R0 to R3 of High Level Controller
100000 to 100111	Instructions for Event 0
101000 to 101111	Instructions for Event 1
110000 to 110111	Instructions for Event 2
111000 to 111111	Instructions for Event 3

Use the following steps to load the value 0x11223344 into the general purpose R0 register:

1. Write 0x11223344 to CLB_LOAD_DATA.
2. Write 0xc to CLB_LOAD_ADDR.
3. Write 0x1 to CLB_LOAD_EN.

Note

Even though HLC registers are accessible by the CPU, your application code needs to make sure that no other CLB internal logics are updating the same HLC register at the same time, causing a race condition.

9.6 DMA Access

The DMA does not have access to the CLB memory-mapped registers, including the PUSH and PULL FIFO registers. For more information, refer to [Section 9.10](#).

9.7 CLB Data Export Through SPI RX Buffer

For a continuous export of data from the CLB peripherals, SPI RX buffers can be used. CLB data can be exported through the SPI RX buffers without CPU/CLA interventions.

For the F2838x devices, CLB1 to CLB4 have access to SPIA to SPID, respectively, as shown in [Table 9-19](#).

Table 9-19. CLB to SPI RX Access

CLB Instance	SPI Instance
CLB1	SPIA
CLB2	SPIB
CLB3	SPIC
CLB4	SPID

When the CLB to SPI data exporting is enabled, 16-bit data can be exported from CLB to SPI RX buffers. The 32-bit HLC R0 register is the data that is exported to the SPI RX buffers. The user can select which 16-bit range of the HLC R0 is exported by configuring the **CLB_SPI_DATA_CTRL_HI.SHIFT**. The CLB also controls when HLC R0 data must be transferred to the SPI RX buffer through **CLB_SPI_DATA_CTRL_HI.STRB** that selects one of the HLC event signals from the static switch block.

When CLB to SPI data exporting is required, note:

- The selected SPI transmit functionality is not affected.
- Even though the data is being pushed into the SPI RX buffers by the CLB, the SPI RX interrupt and the DMA trigger for SPI RX in the respective peripherals must be configured.
- The SPI can resume normal operation when the CLB to SPI data exporting is disabled.

Figure 9-21. CLB Control of SPI RX Buffer

9.8 CLB Pipeline Mode

When operating the CLB TILE at frequencies higher than 100MHz, the Pipeline mode **MUST** be enabled. When CLB Pipeline mode is enabled, the operations of the HLC and COUNTER modules are changed.

- When operating at higher frequencies that require Pipeline mode to be enabled, the pipelined versions of the the CLB CELL OUTPUTs are brought into the HLC. The Pipeline mode causes the CELL outputs delayed by 1 clock cycle to be used as the source of the HLC event triggers.
- In Pipeline mode, the COUNTER module's add/sub/shift operations, which are triggered by an event, use the value of the counter in the previous clock cycle (pipelined).

To enable the CLB Pipeline mode, set the `CLB_LOAD_EN.PIPELINE_EN`.

9.9 Software

9.9.1 CLB Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#\driverlib\DEVICE_GPN/examples\CORE_IF_MULTICORE\clb

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](https://dev.ti.com/C2000Ware/Examples).

9.9.1.1 CLB Empty Project

FILE: empty.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

9.9.1.2 CLB Combinational Logic

FILE: clb_ex1_combinatorial_logic.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

The objective of this example is to prevent simultaneous high or low outputs on a PWM pair. PWM modules 1 and 2 are configured to generate identical waveforms based on a fixed frequency up-count mode.

9.9.1.3 CLB GPIO Input Filter

FILE: clb_ex2_gpio_input_filter.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

This example demonstrates use of finite state machines (FSMs) and counters to implement a simple 'glitch' filter which might, for example, be applied to an incoming GPIO signal to remove unwanted short duration pulses.

9.9.1.4 CLB Auxiliary PWM

FILE: clb_ex3_auxiliary_pwm.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

This example configures a CLB tile as an auxiliary PWM generator. The example uses combinatorial logic (LUTs), state machines (FSMs), counters, and the high level controller (HLC) to demonstrate the PWM output generation capabilities using CLB.

9.9.1.5 CLB PWM Protection

FILE: clb_ex4_pwm_protection.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

This example extends the features of example 1 to ensure an active high complementary pair PWM configuration always operates with a minimum value of dead-band irrespective of how the generating PWM module is configured. The example illustrates the configuration of four separate PWM tiles to implement PWM protection on four PWM modules. The outputs of PWM modules 1 to 4 are operated on by CLB tiles 1 to 4, respectively.

9.9.1.6 CLB Event Window

FILE: clb_ex5_event_window.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

This example uses the counter, FSM, and HLC sub-modules of the CLB to implement an event timing feature which detects whether an interrupt service routine takes too long to respond to an interrupt. The example configures four PWM modules to operate in up-count mode and generate a low-to-high edge on a timer zero match event. The zero match event also triggers a PWM ISR which, for the purposes of this example, contains a dummy payload of variable length. At the end of the ISR, a write operation takes place to a CLB GP register to indicate the ISR has ended.

9.9.1.7 CLB Signal Generator

FILE: clb_ex6_siggen.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

This example uses CLB1 to generate a rectangular wave and CLB2 to check the rectangular wave generated by CLB1 doesn't exceed the defined duty cycle and period limits.

9.9.1.8 CLB State Machine

FILE: clb_ex7_state_machine.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\Designing With the C2000 CLB.pdf This application report describes the process of creating this CLB example and can be used as guidance on designing custom logic with the CLB. This example uses all submodules inside a CLB TILE in order to implement a complete system.

9.9.1.9 CLB External Signal AND Gate

FILE: clb_ex8_external_signal_AND_gate.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, two external signals from two GPIOs are passed through the Input X-BAR and the CLB X-BAR to the CLB TILE. Inside the CLB module these two signals are ANDED. The output of the AND gate is then exported to a GPIO, using Output X-BAR.

9.9.1.10 CLB Timer

FILE: clb_ex9_timer.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, a COUNTER module is used to create timed events. The use of the GP Register is shown. Through setting/clearing the bits in the GP register, the timer is started, stopped or changes direction. The output of the timer event (1-clock cycle) is exported to a GPIO. Interrupts are generated from the timer event using the HLC module. A GPIO is also toggled inside the CLB ISR. The indirect CLB register access is used to update the timer's event match value and the active counter register to modify the frequency of the timer.

9.9.1.11 CLB Timer Two States

FILE: clb_ex10_timer_two_states.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, the timer is setup the same as the previous example. The difference is the use of the FSM submodule to toggle the output of the CLB which is then exported to a GPIO. The FSM module acts as a single bit memory block. Interrupts are setup in the same format as the previous example. The interrupt delay of the CLB can be seen by comparing the output of the CLB and the GPIO toggled in the ISR.

9.9.1.12 CLB Interrupt Tag

FILE: clb_ex11_interrupt_tag.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, a timer is setup with two different match values. These two events are used by the HLC submodule to generate interrupts. The interrupt TAG is used to differentiate between the interrupt generated due to the match1 event of the CLB counter and the match2 event of the CLB counter.

9.9.1.13 CLB Output Intersect

FILE: clb_ex12_output_intersect.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, the CLB module is set up the same as the external_AND_gate example. However, instead of the output being exported to the GPIO using Output X-BAR, the output is exported to the GPIO by replacing the output of ePWM1. This is done by configuring the GPIO for EPWM1A output, followed by enabling output intersection.

9.9.1.14 CLB PUSH PULL

FILE: clb_ex13_push_pull.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, the use of the PUSH-PULL interface is shown. Multiple COUNTER submodules, HLC submodule, FSM submodules, and OUTLUT submodules are used. The PUSH-PULL interface is used alongside the GP register to update the COUNTER submodules' event frequencies.

9.9.1.15 CLB Multi Tile

FILE: clb_ex14_multi_tile.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the output of a CLB TILE is passed to the input of another CLB TILE. The output of the second CLB TILE is then exported to a GPIO, showcasing how two CLB TILES can be used in series.

9.9.1.16 CLB Tile to Tile Delay

FILE: clb_ex15_tile_to_tile_delay.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the output of a GPIO is taken into the CLB TILE through INPUT XBAR and the CLB XBAR. The signal is forwarded by the TILE to the next TILE. This time the signal only goes through the CLB XBAR and NOT the Input XBAR. This is done to show that delays are added when the signals are passed from TILE to TILE and the delay is NOT characterized. The user should always avoid passing signals with timing requirements between tiles. The COUNTER modules inside the CLBs will count the amount of delay in cycles.

9.9.1.17 CLB based One-shot PWM

FILE: clb_ex17_one_shot_pwm.c

For the detailed description of this example, please refer to :

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

9.9.1.18 CLB AOC Control

FILE: clb_ex18_aoc.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the Asynchronous Output Conditioning block is used to asynchronously AND gate the input signals to the CLB. This module is only available for CLB types 2 and up.

9.9.1.19 CLB AOC Release Control

FILE: clb_ex19_aoc_release_control.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the Asynchronous Output Conditioning block is used to asynchronously set/release the input signals to the CLB. This module is only available for CLB types 2 and up.

9.9.1.20 CLB XBARS

FILE: clb_ex20_clbxbars.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the CLB INPUTXBAR and CLB OUTPUTXBAR are used to take input signals from GPIOs into the CLB TILES and take output signal from the TILE to GPIOs. The availability of these XBARS are device dependent.

9.9.1.21 CLB AOC Control

FILE: clb_ex21_clockprescalar_nmi.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the clock prescalar of the CLB module is used to divide down the CLB clock and use it as an input to the TILE logic. Also the HLC module is used to generate NMI interrupts. This module is only available for CLB types 2 and up.

9.9.1.22 CLB Serializer

FILE: clb_ex22_serializer.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the CLB COUNTER is used in serializer mode to act as a shift register. This module is only available for CLB types 2 and up.

9.9.1.23 CLB LFSR

FILE: clb_ex23_lfsr.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the CLB COUNTER module is used in Linear Feedback Shift Register (LFSR) mode. This module is only available for CLB types 2 and up.

9.9.1.24 CLB Lock Output Mask

FILE: clb_ex24_lock_output_mask.c

For the detailed description of this example, please refer to:
C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the lock output mask feature of the CLB is used to lock the selected output signal override settings. This module is only available for CLB types 3 and up.

9.9.1.25 CLB INPUT Pipeline Mode

FILE: clb_ex25_input_pipeline.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the CLB Input Pipeline mode is enable to delay the input signal by a clock cycle. This module is only available for CLB types 3 and up.

9.9.1.26 CLB Clocking and PIPELINE Mode

FILE: clb_ex26_clocking_pipeline.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the CLB pipeline mode is enable and affects the behavior of the CLB COUNTERs and HLC. This module is only available for CLB types 3 and up.

9.9.1.27 CLB SPI Data Export

FILE: clb_ex27_spi_data_export.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the high speed data export feature of the CLB is used and one of the HLC registers is exported out of the CLB module using the SPI RX buffer. This module is only available for CLB types 3 and up.

9.9.1.28 CLB SPI Data Export DMA

FILE: clb_ex28_spi_data_export_dma.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example the high speed data export feature of the CLB is used and one of the HLC registers is exported out of the CLB module using the SPI RX buffer. The data received in the SPI RX buffer is transferred to memory using DMA. This module is only available for CLB types 3 and up.

9.9.1.29 CLB Trip Zone Timestamp

FILE: clb_ex29_timestamp.c

This example displays how to timestamp interrupts generated by the CLB. An interrupt is generated when ePWM1 is tripped.

ePWM1 is configured to be interrupted by TZ1 and TZ2, both one shot trip sources.

The CLB is configured as follows:

- COUNTER0 and COUNTER1 continually count when the program begins.
- COUNTER0 timestamps TZ1 and COUNTER1 timestamps TZ2.
- COUNTER2 increments once when COUNTER0/COUNTER1 overflows using LUT2.
- FSM0/1 are configured to sync counters and stop COUNTER0/1 when an interrupt is received.
- TZ1 (GPIO12) and TZ2 (GPIO13) are routed as inputs through CLBXBAR.
- BOUNDARY.boundaryInput0 denotes TZ1. On rising edge, HLC issues an interrupt with tag 12.
- BOUNDARY.in1 denotes TZ2. On rising edge, HLC issues an interrupt with tag 13.
- BOUNDARY.boundaryInput7 serves as a simultaneous enable for COUNTER0/1 to begin counting.

TZ1 is tripped when GPIO12 is connected to GND. TZ2 is tripped when GPIO13 is connected to GND. When an interrupt occurs, the interrupt handler determines the initial trip source and stores this value in a variable 'initialTripZone'.

View these variables in Debug Expressions tab:

initialTripZone: stores the first TZ to have been tripped tz1Counter64bit: stores the counter value at the instant that TZ1 is tripped. tz2Counter64bit: stores the counter value at the instant that TZ2 is tripped.

9.9.1.30 CLB CRC

FILE: clb_ex30_cyclic_redundancy_check.c

For the detailed description of this example, please refer to:

C2000Ware_PATH\utilities\clb_tool\clb_syscfg\doc\CLB Tool Users Guide.pdf

In this example, the CLB module is used to perform the cyclic redundancy check (C.R.C.) with twelve messages in bits checked with ten different CRC polynomials.

First element passed in is message length, second is the message stored in input_data

This example is only available for CLB types 2 and up.

The known values in the output_data are compared with expected values from the CLB-based CRC calculation. A total of 120 messages are verified, and the number of matching messages are displayed in passCount

Variables to add to Watch Expressions in debug view: passCount - number of messages that match between generated and known CRC values failCount - number of messages that fail the CRC value verification

9.10 CLB Registers

This section describes the Configurable Logic Block Registers.

9.10.1 CLB Base Address Table (C28)

Table 9-20. CLB Base Address Table (C28)

9.10.2 CLB_LOGIC_CONFIG_REGS Registers

Table 9-21 lists the memory-mapped registers for the CLB_LOGIC_CONFIG_REGS registers. All register offset addresses not listed in **Table 9-21** should be considered as reserved locations and the register contents should not be modified.

Table 9-21. CLB_LOGIC_CONFIG_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
2h	CLB_COUNT_RESET	Counter Block RESET	EALLOW, LOCK	Go
4h	CLB_COUNT_MODE_1	Counter Block MODE_1	EALLOW, LOCK	Go
6h	CLB_COUNT_MODE_0	Counter Block MODE_0	EALLOW, LOCK	Go

Table 9-21. CLB_LOGIC_CONFIG_REGS Registers (continued)

Offset	Acronym	Register Name	Write Protection	Section
51h	CLB_SPI_DATA_CTRL_HI	CLB to SPI buffer control High	EALLOW, LOCK	Go

Complex bit access types are encoded to fit into small table cells. [Table 9-22](#) shows the codes that are used for access types in this section.

Table 9-22. CLB_LOGIC_CONFIG_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1C	W1C	Write 1 to clear
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

9.10.2.1 CLB_COUNT_RESET Register (Offset = 2h) [Reset = 00000000h]

CLB_COUNT_RESET is shown in [Figure 9-22](#) and described in [Table 9-23](#).

Return to the [Summary Table](#).

3Eh	CLB_DBG_OUT	Outputs of various units in the Cell		Go

Complex bit access types are encoded to fit into small table cells. [Table 9-64](#) shows the codes that are used for access types in this section.

Table 9-64. CLB_LOGIC_CONTROL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
R-1	R -1	Read Returns 1s
Write Type		

Table 9-64. CLB_LOGIC_CONTROL_REGS Access Type Codes (continued)

Access Type	Code	Description
W	W	Write
W1C	W 1C	Write 1 to clear
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

9.10.3.1 CLB_LOAD_EN Register (Offset = 0h) [Reset = 0000h]

CLB_LOAD_EN is shown in [Figure 9-62](#) and described in [Table 9-65](#).

Return to the [Summary Table](#).

Global enable & indirect load enable control, only Global Enable Bit is LOCK protected

Figure 9-62. CLB_LOAD_EN Register

15	14	13	12	11	10	9	8

RESERVED			PIPELINE_EN	NMI_EN	STOP	GLOBAL_EN	LOAD_EN
R-0-0h			R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h

Table 9-65. CLB_LOAD_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
15-5	RESERVED	R-0	0h	Reserved
4	PIPELINE_EN	R/W	0h	This bit controls pipelining of all the CLB operations in HLC and Counter blocks. Pipelined operation is enabled when this bit is set to 1. Reset type: SYSRSn
3	NMI_EN	R/W	0h	This bit controls the generation of NMI along with the interrupt whenever a INTR operation is executed by the HLC. NMI generation is disabled by default. It will be enabled when this bit is set to 1. Reset type: SYSRSn
2	STOP	R/W	0h	This bit defines the behaviour of the sequential elements in the CELL during debug HALTs of the CPU. If this bit is set to 0, the debug HALT condition is ignored. Reset type: SYSRSn
1	GLOBAL_EN	R/W	0h	This bit is a global enable signal for the logic in the CELL. This also acts as a soft reset for the CELL logic. CLB outputs (including LUTs and OUTLUTs) will be gated when this bit is cleared from 1 to 0, i.e., the CLB outputs will be low when GLOBAL_EN is low. Additionally, the FSM and AOC blocks will also be reset. Note that when this bit goes low, the COUNTER blocks and HLC are simply halted, but they will NOT be reset internally. This allows the ability to preload these submodules when GLOBAL_EN is 0. This bit is normally set after all the other configuration settings are completed. This bit is LOCK protected. Reset type: SYSRSn
0	LOAD_EN	R/W	0h	A write with this bit set to 1 will pulse the Load Enable signal for the indirect register loads in the CELL. Reset type: SYSRSn

9.10.3.2 CLB_LOAD_ADDR Register (Offset = 2h) [Reset = 00000000h]

CLB_LOAD_ADDR is shown in [Figure 9-63](#) and described in [Table 9-66](#).

Table 9-77. CLB_PRESCALE_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PRESCALE	R/W	0h	16-bit Value of prescaler to be used for the counter as reference to reset when reaching this value. The counter is a simple incrementing counter which will count up to the reference value and reset to 0 and this cycle will continue as long as the counter is enabled. This 16-bit register value is used as a reference for the 16-bit counter to reset to zero whenever count reaches this value. Reset type: SYSRSn
15-6	RESERVED	R-0	0h	Reserved
5-2	TAP	R/W	0h	TAP Select value. These 4 bits will be used as a select to tap one of the 16 register bit position of the counter as the output. 0000 selects Counter Bit position 0 0001 selects Counter Bit position 1 1111 selects Counter Bit position 15 Reset type: SYSRSn
1	STRB	R/W	0h	When set to 0, a strobe output will be sent out whenever the counter value matches the PRESCALE_VALUE. When set to 1, the output of the counter register bit position as selected by TAP_SELECT_VALUE will be sent out. Reset type: SYSRSn
0	CLKEN	R/W	0h	Enable the prescale clock/strobe generator. A 16-bit counter is used to either generate a strobe or send out a selected counter bit position to the CLB CELL. This is meant to be a general purpose strobe/prescaled clock which can be used by the CELL logic if needed. This will be sent to the CELL through one of the LCL_IN MUX ports. Reset type: SYSRSn

9.10.3.14 CLB_INTR_TAG_REG Register (Offset = 20h) [Reset = 0000h]

CLB_INTR_TAG_REG is shown in [Figure 9-75](#) and described in [Table 9-78](#).

9.10.4 CLB_DATA_EXCHANGE_REGS Registers

[Table 9-91](#) lists the memory-mapped registers for the CLB_DATA_EXCHANGE_REGS registers. All register offset addresses not listed in [Table 9-91](#) should be considered as reserved locations and the register contents should not be modified.

Table 9-91. CLB_DATA_EXCHANGE_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	CLB_PUSH	CLB_PUSH FIFO Registers (from HLC)		Go
40h	CLB_PULL	CLB_PULL FIFO Registers (TO HLC)		Go

Complex bit access types are encoded to fit into small table cells. [Table 9-92](#) shows the codes that are used for access types in this section.

Table 9-92. CLB_DATA_EXCHANGE_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

9.10.4.1 CLB_PUSH Register (Offset = 0h) [Reset = 00000000h]

This chapter describes the Dual-Clock Comparator (DCC) module.

10.1 Introduction.....	1348
10.2 Module Operation.....	1349
10.3 Interrupts.....	1355
10.4 Software.....	1356
10.5 DCC Registers.....	1358

10.1 Introduction

The dual-clock comparator module is used for evaluating and monitoring the clock input based on a second clock, which can be a more accurate and reliable version. This instrumentation is used to detect faults in clock source or clock structures, thereby enhancing the system's safety metrics.

10.1.1 Features

The main features of each of the DCC modules are:

- Allows the application to make sure that a fixed ratio is maintained between frequencies of two clock signals.
- Supports the definition of a programmable tolerance window in terms of the number of reference clock cycles.
- Supports continuous monitoring without requiring application intervention.
- Supports a single-sequence mode for spot measurements.
- Allows the selection of a clock source for each of the counters, resulting in several specific use cases.

10.1.2 Block Diagram

Figure 10-1 shows how the DCC connects to the rest of the system. Figure 10-2 shows the main concept of the DCC module.

Figure 10-1. DCC Module Overview

Figure 10-2. DCC Operation

10.2 Module Operation

As shown in [Figure 10-2](#), DCC contains three counters – Counter0, Valid0 and Counter1. Initially, all counters are loaded with the user-defined, pre-load value. Counter0 and Counter1 start decrementing once the DCC is enabled at rates determined by the frequencies of Clock0 and Clock1, respectively. When Counter0 equals 0 (expires), the Valid0 counter decrements at a rate determined by Clock0. If Counter1 decrements to 0 in the valid window, then no error is generated and Clock1 is considered to be good within allowable tolerance as configured by the user.

10.2.1 Configuring DCC Counters

Counter0 and Counter1 are configured based on the ratio between the frequencies of Clock0 and Clock1 ($F_{clk1} \times \text{Counter0} = F_{clk0} \times \text{Counter1}$). The Valid0 counter provides tolerance and is configured based on the error in DCC. Since Clock0 and Clock1 are asynchronous, the start and stop of the counters do not occur synchronously. Hence, while configuring the counters, two different sources of errors must be accounted for:

- DCC Errors due to the asynchronous timing of Clock0 and Clock1: this depends on the frequency of Clock0 and Clock1:
 - If $F_{clk1} > F_{clk0}$, then Async. Error (in Clock0 cycles) = $2 + 2 \times (F_{sysclk}/F_{clk0})$
 - If $F_{clk1} < F_{clk0}$, then Async. Error (in Clock0 cycles) = $2 \times (F_{clk0}/F_{clk1}) + 2 \times (F_{sysclk}/F_{clk0})$
 - If F_{clk1} is unknown, then Async. Error (in Clock0 cycles) = $2 + 2 \times (F_{sysclk}/F_{clk0})$
- Digitization Error = 8 Clock0 cycles

DCC Error (in Clock0 Cycles) = Async. Error + Digitization Error

DCC error shows up as a frequency error for clock under measurement. This error is DCC induced and does not represent error in frequency of clock under measurement. The application needs to take this into consideration while configuring the counters, and determine a desirable tolerance for DCC error that defines the window of measurement. To illustrate:

Window (in Clock0 Cycles) = (DCC Error) / (0.01 × Tolerance)

For example, if DCC Error is 10 and the tolerance desired is +/-0.1%, then:

$$\text{Window (in Clock0 Cycles)} = 10 / (0.01 \times 0.1) = 10000$$

Based on above formula for Window, if the desired tolerance is low, then the counter values are large and increase the window of measurement. This means that counter values for a tolerance of 0.1% are larger than that of 0.2%. So, based on the application defined tolerance, define the window of measurement in terms of Clock0 cycles.

The clock under measurement can have an allowed frequency error. If this error is expected, then the error can also be accounted while configuring counters. For example, if measuring INTOSC1/2 frequency using an external crystal as a reference clock, the allowable tolerance of INTOSC1/2 (for example, +/-1%) can be accounted for and factored into the counter configuration. The formula is:

$$\text{Frequency Error Allowed (in Clock0 Cycles)} = \text{Window} \times (\text{Allowable Frequency Tolerance (in \%)} / 100)$$

$$\text{Total Error (in Clock0 Cycles)} = \text{DCC Error} + \text{Frequency Error Allowed}$$

The following equations are used to configure counter values:

$$\text{Counter0 (DCCNTSEED0)} = \text{Window} - \text{Total Error}$$

$$\text{Valid0 (DCCVALIDSEED0)} = 2 \times \text{Total Error}$$

$$\text{Counter1 (DCCNTSEED1)} = \text{Window} \times (F_{clk1}/F_{clk0})$$

Note

Counter1 is a 20-bit counter, so the maximum possible value cannot exceed 1048575. If the value does exceed, then increase the desired Tolerance for DCC error, so that Window of measurement is lowered. The following formula can be used to compute minimum tolerance possible:

$$\text{Tolerance (\%)} = (100 \times \text{DCC Error} \times (F_{clk1}/F_{clk0})) / 1048575$$

10.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot-checking the frequency of a signal.

Example-1: Validating PLLRAWCLK frequency

A practical example of the usage is to validate the PLL output clock frequency using the XTAL as the reference clock. Assume XTAL is 10MHz, PLL output frequency is 100MHz, SYSCLK is 100MHz, allowable Frequency Tolerance is 0.1%, and DCC Tolerance required is 0.1%. The measurement sequence proceeds as follows:

- Set Clock0 source for Counter0 and Valid0 as XTAL, and Clock1 source for Counter1 as PLL output clock.
- Based on the equations defined in [Section 10.2.1](#), calculated seed values for Counters can be Counter0 = 29940; Valid0 = 120; Counter1 = 300000
- Once the DCC is enabled, the counters Counter0 and Counter1 both start counting down from the seed values.
- When Counter0 reaches zero, Counter0 automatically triggers the Valid0 counter.
- When Valid0 reaches zero and Counter1 is not zero, an ERROR status flag is set and a "DCC error" is sent to the PIE. Counter1 is frozen so that the counter stops counting down any further. The application can enable an interrupt to be generated from the PIE whenever this DCC error is indicated. Refer to the PIE Channel Mapping table in the *System Control and Interrupts* chapter to determine the channel mapping of the DCC Interrupt.
- The application then needs to clear the ERROR status flag and restart the DCC module so that the module is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that Clock1 is faster than expected, or Clock0 is slower than expected. This error includes the case when Clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that Clock1 is slower than expected. This error includes the case when Clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application can then read out the counter values to help determine what caused the error.

Example-2: Measuring AUXCLKIN frequency

Another example of single-shot mode is to measure the frequency of AUXCLKIN (unknown frequency) using INTOSC1 (10MHz) as the reference clock and SYSClk is 10MHz. The measurement sequence proceeds as follows:

- Set Clock0 source for Counter0 and Valid0 as INTOSC1 (10MHz), and Clock1 source for Counter1 as AUXCLKIN.
- Now configure counter values using equations in [Section 10.2.1](#). For tolerance = $\pm 0.1\%$, Total Error = 10 clock0 cycles; Window = 10000 clock0 cycles; Counter0 = 9990; Valid0 = 20. Since Clock1 frequency (Fclk1) is unknown, the Counter1 value can be set to the maximum value, 1048575 (0xFFFFF).
- Once the DCC is enabled, the counters Counter0 and Counter1 both start counting down from the seed values.
- Since Counter1 is set to the maximum value, 1048575, the counter does not expire when Counter0 and Valid0 have expired. This generates an error that is expected and the application ignores this error and uses Counter1 values to compute the frequency of Clock1 (Fclk1).
- Knowing the frequency of Clock0 (INTOSC1), Fclk0 = 10MHz, and using [Equation 1](#), the frequency of AUXCLKIN, Fclk1, can be measured:

$$F_{clk1} = \frac{F_{clk0} \times (1048575 - \text{Meas. Counter1})}{(\text{Counter0} + \text{Valid0})} = \frac{10 \times (1048575 - \text{Meas. Counter1})}{(9990 + 20)} \quad (1)$$

10.2.3 Continuous Monitoring Mode

In this mode, the DCC is used by the application to make sure that two clock signals maintain the correct frequency ratio. Suppose the application wants to make sure that the PLL output signal always maintains a fixed frequency relationship with the XTAL:

- In this case, the application can use the XTAL as the Clock0 signal (for Counter0 and Valid0) and the PLL output as the Clock1 (for Counter1).
- The seed values of Counter0, Valid0 and Counter1 are selected based on the equations defined in [Section 10.2.1](#) such that if the actual frequencies of Clock0 and Clock1 are equal to the expected frequencies, then the Counter1 reaches zero during the count down of the Valid0 counter.
- If the Counter1 reaches zero during the count down of the Valid0 counter, then all the counters (Counter0, Valid0, Counter1) are reloaded with the initial seed values.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters must get reloaded if the application resets and restarts the DCC module.

Error Conditions:

An error condition is generated by one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that Clock1 is faster than expected or Clock0 is slower than expected. This condition includes the case when Clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that Clock1 is slower than expected. This condition includes the case when Clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application can then read out the counter values to help determine what caused the error.

10.2.4 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0, and Counter1 all reach 0 without any error.

Figure 10-3. Counter Relationship

Figure 10-4. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting

Figure 10-5. Clock1 Faster Than Clock0 - Results in an Error and Stops Counting

Figure 10-6. Clock1 Not Present - Results in an Error and Stops Counting

Figure 10-7. Clock0 Not Present - Results in an Error and Stops Counting

10.3 Interrupts

DCC generates an interrupt on either of two events:

- DCC finishes counting and all the counters expire within a defined window indicating DONE operation, provided `DCCGCTRL.DONENA=1`.
- DCC finishes counting with error where counters do not expire in a defined window. This indicates an ERROR event, and sets an interrupt provided `DCCGCTRL.ERRENA=1`.

Interrupts generated by DONE or ERROR events are ORed and flagged as `SYS_ERR_INT`, which goes to `INT1.10` in the PIE Channel Mapping table in the *System Control and Interrupts* chapter. The application interrupt service routine needs to check the status flag inside the `DCCSTATUS` register to determine whether the interrupt is due to ERROR or DONE.

10.4 Software

10.4.1 DCC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dcc

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

10.4.1.1 DCC Single shot Clock verification

FILE: dcc_ex1_single_shot_verification.c

This program uses the XTAL clock as a reference clock to verify the frequency of the PLLRAW clock.

The Dual-Clock Comparator Module 0 is used for the clock verification. The clocksource0 is the reference clock (Fclk0 = 25Mhz) and the clocksource1 is the clock that needs to be verified (Fclk1 = 200Mhz). Seed is the value that gets loaded into the Counter.

Please refer to the TRM for details on counter seed values to be set.

External Connections

- None

Watch Variables

- *status/result* - Status of the PLLRAW clock verification

10.4.1.2 DCC Single shot Clock measurement

FILE: dcc_ex2_single_shot_measurement.c

This program demonstrates Single Shot measurement of the INTOSC2 clock post trim using XTAL as the reference clock.

The Dual-Clock Comparator Module 0 is used for the clock measurement. The clocksource0 is the reference clock (Fclk0 = 25Mhz) and the clocksource1 is the clock that needs to be measured (Fclk1 = 10Mhz). Since the frequency of the clock1 needs to be measured an initial seed is set to the max value of the counter.

Please refer to the TRM for details on counter seed values to be set.

External Connections

- None

Watch Variables

- *result* - Status if the INTOSC2 clock measurement completed successfully.
- *meas_freq1* - measured clock frequency, in this case for INTOSC2.

10.4.1.3 DCC Continuous clock monitoring

FILE: dcc_ex3_continuous_monitoring_of_clock.c

This program demonstrates continuous monitoring of PLL Clock in the system using INTOSC2 as the reference clock. This would trigger an interrupt on any error, causing the decrement/ reload of counters to stop.

The Dual-Clock Comparator Module 0 is used for the clock monitoring. The clocksource0 is the reference clock (Fclk0 = 10Mhz) and the clocksource1 is the clock that needs to be monitored (Fclk1 = 200Mhz). The clock0 and clock1 seed are set to achieve a window of 500us. Seed is the value that gets loaded into the Counter. For the sake of demo a slight variance is given to clock1 seed value to generate an error on continuous monitoring.

Please refer to the TRM for details on counter seed values to be set. Note : When running in flash configuration it is good to do a reset & restart after loading the example to remove any stale flags/states.

External Connections

10.4.1.4 DCC Continuous clock monitoring

FILE: dcc_ex3_continuous_monitoring_of_clock_syscfg.c

This program demonstrates continuous monitoring of PLL Clock in the system using INTOSC2 as the reference clock. This would trigger an interrupt on any error, causing the decrement/ reload of counters to stop. The Dual-Clock Comparator Module 0 is used for the clock monitoring. The clocksource0 is the reference clock (Fclk0 = 10Mhz) and the clocksource1 is the clock that needs to be monitored (Fclk1 = 200Mhz). The clock0 and clock1 seed are set automatically by the error tolerances defined in the sysconfig file included this project. For the sake of demo an un-realistic tolerance is assumed to generate an error on continuous monitoring.

Please refer to the TRM for details on counter seed values to be set. Note : When running in flash configuration it is good to do a reset & restart after loading the example to remove any stale flags/states.

10.4.1.5 DCC Detection of clock failure

FILE: dcc_ex4_clock_fail_detect.c

This program demonstrates clock failure detection on continuous monitoring of the PLL Clock in the system using XTAL as the osc clock source. Once the oscillator clock fails, it would trigger a DCC error interrupt, causing the decrement/ reload of counters to stop. In this examples, the clock failure is simulated by turning off the XTAL oscillator. Once the ISR is serviced, the osc source is changed to INTOSC1 and the PLL is turned off.

The Dual-Clock Comparator Module 0 is used for the clock monitoring. The clocksource0 is the reference clock (Fclk0 = 25Mhz) and the clocksource1 is the clock that needs to be monitored (Fclk1 = 200Mhz). Seed is the value that gets loaded into the Counter.

In the current example, the XTAL is expected to be a Resonator running in Crystal mode which is later switched off to simulate the clock failure. If an SE Crystal is used, you will need to physically disconnect the clock on the board. Please refer to the TRM for details on counter seed values to be set. Note : When running in flash configuration it is good to do a reset & restart after loading the example to remove any stale flags/states.

10.5 DCC Registers

This section describes the Dual Clock Comparator Registers.

Note

The DCC is used by Boot ROM; hence, the register values could be different than the hardware reset value. You need to make sure to configure the values of these registers to the desired value before enabling the DCC.

10.5.1 DCC Base Address Table (C28)

Table 10-1. DCC Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
Dcc0Regs	DCC_REGS	DCC0_BASE	0x0005_E700	YES	-	-	-	YES
Dcc1Regs	DCC_REGS	DCC1_BASE	0x0005_E740	YES	-	-	-	YES
Dcc2Regs	DCC_REGS	DCC2_BASE	0x0005_E780	YES	-	-	-	YES

10.5.2 DCC_REGS Registers

Table 10-2 lists the memory-mapped registers for the DCC_REGS registers. All register offset addresses not listed in Table 10-2 should be considered as reserved locations and the register contents should not be modified.

Table 10-2. DCC_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DCCGCTRL	Starts / stops the counters. Clears the error signal.		Go
8h	DCCCNTSEED0	Seed value for the counter attached to Clock Source 0.		Go
Ch	DCCVALIDSEED0	Seed value for the timeout counter attached to Clock Source 0.		Go
10h	DCCCNTSEED1	Seed value for the counter attached to Clock Source 1.		Go
14h	DCCSTATUS	Specifies the status of the DCC Module.		Go
18h	DCCCNT0	Value of the counter attached to Clock Source 0.		Go
1Ch	DCCVALID0	Value of the valid counter attached to Clock Source 0.		Go
20h	DCCCNT1	Value of the counter attached to Clock Source 1.		Go
24h	DCCCLKSRC1	Selects the clock source for Counter 1.		Go
28h	DCCCLKSRC0	Selects the clock source for Counter 0.		Go

Complex bit access types are encoded to fit into small table cells. Table 10-3 shows the codes that are used for access types in this section.

Table 10-3. DCC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
R-1	R -1	Read Returns 1s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

10.5.2.1 DCCGCTRL Register (Offset = 0h) [Reset = 00005555h]

DCCGCTRL is shown in [Figure 10-8](#) and described in [Table 10-4](#).

Return to the [Summary Table](#).

Starts / stops the counters. Clears the error signal.

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and memory without intervention from the CPU; thereby, freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as the data is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for CPU processing.

11.8 Software.....	1389
11.9 DMA Registers.....	1390

11.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of the bandwidth moving data, whether moving data from off-chip memory to on-chip memory, from a peripheral such as an analog-to-digital converter (ADC) to RAM, or from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this chapter has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning the DMA module requires a peripheral or software trigger to start a DMA transfer. Although the DMA module can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module to start memory transfers periodically. The DMA module has six independent DMA channels that can be configured separately and each channel contains an independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. This address control logic allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features is discussed in detail in this chapter.

11.1.1 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

11.1.2 Block Diagram

Figure 11-1 shows a device-level block diagram of the DMA.

Figure 11-1. DMA Block Diagram

11.2 Architecture

11.2.1 Peripheral Interrupt Event Trigger Sources

Each DMA Channel can be configured to trigger by software and other peripheral triggers events. DMACHSRCSELx register can be used to configure DMA Trigger sources for each DMA channel. CHx.MODE.PERINTSEL register bit field can be set to channel number (CHx.MODE.PERINTSEL = x) as shown in [Figure 11-2](#). Included in these DMA Trigger sources are five external interrupt signals that can be connected to most of the general-purpose input/output (GPIO) pins on the device. This adds significant flexibility to the event trigger capabilities. Upon receipt of a peripheral interrupt event signal, the DMA automatically sends a clear signal to the interrupt source so that subsequent interrupt events occur.

Note

To use the system-level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel can be done using the DMACHSRCSELx register and the CHx.MODE.PERINTSEL register. See [Table 11-1](#) or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst completes before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG remains set.

[Figure 11-3](#) shows a diagram of the trigger select circuit.

[Table 11-1](#) shows the peripheral trigger source options that are available for each channel.

CAUTION

See the Device Errata "ADC:DMA Read of Stale Result" Advisory regarding the potential for the DMA to read the ADC result registers before the result is ready

Figure 11-2. DMA Trigger Architecture

Note: See [Figure 11-2](#).

11.2.2 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus by way of interfaces that sometimes share resources with the CPU memory or peripheral bus. Arbitration rules are defined in [Section 11.5](#).

11.3 Address Pointer and Transfer Control

The DMA state machine is, at the most basic level, two nested loops.

Burst (Inner) Loop:

The burst (inner) loop transfers a programmable number of words set by (BURST_SIZE + 1) register when a DMA channel trigger (Peripheral or Software trigger) is received. The BURST_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit or 32-bit word burst that can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC_ADDR_SHADOW) and the destination (DST_ADDR_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into the respective active (SRC_ADDR_ACTIVE or DST_ADDR_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST_STEP register is added to the active register:

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_ADDR_ACTIVE} + \text{SRC_BURST_STEP}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_ADDR_ACTIVE} + \text{DST_BURST_STEP}$$

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral or Software trigger) is received.

Transfer (Outer) Loop:

The Transfer (outer) loop transfers a programmable number of bursts set by (TRANSFER_SIZE + 1) register for each channel. Since TRANSFER_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer:

Method 1 (Default): When address wrapping is disabled (SRC_WRAP_SIZE or DST_WRAP_SIZE is greater than TRANSFER_SIZE), active address pointer is updated as shown below

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_ADDR_ACTIVE} + \text{SRC_TRANSFER_STEP}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_ADDR_ACTIVE} + \text{DST_TRANSFER_STEP}$$

Method 2: Address wrapping gets enabled when SRC_WRAP_SIZE or DST_WRAP_SIZE is less than TRANSFER_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST_WRAP_SIZE + 1) register, the state machine modifies the active address pointers as:

$$\text{SRC_BEG_ADDR_ACTIVE} = \text{SRC_BEG_ADDR_ACTIVE} + \text{SRC_WRAP_STEP}$$

$$\text{DST_BEG_ADDR_ACTIVE} = \text{DST_BEG_ADDR_ACTIVE} + \text{DST_WRAP_STEP}$$

$$\text{SRC_ADDR_ACTIVE} = \text{SRC_BEG_ADDR_ACTIVE}$$

$$\text{DST_ADDR_ACTIVE} = \text{DST_BEG_ADDR_ACTIVE}$$

At the end of DMA transfer, DMA can have transferred (BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words.

OneShot Mode:

OneShot mode is disabled by default.

When OneShot mode is disabled (MODE.CHx[ONESHOT] = 0), DMA transfers one burst [(BURST_SIZE + 1) words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled (MODE.CHx[ONESHOT] = 1), DMA transfers all the bursts [(BURST_SIZE + 1) x (TRANSFER_SIZE + 1) words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

Continuous Mode:

Continuous mode is disabled by default.

When Continuous mode is disabled (MODE.CHx[CONTINUOUS] = 0), DMA state machine disables channel after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuous mode is enabled (MODE.CHx[CONTINUOUS] = 1), DMA state machine keep channel active even after all bursts in a transfer loop (TRANSFER_COUNT = 0) are complete.

Each DMA channel can trigger an EPIE interrupt for each DMA transfer either at start of DMA transfer or end of DMA transfer using MODE.CHx[CHINTMODE] bit.

Source/Destination Address Pointers (SRC/DST_ADDR) The value written into the shadow register is the start address of the first location where data is read or written to.

At the beginning of a transfer the shadow register (SRC/DST_ADDR_SHADOW) is copied into the active register (SRC/DST_ADDR_ACTIVE). The active register performs as the current address pointer.

Source/Destination Begin Address Pointers (SRC/DST_BEG_ADDR) This is the wrap pointer.

The value written into the shadow register (SRC/DST_BEG_ADDR_SHADOW) is loaded into the active register (SRC/DST_BEG_ADDR_ACTIVE) at the start of a transfer. On a wrap condition, the active register (SRC/DST_BEG_ADDR_ACTIVE) is incremented by the signed value in the appropriate SRC/DST_WRAP_STEP register prior to being loaded into the active register (SRC/DST_ADDR_ACTIVE).

For each channel, the transfer process can be controlled with the following size values:

**Source and
Destination
Burst Size
(BURST_SIZE)**

This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST_COUNT register at the beginning of each burst. The BURST_COUNT decrements each word that is transferred and when the register reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size can be all 16 registers (if all 16 registers are used). For RAM, the burst size can be up to the maximum allowed by the BURST_SIZE register, which is 32. See [Table 11-2](#) to understand how BURST_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

Table 11-2. BURSTSIZE versus DATASIZE Behavior

BURSTSIZE	Number of 16-bit words transferred in	
	DataSize = 16-bit data	DataSize = 32-bit data
0	1	2
1	2	2
2	3	4
3	4	4
4	5	6
5	6	6
6	7	8
7	8	8
8	9	10
9	10	10
10	11	12
11	12	12
*	*	*
*	*	*
*	*	*
30	31	32
31	32	32

**Source and
Destination
Transfer Size
(TRANSFER_SIZE)**

This specifies the number of bursts to be transferred per CPU interrupt (if enabled).

Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER_SIZE register is loaded into the TRANSFER_COUNT register at the beginning of each transfer. The TRANSFER_COUNT register keeps track of how many bursts of data the channel has transferred and when the register reaches zero, the DMA transfer is complete.

Source/Destination Wrap Size (SRC/DST_WRAP_SIZE)	This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning. This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST_WRAP_COUNT register at the beginning of each transfer. The SRC/DST_WRAP_COUNT registers keep track of how many bursts of data the channel has transferred and when the registers reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To disable the wrap function, assign the value of these registers to be larger than the TRANSFER_SIZE.
---	---

Note

The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 can be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 can be placed in the SIZE register.

For each source/destination pointer, the address changes can be controlled with the following step values:

Source/Destination Burst Step (SRC/DST_BURST_STEP)	Within each burst transfer, the address source and destination step sizes are specified by these registers. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers can be set to zero.
Source/Destination Transfer Step (SRC/DST_TRANSFER_STEP)	This specifies the address offset to start the next burst transfer after completing the current burst transfer. This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.
Source/Destination Wrap Step (SRC/DST_WRAP_STEP)	When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST_BEG_ADDR pointer and hence sets the new start address. This implements a circular type of addressing mode, useful in many applications. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

Note

Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 can be placed in these registers.

Channel Interrupt Mode (CHINTMODE)	This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer. If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt can be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.
---	--

All of the previous features and modes are shown in [Figure 11-4](#). The following items are in reference to [Figure 11-4](#).

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST_ADDR_ACTIVE registers are not affected by SRC/DST_BEG_ADDR_ACTIVE at the start of a transfer. SRC/DST_BEG_ADDR_ACTIVE only affects the SRC/DST_ADDR_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
 - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
 - SRC/DST_ADDR_SHADOW remains unchanged.
 - SRC/DST_BEG_ADDR_ACTIVE = SRC/DST_BEG_ADDR_SHADOW
 - SRC/DST_ADDR_ACTIVE = SRC/DST_ADDR_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
 - SRC/DST_BEG_ADDR_SHADOW remains unchanged.
 - SRC/DST_ADDR_SHADOW remains unchanged.
 - SRC/DST_BEG_ADDR_ACTIVE += SRC/DST_WRAP_STEP
 - SRC/DST_ADDR_ACTIVE = SRC/DST_BEG_ADDR_ACTIVE
- The best way to remember this is:
 - The shadow registers never change except by software.
 - The active registers never change except by hardware, and a shadow register is only copied into the active register, never an active register by another name.

11.4 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect the total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high-priority interrupt
- Collisions with the CPU can add delay slots (see [Section 11.5](#))
- 32-bit transfers run at double the speed of a 16-bit transfer (takes the same amount of time to transfer a 32-bit word as to transfer a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This gives:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 16 \text{ words/burst}) + 1] = 392 \text{ cycles}$$

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits), the transfer can take:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 8 \text{ words/burst}) + 1] = 200 \text{ cycles}$$

The DMA module consists of a 3-stage pipeline as shown in [Figure 11-5](#) and [Figure 11-6](#).

Figure 11-5. 3-Stage Pipeline DMA Transfer

Figure 11-6. 3-stage Pipeline with One Read Stall

11.5 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict. Accesses to global shared RAM, across different instances, do not have this conflict. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, CMPSS, DAC, SDFM
- Peripheral frame 2: PMBus, SPI, FSI

Conflict Example: The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

Conflict Example: The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

Non-conflict Example: The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

Non-conflict Example: The CPU is accessing GS0 while the DMA is accessing GS1

The exception to all this is the ADC result registers, which are duplicated for each bus master. The CPU, DMA, and CLA can all simultaneously read these result registers with no stalls or arbitration needed for any master.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see [Section 11.4](#)). Suppose CPU accesses a peripheral/memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device:

- The arbitration follows a fixed arbitration scheme with highest priority first:
 - DMA WRITE
 - DMA READ
 - CLA WRITE
 - CLA READ
 - CPU WRITE
 - CPU READ
- The priority scheme for GSx RAM accesses is round-robin.
- The ADC results are duplicated for CPU, CLA, and DMA so that no arbitration is needed when reading the result registers. This allows all masters to access the ADC result registers simultaneously without delay.

Note

If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write can be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

Arbitration within DMA channels is based on a round-robin priority or Channel 1 high-priority scheme described in [Section 11.6](#).

11.6 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

11.6.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as:

$$\text{CH1} \rightarrow \text{CH2} \rightarrow \text{CH3} \rightarrow \text{CH4} \rightarrow \text{CH5} \rightarrow \text{CH6} \rightarrow \text{CH1} \rightarrow \text{CH2} \rightarrow \dots$$

In the case above, after each channel has transferred a burst of words, the next channel is serviced. The user can specify the size of the burst for each channel. Once CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel *x*, all other pending channels between *x* and the end of the round are serviced before CH1. All the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes the burst, CH5 is serviced next. Only after CH5 completes is CH1 serviced. Upon completion of CH1, if there are no more channels pending, the round-robin state machine enters an idle state.

A more complicated example is:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 is serviced since this channel is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst is serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 starts after the completion of the CH5 burst, since this channel is the next channel after CH5 in the round-robin scheme.
- This is followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine enters an idle state.

The round-robin state machine can be reset to the idle state using the DMACTRL[PRIORITYRESET] bit.

11.6.2 Channel 1 High-Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channels 2 to 6 have equal priority and each enabled channel is serviced in a round-robin fashion.

Higher priority: CH1

Lower priority: CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → ...

Given an example where CH1, CH4, and CH5 are enabled in Channel 1 high-priority mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from the respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 word transfer is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution is suspended and CH1 is serviced. After the CH1 burst completes, CH4 resumes execution.

Upon completion of CH4, CH5 is serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine enters an idle state.

Typically Channel 1 is used in this mode for the ADC, since the data rate is so high. However, Channel 1 high-priority mode can be used in conjunction with any peripheral.

Note

High-priority mode and ONESHOT mode cannot be used at the same time on Channel 1. Other channels can use ONESHOT mode when Channel 1 is in high-priority mode.

11.7 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger is lost. This condition sets the OVRFLG bit in the CONTROL register as in Figure 11-7. If the overrun interrupt is enabled, the channel interrupt is generated to the PIE module.

Figure 11-7. Overrun Detection Logic

11.8 Software

11.8.1 DMA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/dma

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

11.8.1.1 DMA GSRAM Transfer (dma_ex1_gsram_transfer)

FILE: dma_ex1_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

: This example project has support for migration across our C2000 device families. If you are wanting to build this project from launchpad or controlCARD, please specify in the .syscfg file the board you're using. At any time you can select another device to migrate this example. *Watch Variables*

- *sData* - Data to send
- *rData* - Received data

11.8.1.2 DMA Transfer Shared Peripheral - C28X_DUAL

FILE: dma_ex1_shared_periph_cpu1.c

This example shows how to initiate a DMA transfer on CPU1 from a shared peripheral which is owned by CPU2. In this specific example, a timer ISR is used on CPU2 to initiate a SPI transfer which will trigger the CPU1 DMA. CPU1's DMA will then in turn update the ePWM1 CMPA value for the PWM which it owns. The PWM output can be observed on the GPIO pins. It is recommended to run the c28x1 core first, followed by the C28x2 core.

Watch Pins

- GPIO0 and GPIO1 - ePWM output can be viewed with oscilloscope

11.8.1.3 DMA Transfer for Shared Peripheral Example (CPU2) - C28X_DUAL

FILE: dma_ex1_shared_periph_cpu2.c

This example shows how to initiate a DMA transfer on CPU1 from a shared peripheral that is owned by CPU2. In this specific example, a timer ISR is used on CPU2 to initiate a SPI transfer that triggers the CPU1 DMA. CPU1 DMA then updates the ePWM1 CMPA value for the PWM that the DMA owns. The PWM output can be observed on the GPIO pins. It is recommended to run the c28x1 core first, followed by the C28x2 core.

11.8.1.4 DMA GSRAM Transfer (dma_ex2_gsram_transfer)

FILE: dma_ex2_gsram_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

Watch Variables

- *sData* - Data to send
- *rData* - Received data

11.8.1.5 DMA Transfer Shared Peripheral - C28X_DUAL

FILE: dma_ex2_sysconfig_cpu1.c

This example shows how to initiate a DMA transfer on CPU1 from a shared peripheral which is owned by CPU2. In this specific example, a timer ISR is used on CPU2 to initiate a SPI transfer which will trigger the CPU1 DMA.

CPU1's DMA will then in turn update the ePWM1 CMPA value for the PWM which it owns. The PWM output can be observed on the GPIO pins. It is recommended to run the C28x1 core first, followed by the C28x2 core.

Watch Pins

- GPIO0 and GPIO1 - ePWM output can be viewed with oscilloscope

11.9 DMA Registers

This section describes the C28x Direct Memory Access Registers.

11.9.1 DMA Base Address Table (C28)

Table 11-3. DMA Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
DmaRegs	DMA_REGS	DMA_BASE	0x0000_1000	YES	YES	-	-	-
Dmach1Regs	DMA_CH_REGS	DMA_CH1_BASE	0x0000_1020	YES	YES	-	-	-
Dmach2Regs	DMA_CH_REGS	DMA_CH2_BASE	0x0000_1040	YES	YES	-	-	-
Dmach3Regs	DMA_CH_REGS	DMA_CH3_BASE	0x0000_1060	YES	YES	-	-	-
Dmach4Regs	DMA_CH_REGS	DMA_CH4_BASE	0x0000_1080	YES	YES	-	-	-
Dmach5Regs	DMA_CH_REGS	DMA_CH5_BASE	0x0000_10A0	YES	YES	-	-	-
Dmach6Regs	DMA_CH_REGS	DMA_CH6_BASE	0x0000_10C0	YES	YES	-	-	-

11.9.2 DMA_REGS Registers

Table 11-4 lists the memory-mapped registers for the DMA_REGS registers. All register offset addresses not listed in Table 11-4 should be considered as reserved locations and the register contents should not be modified.

Table 11-4. DMA_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	DMACTRL	DMA Control Register	EALLOW	Go
1h	DEBUGCTRL	Debug Control Register	EALLOW	Go
4h	PRIORITYCTRL1	Priority Control 1 Register	EALLOW	Go
6h	PRIORITYSTAT	Priority Status Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 11-5 shows the codes that are used for access types in this section.

Table 11-5. DMA_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

11.9.2.1 DMACTRL Register (Offset = 0h) [Reset = 0000h]

DMACTRL is shown in [Figure 11-8](#) and described in [Table 11-6](#).

Return to the [Summary Table](#).

DMA Control Register

Figure 11-8. DMACTRL Register

15	14	13	12	11	10	9	8
RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED						PRIORITYRESET	HARDRESET
R-0h						R-0/W1S-0h	R-0/W1S-0h

Table 11-6. DMACTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	PRIORITYRESET	R-0/W1S	0h	The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0. When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset. If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel). Reset type: SYSRSn
0	HARDRESET	R-0/W1S	0h	Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0. For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers. When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn

11.9.2.2 DEBUGCTRL Register (Offset = 1h) [Reset = 0000h]

DEBUGCTRL is shown in [Figure 11-9](#) and described in [Table 11-7](#).

Return to the [Summary Table](#).

Table 11-9. PRIORITYSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
15-7	RESERVED	R	0h	Reserved
6-4	ACTIVESTS_SHADOW	R	0h	Active Channel Status Shadow These bits are only meaningful when CH1 is in high-priority mode. When CH1 is serviced, the ACTIVESTS bits are copied to the shadow bits and indicate which channel was interrupted by CH1. When CH1 service is completed, the shadow bits are copied back to the ACTIVESTS bits. If this bit field is zero or the same as the ACTIVESTS bit field, then no channel is pending due to a CH1 interrupt. When CH1 is not a higher priority channel, these bits should be ignored. Reset type: SYSRSn 0h (R/W) = No channel is active 1h (R/W) = CH 1 2h (R/W) = CH 2 3h (R/W) = CH 3 4h (R/W) = CH 4 5h (R/W) = CH 5 6h (R/W) = CH 6 7h (R/W) = Reserved
3	RESERVED	R	0h	Reserved
2-0	ACTIVESTS	R	0h	Active Channel Status These bits indicate which channel (if any) is currently active or performing a transfer. Reset type: SYSRSn 0h (R/W) = No channel is active 1h (R/W) = CH 1 2h (R/W) = CH 2 3h (R/W) = CH 3 4h (R/W) = CH 4 5h (R/W) = CH 5 6h (R/W) = CH 6 7h (R/W) = Reserved

11.9.3 DMA_CH_REGS Registers

Table 11-10 lists the memory-mapped registers for the DMA_CH_REGS registers. All register offset addresses not listed in Table 11-10 should be considered as reserved locations and the register contents should not be modified.

Table 11-10. DMA_CH_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	MODE	Mode Register	EALLOW	Go
1h	CONTROL	Control Register	EALLOW	Go

7	6	5	4	3	2	1	0
OVRINTE	RESERVED		PERINTSEL				
R/W-0h	R-0h		R/W-0h				

Table 11-12. MODE Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CHINTE	R/W	0h	Channel Interrupt Enable Bit This bit enables the DMA channel's CPU interrupt. Reset type: SYSRSn 0h (R/W) = Interrupt disabled 1h (R/W) = Interrupt enabled
14	DATASIZE	R/W	0h	Data Size Mode Bit This bit determines whether the DMA channel transfers 16 bits or 32 bits of data per read/write operation. Regardless of this setting, all data lengths and offsets in other DMA registers refer to 16-bit words. The pointer step increments must be configured to accommodate 32-bit words. Reset type: SYSRSn 0h (R/W) = 16-bit data transfer size 1h (R/W) = 32-bit data transfer size
13	RESERVED	R/W	0h	Reserved
12	RESERVED	R/W	0h	Reserved
11	CONTINUOUS	R/W	0h	Continuous Mode Bit If this bit is set to 1, then the channel re-initializes when TRANSFER_COUNT is zero and waits for the next event trigger. Otherwise, the DMA stops and clears the RUNSTS bit. Reset type: SYSRSn
10	ONESHOT	R/W	0h	One Shot Mode If this bit is set to 1, each peripheral event trigger causes the channel to perform an entire transfer. Otherwise, the channel only performs one burst per trigger. Reset type: SYSRSn
9	CHINTMODE	R/W	0h	Channel Interrupt Generation Mode This bit specifies when the DMA channel generates a CPU interrupt for a transfer. Reset type: SYSRSn 0h (R/W) = Generate interrupt at beginning of new transfer 1h (R/W) = Generate interrupt at end of transfer.
8	PERINTE	R/W	0h	Peripheral Event Trigger Enable This bit enables peripheral event triggers on the DMA channel. Reset type: SYSRSn 0h (R/W) = Peripheral event trigger disabled. Neither the selected peripheral nor software can start a DMA burst. 1h (R/W) = Peripheral event trigger enabled.

Table 11-12. MODE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	OVRINTE	R/W	0h	Overflow Interrupt Enable The bit determines whether the DMA module generates a CPU interrupt when it detects an overflow event. Reset type: SYSRSn 0h (R/W) = Overflow interrupt disabled 1h (R/W) = Overflow interrupt enabled
6-5	RESERVED	R	0h	Reserved
4-0	PERINTSEL	R/W	0h	Peripheral Event Trigger Source Select These are legacy bits and should be set to the channel number. The actual source selection is done via the DMACHSRCSELn registers, which are part of the DMA_CLA_SRC_SEL_REGS group. Reset type: SYSRSn

11.9.3.2 CONTROL Register (Offset = 1h) [Reset = 0000h]

CONTROL is shown in [Figure 11-13](#) and described in [Table 11-13](#).

Return to the [Summary Table](#).

Control Register

Figure 11-13. CONTROL Register

15	14	13	12	11	10	9	8
RESERVED	OVRFLG	RUNSTS	BURSTSTS	TRANSFERSTS	RESERVED	RESERVED	PERINTFLG

R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h	R-0/W1S-0h

Table 11-13. CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	OVRFLG	R	0h	Overflow Flag This bit indicates that a peripheral event trigger was received while PERINTFLG was already set. It can be cleared by writing to the ERRCLR bit. Reset type: SYSRSn 0h (R/W) = No overflow detected 1h (R/W) = Overflow detected
13	RUNSTS	R	0h	Run Status Flag This bit indicates that the DMA channel is ready to respond to peripheral event triggers. This bit is set when a 1 is written to the RUN bit. It is cleared when a transfer completes (TRANSFER_COUNT = 0) and continuous mode is disabled, or when the HARDRESET, SOFTRESET, or HALT bit is set. Reset type: SYSRSn 0h (R/W) = The channel is disabled 1h (R/W) = The channel is enabled
12	BURSTSTS	R	0h	Burst Status Flag This bit is set when a DMA burst begins. The BURST_COUNT is set to the BURST_SIZE. This bit is cleared when BURST_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set. Reset type: SYSRSn 0h (R/W) = No burst activity 1h (R/W) = The DMA is currently servicing or suspending a burst transfer from this channel
11	TRANSFERSTS	R	0h	Transfer Status Flag This bit is set when a DMA transfer begins. The address registers are copied to the shadow set and the TRANSFER_COUNT is set to the TRANSFER_SIZE. This bit is cleared when TRANSFER_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set. Reset type: SYSRSn 0h (R/W) = No transfer activity 1h (R/W) = The channel is currently in the middle of a transfer regardless of whether a burst of data is actively being transferred or not
10	RESERVED	R	0h	Reserved
9	RESERVED	R	0h	Reserved

Table 11-13. CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	PERINTFLG	R	0h	Peripheral Event Trigger Flag This bit indicates whether a peripheral event trigger has arrived. This bit is automatically cleared when the first burst transfer begins. Reset type: SYSRSn 0h (R/W) = Waiting for event trigger 1h (R/W) = Event trigger pending
7	ERRCLR	R-0/W1S	0h	Clear Error Writing a 1 to this bit will clear the OVRFLG bit. This is normally done when initializing the DMA module or if an overflow condition is detected. If an overflow event occurs at the same time this bit is set, the overrun has priority and the OVRFLG bit is set. Reset type: SYSRSn
6	RESERVED	R-0/W1S	0h	Reserved
5	RESERVED	R-0/W1S	0h	Reserved
4	PERINTCLR	R-0/W1S	0h	Clear Peripheral Event Trigger Writing a 1 to this bit clears PERINTFLG, which cancels a pending event trigger. This is normally done when initializing the DMA module. If an event trigger arrives at the same time this bit is set, the trigger has priority and PERINTFLG is set. Reset type: SYSRSn
3	PERINTFRC	R-0/W1S	0h	Force Peripheral Event Trigger If the PERINTE bit of the MODE register is set, writing a 1 to this bit sets PERINTFLG, which triggers a DMA burst. This bit can be used to start a DMA transfer in software. Reset type: SYSRSn
2	SOFTRESET	R-0/W1S	0h	Channel Soft Reset Writing a 1 to this bit places the channel into its default state after the current read/write access has completed: RUNSTS = 0 TRANSFERSTS = 0 BURSTSTS = 0 BURST_COUNT = 0 TRANSFER_COUNT = 0 SRC_WRAP_COUNT = 0 DST_WRAP_COUNT = 0 When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn
1	HALT	R-0/W1S	0h	Halt Channel Writing a 1 to this bit halts the DMA channel in its current state after any ongoing read/write access has completed. Reset type: SYSRSn
0	RUN	R-0/W1S	0h	Run Channel Writing a 1 to this bit enables the DMA channel and sets the RUNSTS bit to 1. This bit is also used to resume after a channel halt. The RUN bit is typically used to start the DMA channel after configuration. The channel will then wait for the first peripheral event trigger (PERINTFLG == 1) to start a burst. Reset type: SYSRSn

11.9.3.3 BURST_SIZE Register (Offset = 2h) [Reset = 0000h]

BURST_SIZE is shown in [Figure 11-14](#) and described in [Table 11-14](#).

Chapter 12

External Memory Interface (EMIF)

This chapter describes the external memory interface (EMIF).

Further information can be found in the following documents:

[Accessing External SDRAM on the TMS320F2837x/2807x Microcontrollers Using C/C++ Application Report](#)

[Design and Usage Guidelines for the C2000™ External Memory Interface \(EMIF\) Application Report](#)

12.1 Introduction.....	1426
12.2 EMIF Module Architecture.....	1430
12.3 Example Configuration.....	1460
12.4 Software.....	1469
12.5 EMIF Registers.....	1472

12.1 Introduction

This device supports dual-core architecture. To have a dedicated EMIF for each CPU subsystem, the device supports two EMIF modules — EMIF1 and EMIF2, as shown in [Figure 12-1](#). Both modules are exactly the same with the same feature set, but have different address/data sizes. EMIF1 is shared between the CPU1 and CPU2 subsystem, whereas EMIF2 is dedicated to the CPU1 subsystem.

[Table 12-1](#) gives the configuration for two EMIF modules.

Figure 12-1. EMIF Module Overview

Table 12-1. Configuration for EMIF1 and EMIF2 Modules

	EMIF1	EMIF2
176-Pin Package	Yes	NA
337- Pin Package	Yes	Yes
Maximum Data Width	32	16
Maximum Address Width	22 (Some of the EMIF1 pins are muxed with each other. Refer to Section 12.2.11 for usage)	13
SDRAM CSx Support	1 (CS0)	1 (CS0)
ASRAM CSx Support	3 (CS2/CS3/CS4)	1 (CS2)

Note

Subsequent sections in this chapter provide the details on the generic EMIF module. Unless otherwise specified, pin names are used from EMIF1 to define the functionality.

12.1.1 Purpose of the Peripheral

This EMIF memory controller is compliant with the JESD21-C SDR SDRAM memories utilizing a 32-bit/16-bit data bus. The purpose of this EMIF is to provide a means for the CPU to connect to a variety of external devices including:

- Single data rate (SDR) SDRAM
- Asynchronous devices including NOR Flash and SRAM

A common use for the EMIF is to interface with both a Flash device and an SDRAM device simultaneously. [Section 12.3](#) contains an example of operating the EMIF in this configuration.

12.1.2 EMIF Related Collateral

Foundational Materials

- [C2000 Academy - EMIF](#)

 - In addition to the devices in the title, this material also applies to other devices with EMIF.

12.1.3 Features

The EMIF controller includes many features to enhance the ease and flexibility of connecting to the external SDR SDRAM and asynchronous devices.

12.1.3.1 Asynchronous Memory Support

The EMIF controller supports asynchronous:

- SRAM memories
- NOR Flash memories

There is an external wait input that allows slower asynchronous memories to extend the memory access. The EMIF module supports more than one chip select (enable). Each chip select has the following individually programmable attributes:

- Data bus width
- Read cycle timings: setup, hold, strobe
- Write cycle timings: setup, hold, strobe
- Bus turnaround time
- Extended wait option with programmable timeout
- Select strobe option

12.1.3.2 Synchronous DRAM Memory Support

The EMIF module supports 16-bit/32-bit SDRAM in addition to the asynchronous memories listed in [Section 12.1.3.1](#). The EMIF module has a single SDRAM chip select. SDRAM configurations that are supported are:

- One, two and four bank SDRAM devices
- Devices with eight, nine, ten, and eleven column address
- CAS latency of two or three clock cycles
- 16-bit/32-bit data bus width
- 3.3V LVCMOS interface

Additionally, the EMIF supports placing the SDRAM in self-refresh and power-down modes. The self-refresh mode allows the SDRAM to be put in a low-power state while still retaining memory contents, since the SDRAM continues to refresh itself even without clocks from the microcontroller. The power-down mode achieves even lower power, except the microcontroller must periodically wake up and issue refreshes if data retention is required.

Note that the EMIF module does not support mobile SDRAM devices.

12.1.4 Functional Block Diagram

Figure 12-2 shows the connections between the EMIF and the internal requesters, along with the external EMIF pins. Section 12.2.2 contains a description of the entities internal to the MCU that can send requests to the EMIF, along with their prioritization. Section 12.2.3 describes the EMIF external pins and summarizes their purpose when interfacing with the SDRAM and asynchronous devices.

Figure 12-2. EMIF Functional Block Diagram

12.1.5 Configuring Device Pins

The GPIO mux registers must be configured to connect this peripheral to the device pins. To avoid glitches on the pins, the GPyGMUX bits must be configured first (while keeping the corresponding GPyMUX bits at the default of zero), followed by writing the GPyMUX register to the desired value.

Some IO functionality is defined by GPIO register settings independent of this peripheral. For input signals, the GPIO input qualification must be set to asynchronous mode by setting the appropriate GPxQSELn register bits to 11b. The internal pullups can be configured in the GPyPUD register.

See the *General-Purpose Input/Output (GPIO)* chapter for more details on GPIO mux and settings.

12.2 EMIF Module Architecture

This section provides details about the architecture and operation of the EMIF. Both the SDRAM and asynchronous interface are covered, along with other system-related configurations such as clock control.

12.2.1 EMIF Clock Control

The EMIF clock is output on the EMxCLK pin and must be used when interfacing to external SDRAM devices. The EMIF module gets the PLLSYSCLK clock domain as the input. The user can choose to run the EMIF at PLLSYSCLK/1 or PLLSYSCLK/2 clock frequency by configuring the EMIFxCLKDIV field in the PERCLKDIVSEL register in the *Clock Control* module.

12.2.2 EMIF Requests

Different sources within the MCU can make requests to the EMIF. These requests consist of accesses to the SDRAM memory, the asynchronous memory, and the EMIF registers. The EMIF can process only one request at a time. Therefore, a high performance master arbitration block exists within the MCU to provide prioritized requests from the different sources to the EMIF. The sources are:

- CPU1
- CPU1.DMA
- CPU2
- CPU2.DMA

If a request is submitted from two or more sources simultaneously, the crossbar switch forwards the highest priority request to the EMIF first. Upon completion of a request, the master arbitration block again evaluates the pending requests and forwards the highest priority pending request to the EMIF.

The master arbitration block always allows RD access from any of the masters. But for WR access (or execute access), the master arbitration block only allows access of masters from a CPU subsystem that takes master ownership of the EMIF module based on the configuration in the EMIF1MSEL register in the *Memory Controller* module. Note that only the EMIF1 has access from both the CPU subsystems; hence, the concept of grab-semaphore is applicable for the EMIF1 only.

When the EMIF receives a request, it is possible that the request is not immediately processed. In some cases, the EMIF performs one or more auto-refresh cycles before processing the request. For details on the EMIF internal arbitration between performing requests and performing auto-refresh cycles, see [Section 12.2.13](#).

12.2.3 EMIF Signal Descriptions

This section describes the function of each of the EMIF signals.

Table 12-2. EMIF Pins Used to Access Both SDRAM and Asynchronous Memories

Pins	I/O	Description
EM1D[x:0]	I/O	EMIF data bus.
EM1A[x:0]	O	EMIF address bus. When interfacing to an SDRAM device, these pins are primarily used to provide the row and column address to the SDRAM. The mapping from the internal program address to the external values placed on these pins is found in Table 12-14 . EM1A[10] is also used during the PRE command to select which banks to deactivate. When interfacing to an asynchronous device, these pins are used in conjunction with the EM1BA pins to form the address that is sent to the device. The mapping from the internal program address to the external values placed on these pins is found in Section 12.2.6.1 .
EM1BA[1:0]	O	EMIF bank address. When interfacing to an SDRAM device, these pins are used to provide the bank address inputs to the SDRAM. The mapping from the internal program address to the external values placed on these pins is found in Table 12-14 . When interfacing to an asynchronous device, these pins are used in conjunction with the EM1A pins to form the address that is sent to the device. The mapping from the internal program address to the external values placed on these pins is found in Section 12.2.6.1 .
EM1DQM[x:0]	O	Active-low byte enables. When interfacing to SDRAM, these pins are connected to the DQM pins of the SDRAM to individually enable/disable each of the bytes in a data access. When interfacing to an asynchronous device, these pins are connected to byte enables. See Section 12.2.6 for details.
EM1WE	O	Active-low write enable. When interfacing to SDRAM, this pin is connected to the nWE pin of the SDRAM and is used to send commands to the device. When interfacing to an asynchronous device, this pin provides a signal which is active-low during the strobe period of an asynchronous write access cycle.

Table 12-3. EMIF Pins Specific to SDRAM

Pins	I/O	Description
EM1CS0	O	Active-low chip enable pin for SDRAM devices. This pin is connected to the chip-select pin of the attached SDRAM device and is used for enabling/disabling commands. By default, EMIF keeps this SDRAM chip select active, even if EMIF is not interfaced with an SDRAM device. This pin is deactivated when accessing the asynchronous memory bank and is reactivated on completion of the asynchronous access.
EM1RAS	O	Active-low row address strobe pin. This pin is connected to the nRAS pin of the attached SDRAM device and is used for sending commands to the device.
EM1CAS	O	Active-low column address strobe pin. This pin is connected to the nCAS pin of the attached SDRAM device and is used for sending commands to the device.
EM1SDCKE	O	Clock enable pin. This pin is connected to the CKE pin of the attached SDRAM device and is used for issuing the SELF REFRESH command which places the device in self-refresh mode. See Section 12.2.5.7 for details.
EM1CLK	O	SDRAM clock pin. This pin is connected to the CLK pin of the attached SDRAM device. See Section 12.2.1 for details on the clock signal.

Table 12-4. EMIF Pins Specific to Asynchronous Memory

Pins	I/O	Description
EM1CS[4:2]	O	Active-low chip enable pins for asynchronous devices. These pins are meant to be connected to the chip-select pins of the attached asynchronous device. These pins are active only during accesses to the asynchronous memory.
EM1WAIT	I	Wait input with programmable polarity / NAND Flash ready input. A connected asynchronous device can extend the strobe period of an access cycle by asserting the EM1WAIT input to EMIF as described in Section 12.2.6.6 . To enable this functionality, the EW bit in the asynchronous 1 configuration register (ASYNC_CS2_CFG) must be set to 1. In addition, the WP0 bit in ASYNC_CS2_CFG must be configured to define the polarity of the EM1WAIT pin. When the CS2NAND/CS3NAND/CS4NAND/CS5NAND bit in the NAND Flash control register (NANDFCR) is set, this pin instead functions as a NAND Flash ready input.
EM1OE	O	Active-low pin enable for asynchronous devices. This pin provides a signal which is active-low during the strobe period of an asynchronous read access cycle.
EM1RNW	O	EMIF asynchronous read/write control. This pin stays high during reads and stays low during writes (same duration as CS).

12.2.4 EMIF Signal Multiplexing Control

Several EMIF signals are multiplexed with other functions on this microcontroller. Refer to the multiplexing section of the *General-Purpose Input/Output (GPIO)* chapter for more information on how to enable the output of these EMIF signals.

12.2.5 SDRAM Controller and Interface

The EMIF controller provides a glueless interface to most standard SDR SDRAM devices and supports features like self-refresh mode and prioritized refresh. In addition, it provides flexibility through programmable parameters such as the refresh rate, CAS latency, and many SDRAM timing parameters. The following sections include details on how to Interface and properly configure the EMIF to perform read and write operations to externally connected SDR SDRAM devices. Also, [Section 12.3](#) provides a detailed example of interfacing the EMIF to a common SDRAM device.

12.2.5.1 SDRAM Commands

The EMIF controller supports the SDRAM commands described in [Table 12-5](#). [Table 12-6](#) shows the truth table for the SDRAM commands, and an example timing waveform of the PRE command is shown in [Figure 12-3](#). EM1A[10] is pulled low in this example to deactivate only the bank specified by the EM1BA pins.

Table 12-5. EMIF SDRAM Commands

Command	Function
PRE	Precharge. Depending on the value of EM1A[10], the PRE command either deactivates the open row in all banks (EM1A[10] = 1) or only the bank specified by the EM1BA[1:0] pins (EM1A[10] = 0).
ACTV	Activate. The ACTV command activates the selected row in a particular bank for the current access.
READ	Read. The READ command outputs the starting column address and signals the SDRAM to begin the burst read operation. Address EM1A[10] is always pulled low to avoid auto precharge. This allows for better bank interleaving performance.
WRT	Write. The WRT command outputs the starting column address and signals the SDRAM to begin the burst write operation. Address EM1A[10] is always pulled low to avoid auto precharge. This allows for better bank interleaving performance.
BT	Burst terminate. The BT command is used to truncate the current read or write burst request. On this device, all the SDRAM accesses are single access except when EMIF controller splits a single access into multiple access (for example, a 32-bit access from CPU is split into two 16-bit accesses if external SDRAM device is 16 bit (NM = 1).
LMR	Load mode register. The LMR command sets the mode register of the attached SDRAM devices and is only issued during the SDRAM initialization sequence described in Section 12.2.5.4 .
REFR	Auto refresh. The REFR command signals the SDRAM to perform an auto refresh according to the internal address.
SLFR	Self refresh. The self-refresh command places the SDRAM into self-refresh mode, during which the SDRAM provides a clock signal and auto refresh cycles.
NOP	No operation. The NOP command is issued during all cycles in which one of the above commands is not issued.

Table 12-6. Truth Table for SDRAM Commands

12.2.5.2 Interfacing to SDRAM

The EMIF supports a glueless interface to SDRAM devices with the following characteristics:

- Pre-charge bit is A[10]
- The number of column address bits is 8, 9, 10, or 11.
- The number of row address bits is 13, 14, 15, or 16.
- The number of internal banks is 1, 2, or 4.

Figure 12-4 shows an interface between the EMIF and a $2\text{M} \times 16 \times 4$ bank SDRAM device, and Figure 12-5 shows an interface between the EMIF and a $512\text{K} \times 16 \times 2$ bank SDRAM device. For devices supporting 16-bit interface, refer to Table 12-7 for list of commonly-supported SDRAM devices and the required connections for the address pins.

Figure 12-4. EMIF to $2\text{M} \times 16 \times 4$ Bank SDRAM Interface

Figure 12-5. EMIF to $512\text{K} \times 16 \times 2$ Bank SDRAM Interface

Table 12-7. 16-bit EMIF Address Pin Connections

SDRAM Size	Width	Banks	Device	Address Pins
16M bits	×16	2	SDRAM	A[10:0]
			EMIF	EM1A[10:0]
64M bits	×16	4	SDRAM	A[11:0]
			EMIF	EM1A[11:0]
128M bits	×16	4	SDRAM	A[11:0]
			EMIF	EM1A[11:0]
256M bits	×16	4	SDRAM	A[12:0]
			EMIF	EM1A[12:0]
512M bits	×16	4	SDRAM	A[12:0]
			EMIF	EM1A[12:0]

12.2.5.3 SDRAM Configuration Registers

The operation of the EMIF SDRAM interface is controlled by programming the appropriate configuration registers. This section describes the purpose and function of each configuration register, but [Section 12.5](#) can be referred to for a more detailed description of each register, including the default registers values and bit-field positions. The following tables list the four such configuration registers, along with a description of each of their programmable fields.

Note

Writing to any of the fields: NM, CL, IBANK, and PAGESIZE in the SDRAM configuration register (SDRAM_CR) causes the EMIF to abandon whatever the EMIF is currently doing and trigger the SDRAM initialization procedure described in [Section 12.2.5.4](#).

Table 12-8. Description of the SDRAM Configuration Register (SDRAM_CR)

Parameter	Description
SR	This bit controls entering and exiting of the self-refresh mode
PD	This bit controls entering and exiting of the power-down mode. If both SR and PD bits are set, the EMIF goes into self-refresh mode.
PDWR	Perform refreshes during power down. Writing a 1 to this bit causes the EMIF to exit the power-down state and issue an AUTO REFRESH command every time Refresh May level is set. This bit must be set along with PD when entering power-down mode.
NM	Narrow Mode. This bit defines the width of the data bus between the EMIF and the attached SDRAM device. When set to 1, the data bus is set to 16-bits. When set to 0, the data bus is set to 32-bits.
CL	CAS latency. This field defines the number of clock cycles between when an SDRAM issues a READ command and when the first piece of data appears on the bus. The value in this field is sent to the attached SDRAM device using the LOAD MODE REGISTER command during the SDRAM initialization procedure as described in Section 12.2.5.4 . Only, values of 2h (CAS latency = 2) and 3h (CAS latency = 3) are supported and must be written to this field. While updating the CL field, BIT11_9LOCK bit field must be set to 1 simultaneously.
IBANK	Number of Internal SDRAM Banks. This field defines the number of banks inside the attached SDRAM devices in the following way: - When IBANK = 0, 1 internal bank is used - When IBANK = 1h, 2 internal banks are used - When IBANK = 2h, 4 internal banks are used This field value affects the mapping of logical addresses to the SDRAM row, column, and bank addresses. See Section 12.2.5.11 for details.
PAGESIZE	Page Size. This field defines the internal page size of the attached SDRAM devices in the following way: - When PAGESIZE = 0, 256-word pages are used - When PAGESIZE = 1h, 512-word pages are used - When PAGESIZE = 2h, 1024-word pages are used - When PAGESIZE = 3h, 2048-word pages are used This field value affects the mapping of logical addresses to the SDRAM row, column, and bank addresses. See Section 12.2.5.11 for details.

Table 12-9. Description of the SDRAM Refresh Control Register (SDRAM_RCR)

Parameter	Description
RR	Refresh Rate. This field controls the rate at which attached SDRAM devices are refreshed. The following equation can be used to determine the required value of RR for an SDRAM device: $RR = f_{EM1CLK} / (\text{Required SDRAM Refresh Rate})$ More information about the operation of the SDRAM refresh controller is found in Section 12.2.5.6.

Table 12-10. Description of the SDRAM Timing Register (SDRAM_TR)

Parameter	Description
T_RFC	SDRAM Timing Parameters. These fields configure the EMIF to comply with the AC timing requirements of the attached SDRAM devices. This allows the EMIF to avoid violating SDRAM timing constraints and to more efficiently schedule operations. More details about each of these parameters can be found in the SDRAM_TR register description. These parameters must be set to satisfy the corresponding timing requirements found in the SDRAM data sheet.
T_RP	
T_RCD	
T_WR	
T_RAS	
T_RC	
T_RRD	

Table 12-11. Description of the SDRAM Self Refresh Exit Timing Register (SDR_EXT_TMNG)

Parameter	Description
T_XS	Self Refresh Exit Parameter. The T_XS field of this register informs the EMIF about the minimum number of EM1CLK cycles required between exiting self-refresh and issuing any command. This parameter must be set to satisfy the t_{XSR} value for the attached SDRAM device.

12.2.5.4 SDRAM Auto-Initialization Sequence

The EMIF automatically performs an SDRAM initialization sequence, regardless of whether the EMIF is interfaced to an SDRAM device, when either of the following two events occur:

- The EMIF comes out of reset. No memory accesses to the SDRAM and asynchronous interfaces are performed until this auto-initialization is complete.
- A write is performed to any of the three least-significant bytes of the SDRAM configuration register (SDRAM_CR)

An SDRAM initialization sequence consists of the following steps:

1. If the initialization sequence is activated by a write to SDRAM_CR, and if any of the SDRAM banks are open, the EMIF issues a PRE command with EM1A[10] held high to indicate all banks. This is done so that the maximum ACTV to PRE timing for an SDRAM is not violated.
2. The EMIF drives EM1SDCKE high and begins continuously issuing NOP commands until eight SDRAM refresh intervals have elapsed. An SDRAM refresh interval is equal to the value of the RR field of the SDRAM refresh control register (SDRAM_RCR), divided by the frequency of EM1CLK (RR/f_{EM1CLK}). This step is used to avoid violating the power-up constraint of most SDRAM devices that requires 200 μ s (sometimes 100 μ s) between receiving stable Vdd and CLK and the issuing of a PRE command. Depending on the frequency of EM1CLK, this step could be insufficient to avoid violating the SDRAM constraint. See [Section 12.2.5.5](#) for more information.
3. After the refresh intervals have elapsed, the EMIF issues a PRE command with EM1A[10] held high to indicate all banks.
4. The EMIF issues eight AUTO REFRESH commands.
5. The EMIF issues the LMR command with the EM1A[9:0] pins set as described in [Table 12-12](#).
6. Finally, the EMIF performs a refresh cycle, which consists of the following steps:
 - a. Issuing a PRE command with EM1A[10] held high if any banks are open
 - b. Issuing an REF command

Table 12-12. SDRAM LOAD MODE REGISTER Command

EM1A[9:7]	EM1A[6:4]	EM1A[3]	EM1A[2:0]
0 (Write bursts are of the programmed burst length in EM1A[2:0])	These bits control the CAS latency of the SDRAM and are set according to CL field in the SDRAM configuration register (SDRAM_CR) as follows: • If CL = 2, EM1A[6:4] = 2h (CAS latency = 2) • If CL = 3, EM1A[6:4] = 3h (CAS latency = 3)	0 (Sequential Burst Type. Interleaved Burst Type not supported)	These bits control the burst length of the SDRAM and are set according to the NM field in the SDRAM configuration register (SDRAM_CR) as follows: • If NM = 0, EM1A[2:0] = 2h (Burst Length = 4) • If NM = 1, EM1A[2:0] = 3h (Burst Length = 8)

12.2.5.5 SDRAM Configuration Procedure

There are two different SDRAM configuration procedures. Although the EMIF automatically performs the SDRAM initialization sequence described in [Section 12.2.5.4](#) when coming out of reset, follow one of the procedures before performing any EMIF memory requests.

Procedure A must be followed if the SDRAM power-up constraint was not violated during the SDRAM auto-initialization sequence detailed in [Section 12.2.5.4](#) on coming out of Reset. The SDRAM power-up constraint specifies that 200µs (sometimes 100µs) must exist between receiving stable Vdd and CLK and the issuing of a PRE command.

Procedure B must be followed if the SDRAM power-up constraint was violated. The 200µs (100µs) SDRAM power-up constraint is violated, if the frequency of EM1CLK is greater than 50MHz (100MHz for 100µs SDRAM power-up constraint) during SDRAM Auto-Initialization Sequence. Procedure B must be followed if there is any doubt that the power-up constraint was not met.

Procedure A — Following is the procedure to be followed if the SDRAM power-up constraint was not violated:

1. Place the SDRAM into self-refresh mode by setting the SR bit of SDRAM_CR to 1. The SDRAM can be placed into self-refresh mode when changing the frequency of the EM1CLK to avoid incurring the 200µs power-up constraint again.
2. Configure the desired EMIF1 clock (EM1CLK) frequency. The frequency of the memory clock must meet the timing requirements in the SDRAM manufacturer's documentation and the timing limitations shown in the electrical specifications of the device data sheet.
3. Remove the SDRAM from self-refresh mode by clearing the SR bit of the SDRAM_CR to 0.
4. Program SDRAM_TR and SDR_EXT_TMNG to satisfy the timing requirements for the attached SDRAM device. The timing parameters must be taken from the SDRAM data sheet.
5. Program the RR field of SDRAM_RCR to match that of the attached device's refresh interval. See [Section 12.2.5.6.1](#) details on determining the appropriate value.
6. Program the SDRAM_CR to match the characteristics of the attached SDRAM device. This causes the auto-initialization sequence in [Section 12.2.5.4](#) to be re-run. This second initialization generally takes much less time due to the increased frequency of EM1CLK.

Procedure B — Following is the procedure to be followed if the SDRAM power-up constraint was violated:

1. Configure the desired EM1CLK clock frequency. The frequency of the memory clock must meet the timing requirements in the SDRAM manufacturer's documentation and the timing limitations shown in the electrical specifications of the device data sheet.
2. Program SDRAM_TR and SDR_EXT_TMNG to satisfy the timing requirements for the attached SDRAM device. The timing parameters must be taken from the SDRAM data sheet.
3. Program the RR field of the SDRAM_RCR such that the following equation is satisfied: $(RR \times 8) / (f_{EM1CLK}) > 200\mu s$ (sometimes 100µs). For example, an EM1CLK frequency of 100MHz requires setting RR to 2501 (9C5h) or higher to meet a 200µs constraint.
4. Program the SDRAM_CR to match the characteristics of the attached SDRAM device. This causes the auto-initialization sequence in [Section 12.2.5.4](#) to be re-run with the new value of RR.
5. Perform a read from the SDRAM to make sure that step 5 of this procedure occurs after the initialization process has completed. Alternatively, wait for 200µs instead of performing a read.
6. Finally, program the RR field to match that of the attached device's refresh interval. See [Section 12.2.5.6.1](#) details on determining the appropriate value.

After following the above procedure, the EMIF is ready to perform accesses to the attached SDRAM device.

12.2.5.6 EMIF Refresh Controller

An SDRAM device requires that each of the rows be refreshed at a minimum required rate. The EMIF can meet this constraint by performing auto refresh cycles at or above this required rate. An auto-refresh cycle consists of issuing a PRE command to all banks of the SDRAM device followed by issuing a REFR command. To inform the EMIF of the required rate for performing auto refresh cycles, the RR field of the SDRAM refresh control register (SDRAM_RCR) must be programmed. The EMIF uses this value along with two internal counters to automatically perform auto refresh cycles at the required rate. The auto-refresh cycles cannot be disabled, even if the EMIF is not interfaced with an SDRAM. The remainder of this section details the EMIF's refresh scheme and provides an example for determining the appropriate value to place in the RR field of the SDRAM_RCR.

The two counters used to perform auto-refresh cycles are a 13-bit refresh interval counter and a 4-bit refresh backlog counter. At reset and upon writing to the RR field, the refresh interval counter is loaded with the value from RR field and begins decrementing, by one, each EMIF clock cycle. When the refresh interval counter reaches zero, the following actions occur:

- The refresh interval counter is reloaded with the value from the RR field and restarts decrementing.
- The 4-bit refresh backlog counter increments unless the counter has already reached the maximum value.

The refresh backlog counter records the number of auto refresh cycles that the EMIF currently has outstanding. This counter is decremented by one each time an auto refresh cycle is performed and incremented by one each time the refresh interval counter expires. The refresh backlog counter saturates at the values of 0000b and 1111b. The EMIF uses the refresh backlog counter to determine the urgency with which an auto refresh cycle must be performed. The four levels of urgency are described in [Table 12-13](#). This refresh scheme allows the required refreshes to be performed with minimal impact on access requests.

Table 12-13. Refresh Urgency Levels

Urgency Level	Refresh Backlog Counter Range	Action Taken
Refresh May	1-3	An auto-refresh cycle is performed only if the EMIF has no requests pending and none of the SDRAM banks are open.
Refresh Release	4-7	An auto-refresh cycle is performed if the EMIF has no requests pending, regardless of whether any SDRAM banks are open.
Refresh Need	8-11	An auto-refresh cycle is performed at the completion of the current access unless there are read requests pending.
Refresh Must	12-15	Multiple auto-refresh cycles are performed at the completion of the current access until the Refresh Release urgency level is reached. At that point, the EMIF can begin servicing any new read or write requests.

12.2.5.6.1 Determining the Appropriate Value for the RR Field

The value that must be programmed into the RR field of the SDRAM_RCR must can be calculated by using the frequency of the EM1CLK signal (f_{EM1CLK}) and the required refresh rate of the SDRAM ($f_{Refresh}$). The following formula can be used:

$$RR = f_{EM1CLK} / f_{Refresh}$$

The SDRAM data sheet often communicates the required SDRAM Refresh Rate in terms of the number of REFR commands required in a given time interval. The required SDRAM Refresh Rate in the formula above can therefore be calculated by dividing the number of required cycles per time interval (n_{cycles}) by the time interval given in the data sheet ($t_{Refresh\ Period}$):

$$f_{Refresh} = n_{cycles} / t_{Refresh\ Period}$$

Combining these formulas, the value that must be programmed into the RR field can be computed as:

$$RR = f_{EM1CLK} \times t_{Refresh\ Period} / n_{cycles}$$

The following example illustrates calculating the value of RR. Given that:

- $f_{EM1CLK} = 100\text{MHz}$ (frequency of EMIF clock)
- $t_{Refresh\ Period} = 64\text{ms}$ (required refresh interval of the SDRAM)
- $n_{cycles} = 8192$ (number of cycles in a refresh interval for the SDRAM)

RR can be calculated as:

$$RR = 100\text{MHz} \times 64\text{ms}/8192$$

$$RR = 781.25$$

$$RR = 782\text{ cycles} = 30\text{Eh cycles}$$

12.2.5.7 Self-Refresh Mode

The EMIF can be programmed to enter the self-refresh state by setting the SR bit of SDRAM_CR to 1. This causes the EMIF to issue the SLFR command after completing any outstanding SDRAM access requests and clearing the refresh backlog counter by performing one or more auto refresh cycles. This places the attached SDRAM device into self-refresh mode in which the EMIF consumes a minimal amount of power while performing the refresh cycles.

While in the self-refresh state, the EMIF continues to service asynchronous bank requests and register accesses as normal, with one caveat. The EMIF does not park the data bus following a read to asynchronous memory while in the self-refresh state. Instead, the EMIF tri-states the data bus. Therefore, it is not recommended to perform asynchronous read operations while the EMIF is in the self-refresh state to prevent floating inputs on the data bus. More information about data bus parking can be found in [Section 12.2.7](#).

The EMIF exits from the self-refresh state, if either of the following events occur:

- The SR bit of SDRAM_CR is cleared to 0.
- An SDRAM accesses is requested.

The EMIF exits from the self-refresh state by driving EM1SDCKE high and performing an auto refresh cycle.

The attached SDRAM device must also be placed into self-refresh mode when changing the frequency of EM1CLK. If the frequency of EM1CLK changes while the SDRAM is not in self-refresh mode, Procedure B in [Section 12.2.5.5](#) must be followed to reinitialize the device.

12.2.5.8 Power-Down Mode

To support low-power modes, the EMIF can be requested to issue a POWER DOWN command to the SDRAM by setting the PD bit in the SDRAM configuration register (SDRAM_CR). When this bit is set, the EMIF continues normal operation until all outstanding memory access requests have been serviced and the SDRAM refresh backlog (if there is one) has been cleared. At this point, the EMIF enters the power-down state. Upon entering this state, the EMIF issues a POWER DOWN command (same as a NOP command but driving the EM1SDCKE low on the same cycle). The EMIF then maintains the EM1SDCKE low until the EMIF exits the power-down state.

Since the EMIF services the refresh backlog before the EMIF enters the power-down state, all internal banks of the SDRAM are closed (precharged) prior to issuing the POWER DOWN command. Therefore, the EMIF only supports precharge power-down. The EMIF does not support active power-down, where internal banks of the SDRAM are open (active) before the POWER DOWN command is issued.

During the power-down state, the EMIF services the SDRAM, asynchronous memory, and register accesses as normal, returning to the power-down state upon completion.

The PDWR bit in the SDRAM_CR indicates whether the EMIF must perform refreshes in power-down state. If the PDWR bit is set, the EMIF exits the power-down state every time the Refresh Must level is set, performs AUTO REFRESH commands to the SDRAM, and returns back to the power-down state. This evenly distributes the refreshes to the SDRAM in power-down state. If the PDWR bit is not set, the EMIF does not perform any refreshes to the SDRAM. Therefore, the data integrity of the SDRAM is not maintained upon power-down exit, if the PDWR bit is not set.

If the PD bit is cleared while in the power-down state, the EMIF comes out of the power-down state. The EMIF:

- Drives EM1SDCKE high
- Enters the idle state

12.2.5.9 SDRAM Read Operation

When the EMIF receives a read request to the SDRAM from one of the requesters listed in [Section 12.2.2](#), the EMIF performs one or more read access cycles. A read access cycle begins with the issuing of the ACTV command to select the desired bank and row of the SDRAM device. After the row has been opened, the EMIF proceeds to issue a READ command while specifying the desired bank and column address. EM1A[10] is held low during the READ command to avoid auto-precharging. The READ command signals the SDRAM device to output data from the specified address while EMIF issues NOP commands. Following a READ command, the CL field of the SDRAM configuration register (SDRAM_CR) defines how many delay cycles are present before the read data appears on the data bus. This is referred to as the CAS latency.

[Figure 12-6](#) shows the signal waveforms for a basic SDRAM read operation in which multiple data is read from a single page. On this device, burst accesses are not supported; hence, the EMIF issues a READ command for each data access. Only when the EMIF SDRAM interface is configured to 16-bit by setting the NM bit of the SDRAM configuration register (SDRAM_CR) to 1 and CPU (or any other master) does a 32-bit READ access, a burst access is issued with a size of two.

Figure 12-6. Timing Waveform for Basic SDRAM Read Operation

Several other pins are also active during a read access. The EM1DQM[x:0] pins are driven low during the READ commands and are kept low during the NOP commands that correspond to the burst request. The state of the other EMIF pins during each command can be found in [Table 12-6](#).

The EMIF schedules the commands based on the timing information that is provided to the EMIF in the SDRAM timing register (SDRAM_TR). The values for the timing parameters in this register must be chosen to satisfy the timing requirements listed in the SDRAM data manual. The EMIF uses this timing information to avoid violating any timing constraints related to issuing commands. This is commonly accomplished by inserting NOP commands between various commands during an access. Refer to the register description of SDRAM_TR in the SDTIMER register for more details on the various timing parameters.

12.2.5.10 SDRAM Write Operations

When the EMIF receives a write request to SDRAM from one of the requesters listed in [Section 12.2.2](#), the EMIF performs one or more write-access cycles. A write-access cycle begins with the issuing of the ACTV command to select the desired bank and row of the SDRAM device. After the row has been opened, the EMIF proceeds to issue a WRT command while specifying the desired bank and column address. EM1A[10] is held low during the WRT command to avoid auto-precharging. The WRT command signals the SDRAM device to start writing the given data to the specified address while the EMIF issues NOP commands. On this device, burst accesses are not supported; hence, the EMIF issues a WRITE command for each data access. Only when the EMIF SDRAM interface is configured to 16-bit by setting the NM bit of the SDRAM configuration register (SDRAM_CR) to 1 and CPU (or any other master) does a 32bit WRITE access, a burst access is issued with size of two.

[Figure 12-7](#) shows the signal waveforms for a basic SDRAM write operation.

Figure 12-7. Timing Waveform for Basic SDRAM Write Operation

The EMIF truncates a series of bursting data if the remaining addresses of the burst are not part of the write request. The EMIF can truncate the burst in three ways:

- By issuing another WRT to the same page
- By issuing a PRE command to prepare for accessing a different page of the same bank
- By issuing a BT command to prepare for accessing a page in a different bank

Several other pins are also active during a write access. The EM1DQM[x:0] pins are driven to select which bytes of the data word are written to the SDRAM device. The pins are also used to mask out entire undesired data words during a burst access. The state of the other EMIF pins during each command can be found in [Table 12-6](#).

The EMIF schedules the commands based on the timing information that is provided to the EMIF in the SDRAM timing register (SDRAM_TR). The values for the timing parameters in this register must be chosen to satisfy the timing requirements listed in the SDRAM data sheet. The EMIF uses this timing information to avoid violating any timing constraints related to issuing commands. This is commonly accomplished by inserting NOP commands during various cycles of an access. Refer to the register description of SDRAM_TR in the SDTIMR register for more details on the various timing parameters.

12.2.5.11 Mapping from Logical Address to EMIF Pins

When the EMIF receives an SDRAM access request, the EMIF must convert the address of the access into the appropriate signals to send to the SDRAM device. The details of this address mapping are shown in [Table 12-14](#) for 32-bit operation and in [Table 12-15](#) for 16-bit operation. Using the settings of the IBANK and PAGESIZE fields of the SDRAM configuration register (SDRAM_CR), the EMIF determines which bits of the logical address are mapped to the SDRAM row, column, and bank addresses.

As the logical address is incremented by one halfword (16-bit operation), the column address is likewise incremented by one until a page boundary is reached. When the logical address increments across a page boundary, the EMIF moves into the same page in the next bank of the attached device by incrementing the bank address EM1BA and resetting the column address. The page in the previous bank is left open until necessary to close the page. This method of traversal through the SDRAM banks helps maximize the number of open banks inside of the SDRAM and results in an efficient use of the device. There is no limitation on the number of banks that can be open at one time, but only one page within a bank can be open at a time.

The EMIF uses the EM1DQM[3:0] pins during a WRT command to mask out selected bytes or entire words. The EM1DQM[3:0] pins are always low during a READ command.

Table 12-14. Mapping from Logical Address to EMIF Pins for 32-bit SDRAM

IBANK	PAGESIZE	Logical Address												
		31:27	26	25	24	23	22	21:14	13	12	11	10	9	8:1
0	0	-					Row Address					Col Address		EM1DQM[2]/EM1DQM[3]
1	0	-					Row Address					EM1BA[0]	Col Address	EM1DQM[2]/EM1DQM[3]
2	0	-					Row Address					EM1BA[1:0]	Col Address	EM1DQM[2]/EM1DQM[3]
0	1	-					Row Address					Column Address		EM1DQM[2]/EM1DQM[3]
1	1	-					Row Address					EM1BA[0]	Column Address	EM1DQM[2]/EM1DQM[3]

Note

The upper bit of the row address is used only when addressing 256-Mbit and 512-Mbit SDRAM memories.

12.2.6 Asynchronous Controller and Interface

The EMIF easily interfaces to a variety of asynchronous devices including NOR Flash and SRAM. It can be operated in two major modes (see [Table 12-16](#)):

- Normal Mode
- Select Strobe Mode

Table 12-16. Normal Mode vs. Select Strobe Mode

Mode	Function of EM1DQM pins	Operation of EM1CS[4:2]
Normal Mode	Byte enables	Active during the entire asynchronous access cycle
Select Strobe Mode	Byte enables	Active only during the strobe period of an access cycle

The first mode of operation is normal mode, in which the EM1DQM pins of the EMIF function as byte enables. In this mode, the $\overline{\text{EM1CS}}[4:2]$ pins behave as typical chip select signals, remaining active for the duration of the asynchronous access. See [Section 12.2.6.1](#) for an example interface with multiple 8-bit devices.

The second mode of operation is select strobe mode, in which the $\overline{\text{EM1CS}}[4:2]$ pins act as a strobe, active only during the strobe period of an access. In this mode, the EM1DQM pins of the EMIF function as standard byte enables for reads and writes. A summary of the differences between the two modes of operation are shown in [Table 12-16](#). Refer to [Section 12.2.6.4](#) for the details of asynchronous operations in normal mode, and to [Section 12.2.6.5](#) for the details of asynchronous operations in select strobe mode. The EMIF hardware defaults to normal mode, but can be manually switched to select strobe mode by setting the SS bit in the asynchronous m ($m = 1, 2, 3$, or 4) configuration register (CENCFG) ($n = 2, 3$, or 4). Throughout the chapter, m can hold the values 1, 2, 3 or 4; and n can hold the values 2, 3, or 4.

In both normal mode and select strobe mode, EMIF can be configured to operate in a sub-mode called NAND Flash Mode. In NAND Flash Mode, the EMIF is able to calculate an error correction code (ECC) for transfers up to 512 bytes.

The EMIF also provides configurable cycle timing parameters and an extended wait mode that allows the connected device to extend the strobe period of an access cycle. The following sections describe the features related to interfacing with external asynchronous devices.

12.2.6.1 Interfacing to Asynchronous Memory

[Figure 12-8](#) shows the EMIF's external pins used in interfacing with an asynchronous device. In $\overline{\text{EM1CS}}[n]$, $n = 2, 3$, or 4 .

Figure 12-8. EMIF Asynchronous Interface

Of special note is the connection between the EMIF and the external device's address bus. The EMIF address pin EM1A[0] always provides the least-significant bit of a 32-bit word address. Therefore, when interfacing to a 16-bit or 8-bit asynchronous device, the EM1BA[1] and EM1BA[0] pins provide the least-significant bits of the halfword or byte address, respectively. Figure 12-9 and Figure 12-10 show the mapping between the EMIF and the connected device's data and address pins for various programmed data bus widths. The data bus width can be configured in the asynchronous n configuration register (ASYNC_CS n _CR).

Figure 12-10 shows an interface between the EMIF and an external memory with byte enables. The EMIF must be operated in either normal mode or select strobe mode when using this interface, so that the EM1DQM signals operate as byte enables.

a) EMIF to 8-bit memory interface

b) EMIF to 16-bit memory interface

Figure 12-9. EMIF to 8-bit/16-bit Memory Interface

Figure 12-10. Common Asynchronous Interface

12.2.6.2 Accessing Larger Asynchronous Memories

If a device such as a large asynchronous Flash needs to be attached to the EMIF, then GPIO pins can be used to control the Flash device upper address lines.

12.2.6.3 Configuring EMIF for Asynchronous Accesses

The operation of the EMIF's asynchronous interface can be configured by programming the appropriate register fields. The reset value and bit position for each register field can be found in [Section 12.5](#). The following tables list the register fields that can be programmed and describe the purpose of each field. These registers can be programmed prior to accessing the external memory, and the transfer following a write to these registers uses the new configuration.

Table 12-17. Description of the Asynchronous *m* Configuration Register (ASYNC_CS*n*_CR)

Parameter	Description
SS	Select Strobe mode. This bit selects the EMIF's mode of operation in the following way: - SS = 0 selects Normal Mode - EM1DQM pins function as byte enables - EM1CS[4:2] active for duration of access - SS = 1 selects Select Strobe Mode - EM1DQM pins function as byte enables - EM1CS[4:2] acts as a strobe.
EW	Extended Wait Mode enable. - EW = 0 disables Extended Wait Mode - EW = 1 enables Extended Wait Mode When set to 1, the EMIF enables the Extended Wait Mode in which the strobe width of an access cycle can be extended in response to the assertion of the EM1WAIT pin. The WP<i>n</i> bit in the asynchronous wait cycle configuration register (AWCC) controls the polarity of the EM1WAIT pin. Extended Wait Mode must not be used while in NAND Flash Mode. See Section 12.2.6.6 for more details on this mode of operation.
W_SETUP/R_SETUP	Read/Write setup widths. These fields define the number of EMIF clock cycles of setup time for the address pins (EM1A), byte enables (EM1DQM), and asynchronous chip enable (EM1CS[4:2]) before the read strobe pin (EM103) or write strobe pin (EM1WE) falls, minus one cycle. For writes, the W_SETUP field also defines the setup time for the data pins (EM1D). Refer to the asynchronous device's data sheet to determine the appropriate setting for this field.
W_STROBE/R_STROBE	Read/Write strobe widths. These fields define the number of EMIF clock cycles between the falling and rising of the read strobe pin (EM103) or write strobe pin (EM1WE<i>n</i>), minus one cycle. If Extended Wait Mode is enabled by setting the EW field in the asynchronous <i>n</i> configuration register (ASYNC_CS<i>n</i>_CR), these fields must be set to a value greater than zero. Refer to the data manual of the external asynchronous device to determine the appropriate setting for this field.
W_HOLD/R_HOLD	Read/Write hold widths. These fields define the number of EMIF clock cycles of hold time for the address pins (EM1A and EM1BA), byte enables (EM1DQM), and asynchronous chip enable (EM1CS[4:2]) after the read strobe pin (EM103) or write strobe pin (EM1WE) rises, minus one cycle. For writes, the W_HOLD field also defines the hold time for the data pins (EM1D). Refer to the data manual of the external asynchronous device to determine the appropriate setting for this field.
TA	Minimum turnaround time. This field defines the minimum number of EMIF clock cycles between asynchronous reads and writes, minus one cycle. The purpose of this feature is to avoid contention on the bus. The value written to this field also determines the number of cycles that are inserted between asynchronous accesses and SDRAM accesses. Refer to the data manual of the external asynchronous device to determine the appropriate setting for this field.

Table 12-17. Description of the Asynchronous *m* Configuration Register (ASYNC_CS*n*_CR) (continued)

Parameter	Description
ASIZE	Asynchronous Device Bus Width. This field determines the data bus width of the asynchronous interface in the following way: - ASIZE = 0 selects an 8-bit bus - ASIZE = 1 selects a 16-bit bus - ASIZE = 2 selects a 32-bit bus The configuration of ASIZE determines the function of the EM1A and EM1BA pins as described in Section 12.2.6.1. This field also determines the number of external accesses required to fulfill a request generated by one of the sources mentioned in Section 12.2.2. For example, a request for a 32-bit word requires four external access when ASIZE = 0. Refer to the data manual of the external asynchronous device to determine the appropriate setting for this field.

Table 12-18. Description of the Asynchronous Wait Cycle Configuration Register (ASYNC_WCCR)

Parameter	Description
WP <i>n</i>	EM_WAIT Polarity. - WP<i>n</i> = 0 selects active-low polarity - WP<i>n</i> = 1 selects active-high polarity When set to 1, the EMIF waits if the EM1WAIT pin is high. When cleared to 0, the EMIF waits if the EM1WAIT pin is low. The EMIF must have the Extended Wait Mode enabled for the EM1WAIT pin to affect the width of the strobe period. The polarity of the EM1WAIT signal is not programmable in NAND Flash Mode.
MAX_EXT_WAIT	Maximum Extended Wait Cycles. This field configures the number of EMIF clock cycles the EMIF waits for the EM1WAIT pin to be deactivated during the strobe period of an access cycle. The maximum number of EMIF clock cycles the EMIF waits is determined by the following formula: Maximum Extended Wait Cycles = (MAX_EXT_WAIT + 1) × 16 If the EM1WAIT pin is not deactivated within the time specified by this field, the EMIF resumes the access cycle, registering whatever data is on the bus and proceeding to the hold period of the access cycle. This situation is referred to as an Asynchronous Timeout. An Asynchronous Timeout generates an interrupt, if the interrupt has been enabled in the EMIF interrupt mask set register (INT_MSK_SET). Refer to Section 12.2.9.1 for more information about EMIF interrupts. Extended Wait Mode can not be used while in NAND Flash Mode.

Table 12-19. Description of EMIF Interrupt Mask Set Register (INT_MSK_SET)

Parameter	Description
WR_MASK_SET	Wait Rise Mask Set. Writing a 1 enables an interrupt to be generated when a rising edge on EM1WAIT occurs.
AT_MASK_SET	Asynchronous Timeout Mask Set. Writing a 1 to this bit enables an interrupt to be generated when an Asynchronous Timeout occurs.

Table 12-20. Description of EMIF Interrupt Mast Clear Register (INT_MSK_CLR)

Parameter	Description
WR_MASK_CLR	Wait Rise Mask Clear. Writing a 1 to this bit disables the interrupt, clearing the WR_MASK_SET bit in EMIF interrupt mask set register (INT_MSK_SET).
AT_MASK_CLR	Asynchronous Timeout Mask Clear. Writing a 1 to this bit prevents an interrupt from being generated when an Asynchronous Timeout occurs.

Note

The EMIF performs SDRAM refreshes even if the SDRAM interface is not used. If using only the ASRAM interface, then SDRAM refreshes impact the ASRAM performance. To avoid this, set PD=1 in the SDRAM_CR register (Emif1Regs.SDRAM_CR.bit.PD=1). This bit can be updated only if there are no pending EMIF accesses.

12.2.6.4 Read and Write Operations in Normal Mode

Normal mode is the asynchronous interface's default mode of operation. It is selected when the SS bit in the asynchronous *n* configuration register (ASYNC_CS*n*_CR) is cleared to 0. In this mode, the EM1DQM pins operate as byte enables. [Section 12.2.6.4.1](#) and [Section 12.2.6.4.2](#) explain the details of read and write operations while in normal mode.

12.2.6.4.1 Asynchronous Read Operations (Normal Mode)

Note

During an entire asynchronous read operation, the EM1WE pin is driven high.

An asynchronous read is performed when any of the requesters mentioned in [Section 12.2.2](#) request a read from the attached asynchronous memory. After the request is received, a read operation is initiated once the request becomes the EMIF's highest priority task, according to the priority scheme detailed in [Section 12.2.13](#). In the event that the read request cannot be serviced by a single access cycle to the external device, multiple access cycles are performed by EMIF until the entire request is fulfilled. The details of an asynchronous read operation in normal mode are described in [Table 12-21](#). Also, [Figure 12-11](#) shows an example timing diagram of a basic read operation.

Table 12-21. Asynchronous Read Operation in Normal Mode

Time Interval	Pin Activity in Normal Mode
Turnaround period	Once the read operation becomes the highest priority task for EMIF, the EMIF waits for the programmed number of turn-around cycles before proceeding to the setup period of the operation. The number of wait cycles is taken directly from the TA field of the asynchronous <i>n</i> configuration register (ASYNC_CS <i>n</i> _CR). Between each access (write or read), the EMIF inserts two cycles of delay even though TA field is programmed as 0. After the EMIF has waited for the turnaround cycles to complete, the EMIF again checks to make sure that the read operation is still the highest priority task. If so, the EMIF proceeds to the setup period of the operation. If the read operation is no longer the highest priority task, the EMIF terminates the operation.
Start of the setup period	The following actions occur at the start of the setup period: - The setup, strobe, and hold values are set according to the R_SETUP, R_STROBE, and R_HOLD values in ASYNC_CS<i>n</i>_CR. - The address pins EM1A and EM1BA become valid and carry the values described in Section 12.2.6.1. <u>EM1CS[4:2]</u> falls to enable the external device (if not already low from a previous operation)

Table 12-21. Asynchronous Read Operation in Normal Mode (continued)

Time Interval	Pin Activity in Normal Mode
Strobe period	The following actions occur during the strobe period of a read operation: 1. $\overline{\text{EM1OE}}$ falls at the start of the strobe period 2. On the rising edge of the clock that is concurrent with the end of the strobe period: • $\overline{\text{EM1OE}}$ rises • The data on the EM1Dx bus is sampled by EMIF. In Figure 12-11, EM1WAIT is inactive. If EM1WAIT is instead activated, the strobe period can be extended by the external device to give it more time to provide the data. Section 12.2.6.6 contains more details on using the EM1WAIT pin.
End of the hold period	At the end of the hold period: • The address pins EM1A and EM1BA become invalid • $\overline{\text{EM1CS}}[4:2]$ rises (if no more operations are required to complete the current request) The EMIF can be required to issue additional read operations to a device with a small data bus width to complete an entire word access. In this case, the EMIF immediately re-enters the setup period to begin another operation without incurring the turn-round cycle delay. The setup, strobe, and hold values are not updated in this case. If the entire word access has been completed, the EMIF returns to the previous state unless another asynchronous request has been submitted and is currently the highest priority task. If this is the case, EMIF instead enters directly into the turnaround period for the pending read or write operation.

Figure 12-11. Timing Waveform of an Asynchronous Read Cycle in Normal Mode

12.2.6.4.2 Asynchronous Write Operations (Normal Mode)

Note

During an entire asynchronous write operation, the EM1OE pin is driven high.

An asynchronous write is performed when any of the requesters mentioned in [Section 12.2.2](#) request a write to memory in the asynchronous bank of EMIF. After the request is received, a write operation is initiated once the request becomes the EMIF's highest priority task, according to the priority scheme detailed in [Section 12.2.13](#). In the event that the write request cannot be serviced by a single access cycle to the external device, multiple access cycles are performed by the EMIF until the entire request is fulfilled. The details of an asynchronous write operation in normal mode are described in [Table 12-22](#). Also, [Figure 12-12](#) shows an example timing diagram of a basic write operation.

Table 12-22. Asynchronous Write Operation in Normal Mode

Time Interval	Pin Activity in Normal Mode
Turnaround period	Once the write operation becomes the highest priority task for the EMIF, the EMIF waits for the programmed number of turn-around cycles before proceeding to the setup period of the operation. The number of wait cycles is taken directly from the TA field of the asynchronous <i>n</i> configuration register (ASYNC_CS<i>n</i>_CR). Between each access (write or read) EMIF inserts two cycles of delay even though TA field is programmed as 0. After the EMIF has waited for the turn-around cycles to complete, the EMIF again checks to make sure that the write operation is still the highest priority task. If so, the EMIF proceeds to the setup period of the operation. If the write operation is no longer the highest priority task, EMIF terminates the operation.
Start of the setup period	The following actions occur at the start of the setup period: - The setup, strobe, and hold values are set according to the W_SETUP, W_STROBE, and W_HOLD values in ASYNC_CS<i>n</i>_CR. - The address pins EM1A and EM1BA and the data pins EM1D<i>x</i> become valid. The EM1A and EM1BA pins carry the values described in Section 12.2.6.1. $\overline{\text{EM1CS}}[4:2]$ falls to enable the external device (if not already low from a previous operation).
Strobe period	The following actions occur at the start of the strobe period of a write operation: - EM1WE falls - The EM1DQM pins become valid as byte enables. The following actions occur on the rising edge of the clock that is concurrent with the end of the strobe period: - EM1WE rises - The EM1DQM pins deactivate In Figure 12-12, EM1WAIT is inactive. If EM1WAIT is instead activated, the strobe period can be extended by the external device to give it more time to accept the data. Section 12.2.6.6 contains more details on using the EM1WAIT pin.
End of the hold period	At the end of the hold period: - The address pins EM1A<i>x</i> and EM1BA<i>x</i> become invalid - The data pins become invalid $\overline{\text{EM1CS}}[n]$ (<i>n</i> = 2, 3, or 4) rises (if no more operations are required to complete the current request) The EMIF can be required to issue additional write operations to a device with a small data bus width to complete an entire word access. In this case, the EMIF immediately re-enters the setup period to begin another operation without incurring the turnaround cycle delay. The setup, strobe, and hold values are not updated in this case. If the entire word access has been completed, the EMIF returns to the previous state unless another asynchronous request has been submitted and is currently the highest priority task. If this is the case, the EMIF instead enters directly into the turnaround period for the pending read or write operation.

Figure 12-12. Timing Waveform of an Asynchronous Write Cycle in Normal Mode

12.2.6.5 Read and Write Operation in Select Strobe Mode

Select Strobe Mode is the EMIF's second mode of operation. It is selected when the SS bit of the asynchronous n configuration register (ASYNC_CS n _CR) is set to 1. In this mode, the EM1DQM pins operate as byte enables and the EM1CS[n] ($n = 2, 3, \text{ or } 4$) pin is only active during the strobe period of an access cycle. [Section 12.2.6.4.1](#) and [Section 12.2.6.4.2](#) explain the details of read and write operations while in select strobe mode.

12.2.6.5.1 Asynchronous Read Operations (Select Strobe Mode)

Note

During the entirety of an asynchronous read operation, the EM1WEn pin is driven high.

An asynchronous read is performed when any of the requesters mentioned in [Section 12.2.2](#) request a read from the attached asynchronous memory. After the request is received, a read operation is initiated once the request becomes the EMIF's highest priority task, according to the priority scheme detailed in [Section 12.2.13](#). In the event that the read request cannot be serviced by a single access cycle to the external device, multiple access cycles are performed by the EMIF until the entire request is fulfilled. The details of an asynchronous read operation in select strobe mode are described in [Table 12-23](#). Also, [Figure 12-13](#) shows an example timing diagram of a basic read operation.

Table 12-23. Asynchronous Read Operation in Select Strobe Mode

Time Interval	Pin Activity in Select Strobe Mode
Turnaround period	Once the read operation becomes the highest priority task for the EMIF, the EMIF waits for the programmed number of turnaround cycles before proceeding to the setup period of the operation. The number of wait cycles is taken directly from the TA field of the asynchronous n configuration register (ASYNC_CSn_CR). Between each access (Write or Read) EMIF inserts two cycles of delay even though TA field is programmed as 0. After the EMIF has waited for the turn-around cycles to complete, the EMIF again checks to make sure that the read operation is still the highest priority task. If so, the EMIF proceeds to the setup period of the operation. If the read operation is no longer the highest priority task, the EMIF terminates the operation.
Start of the setup period	The following actions occur at the start of the setup period: - The setup, strobe, and hold values are set according to the R_SETUP, R_STROBE, and R_HOLD values in ASYNC_CSn_CR. - The address pins EM1A and EM1BA become valid and carry the values described in Section 12.2.6.1. - The EM1DQM pins become valid as byte enables.
Strobe period	The following actions occur during the strobe period of a read operation: - EM1CS[n] ($n = 2, 3, \text{ or } 4$) and EM1OE fall at the start of the strobe period - On the rising edge of the clock that is concurrent with the end of the strobe period: - EM1CS[n] ($n = 2, 3, \text{ or } 4$) and EM1OE rise - The data on the EM1D bus is sampled by EMIF. In Figure 12-13, EM1WAIT is inactive. If EM1WAIT is instead activated, the strobe period can be extended by the external device to give more time to provide the data. Section 12.2.6.6 contains more details on using the EM1WAIT pin.
End of the hold period	At the end of the hold period: - The address pins EM1A and EM1BA become invalid - The EM1DQM pins become invalid The EMIF can be required to issue additional read operations to a device with a small data bus width to complete an entire word access. In this case, the EMIF immediately re-enters the setup period to begin another operation without incurring the turnaround cycle delay. The setup, strobe, and hold values are not updated in this case. If the entire word access has been completed, the EMIF returns to the previous state unless another asynchronous request has been submitted and is currently the highest priority task. If this is the case, the EMIF instead enters directly into the turnaround period for the pending read or write operation.

Figure 12-13. Timing Waveform of an Asynchronous Read Cycle in Select Strobe Mode

12.2.6.5.2 Asynchronous Write Operations (Select Strobe Mode)

Note

During the entirety of an asynchronous write operation, the $\overline{\text{EM1OE}}$ pin is driven high.

An asynchronous write is performed when any of the requesters mentioned in [Section 12.2.2](#) request a write to memory in the asynchronous bank of EMIF. After the request is received, a write operation is initiated once the request becomes the EMIF's highest priority task, according to the priority scheme detailed in [Section 12.2.13](#). In the event that the write request cannot be serviced by a single access cycle to the external device, multiple access cycles are performed by the EMIF until the entire request is fulfilled. The details of an asynchronous write operation in select strobe mode are described in [Table 12-24](#). Also, [Figure 12-14](#) shows an example timing diagram of a basic write operation.

Table 12-24. Asynchronous Write Operation in Select Strobe Mode

Time Interval	Pin Activity in Select Strobe Mode
Turnaround period	Once the write operation becomes the highest priority task for the EMIF, the EMIF waits for the programmed number of turnaround cycles before proceeding to the setup period of the operation. The number of wait cycles is taken directly from the TA field of the asynchronous n configuration register (ASYNC_CS$_n$_CR). Between each access (Write or Read) EMIF inserts two cycles of delay even though TA field is programmed as 0. After the EMIF has waited for the turnaround cycles to complete, the EMIF again checks to make sure that the write operation is still the highest priority task. If so, the EMIF proceeds to the setup period of the operation. If the write operation is no longer the highest priority task, the EMIF terminates the operation.
Start of the setup period	The following actions occur at the start of the setup period: - The setup, strobe, and hold values are set according to the W_SETUP, W_STROBE, and W_HOLD values in ASYNC_CS$_n$_CR. - The address pins EM1A and EM1BA and the data pins EM1D become valid. The EM1A and EM1BA pins carry the values described in Section 12.2.6.1. - The EM1DQM pins become active as byte enables.
Strobe period	The following actions occur at the start of the strobe period of a write operation: $\overline{\text{EM1CS}}[n]$ ($n = 2, 3, \text{ or } 4$) and $\overline{\text{EM1WE}}$ fall The following actions occur on the rising edge of the clock which is concurrent with the end of the strobe period: $\overline{\text{EM1CS}}[n]$ ($n = 2, 3, \text{ or } 4$) and $\overline{\text{EM1WE}}$ rise In Figure 12-14, EM1WAIT is inactive. If EM1WAIT is instead activated, the strobe period can be extended by the external device to give more time to accept the data. Section 12.2.6.6 contains more details on using the EM1WAIT pin.
End of the hold period	At the end of the hold period: - The address pins EM1A and EM1BA become invalid - The data pins become invalid - The EM1DQM pins become invalid The EMIF can be required to issue additional write operations to a device with a small data bus width to complete an entire word access. In this case, the EMIF immediately re-enters the setup period to begin another operation without incurring the turnaround cycle delay. The setup, strobe, and hold values are not updated in this case. If the entire word access has been completed, the EMIF returns to the previous state unless another asynchronous request has been submitted and is currently the highest priority task. If this is the case, the EMIF instead enters directly into the turnaround period for the pending read or write operation.

Figure 12-14. Timing Waveform of an Asynchronous Write Cycle in Select Strobe Mode

12.2.6.6 Extended Wait Mode and the EM1WAIT Pin

The EMIF supports the extended wait mode. This is a mode that the external asynchronous device can assert control over the length of the strobe period. The extended wait mode can be entered by setting the EW bit in the asynchronous n configuration register (ASYNC_CS n _CR ($n = 2, 3$, or 4)). When this bit is set, the EMIF monitors the EM1WAIT pin to determine if the attached device wishes to extend the strobe period of the current access cycle beyond the programmed number of clock cycles.

When the EMIF detects that the EM1WAIT pin has been asserted, the EMIF begins inserting extra strobe cycles into the operation until the EM1WAIT pin is deactivated by the external device. The EMIF then returns to the last cycle of the programmed strobe period and the operation proceeds as usual from this point. Refer to the device data sheet for details on the timing requirements of the EM1WAIT signal.

The EM1WAIT pin cannot be used to extend the strobe period indefinitely. The programmable MAX_EXT_WAIT field in the asynchronous wait cycle configuration register (AWCC) determines the maximum number of EM1CLK cycles the strobe period can be extended beyond the programmed length. When the counter expires, the EMIF proceeds to the hold period of the operation regardless of the state of the EM1WAIT pin. The EMIF can also generate an interrupt upon expiration of this counter. See [Section 12.2.9.1](#) for details on enabling this interrupt.

For the EMIF to function properly in the extended wait mode, the WP n bit of AWCC must be programmed to match the polarity of the EM1WAIT pin. In the reset state of 1, the EMIF inserts wait cycles when the EM1WAIT pin is sampled high. When set to 0, the EMIF inserts wait cycles only when EM1WAIT is sampled low. This programmability allows for a glueless connection to larger variety of asynchronous devices.

Finally, a restriction is placed on the strobe period timing parameters when operating in extended wait mode. Specifically, the sum of the W_SETUP and W_STROBE fields must be greater than four, and the sum of the R_SETUP and R_STROBE fields must be greater than four for the EMIF to recognize the EM1WAIT pin has been asserted. The W_SETUP, W_STROBE, R_SETUP, and R_STROBE fields are in ASYNC_CS n _CR.

12.2.7 Data Bus Parking

The EMIF always drives the data bus to the previous write data value when the EMIF is idle. This feature is called data bus parking. Only when the EMIF issues a read command to the external memory does the EMIF stop driving the data bus. After the EMIF latches the last read data, the EMIF immediately parks the data bus again.

The one exception to this behavior occurs after performing an asynchronous read operation while the EMIF is in the self-refresh state. In this situation, the read operation is not followed by the EMIF parking the data bus. Instead, the EMIF tri-states the data bus. Therefore, it is not recommended to perform asynchronous read operations while the EMIF is in the self-refresh state, to prevent floating inputs on the data bus. External pull-ups, such as 10-kohm resistors, must be placed on the 16 EMIF data bus pins (that do not have internal pull-ups) if required to perform reads in this situation. The precise resistor value must be chosen so that the worst case combined off-state leakage currents do not cause the voltage levels on the associated pins to drop below the high-level input voltage requirement.

For information about the self-refresh state, see [Section 12.2.5.7](#).

12.2.8 Reset and Initialization Considerations

The EMIF memory controller has two active-low reset signals, CHIP_RST_n and MOD_G_RST_n. Both these reset signals are driven by the device system reset signal. This device does not offer the flexibility to reset just the EMIF state machine without also resetting the EMIF controller's memory-mapped registers. As soon as the device system reset is released (driven high), the EMIF memory controller immediately begins its initialization sequence. Command and data stored in the EMIF memory controller FIFOs are lost. Refer to [Section 12.2](#) for more information on conditions that can cause a device system reset to be asserted.

When system reset is released, the EMIF automatically begins running the SDRAM initialization sequence described in [Section 12.2.5.4](#). Even though the initialization procedure is automatic, a special procedure, found in [Section 12.2.5.5](#) must still be followed.

12.2.9 Interrupt Support

The EMIF supports a single interrupt to the CPU. [Section 12.2.9.1](#) details the generation and internal masking of EMIF interrupts.

12.2.9.1 Interrupt Events

There are three conditions that can cause the EMIF to generate an interrupt to the CPU. These conditions are:

- A rising edge on the EM1WAIT signal (wait rise interrupt)
- An asynchronous time out
- Usage of unsupported addressing mode (line trap interrupt)

The wait rise interrupt occurs when a rising edge is detected on EM1WAIT signal. This interrupt generation is not affected by the WPn bit in the asynchronous wait cycle configuration register (ASYNC_WCCR). The asynchronous time out interrupt condition occurs when the attached asynchronous device fails to deassert the EM1WAIT pin within the number of cycles defined by the MAX_EXT_WAIT bit in AWCC (this happens only in extended wait mode). The EMIF supports only linear incrementing and cache line wrap addressing modes. If an access request for an unsupported addressing mode is received, the EMIF sets the LT bit in the EMIF interrupt raw register (INT_RAW) and treats the request as a linear incrementing request.

Only when the interrupt is enabled by setting the appropriate bit (WR_MASK_SET/AT_MASK_SET/LT_MASK_SET) in the EMIF interrupt mask set register (INT_MSK_SET) to 1, is the interrupt sent to the CPU. Once enabled, the interrupt can be disabled by writing a 1 to the corresponding bit in the EMIF interrupt mask clear register (INT_MSK_CLR). The bit fields in both the INT_MSK_SET and INT_MSK_CLR can be used to indicate whether the interrupt is enabled. When the interrupt is enabled, the corresponding bit field in both the INT_MSK_SET and INT_MSK_CLR have a value of 1; when the interrupt is disabled, the corresponding bit field has a value of 0.

The EMIF interrupt raw register (INT_RAW) and the IF interrupt mask register (INT_MSK) indicate the status of each interrupt. The appropriate bit (WR/AT/LT) in INT_RAW is set when the interrupt condition occurs, whether or not the interrupt has been enabled. However, the appropriate bit (WR_MASKED/AT_MASKED/LT_MASKED) in INT_MSK is set only when the interrupt condition occurs and the interrupt is enabled. Writing a 1 to the bit in INT_RAW clears the INT_RAW bit as well as the corresponding bit in INT_MSK. [Table 12-25](#) contains a brief summary of the interrupt status and control bit fields. See [Section 12.5](#) for complete details on the register fields.

Table 12-25. Interrupt Monitor and Control Bit Fields

Register Name	Bit Name	Description
EMIF interrupt raw register (INT_RAW)	WR	This bit is set when an rising edge on the EM1WAIT signal occurs. Writing a 1 clears the WR bit as well as the WR_MASKED bit in INT_MSK.
	AT	This bit is set when an asynchronous timeout occurs. Writing a 1 clears the AT bit as well as the AT_MASKED bit in INT_MSK.
	LT	This bit is set when an unsupported addressing mode is used. Writing a 1 clears LT bit as well as the LT_MASKED bit in INT_MSK.
EMIF interrupt mask register (INT_MSK)	WR_MASKED	This bit is set only when a rising edge on the EM1WAIT signal occurs and the interrupt has been enabled by writing a 1 to the WR_MASK_SET bit in INT_MSK_SET.
	AT_MASKED	This bit is set only when an asynchronous timeout occurs and the interrupt has been enabled by writing a 1 to the AT_MASK_SET bit in INT_MSK_SET.
	LT_MASKED	This bit is set only when line trap interrupt occurs and the interrupt has been enabled by writing a 1 to the LT_MASK_SET bit in INT_MSK_SET.
EMIF interrupt mask set register (INT_MSK_SET)	WR_MASK_SET	Writing a 1 to this bit enables the wait rise interrupt.
	AT_MASK_SET	Writing a 1 to this bit enables the asynchronous timeout interrupt.
	LT_MASK_SET	Writing a 1 to this bit enables the line trap interrupt.
EMIF interrupt mask clear register (INT_MSK_CLR)	WR_MASK_CLR	Writing a 1 to this bit disables the wait rise interrupt.
	AT_MASK_CLR	Writing a 1 to this bit disables the asynchronous timeout interrupt.
	LT_MASK_CLR	Writing a 1 to this bit disables the line trap interrupt.

12.2.10 DMA Event Support

The EMIF memory controller is a DMA slave peripheral and therefore does not generate DMA events. Data read and write requests can be made directly, by masters and the DMA.

12.2.11 EMIF Signal Multiplexing

For details on the EMIF signal multiplexing, see the *GPIO* chapter, I/O Multiplexing Module section, of this technical reference manual.

12.2.12 Memory Map

For information describing the device memory-map, see the data sheet.

12.2.13 Priority and Arbitration

[Section 12.2.2](#) describes the external prioritization and arbitration among requests from different sources within the microcontroller. The result of this external arbitration is that only one request is presented to the EMIF at a time. Once the EMIF completes a request, the external arbiter then provides the EMIF with the next pending request.

Internally, the EMIF undertakes memory device transactions according to a strict priority scheme. The highest priority events are:

- A device reset.
- A write to any of the three least significant bytes of the SDRAM configuration register (SDRAM_CR).

Either of these events causes the EMIF to immediately commence the initialization sequence as described in [Section 12.2.5.4](#).

Once the EMIF has completed its initialization sequence, the EMIF performs memory transactions according to the following priority scheme (highest priority listed first):

1. If the EMIF's backlog refresh counter is at the Refresh Must urgency level, the EMIF performs multiple SDRAM auto-refresh cycles until the Refresh Release urgency level is reached.
2. If an SDRAM or asynchronous read has been requested, the EMIF performs a read operation.
3. If the EMIF's backlog refresh counter is at the Refresh Need urgency level, the EMIF performs an SDRAM auto-refresh cycle.
4. If an SDRAM or asynchronous write has been requested, the EMIF performs a write operation.
5. If the EMIF's backlog refresh counter is at the Refresh May or Refresh Release urgency level, the EMIF performs an SDRAM auto-refresh cycle.
6. If the value of the SR bit in SDRAM_CR has been set to 1, the EMIF enters the self-refresh state as described in [Section 12.2.5.7](#).

After taking one of the actions listed above, the EMIF then returns to the top of the priority list to determine the next action.

Because the EMIF does not issue auto-refresh cycles when in the self-refresh state, the above priority scheme does not apply when in this state. See [Section 12.2.5.7](#) for details on the operation of the EMIF when in the self-refresh state.

12.2.14 System Considerations

This section describes various system considerations to keep in mind when operating the EMIF.

12.2.14.1 Asynchronous Request Times

In a system that interfaces to both SDRAM and asynchronous memory, the asynchronous requests must not take longer than the smaller of the following two values:

- t_{RAS} (typically 120 μs) - to avoid violating the maximum time allowed between issuing an ACTV and PRE command to the SDRAM.
- $t_{Refresh Rate} \times 11$ (typically $15.7 \mu s \times 11 = 172.7 \mu s$) - to avoid refresh violations on the SDRAM.

The length of an asynchronous request is controlled by multiple factors, the primary factor being the number of access cycles required to complete the request. For example, an asynchronous request for 4 bytes requires four access cycles using an 8-bit data bus and only two access cycle using a 16-bit data bus. The maximum request size that the EMIF can be sent is 16 words; therefore, the maximum number of access cycles per memory request is 64 when the EMIF is configured with an 8-bit data bus. The length of the individual access cycles that make up the asynchronous request is determined by the programmed setup, strobe, hold, and turnaround values, but can also be extended with the assertion of the EM1WAIT input signal up to a programmed maximum limit. The user must make sure that an entire asynchronous request does not exceed the timing values listed above when also interfacing to an SDRAM device. This can be done by limiting the asynchronous timing parameters.

12.2.15 Power Management

Power dissipation from the EMIF memory controller can be managed by following methods:

- Self-refresh mode
- Power-down mode
- Gating input clocks to the module off

Gating input clocks off to the EMIF memory controller achieves higher power savings when compared to the power savings of self-refresh or power down mode. The input clock to EMIF can be turned off through the use of the Global Clock Module (GCM). Before gating clocks off, the EMIF memory controller must place the SDR SDRAM memory in self-refresh mode. If the external memory requires a continuous clock, the VCLK3 clock domain must not be turned off because this can result in data corruption. See the following subsections for the proper procedures to follow when stopping EMIF memory controller clocks.

12.2.15.1 Power Management Using Self-Refresh Mode

The EMIF memory controller can be placed into a self-refresh state in order to place the attached SDRAM devices into self-refresh mode, which consumes less power for most SDRAM devices. In this state, the attached SDRAM device uses an internal clock to perform its own auto refresh cycles. This maintains the validity of the data in the SDRAM without the need for any external commands. Refer to [Section 12.2.5.7](#) for more details on placing the EMIF into the self-refresh state.

12.2.15.2 Power Management Using Power Down Mode

In the power down mode, the EMIF drives EM1SDCKE low to lower the power consumption. EM1SDCKE goes high when there is a need to send refresh (REFR) commands, after which EM1SDCKE is again driven low. EM1SDCKE remains low until any request arrives. Refer to [Section 12.2.5.8](#) for more details on placing the EMIF in power-down mode.

12.2.16 Emulation Considerations

The EMIF remains fully functional during emulation halts in order to allow emulation access to external memory.

12.3 Example Configuration

This section presents an example of interfacing the EMIF1 to both an SDR SDRAM device and an asynchronous Flash device.

12.3.1 Hardware Interface

[Figure 12-15](#) shows the hardware interface between the EMIF, a Samsung K4S641632H-TC(L)70 64Mb SDRAM device, and a SHARP LH28F800BJE-PTTL90 8Mb Flash memory. The connection between EMIF and the SDRAM is straightforward, but the connection between the EMIF and the Flash deserves a detailed look.

The address inputs for the Flash are provided by three sources. The A[18:0] address inputs are provided by a combination of the EM1A and EM1BA pins according to [Section 12.2.6.1](#), and a set of GPIO pins. The RD/nBY signal from Flash is connected to EM1WAIT pin of the EMIF.

Finally, this example configuration connects the EM1WE pin to the nWE input of the Flash and operates the EMIF in select strobe mode.

Figure 12-15. Example Configuration Interface

12.3.2 Software Configuration

The following sections describe how to configure the EMIF registers and bit fields to interface the EMIF with the Samsung K4S641632H-TC(L)70 SDRAM and the SHARP LH28F800BJE-PTTL90 8Mb Flash memory.

12.3.2.1 Configuring the SDRAM Interface

This section describes how to configure the EMIF to interface with the Samsung K4S641632H-TC(L)70 SDRAM with a clock frequency of $f_{EM1CLK} = 100\text{MHz}$. Procedure A described in [Section 12.2.5.5](#) is followed that assumes that the SDRAM power-up timing constraints were met during the SDRAM auto-initialization sequence after reset.

12.3.2.1.1 PLL Programming for EMIF to K4S641632H-TC(L)70 Interface

If the system PLL is programmed to provide a SYSCLK frequency $> 100\text{MHz}$, then configure the EMIF1CLKDIV field in the PERSYSCLKDIVSEL register to make $EM1CLK = SYSCLK/2$ (default configuration). Before doing this, the SDRAM must be placed in self-refresh mode by setting the SR bit in the SDRAM configuration register. Once the EM1CLK frequency has been configured, remove the SDRAM from self-refresh by clearing the SR bit in SDRAM_CR.

Table 12-26. SR Field Value For EMIF to K4S641632H-TC(L)70 Interface

Field	Value	Purpose
SR	1 then 0	To place the EMIF into the self-refresh state

12.3.2.1.2 SDRAM Timing Register (SDRAM_TR) Settings for EMIF to K4S641632H-TC(L)70 Interface

The fields of the SDRAM timing register (SDRAM_TR) must be programmed first as described in [Table 12-27](#) to satisfy the required timing parameters for the K4S641632H-TC(L)70. Based on these calculations, a value of 6111 4610h must be written to the SDRAM_TR. [Figure 12-16](#) shows a graphical description of how the SDRAM_TR must be programmed.

Table 12-27. SDRAM_TR Field Calculations for EMIF to K4S641632H-TC(L)70 Interface

Field Name	Formula	Value from K4S641632H-TC(L)70 Data Sheet	Value Calculated for Field
T_RFC	$T_RFC \geq (t_{RFC} \times f_{EM1CLK}) - 1$	$t_{RC} = 68 \text{ ns (min)}^{(1)}$	6
T_RP	$T_RP \geq (t_{RP} \times f_{EM1CLK}) - 1$	$t_{RP} = 20 \text{ ns (min)}$	1
T_RCD	$T_RCD \geq (t_{RCD} \times f_{EM1CLK}) - 1$	$t_{RCD} = 20 \text{ ns (min)}$	1
T_WR	$T_WR \geq (t_{WR} \times f_{EM1CLK}) - 1$	$t_{RDL} = 2 \text{ CLK} = 20 \text{ ns (min)}^{(2)}$	1
T_RAS	$T_RAS \geq (t_{RAS} \times f_{EM1CLK}) - 1$	$t_{RAS} = 49 \text{ ns (min)}$	4
T_RC	$T_RC \geq (t_{RC} \times f_{EM1CLK}) - 1$	$t_{RC} = 68 \text{ ns (min)}$	6
T_RRD	$T_RRD \geq (t_{RRD} \times f_{EM1CLK}) - 1$	$t_{RRD} = 14 \text{ ns (min)}$	1

(1) The Samsung data sheet does not specify a t_{RFC} value. Instead, Samsung specifies t_{RC} as the minimum auto refresh period.

(2) The Samsung data sheet does not specify a t_{WR} value. Instead, Samsung specifies t_{RDL} as last data in to row precharge minimum delay.

Figure 12-16. SDRAM Timing Register (SDRAM_TR)

12.3.2.1.3 SDRAM Self Refresh Exit Timing Register (SDR_EXT_TMNG) Settings for EMIF to K4S641632H-TC(L)70 Interface

The SDRAM self-refresh exit timing register (SDSRETR) must be programmed second to satisfy the t_{XSR} timing requirement from the K4S641632H-TC(L)70 data sheet. [Table 12-28](#) shows the calculation of the proper value to program into the T_XS field of this register. Based on this calculation, a value of 6h must be written to the SDSRETR. [Figure 12-17](#) shows how the SDSRETR must be programmed.

Table 12-28. RR Calculation for EMIF to K4S641632H-TC(L)70 Interface

Field Name	Formula	Value from K4S641632H-TC(L)70 Data Sheet	Value Calculated for Field
T_XS	$T_{XS} \geq (t_{XSR} \times f_{EM1CLK}) - 1$	$t_{RC} = 68 \text{ ns (min)}$ ⁽¹⁾	6

- (1) The Samsung data sheet does not specify a t_{XSR} value. Instead, Samsung specifies t_{RC} as the minimum required time after CKE going high to complete self-refresh exit.

Figure 12-17. SDRAM Self Refresh Exit Timing Register (SDR_EXT_TMNG)

12.3.2.1.4 SDRAM Refresh Control Register (SDRAM_RCR) Settings for EMIF to K4S641632H-TC(L)70 Interface

The SDRAM refresh control register (SDRAM_RCR) can next be programmed to satisfy the required refresh rate of the K4S641632H-TC(L)70. [Table 12-29](#) shows the calculation of the proper value to program into the RR field of this register. Based on this calculation, a value of 61Ah must be written to the SDRAM_RCR. [Figure 12-18](#) shows how the SDRAM_RCR must be programmed.

Table 12-29. RR Calculation for EMIF to K4S641632H-TC(L)70 Interface

Field Name	Formula	Values	Value Calculated for Field
RR	$RR \leq f_{EM1CLK} \times t_{Refresh} \text{ Period} / n_{cycles}$	From SDRAM data sheet: $t_{Refresh} \text{ Period} = 64\text{ms}$; $n_{cycles} = 4096$ EMIF clock rate: $f_{EM1CLK} = 100\text{MHz}$	$RR = 1562 \text{ cycles} = 61\text{Ah cycles}$

Figure 12-18. SDRAM Refresh Control Register (SDRAM_RCR)

12.3.2.1.5 SDRAM Configuration Register (SDRAM_CR) Settings for EMIF to K4S641632H-TC(L)70 Interface

Finally, the fields of the SDRAM configuration register (SDRAM_CR) must be programmed as described in [Table 12-30](#) to properly interface with the K4S641632H-TC(L)70 device. Based on these settings, a value of 4720h must be written to the SDRAM_CR. [Figure 12-19](#) shows how the SDRAM_CR must be programmed. The EMIF is now ready to perform read and write accesses to the SDRAM.

Table 12-30. SDRAM_CR Field Values For EMIF to K4S641632H-TC(L)70 Interface

Field	Value	Purpose
SR	0	To avoid placing the EMIF into the self-refresh state
NM	1	To configure the EMIF for a 16-bit data bus
CL	011b	To select a CAS latency of 3
BIT11_9LOCK	1	To allow the CL field to be written
IBANK	010b	To select 4 internal SDRAM banks
PAGESIZE	0	To select a page size of 256 words

12.3.2.2 Configuring the Flash Interface

This section describes how to configure the EMIF to interface with the SHARP LH28F800BJE-PTTL90 8Mb Flash memory with a clock frequency of $f_{EM1CLK} = 100\text{MHz}$.

12.3.2.2.1 Asynchronous 1 Configuration Register (ASYNC_CS2_CFG) Settings for EMIF to LH28F800BJE-PTTL90 Interface

The asynchronous 1 configuration register (ASYNC_CS2_CFG) is the only register that is necessary to program for this asynchronous interface. The SS bit must be set to 1 to enable select strobe command and the ASIZE field can be set to 1 to select a 16-bit interface. The other fields in this register control the shaping of the EMIF signals, and the proper values can be determined by referring to the AC Characteristics in the Flash data sheet and the device data sheet. [Table 12-31](#) and [Table 12-32](#) show the pertinent AC Characteristics for reads and writes to the Flash device, and [Figure 12-20](#) and [Figure 12-21](#) show the associated timing waveforms. Finally, [Figure 12-22](#) shows programming the ASYNC_CS2_CFG with the calculated values.

Table 12-31. AC Characteristics for a Read Access

AC Characteristic	Device	Definition	Minimum	Maximum	Unit
t_{SU}	EMIF	Setup time, read EM1D before EM1OE high	15		ns
t_H	EMIF	Data hold time, read EM1D after EM1OE high	0		ns
t_{ELQV}	Flash	nCE to Output Delay		90	ns
t_{EHQZ}	Flash	nCE High to Output in High Impedance		55	ns

Table 12-32. AC Characteristics for a Write Access

AC Characteristic	Device	Definition	Minimum	Maximum	Unit
t_{AVAV}	Flash	Write Cycle Time	90		ns
t_{ELEH}	Flash	nCE Pulse Width Low	50		ns
t_{EHEL}	Flash	nCE Pulse Width High (not shown in Figure 12-21)	30		ns

Figure 12-20. LH28F800BJE-PTTL90 to EMIF Read Timing Waveforms

Figure 12-21. LH28F800BJE-PTTL90 to EMIF Write Timing Waveforms

The R_STROBE field must be set to meet the following equation:

$$R_STROBE \geq (t_{ELQV} + t_{SU}) \times f_{EM1CLK} - 1$$

$$R_STROBE \geq (90ns + 15ns) \times 200MHz - 1$$

$$R_STROBE \geq 20$$

$$R_STROBE = 20$$

The R_HOLD field must be large enough to satisfy EMIF Data hold time, t_H :

$$R_HOLD \geq t_H \times f_{EM1CLK} - 1$$

$$R_HOLD \geq 0ns \times 200MHz - 1$$

$$R_HOLD \geq -1$$

The R_HOLD field must also combine with the TA field to satisfy the Flash nCE High to Output in High Impedance time, t_{EHQZ} :

$$R_HOLD + TA \geq t_{EHQZ} \times f_{EM1CLK} - 2$$

$$R_HOLD + TA \geq 55ns \times 200MHz - 2$$

$$R_HOLD + TA \geq 9$$

The largest value that can be programmed into the TA field is 3h, therefore the following values must be used:

$$R_HOLD = 6$$

$$TA = 3$$

For Writes, the W_STROBE field must be set to satisfy the Flash nCE Pulse Width constraint, t_{ELEH} :

$$W_STROBE \geq t_{ELEH} \times f_{EM1CLK} - 1$$

$$W_STROBE \geq 50ns \times 200MHz - 1$$

$$W_STROBE \geq 9$$

The W_SETUP and W_HOLD fields must combine to satisfy the Flash nCE Pulse Width High constraint, t_{EHEL} :

$$W_SETUP + W_HOLD \geq t_{\text{EHEL}} \times f_{\text{EM1CLK}} - 2$$

$$W_SETUP + W_HOLD \geq 30\text{ns} \times 200\text{MHz} - 2$$

$$W_SETUP + W_HOLD \geq 4$$

In addition, the entire Write access length must satisfy the Flash minimum Write Cycle Time, t_{AVAV} :

$$W_SETUP + W_STROBE + W_HOLD \geq t_{\text{AVAV}} \times f_{\text{EM1CLK}} - 3$$

$$W_SETUP + W_STROBE + W_HOLD \geq 90\text{ns} \times 200\text{MHz} - 3$$

$$W_SETUP + W_STROBE + W_HOLD \geq 15$$

Solving the above equations for the Write fields results in the following:

$$W_SETUP = 4$$

$$W_STROBE = 10$$

$$W_HOLD = 1$$

Adding a 5ns (1 cycle) margin to each of the periods (excluding TA that is already at the maximum) in this example produces the following recommended values:

$$W_SETUP = 5h$$

$$W_STROBE = 8h$$

$$W_HOLD = 2h$$

$$R_SETUP = 1h$$

$$R_STROBE = 15h$$

$$R_HOLD = 7h$$

$$TA = 3h$$

12.4.1 EMIF Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/emif

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

12.4.1.1 Pin setup for EMIF module accessing ASRAM.

FILE: emif_asram_pin_setup.c

This example configures pins for EMIF in ASYNC mode.

12.4.1.2 EMIF1 ASYNC module accessing 16bit ASRAM.

FILE: emif_ex1_16bit_asram.c

This example configures EMIF1 in 16bit ASYNC mode and uses CS2 as chip enable.

External Connections

- External ASRAM memory (CY7C1041CV33 -10ZSXA) daughter card

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.3 EMIF1 ASYNC module accessing 16bit ASRAM through CPU1 and CPU2. - C28X_DUAL

FILE: emif_ex1_16bit_asram_dual_access_cpu1.c

This example configures EMIF1 in 16bit ASYNC mode and uses CS2 as chip enable. The EMIF1 ownership is passed between CPU1 and CPU2 to access different memory regions. Initially CPU2 grabs and configures the EMIF1, thereafter both CPU1 and CPU2 grabs EMIF1 to access different memory regions in external memory.

External Connections

- External ASRAM memory (CY7C1041CV33 -10ZSXA) daughter card

Watch Variables

- *testStatusGlobalCPU1* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobalCPU1* - Error counter

12.4.1.4 EMIF1 ASYNC module accessing 16bit ASRAM through CPU1 and CPU2. - C28X_DUAL

FILE: emif_ex1_16bit_asram_dual_access_cpu2.c

This example configures EMIF1 in 16bit ASYNC mode and uses CS2 as chip enable. The EMIF1 ownership is passed between CPU1 and CPU2 to access different memory regions. Initially CPU2 grabs and configures the EMIF1, thereafter both CPU1 and CPU2 grabs EMIF1 to access different memory regions in external memory.

External Connections

- External ASRAM memory (CY7C1041CV33 -10ZSXA) daughter card

Watch Variables

- *testStatusGlobalCPU2* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobalCPU2* - Error counter

12.4.1.5 EMIF1 module accessing 16bit ASRAM as code memory.

FILE: emif_ex2_16bit_asram_codemem.c

This example configures EMIF1 in 16bit ASYNC mode and uses CS2 as chip enable. This example enables use of ASRAM as code memory.

External Connections

- External ASRAM memory (CY7C1041CV33 -10ZSXA) daughter card

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.6 EMIF1 module accessing 16bit SDRAM using memcpy_fast_far().

FILE: emif_ex3_16bit_sdram_far.c

This example configures EMIF1 in 16bit SYNC mode and uses CS0 as chip enable. It will first write to an array in the SDRAM and then read it back using the FPU function, *memcpy_fast_far()*, for both operations.

The buffer in SDRAM will be placed in the .farbss memory on account of the fact that its assigned the attribute "far" indicating it lies beyond the 22-bit program address space. The compiler will take care to avoid using instructions such as PREAD, which uses the Program Read Bus, or addressing modes restricted to the lower 22-bit space when accessing data with the attribute "far".

The memory space beyond 22-bits must be treated as data space for load/store operations only. The user is cautioned against using this space for either instructions or working memory. *External Connections*

- External SDR-SDRAM memory (MT48LC32M16A2 -75) daughter card

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.7 EMIF1 module accessing 16bit SDRAM then puts into Self Refresh mode before entering Low Power Mode.

FILE: emif_ex4_16bit_sdram_far_lpm.c

This example configures EMIF1 in 16bit SYNC mode and uses CS0 as chip enable. This example puts SDRAM into self refresh before entering standby mode. Watchdog timer is configured to trigger WAKEINT interrupt.

As soon as the watchdog timer expires, the device should wake up, SDRAM should come out of self refresh mode and GPIO11 can be observed to toggle.

External Connections

- External SDR-SDRAM memory (MT48LC32M16A2 -75) daughter card

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.8 EMIF1 module accessing 32bit SDRAM using DMA.

FILE: emif_ex5_16bit_sdram_dma.c

This example configures EMIF1 in 16bit SYNC(SDRAM) mode and uses CS0 as chip enable. It will first write to an array in the SDRAM and then read it back, using the DMA for both operations.

The buffer in SDRAM will be placed in the .farbss memory on account of the fact that its assigned the attribute "far" indicating it lies beyond the 22-bit program address space. The compiler will take care to avoid using instructions such as PREAD, which uses the Program Read Bus, or addressing modes restricted to the lower 22-bit space when accessing data with the attribute "far".

The memory space beyond 22-bits must be treated as data space for load/store operations only. The user is cautioned against using this space for either instructions or working memory. *External Connections*

- External SDR-SDRAM (Micron MT48LC32M16A2 "P -75 C") daughter card.

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.9 EMIF1 module accessing 16bit SDRAM using alternate address mapping.

FILE: emif_ex6_16bit_sdram_nonfar.c

This example configures EMIF1 in 16bit SYNC mode and uses CS0 as chip enable. It will first write to an array in the SDRAM and then read it back.

The buffer in SDRAM will be placed in the emif_cs0_nonfar memory section which is dual mapped with CS2 memory range. This has been done to keep the SDRAM memory range within 22-bit address range in order to generate optimal code. EMIF1 Async RAM accesses will not be issued at the same time and program space reads & fetches will be allowed to SDRAM in non-far range.

External Connections

- External SDR-SDRAM memory (MT48LC32M16A2 -75) daughter card

Watch Variables

- *testStatusGlobal* - Equivalent to *TEST_PASS* if test finished correctly, else the value is set to *TEST_FAIL*
- *errCountGlobal* - Error counter

12.4.1.10 EMIF1 ASYNC module accessing 16bit ASRAM HIC FSI

FILE: emif_ex7_16bit_asram_hic_fsi.c

This example configures EMIF1 in 16bit ASYNC mode and uses CS2 as chip enable. This can be run with hic_ex3_config_16bit_fsi example on F28002x device. This is run first followed by the run of F28002x device example. This example configures EMIF1 in 16-bit ASYNC mode and uses CS2 as chip enable to access Host Interface Controller(HIC) on F28002X device

This follows example configuration for performance critical applications described in the Application note titled "Application guide for peripheral expansion using HIC"(SPRACR2).

-This example sets up the EMIF CS2 for ASRAM interface to access the Host interface Controller. This uses the Direct Access Mode of the HIC. -The example on F28002x side sets up the FSI module for internal loopback Sets up the Host interface Controller for direct access mode

- Sends a HIC_INIT_DONE_TOKEN after which this example accesses the FSI of the device side over HIC direct access
- Fills the Transmit frame and triggers transmit
- Receives an interrupt when the frame is received on the device side FSI(uses GPIO04 connected to HIC_INT, configured for XINT1)
- reads the FSI received frame and checks for correctness This demonstrates the usage of Direct access mode and 16 bit mode of HIC module. *External Connections*
 - This example will not work on F2838x Control Card and has been tested in TI Internal Validation platform.

Watch Variables

- *errCountGlobal* - Error counter
- *xint1Count* - Number of times HIC Interrupt is received for FSI Receive event

12.4.1.11 EMIF1 ASYNC module accessing 8bit HIC controller.

FILE: emif_ex8_8bit_asram_hic_adc.c

This can be run with hic_ex2_config_8bit example on F28002x device. This is run first followed by the run of F28002x device. This example configures EMIF1 in 8 bit ASYNC mode and uses CS2 as chip enable to access Host Interface controller on F28002X device It uses Select Strobe mode of EMIF Controller.

This follows example configuration for pin constrained applications described in the Application note titled Application guide for peripheral expansion using HIC(SPRACR2).

- This uses 8 bit ASRAM with control signals as explained in the note. uses the Mailbox access mode of Host interface Controller
- This sets up the EMIF waits for HIC_INIT_DONE_TOKEN from device
- sends HIC_START_TOKEN to the device to signal the device to start sampling the Analog channels
- The device sends periodic HIC_DATA_TOKEN token
- The samples are available in the HIC D2H Buffer
- Uses the HIC_INT interrupt from device(which is mapped to GPIO4, XINT1) Refer F28002X device TRM for further details on HIC.

External Connections

- This example will not work on F2838x Control Card and has been tested in TI Internal Validation platform.

Watch Variables

- *sampleCount* - Number of samples of data received from device.
- *xint1Count* - Number interrupts received from device.

12.5 EMIF Registers

This section describes the External Memory Interface Registers.

12.5.1 EMIF Base Address Table (C28)

Table 12-33. EMIF Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
Emif1ConfigRegs	EMIF1_CONFIG_REGS	EMIF1CONFIG_BASE	0x0005_F4C0	YES	YES	-	-	YES
Emif2ConfigRegs	EMIF2_CONFIG_REGS	EMIF2CONFIG_BASE	0x0005_F4E0	YES	-	-	-	YES
Emif1Regs	EMIF_REGS	EMIF1_BASE	0x0004_7000	YES	YES	-	-	YES
Emif2Regs	EMIF_REGS	EMIF2_BASE	0x0004_7800	YES	-	-	-	YES

12.5.2 EMIF_REGS Registers

Table 12-34 lists the memory-mapped registers for the EMIF_REGS registers. All register offset addresses not listed in Table 12-34 should be considered as reserved locations and the register contents should not be modified.

Table 12-34. EMIF_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	RCSR	Revision Code and Status Register		Go
2h	ASYNC_WCCR	Async Wait Cycle Config Register		Go
4h	SDRAM_CR	SDRAM (EMxCS0n) Config Register		Go
6h	SDRAM_RCR	SDRAM Refresh Control Register		Go
8h	ASYNC_CS2_CR	Async 1 (EMxCS2n) Config Register		Go
Ah	ASYNC_CS3_CR	Async 2 (EMxCS3n) Config Register		Go
Ch	ASYNC_CS4_CR	Async 3 (EMxCS4n) Config Register		Go
10h	SDRAM_TR	SDRAM Timing Register		Go
18h	TOTAL_SDRAM_AR	Total SDRAM Accesses Register		Go
1Ah	TOTAL_SDRAM_ACTR	Total SDRAM Activate Register		Go
1Eh	SDR_EXT_TMNG	SDRAM SR/PD Exit Timing Register		Go
20h	INT_RAW	Interrupt Raw Register		Go
22h	INT_MSK	Interrupt Masked Register		Go
24h	INT_MSK_SET	Interrupt Mask Set Register		Go
26h	INT_MSK_CLR	Interrupt Mask Clear Register		Go

Complex bit access types are encoded to fit into small table cells. Table 12-35 shows the codes that are used for access types in this section.

Table 12-35. EMIF_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

12.5.2.1 RCSR Register (Offset = 0h) [Reset = 40000205h]

RCSR is shown in [Figure 12-23](#) and described in [Table 12-36](#).

Return to the [Summary Table](#).

Revision Code and Status Register

Table 12-38. SDRAM_CR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SR	R/W	0h	Self Refresh. Writing a 1 to this bit will cause connected SDRAM devices to be placed into Self Refresh mode and the EMIF to enter the self refresh state. In this state the EMIF will service all asynchronous memory accesses immediately but any SDRAM access will take at least $t_{\text{ras}} + 1$ cycles due to the time required for the SDRAM devices to out of Self Refresh mode. If an SDRAM access immediately follows the setting of the sr bit, the access will take $t_{\text{ras}} + t_{\text{xs}} + 2$ cycles. If both sr and pd bits are set, the EMIF will go into Self Refresh. Reset type: SYSRSn
30	PD	R/W	0h	Power Down. Writing a 1 to this bit will cause connected SDRAM devices to be placed into Power Down mode. If both sr and pd bits are set, the EMIF will go into Self Refresh. Reset type: SYSRSn
29	PDWR	R/W	0h	Perform refreshes during Power Down. Writing a 1 to this bit will cause the EMIF to exit the power down state and issue an AUTO REFRESH command every time Refresh May level is set. Reset type: SYSRSn
28-26	RESERVED	R	0h	Reserved
25-23	RESERVED	R/W	0h	Reserved

12.5.3 EMIF1_CONFIG_REGS Registers

Table 12-51 lists the memory-mapped registers for the EMIF1_CONFIG_REGS registers. All register offset addresses not listed in Table 12-51 should be considered as reserved locations and the register contents should not be modified.

Table 12-51. EMIF1_CONFIG_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	EMIF1LOCK	EMIF1 Config Lock Register	EALLOW	Go
2h	EMIF1COMMIT	EMIF1 Config Lock Commit Register	EALLOW	Go
4h	EMIF1MSEL	EMIF1 Master Sel Register	EALLOW	Go
8h	EMIF1ACCPROT0	EMIF1 Config Register 0	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 12-52 shows the codes that are used for access types in this section.

Table 12-52. EMIF1_CONFIG_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

12.5.3.1 EMIF1LOCK Register (Offset = 0h) [Reset = 00000000h]

Complex bit access types are encoded to fit into small table cells. Table 12-58 shows the codes that are used for access types in this section.

Table 12-58. EMIF2_CONFIG_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

12.5.4.1 EMIF2LOCK Register (Offset = 0h) [Reset = 0h]

EMIF2LOCK is shown in [Figure 12-42](#) and described in [Table 12-59](#).

13.1 Introduction to Flash and OTP Memory

Flash is an electrically erasable/programmable nonvolatile memory that can be programmed and erased many times to ease code development. Flash memory can be used primarily as a program memory for the core, and secondarily as static data memory.

This section describes the proper sequence to configure the wait states and operating mode of Flash. It also includes information on Flash and OTP power modes, how to improve Flash performance by enabling the Flash prefetch/cache mode, and the SECDED safety feature.

13.1.1 FLASH Related Collateral

13.1.2 Features

Features of Flash memory include:

- Dedicated Flash bank in the CPU1 and CPU2 subsystem (refer to the device data sheet for the size of Flash bank)
- Dedicated Flash bank in the Connectivity Manager (CM) subsystem (refer to the device data sheet for the size of Flash bank)
- Dedicated Flash module controller (FMC) in the CPU1, CPU2, and CM subsystems for each bank
- 128 bits (bank width) can be programmed at a time along with ECC
- Multiple sectors providing the option of leaving some sectors programmed and only erasing specific sectors using sector erase command.
- User-programmable OTP locations for configuring security, OTP boot-mode and boot-mode select pins (if the user is unable to use the factory-default boot-mode select pins)
- Single-Flash pump shared by the CPU1, CPU2, and CM subsystems
- Hardware Flash pump semaphore to control ownership of the pump between the three FMCs.
- Enhanced performance using the code prefetch mechanism and data cache in CPU1-FMC, CPU2-FMC, and CM-FMC
- Configurable wait states to give the best performance for a given execution speed
- Safety Features:
 - SECDED - single-error correction and double-error detection is supported in all three FMCs
 - Address bits are included in ECC
 - Test mode to check the health of ECC logic
- Supports low-power modes for Flash bank and pump for power savings
- Built-in power mode control logic
- Integrated Flash program/erase state machine (FSM) in all three FMCs:
 - Simple Flash API algorithms
 - Fast erase and program times (refer to the device data sheet for details)
- Code Security Module (CSM) to prevent unauthorized access to the Flash (refer to the *Dual Code Security Module (DCSM)* chapter for details)

13.1.3 Flash Tools

Texas Instruments provides the following tools for Flash:

- Code Composer Studio™ (CCS) IDE - the development environment with integrated Flash plugin. TI recommends performing a debug reset and restart after programming the code into Flash using CCS.
- Flash API Library - a set of software peripheral functions to erase/program Flash
- UniFlash - standalone tool to erase/program/verify the Flash content through JTAG. No CCS is required.
- Users must check and install available updates for CCS On-Chip Flash Plugin and UniFlash tools.

13.1.4 Default Flash Configuration

The following are Flash module configuration settings at power-up:

- Dedicated Flash banks are in sleep mode (BNKPWR bit field in the FBFALLBAC register)
- Shared pump is in sleep mode (PMPPWR bit field in the FPAC1 register)
- ECC is enabled
- Wait-states are set to the maximum (0xF)
- Code-prefetch mechanism and data cache are disabled in all three FMCs
- Bank and pump active grace periods are set to 0x0 (refer to the BAGP field in the FBAC register and PAGP bit field in the FPAC2 register)

During the boot process, the boot ROM performs a dummy read of the Code Security Module (CSM) password locations in the OTP. This read is performed to unlock a new device that has no password stored in it, so that Flash programming or loading of code into CSM-protected SRAM can be performed. On devices with a password, this read has no effect and the device remains locked. One effect of this read is that the Flash will transition from the sleep (reset) state to the active state.

User application software must initialize wait-states using the FRDCNTL register, and configure cache/prefetch features using the FRD_INTF_CTRL register, to achieve optimum system performance. Software that configures Flash settings like wait-states, cache/prefetch features, and so on, must be executed only from RAM memory, **not** from Flash memory.

Note

Before initializing wait-states, turn off the prefetch and data caching in the FRD_INTF_CTRL register.

13.2 Flash Bank, OTP, and Pump

There is a dedicated Flash bank for CPU subsystem(CPU1, CPU2, and CM) called CPU1 Flash bank, CPU2 Flash bank, and CM Flash bank. Also, there is a one-time programmable (OTP) memory on the CPU1, CPU2, and CM subsystems called USER OTP, which the user can program only once and cannot erase. Flash and OTP are uniformly mapped in both program and data memory space.

The CPU subsystem has a TI-OTP that contains manufacturing information like settings used by the Flash state machine for erase and program operations, and so on. Users can read TI-OTP but TI-OTP cannot be programmed or erased. For memory maps and size information for the Flash Banks, TI-OTP, USER OTP, and corresponding ECC locations, refer to the device data sheet.

The CPU1 Flash bank/USER OTP, CPU2 Flash bank/USER OTP and CM Flash bank/USER OTP share a common Flash pump. A hardware semaphore, called the Flash pump semaphore, is provided to control the access of the Flash pump between the CPU1, CPU2 and CM subsystem.

The *Location of Zone-Select Block Based on Link-Pointer* figure in the *Dual Code Security Module (DCSM)* chapter shows the user-programmable OTP locations in CPU1 USER-OTP. For more information on the functionality of these fields, refer to the *Introduction* section of the *Dual Code Security Module (DCSM)* chapter and the *ROM Code and Peripheral Booting* chapter.

13.3 Flash Module Controller (FMC)

There is a dedicated Flash module controller in CPU1 subsystem (CPU1-FMC), CPU2 subsystem (CPU2-FMC), and CM subsystem (CM-FMC). The CPU1 in the CPU1 subsystem interfaces with the CPU1 Flash module controller (CPU1-FMC), which in turn, interfaces with the CPU1 Flash bank and shared pump to perform erase/program operations as well as to read data/execute code from the CPU1 Flash bank.

Figure 13-1. FMC Interface with Core, Bank, and Pump

The CPU2 in the CPU2 subsystem interfaces with the CPU2 Flash module controller (CPU2-FMC) that interfaces with the CPU2 Flash bank and shared pump to perform erase/program operations as well as to read data/execute code from the CPU2 Flash bank.

The CM in the CM subsystem interfaces with the CM Flash module controller (CM-FMC) that interfaces with the CM Flash bank and shared pump to perform erase/program operations as well as to read data/execute code from the CM Flash bank. Control signals to the Flash pump are controlled by either CPU1-FMC or CPU2-FMC or CM-FMC, depending on who gains the Flash pump semaphore.

13.4 Flash and OTP Memory Power-Down Modes and Wakeup

The Flash bank and pump consume a significant amount of power when active. The Flash module provides a mechanism to power-down Flash banks and pump. Special timers automatically sequence the power-up of the CPU1 Flash bank, CPU2 Flash bank, and CM Flash bank independently of each other. The shared charge pump module includes an independent power-up timer as well.

The Flash bank and OTP memory operate in three power modes: Sleep (lowest power), Standby, and Active (highest power)

- **Sleep State**
This is the state after a device reset. In this state, a CPU data read or opcode fetch automatically initiates a change in power mode to the standby state and then to the active state. During this transition time to the active state, the CPU execution is automatically stalled.
- **Standby State**
This state uses more power than the sleep state, but takes a shorter time to transition to the active or read state. In this state, a CPU data read or opcode fetch automatically initiates a change in power mode to the active state. During this transition time to the active state, the CPU execution is automatically stalled. Once the Flash/OTP has reached the active state, the CPU access completes as normal.
- **Active or Read State**
In this state, the bank and pump are in active power mode state (highest power)

The charge pump operates in two power modes:

- Sleep (lowest power)
- Active (highest power)

Any access to any Flash bank/OTP causes the charge pump to go into active mode, if in sleep mode. An erase or program command causes the charge pump and bank to become active. If any bank is in active or in standby mode, the charge pump is in active mode, independent of the pump power mode control configuration (PMPPWR bit field in the FPAC1 register).

To power down the Flash pump, all three cores (CPU1, CPU2, and CM) must each power down the Flash Pump without any Flash accesses in between. The Flash Pump does not enter low-power mode if the following sequence of operations is not executed.

1. When the system is ready to power down the Flash completely, synchronize CPU1, CPU2, and CM. CM executes the Flash power-down phase (steps 2, 3, and 4) while CPU1 and CPU2 wait for CM to complete the Flash power-down sequence.
2. Acquire the Pump Semaphore with the CM.
3. Change the CM Flash Bank Fall Back power mode to Sleep: FBFALLBACK.BNKPWR = 0.
4. Change the CM Flash Charge Pump Fall Back power-mode to Sleep: FPAC1.PMPPWR = 0. Using IPC, notify CPU1 and CPU2 that the CM has completed the above sequence. After sending the notification, wait until CPU1 and CPU2 have completed steps 5 to 11, and an IPC notification has been received to confirm that all cores have completed the power-down sequence.
5. Acquire the Pump Semaphore with the CPU2.
6. Change the CPU2 Flash Bank Fall Back power mode to Sleep: FBFALLBACK.BNKPWR = 0.
7. Change the CPU2 Flash Charge Pump Fall Back power mode to Sleep: FPAC1.PMPPWR = 0.
8. Release the Pump Semaphore from the CPU2. Using IPC, notify CPU1 that CPU2 has completed the power-down sequence. After sending the notification, wait until CPU1 completes steps 9, 10 and 11.
9. Acquire the Pump Semaphore with the CPU1.
10. Change the CPU1 Flash Bank Fall Back power mode to Sleep: FBFALLBACK.BNKPWR = 0.
11. Change the CPU1 Flash Charge Pump Fall Back power mode to Sleep: FPAC1.PMPPWR = 0.
12. Release the Pump Semaphore from the CPU1. Using IPC, notify CPU2 and CM that CPU1 has completed the power-down sequence so that all three (CPU1, CPU2, and CM) subsystems can continue.

The previously described procedure can only be executed from RAM, not from Flash.

Note

Before configuring FPAC1.PMPPWR as described above, be sure to gain exclusive control of the Flash pump by using PUMPREQUEST register. Since the charge pump is shared between CPU1-FMC, CPU2-FMC, and CM-FMC, the effective PMPPWR value used when powering down the pump is the FMC (out of these three) that currently owns the pump. The application code can check the current power mode of the Flash bank by reading the FBPRDY register. The effective power mode of the charge pump is a logical OR of the FBPRDY.PUMPRDY register bits in CPU1-FMC, CPU2-FMC, and CM-FMC. A value of 0 in the PUMPRDY bit in all three FMCs indicates that the charge pump is in sleep mode. If the value of FBPRDY.PUMPRDY in any of the FMCs is 1, then the charge pump is in active mode. For more details, see the Flash register descriptions in [Section 13.15](#).

While the pump is in sleep state, a charge pump sleep down counter holds a user configurable value (PSLEEP bit field in the FPAC1 register). When the charge pump exits sleep mode, the device waits for PSLEEP pre-scaled SYSCLK/CMCLK clock cycles (pre-scaled clock is SYSCLK/2 for CPU1 and CPU2, and is CMCLK/2 for CM) before putting the charge pump into active power mode. The configured PSLEEP value must result in a minimum delay of 20 μ s before the pump enters active mode. For more details, see the Flash register descriptions in [Section 13.15](#).

Following are the cycle counts required for the bank and pump to wake up from low-power modes.

1. Pump sleep to active = PSLEEP * (SYSCLK or CMCLK)/2 cycles
2. Bank sleep to standby = 425 Flash clock cycles
3. Bank standby to active = 90 Flash clock cycles

Where: Flash clock = (SYSCLK or CMCLK)/(RWAIT+1)

13.5 Active Grace Period

The active grace period (AGP) can be used to optimize the Flash module power consumption versus access time. Faster access times are associated with higher-power modes of operation. At one extreme, the power control logic can attempt to reduce power consumption by putting the bank and charge pump into a low-power mode immediately at the end of every Flash access. However, if accesses are only a few cycles apart, this can actually increase power consumption versus leaving the Flash powered, because the bank and charge pump consume more power during Flash startup and access.

The active grace periods allows the bank and charge pump to be maintained in active mode for a specified period following an access. This is done in anticipation of another read within the AGP time, to allow the subsequent read to have a faster access and spend less time dissipating power, than if the bank went into one of the low-power modes immediately. If the next access does not occur within the AGP time, the power control logic can automatically put the bank and charge pump into a low-power mode to reduce power consumption during long periods of inactivity.

The AGP value is programmed by a set of programmable counters (FBAC and FPAC2) that keep the Flash bank or charge pump in active mode until the counter expires, at which time the bank or charge pump reverts to the fallback power mode as defined in the FBFALLBACK and FPAC1 (refer to PMPPWR bit-field) registers. The application software can configure the fallback power mode to reduce power consumption, or configure the power mode to be active mode to keep the bank active regardless of counter settings (default is SLEEP). The charge pump AGP counter remains in the initialized state when the bank is active, including the AGP counter of the bank. The charge pump AGP counter begins counting when the bank has become inactive.

The application software can check the current power mode of Flash bank and charge pump by reading the FBPRDY register.

13.6 Flash and OTP Memory Performance

Flash read or instruction fetch accesses can be classified either as a Flash access (access to an address location in Flash), or an OTP access (access to an address location in OTP).

When the CPU performs an access to a Flash memory address, data is returned after (RWAIT+1) SYSCLK/CMCLK cycles.

For a USER-OTP access, data is returned after 11 SYSCLK cycles.

For a USER-OTP access, data is returned after 11 SYSCLK cycles for CPU1, RWAIT+2 SYSCLK cycles for CPU2, and RWAIT+2 CMCLK cycles for CM.

RWAIT defines the number of random access wait states, and is configured using the RWAIT field in the FRDCNTL register. At reset, RWAIT defaults to a worst-case wait state count (15), and therefore must be initialized to the appropriate number of wait states to improve performance, based on the CPU clock frequency and the access time of the Flash. The Flash supports zero-wait accesses when RWAIT is set to zero, when the CPU clock frequency is low enough to accommodate the Flash access time.

For a given system clock frequency, configure RWAIT using the following formula:

For C28x Flash Bank: $RWAIT = \text{ceiling}[(SYSCLK/FCLK)-1]$

For CM Flash Bank: $RWAIT = \text{ceiling}[(CMCLK/FCLK)-1]$

where SYSCLK is the system operating frequency for CPU1 and CPU2, where CMCLK is the system operating frequency for CM, and FCLK is the clock frequency for Flash.

FCLK must be $\leq FCLK_{max}$, the allowed maximum Flash clock frequency at RWAIT=0.

If RWAIT results in a fractional value when calculated using the above formula, round up RWAIT to the nearest integer.

13.7 Flash Read Interface

This section provides details about the data read modes to access Flash bank/OTP and the configuration registers that control the read interface. In addition to a standard read mode, the FMC has a built-in prefetch and cache mechanism to allow increased clock speeds and CPU throughput wherever applicable.

13.7.1 C28x-FMC (CPU1-FMC and CPU2-FMC) Flash Read Interface

13.7.1.1 Standard Read Mode

Standard read mode is the default Flash read mode after reset. In this mode, the code prefetch mechanism and data cache are disabled. When standard read mode is active, every read access to Flash is decoded by the Flash wrapper to fetch the data from the addressed location, and the data is returned after RWAIT+1 cycles (except User OTP).

Flash data buffers associated with the prefetch mechanism and data cache are bypassed in standard read mode; therefore, every access to the Flash/OTP is used by the CPU immediately, and every access creates a unique Flash bank access.

Standard read mode is the recommended mode for lower system frequency operation, where RWAIT can be set to zero to provide single-cycle access operation. The FMC can operate at higher frequencies using standard read mode, at the expense of adding wait states. At higher system frequencies, it is recommended to enable the data cache and prefetch mechanisms to improve performance. Refer to the device data sheet to determine the maximum Flash frequency allowed in standard read mode (that is, maximum Flash clock frequency with RWAIT=0, $FCLK_{MAX}$).

13.7.1.2 Prefetch Mode

Flash memory is typically used to store application code. During code execution, instructions are fetched from contiguous memory addresses, except when a discontinuity occurs. Usually, the portion of the code that resides in contiguous address locations makes up the majority of the application code, and is referred to as linear code. To improve the performance of linear code execution, a Flash prefetch mechanism has been implemented.

[Figure 13-2](#) illustrates how this mode functions.

The prefetch mechanism does a look-ahead prefetch on linear address increments, starting from the address of the last instruction fetch. The Flash prefetch mechanism is disabled by default. To enable prefetch mode, set the PREFETCH_EN bit in the FRD_INTF_CTRL register, or call the `Flash_enablePrefetch()` driverlib function.

Each instruction fetch from the Flash or OTP reads out 128 bits. The starting address of the access from Flash is automatically aligned to a 128-bit boundary, such that the instruction location is within the 128 bits to be fetched. When Flash prefetch mode is enabled, the 128 bits read from the instruction fetch are stored in a 128-bit wide by 2-level deep instruction prefetch buffer. The contents of this prefetch buffer are then sent to the CPU for processing as required.

Up to four 32-bit or eight 16-bit instructions can reside within a single 128-bit access. The majority of C28x instructions are 16 bits, so for every 128-bit instruction fetch from the Flash bank there are up to eight instructions in the prefetch buffer ready to process through the CPU. During the time to process these instructions, the Flash prefetch mechanism automatically initiates another access to the Flash bank to prefetch the next 128 bits. The Flash prefetch mechanism works in the background to keep the instruction prefetch buffers as full as possible. Using this technique, the overall efficiency of sequential code execution from Flash or OTP is improved significantly.

Note

If the prefetch mechanism is enabled, then the last two rows (16 16-bit words, 256 bits) of a Flash bank can not be used if there are no valid Flash memory addresses beyond the bank boundary. This is necessary to prevent the Flash prefetch mechanism from attempting to preload the instruction buffer with data from invalid address locations, causing an ECC error.

Figure 13-2. Flash Prefetch Mode

The Flash prefetch is aborted only when there is a code discontinuity caused by executing an instruction such as a branch, function call, or loop. When this occurs, the prefetch mechanism is aborted, and the contents of the prefetch buffer are flushed. There are two possible scenarios when this occurs:

1. If the destination address is within the Flash or OTP, the prefetch aborts and then resumes at the destination address.
2. If the destination address is outside of the Flash and OTP, the prefetch is aborted, and begins again only when the code branches back into the Flash or OTP. The Flash prefetch mechanism only applies to instruction fetches from program space. Data reads from data memory and from program memory do not utilize the prefetch mechanism and thus bypass the prefetch buffer. For example, instructions such as MAC, DMAC, and PREAD read a data value from program memory. When such a read happens, the prefetch buffer is bypassed, but the buffer is not flushed. If an instruction prefetch is already in progress when a data read operation is initiated, then the data read is stalled until the prefetch completes.

Note that the prefetch mechanism gets bypassed when RWAIT is configured as zero.

13.7.1.2.1 Data Cache

In addition to the prefetch mechanism, a data cache of 128-bits wide has been implemented to improve data space read performance. This data cache is separate from the instruction prefetch buffer, and is used for data reads only. Whenever a data read access is performed by the CPU to a Flash bank address, if the data located at that address is not presently loaded into the data cache, then the Flash wrapper reads 128 bits of data from the Flash bank and stores the data in the data cache. This data is eventually sent to the CPU for processing. The starting address of the Flash bank access is automatically aligned to a 128-bit boundary, such that the requested address location is within the 128 bits to be read from the bank.

The data cache is disabled by default at reset. To enable the data cache, set the DATA_CACHE_EN bit in the FRD_INTF_CTRL register, or call the `Flash_enableCache()` driverlib function. Note that the data cache gets bypassed when RWAIT is set to zero.

Note

The data cache does not get updated on a debugger access, or when a read to the ECC memory-mapped region is performed.

13.7.2 M4-FMC (CM-FMC) Flash Read Interface

13.7.2.1 Standard Read Mode

Standard read mode is defined as the read mode in effect when program cache/prefetch-mechanism and data cache are disabled. Standard read mode is also the default read mode after reset. During this mode, each read access to Flash is decoded by the Flash wrapper to fetch the data from the addressed location and the data is returned after the RWAIT+1 number of cycles.

The program cache/prefetch mechanism and data cache are bypassed in standard read mode; therefore, every access to the Flash/OTP is used by the CPU immediately and every access creates a unique Flash bank access.

Standard read mode is the recommended mode for lower system frequency operation in which RWAIT can be set to zero to provide single cycle access operation.

FMC can operate at higher frequencies using standard read mode at the expense of adding wait states. At higher system frequencies, enable cache and prefetch mechanisms to improve performance. Refer to the data sheet to determine the maximum Flash frequency allowed in standard read mode (that is, the maximum Flash clock frequency with one wait state - FCLKmax).

13.7.2.2 Cache Mode

13.7.2.2.1 Program Cache

Flash memory is typically used to store application code. During code execution, instructions are fetched from sequential memory addresses, except when a discontinuity occurs. Usually, the portion of the code that resides in sequential addresses makes up the majority of the application code, and is referred to as linear code. To improve the performance of linear code execution, the FMC includes a Flash prefetch mechanism. This prefetch mechanism does a look-ahead prefetch on linear address increments starting from the address of the last program access.

Apart from linear code, in general application code, there can be several loops wherein a set of instructions located in sequential addresses are executed repeatedly in a loop, until a condition holds true. To improve the performance of small loop code execution, an 8-level deep 128-bit wide (8 x 128) direct mapped program cache has been implemented in the FMC. Whenever instructions in the cache are fetched for CPU processing, the Flash prefetch mechanism does a look-ahead prefetch of 128 bits from the next linear 128-bit aligned address from last address access, and fills the program cache as shown in Figure 13-3.

Up to four 32-bit instructions or up to eight 16-bit instructions can reside within a single 128-bit access. For every 128-bit instruction fetch from the Flash bank, it is likely that there are up to eight instructions (assuming 16-bit instructions) in each level of cache, ready to process through the CPU. During the time it takes to process these instructions, the Flash prefetch mechanism automatically initiates another access to the Flash bank to prefetch the next 128 bits. In this manner, the Flash prefetch mechanism works in the background to keep the cache as full as possible with data corresponding to the next linear address. Using this technique, the overall efficiency of sequential code execution and small loop code execution from Flash or OTP is improved significantly.

The Flash program cache and prefetch mechanism features are disabled by default. Setting the PROG_CACHE_EN bit in the FRD_INTF_CTRL register enables this cache mode. The Flash prefetch and cache mechanisms are independent of the CPU pipeline.

Figure 13-3. Flash Cache Mode

When the Cortex®-M4 CPU (CM) initiates an ICODE access from an address in program space in Flash:

1. The M4-FMC (CM-FMC) checks the program cache, if enabled, to determine the presence of required data.
2. If data corresponding to the requested address is present in the cache, the data is construed as a cache hit, and data is provided to the CPU from cache. At this time, the prefetch mechanism fetches 128 bits from the next linear 128-bit aligned address from last address access, and fills the program cache.
3. If data corresponding to the requested address is not present in the cache, the data is construed as a cache miss. Therefore, the prefetch mechanism fetches 128 bits of the data from the requested address in bank (the starting address of the access from Flash is automatically aligned to a 128-bit boundary such that the instruction location is within the 128 bits to be fetched) and writes that data on to cache, and eventually the requested data is sent to the CPU from cache for processing.

When cache mode is enabled, avoid placing code in the last row of 128 bits in the Flash bank. Doing so can result in an ECC error caused by a look-ahead prefetch access to an address past the bank address boundary.

The Flash prefetch mechanism is aborted only on a PC discontinuity caused by executing an instruction such as a branch, function call, or loop, and so on. When this occurs, the prefetch is aborted. There are two possible scenarios when this occurs:

- If the destination address is within the Flash or OTP, then prefetch aborts and then resumes at the destination address.
- If the destination address is outside of the Flash and OTP, the prefetch is aborted and begins again only when a branch is made back into the Flash or OTP. The Flash prefetch mechanism only applies to instruction fetches (ICODE) from program space. Data space accesses (DCODE) do not utilize the prefetch mechanism. For data space accesses, the program cache and prefetch mechanism are bypassed. If an instruction prefetch is already in progress when a data read operation is initiated, then the data read stalls until the prefetch completes.

13.7.2.2.2 Data Cache

Along with the program cache, a data cache of 128-bits width is also implemented to improve data space access (DCODE) performance. This data cache is not filled by the prefetch mechanism. When any kind of data space access is made by the CPU from an address in the bank, and if the data corresponding to the requested address is not in the data cache, then 128 bits of data are read from the bank and loaded in the data cache. The data is eventually sent to the CPU for processing. The starting address of the access from Flash is automatically aligned to a 128-bit boundary such that the requested address location is within the 128 bits to be read from the bank. By default, this data cache is disabled and can be enabled by setting DATA_CACHE_EN bit in the FRD_INTF_CTRL register.

Some other points to keep in mind when working with M3 Flash:

- Reads of the CSM password locations, GRABRAM, GRABSECT, ECSLKEY and EXEONLY locations are hardwired for 10 wait states. The RWAIT bits have no effect on these locations.
- CPU writes to the Flash or OTP memory map areas are ignored and complete in a single cycle.
- DCODE access to zone-1 and zone-2 password locations return the data to Code Security Module (CSM) and return a value of zero to Cortex®-M4 (CM) when the respective password lock bits are not all 1s and the respective zone is not unlocked.
- ICODE accesses to zone-1 and zone-2 password locations return a 0 when the respective password lock bits are not all 1s and the respective zone is not unlocked.
- When the Code Security Module (CSM) is secured, reads to the Flash/OTP memory map area from outside the secure zone take the same number of cycles as a normal access. However, the read operation returns a zero.
- The arbitration scheme in M3-FMC prioritizes Cortex®-M4 (CM) accesses in the fixed priority order of data space access (DCODE), program space access (ICODE)/program space prefetch.
- When FSM interface is active for erase/program operations, data in the program cache and data cache in FMC is invalidated.

13.8 Flash Erase and Program

Flash memory can be programmed either by using the CCS Flash plug-in or by using the UniFlash application. If these methods are not feasible in an application, the Flash API can be used. The Flash memory can be programmed, erased, and verified only by using the Flash API library. These functions are written, compiled and validated by Texas Instruments. The Flash module contains a Flash state machine (FSM) to perform program and erase operations.

The recommended flow for programming Flash is:

Erase → Program → Verify

13.8.1 Erase

When the target Flash is erased, the Flash reads as all 1s. This state is called 'blank.' The erase function must be executed before programming. The user cannot skip erase on sectors that read as 'blank' because these sectors can require additional erasing due to marginally erased bits columns. The FSM provides an Erase Sector command to erase the target sector. The erase function erases the data and the ECC together.

13.8.2 Program

The Flash controller provides a command to program the Flash and User OTP. This command is also used to program ECC check bits.

Note

The main array Flash programming must be aligned to 64-bit address boundaries, and each 64-bit word can only be programmed once per write/erase cycle.

The DCSM OTP programming must be aligned to 128-bit address boundaries and each 128-bit word can only be programmed once. The exceptions are:

- The DCSM Zx-LINKPOINTER1 and Zx-LINKPOINTER2 values in the DCSM OTP can be programmed together and can be programmed one bit at a time as required by the DCSM operation.
 - The DCSM Zx-LINKPOINTER3 values in the DCSM OTP can be programmed one bit at a time as required by the DCSM operation.
-

13.8.3 Verify

After programming, the user must perform verify using API function `Fapi_doVerify()`. This function verifies the Flash contents against supplied data.

Application software typically perform a CRC check of the Flash memory contents during power-up and at regular intervals during runtime (as needed). Apart from this, ECC logic, when enabled (enabled by default), catches single-bit errors, double-bit errors, and address errors whenever the CPU reads/fetches from a Flash address.

13.9 Error Correction Code (ECC) Protection

CPU1-FMC and CPU2-FMC contain an embedded single error correction and double error detection (SECDED) module. SECDED, when enabled, provides the capability to screen out memory faults. SECDED can detect and correct single-bit data errors and detect address errors/double-bit data errors. For every 64 bits of Flash/OTP data (aligned on a 64-bit memory boundary) that is programmed, eight ECC check bits have to be calculated and programmed in ECC memory space. Refer to the device data sheet for the Flash/OTP ECC memory-map. SECDED works with a total of eight user-calculated error correction code (ECC) check bits associated with each 64-bit wide data word and the corresponding 128-bit memory-aligned address. Users must program ECC check bits along with Flash data. TI recommends using the AutoEccGeneration option available in the Plugin/API to program ECC. Users can use the Flash API to calculate and program ECC data along with Flash data. Flash API uses hardware ECC logic in the device to generate the ECC data for the given Flash data. The Flash Plugin, the Flash programming tool integrated with the Code Composer Studio™ IDE, uses the Flash API to generate and program ECC data.

Figure 13-4 illustrates the ECC logic inputs and outputs.

During an instruction fetch or a data read operation, the 19 most significant address bits (three least significant bits of address are not considered), together with the 64-bit data/8-bit ECC read-out of Flash banks/ECC memory map area, pass through the SECDED logic and the eight checkbits are produced in FMC. These eight calculated ECC check bits are then XORed with the stored check bits (user programmed check bits) associated with the address and the read data. The 8-bit output is decoded inside the SECDED module to determine one of three conditions:

- No error occurred
- A correctable error (single bit data error) occurred
- A non-correctable error (double bit data error or address error) occurred

Figure 13-4. ECC Logic Inputs and Outputs

If the SECEDED logic finds a single-bit error in the address field, then the error is considered to be a non-correctable error.

Note

Since ECC is calculated for an entire 64-bit data, a non 64-bit read such as a byte read or a half-word read still forces the entire 64-bit data to be read and calculated, but only the byte or half-word are actually used by the CPU.

This ECC (SECEDED) feature is enabled at reset. The ECC_ENABLE register can be used to configure (enable/disable) the ECC feature. The ECC for the application code must be programmed. There are two SECEDED modules in each FMC. Out of the 128-bit data (aligned on a 128-bit memory boundary) read from the bank/OTP address, the lower 64 bits of data and corresponding 8 ECC bits (read from user programmable ECC memory area) are fed as inputs to one SECEDED module along with 128-bit aligned 19-bit address from where data has been read. The upper 64 bits of data and corresponding 8 ECC bits are fed as inputs to another SECEDED module in parallel, along with 128-bit aligned 19-bit address. Each of the SECEDED modules evaluate the inputs and determine if there is any single-bit data error or double-bit data error/address error.

ECC logic is bypassed when the 64 data bits and the associated ECC bits fetched from the bank are either all ones or zeros.

13.9.1 Single-Bit Data Error

This section provides information for both single-bit data errors and single-bit ECC check bit errors. If there is a single bit flip (0 to 1 or 1 to 0) in Flash data or in ECC data, then the error is considered as a single-bit data error. The SECEDED module detects and corrects single-bit errors, if any, in the 64-bit Flash data or eight ECC check bits read from the Flash/ECC memory map before the read data is provided to the CPU.

When SECEDED finds and corrects single bit data errors, the following information is logged in the ECC registers if the ECC feature is enabled:

- Address where the error occurred: if the single-bit error occurs in the lower 64 bits of a 128-bit memory-aligned Flash data word, the address of the lower 64-bit word is captured in the SINGLE_ERR_ADDR_LOW register. If the single-bit error occurs in the upper 64 bits of the 128-bit data word, then the address of the upper 64-bit word is captured in the SINGLE_ERR_ADDR_HIGH register.
- Whether the error occurred in data bits or ECC bits: the ERR_TYPE_L and ERR_TYPE_H bit fields in the ERR_POS register indicate whether the error occurred in data bits or ECC bits of the lower 64 bits, or the upper 64 bits respectively, of a 128-bit memory-aligned Flash data word.
- Bit position at which the error occurred: the ERR_POS_L and ERR_POS_H bit fields in the ERR_POS register indicate the bit position of the error in the lower 64 bits/lower 8-bit ECC, or the upper 64 bits/upper 8-bit ECC respectively, of a 128-bit memory-aligned Flash data word.
- Whether the corrected value is 0 (FAIL_0_L, FAIL_0_H flags in ERR_STATUS register).
- Whether the corrected value is 1 (FAIL_1_L, FAIL_1_H flags in ERR_STATUS register).
- A single bit error counter that increments on every single bit error occurrence (ERR_CNT register) until a user-configurable threshold (see ERR_THRESHOLD) is met.
- A flag that gets set when one or more single-bit errors occurs after ERR_CNT equals ERR_THRESHOLD (SINGLE_ERR_INT_FLG flag in the ERR_INTFLG register).

When the ERR_CNT value equals ERR_THRESHOLD+1, and a single bit error occurs, the Flash module sets the SINGLE_ERR_INT flag and generates an interrupt signal. To enable propagation of the generated interrupt pulse to the CPU, the user application must enable the FLASH_CORRECTABLE_ERROR channel in the C28 Peripheral Interrupt Expansion module (PIE). The interrupt signal remains high until the application clears the SINGLE_ERR_INTFLG flag by writing to the SINGLE_ERR_INTCLR bit in the ERR_INTCLR register. The Flash module cannot generate any further FLASH_CORRECTABLE_ERROR interrupt signals to the PIE/CPU until SINGLE_ERR_INTFLG is cleared, as this is an edge-based interrupt.

When multiple single-bit errors have been detected by ECC logic, the contents of the Flash ECC registers reflect the most recent ECC error. When multiple single-bit errors have been detected, both FAIL_0_L and FAIL_1_L (or FAIL_0_H and FAIL_1_H) can be set, indicating that single-bit fail0/fail1 occurred in different 64-bit aligned addresses.

Although ECC is calculated on 64-bit basis, a read of any address location within a 128-bit aligned Flash data word causes the single-bit error flag to get set, if there is a single-bit error in both or in either the lower 64 or upper 64 bits (or corresponding ECC check bits) of that 128-bit data word.

13.9.2 Uncorrectable Error

Uncorrectable errors include address errors and double-bit errors in data or ECC. When the ECC logic finds uncorrectable errors, the following information is logged in ECC registers if the ECC feature is enabled:

- Address where the error occurred: if the uncorrectable error occurs in the lower 64 bits of a 128-bit memory-aligned Flash data word, the lower 64-bit memory-aligned address is captured in the UNC_ERR_ADDR_LOW register. If the uncorrectable error occurs in the upper 64 bits of a 128-bit memory-aligned Flash data word, the upper 64-bit memory-aligned address is captured in the UNC_ERR_ADDR_HIGH register.
- A flag is set indicating that an uncorrectable error occurred – the UNC_ERR_L and UNC_ERR_H flags in the ERR_STATUS register indicate the uncorrectable error occurrence in the lower 64 bits/lower 8-bit ECC, or the upper 64 bits/upper 8-bit ECC, respectively, of a 128-bit memory-aligned Flash data word.
- A flag is set indicating that an uncorrectable error interrupt is generated (UNC_ERR_INTFLG in ERR_INTFLG register).

When an uncorrectable error occurs, the Flash module sets the UNC_ERR_INTFLG bit and generates an uncorrectable error interrupt. This uncorrectable error interrupt generates a non-maskable interrupt (NMI), if enabled, in the CPU. If an uncorrectable error interrupt flag is not cleared by writing to the UNC_ERR_INTCLR bit in the ERR_INTCLR register, the Flash module cannot generate new uncorrectable interrupt signals, as this is an edge-based interrupt.

Although ECC is calculated on 64-bit basis, a read of any address location within a 128-bit aligned Flash word causes the uncorrectable error flag to get set, and an uncorrectable error interrupt/NMI to occur, when there is a uncorrectable error in both or in either the lower 64 bits or upper 64 bits (or corresponding ECC check bits) of that 128-bit data word.

13.9.3 SECEDED Logic Correctness Check

Since error detection and correction logic are part of safety-critical logic, safety applications often need to make sure that the SECEDED logic is always working properly. For these safety concerns, to confirm the correctness of the SECEDED logic, an ECC test mode is provided to test the correctness of ECC logic periodically. In this ECC test mode, data/ECC and address inputs to the ECC logic are controlled by the ECC test mode registers FDATAH_TEST, FDATAI_TEST, FECC_TEST, and FADDR_TEST, respectively. Using this test mode, users can introduce single-bit errors, double-bit errors, or address errors and check whether or not SECEDED logic is catching those errors. Users can also check if SECEDED logic is reporting any false errors when no errors are introduced.

This ECC test mode can be enabled by setting the ECC_TEST_EN bit in the FECC_CTRL register. When ECC test mode is enabled, the CPU cannot read the data from Flash. Instead, the CPU gets data from the ECC test mode registers (FDATAH_TEST/FDATAI_TEST). This is because the ECC test mode registers (FDATAH_TEST, FDATAI_TEST, FECC_TEST) are multiplexed with data from the Flash. For this reason, ECC test mode code must be executed from RAM and not from Flash.

Only one of the SECEDED modules (out of the two SECEDED modules that work on lower 64 bits and upper 64 bits of a read 128-bit data) at a time can be tested. The ECC_SELECT bit in the FECC_CTRL register can be configured by users to select one of the SECEDED modules for test.

To test the ECC logic using ECC test mode, follow these steps:

1. Obtain the ECC for a given Flash address (128-bit aligned) and 64-bit data by using the Auto ECC generation option provided in Flash API.
2. Develop an application to test ECC logic using the above data. In this application:
 - Write the 128-bit aligned 19-bit Flash address in FADDR_TEST.
 - Write 64-bit data in FDATAx_TEST (FDATAI_TEST and FDATAH_TEST) registers.
 - Write the corresponding 8-bit ECC in the FECC_TEST register.
 - In any of the above three steps, the application can insert errors (single-bit data error or double-bit data error or address error or single-bit ECC error or double-bit ECC error) to check whether or not ECC logic is able to detect the errors.
 - Select the ECC logic block (lower 64-bits or upper 64-bits) which needs to be tested using the ECC_SELECT bit in the FECC_CTRL register.
 - Enable ECC test mode using the ECC_TEST_EN bit in FECC_CTRL register.
 - Write a value of 1 in the DO_ECC_CALC bit in FECC_CTRL register to enable ECC test logic for a single cycle to evaluate the address, data, ECC in FADDR_TEST, FDATAx_TEST and FECC_TEST registers for ECC errors.

Once the above ECC test mode registers are written by the user:

- The FECC_OUTH register holds the data output bits 63:32 from the SECEDED block under test.
- The FECC_OUTL register holds the data output bits 31:0 from the SECEDED block under test.
- The FECC_STATUS register holds the status of single-bit error occurrence, uncorrectable error occurrence, and error position of single-bit error in data/check bits.

13.10 Reserved Locations Within Flash and OTP Memory

When allocating code and data to Flash and OTP memory, keep the following reserved locations in mind:

- The entire OTP has reserved user-configurable locations for security and boot process. For more details on the functionality of these fields, refer to the *ROM Code and Peripheral Booting* and the *Dual Code Security Module (DCSM)* chapters.
- Refer to the *ROM Code and Peripheral Booting* chapter for reserved locations in Flash for real-time operating system usage and a boot-to-Flash entry point. A boot-to-Flash entry point is reserved for an entry-into-Flash branch instruction. When the boot-to-Flash boot option is used, the boot ROM jumps to this address in Flash. If the user programs a branch instruction here, that then redirects code execution to the entry point of the application.

13.11 Migrating an Application from RAM to Flash

To migrate an existing application that is configured to run from RAM to a Flash-based linker configuration, follow these steps:

1. Replace the RAM linker command file with a Flash linker command file. For examples of Flash-based linker command files, see the `device_support\<device>\common\cmd` directory.
2. When modifying the Flash-based linker command file, be sure to map any initialized sections to Flash memory regions.
3. Make sure the boot mode pins are configured for Flash boot. This tells the boot ROM to redirect execution to the application programmed into Flash memory after boot code execution is complete. For more information on boot mode configuration, see *Detailed Description > Device Boot Modes* in the device data sheet.
4. When the device is configured for Flash boot, the boot ROM redirects execution to the Flash entry point location (defined as BEGIN in TI-provided Flash linker command files) at the end of boot code execution. Make sure there is a branch instruction at the Flash entry point to your code initialization (for example, `_c_int00`) function. In the C2000Ware examples, the entry point code is specified in the `codestartbranch.asm` file.
5. To achieve best performance for Flash execution, configure the Flash wait states as per the device operating clock frequency, as specified in the device data sheet. In addition, enable prefetch mode and data cache mode. Calling the `Flash_initModule()` driverlib function achieves these steps. Note that code that initializes the Flash module must execute from a RAM location. This is accomplished by assigning the Flash initialization function to the `.TI.ramfunc` section. In the linker command file, map this section to Flash for load, and RAM for execution. The example cmd files provided in C2000Ware show how to do this correctly.
6. For any functions that require 0- or 1-wait state performance, be sure to map to RAM for execution in the linker command file, similar to the Flash initialization function. The `.TI.ramfunc` section in the TI-provided Flash linker command files accomplishes this purpose.
7. Align all code and data sections to 128-bit address boundaries when mapping to Flash memory, using the `ALIGN` directive in the linker command file.
8. For EABI executable formats, define all uninitialized sections mapped to RAM as NOINIT sections (using the directive `"type=NOINIT"`) in the linker command file.
9. Be sure to program ECC bits correctly for the Flash application image. Keep the `AutoEccGeneration` option enabled in the Code Composer Studio Flash Plugin or UniFlash GUI.

13.12 Procedure to Change the Flash Control Registers

During Flash configuration, no accesses to the Flash or OTP can be in progress. This includes instructions still in the CPU pipeline, data reads, and instruction prefetch operations. To be sure that no access takes place during the configuration change, follow the procedure shown below for any code that modifies the Flash control registers.

1. Start executing application code from RAM/Flash/OTP.
2. Branch to or call the Flash configuration code (that writes to Flash control registers) in RAM. This is required to properly flush the CPU pipeline before the configuration change. The function that changes the Flash configuration cannot execute from the Flash or OTP and must reside in RAM.
3. Execute the Flash configuration code (located in RAM) that writes to Flash control registers like FRDCNTL, FRD_INTF_CTRL, and so on.
4. At the end of the Flash configuration code execution, wait eight cycles to let the write instructions propagate through the CPU pipeline. This must be done before the return-from-function call is made.
5. Return to the calling function that resides in RAM or Flash/OTP and continue execution.

13.13 Flash Pump Ownership Semaphore

Each CPU subsystem includes a dedicated Flash bank, which the subsystem can read, program, and erase. Both Flash banks share a single charge pump for program and erase operations. Hence, only one CPU can program or erase the Flash at any given time. A CPU can read data and execute code from the Flash even when the other CPU is programming or erasing. The Flash pump ownership semaphore allows one CPU to take control of the pump without being interrupted by the other CPU.

The pump ownership semaphore is implemented as a two-bit field in a PUMPREQUEST register with special write protections. This register requires a key field to be written at the same time as the semaphore bits. The possible semaphore states are:

PUMPREQUEST.SEM	Description
00	CPU1 has control of the pump, but CPU2 and CM can seize control at any time
01	CPU2 has exclusive control of the pump and of these semaphore bits. CPU2 can relinquish control by setting the bits back to 00
10	CPU1 has exclusive control of the pump and of these semaphore bits. CPU1 can relinquish control by setting the bits back to 00
11	CM has exclusive control of the pump and of these semaphore bits. CM can relinquish control by setting the bits back to 00

Semaphore bit changes from 01→10, 01→11, 10→01, 10→11, 11→01, or 11→10 are not allowed. The CPU that currently controls the Pump semaphore must first relinquish control by setting the bits to 00 before another CPU can assume ownership.

Figure 13-5 describes the allowed states and state transitions.

Figure 13-5. Flash Pump Semaphore (PUMPREQUEST) States and State Transitions

Note

Although there are multiple references and descriptions of PUMPREQUEST in this document, all of these reference the same register. There is only one PUMPREQUEST register in the device.

13.14 Software

13.14.1 FLASH Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/flash

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](https://dev.ti.com/C2000Ware/Examples).

13.14.1.1 Flash Programming with AutoECC, DataAndECC, DataOnly and EccOnly - CM

FILE: flashapi_cm_ex1_programming.c

This example demonstrates how to program Flash using API's following options

1. AutoEcc generation
2. DataOnly and EccOnly
3. DataAndECC

Before running this example, please run the cm_common_config_c28x Example from the c28x folder. It will initialize the clock, configure CPU1 Flash wait-states, fall back power mode, performance features and ECC.

External Connections

- None.

Watch Variables

- None.

13.14.1.2 Flash Programming with AutoECC, DataAndECC, DataOnly and EccOnly

FILE: flashapi_ex1_programming.c

This example demonstrates how to program Flash using API's following options

1. AutoEcc generation
2. DataOnly and EccOnly
3. DataAndECC

External Connections

- None.

Watch Variables

- None.

13.14.1.3 Flash ECC Test Mode

FILE: flash_ex2_ecc_test_mode.c

This example demonstrates ECC Test mode.

13.14.1.4 Flash ECC Test Mode - CM

FILE: flash_ex2_ecc_test_mode.c

This example demonstrates ECC Test mode.

13.15 Flash Registers

This section describes the Flash Module Registers.

13.15.1 FLASH Base Address Table (C28)

Table 13-1. FLASH Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
Flash0CtrlRegs	FLASH_CTRL_REGS	FLASH0CTRL_BASE	0x0005_F800	YES	YES	-	-	YES
Flash0EccRegs	FLASH_ECC_REGS	FLASH0ECC_BASE	0x0005_FB00	YES	YES	-	-	YES
FlashPumpSemaphoreRegs	FLASH_PUMP_SEMAPHORE_REGS	FLASHPUMPSEMAPHORE_BASE	0x0005_CE24	YES	YES	-	-	YES

13.15.2 CM FLASH Base Address Table (CM)

Table 13-2. CM FLASH Base Address Table (CM)

DriverLib Name	Base Address	μDMA Access	Ethernet DMA Access
FLASH0CTRL_BASE	0x400F_A000	-	-
FLASH0ECC_BASE	0x400F_A600	-	-
FLASHPUMPSEMAPHORE_BASE	0x400F_D048	-	-

13.15.3 FLASH_CTRL_REGS Registers

Table 13-3 lists the memory-mapped registers for the FLASH_CTRL_REGS registers. All register offset addresses not listed in Table 13-3 should be considered as reserved locations and the register contents should not be modified.

Table 13-3. FLASH_CTRL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	FRDCNTL	Flash Read Control Register	EALLOW	Go
1Eh	FBAC	Flash Bank Access Control Register	EALLOW	Go
20h	FBFALLBACK	Flash Bank Fallback Power Register	EALLOW	Go
22h	FBPRDY	Flash Bank Pump Ready Register	EALLOW	Go
24h	FPAC1	Flash Pump Access Control Register 1	EALLOW	Go
2Ah	FMSTAT	Flash Module Status Register	EALLOW	Go
180h	FRD_INTF_CTRL	Flash Read Interface Control Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 13-4 shows the codes that are used for access types in this section.

Table 13-4. FLASH_CTRL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

13.15.3.1 FRDCNTL Register (Offset = 0h) [Reset = 00000300h]

FRDCNTL is shown in [Figure 13-6](#) and described in [Table 13-5](#).

Return to the [Summary Table](#).

Flash Read Control Register

26h	FECC_STATUS	ECC Status	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 13-13 shows the codes that are used for access types in this section.

Table 13-13. FLASH_ECC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

Table 13-13. FLASH_ECC_REGS Access Type Codes (continued)

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

13.15.4.1 ECC_ENABLE Register (Offset = 0h) [Reset = 0000000Ah]

ECC_ENABLE is shown in [Figure 13-13](#) and described in [Table 13-14](#).

Return to the [Summary Table](#).

RESERVED																ERR_CNT															
R-0h																R/W-0h															

Table 13-22. ERR_CNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-0	ERR_CNT	R/W	0h	Single bit error count. This counter increments with every single bit ECC error occurrence. Upon reaching the threshold value counter stops counting on single bit errors. ERR_CNT can be cleared (irrespective of whether threshold is met or not) using 'Single Err Int Clear' bit. This is applicable for ECC logic test mode and normal operational mode. In ECC logic test mode, ERR_CNT will keep incrementing for every cycle after a single bit error occurrence. So, in order to clear ERR_CNT in ECC logic test mode, ECC logic test mode has to be disabled prior to clearing the ERR_CNT using 'Single Err Int Clear' bit. Reset type: SYSRSn

13.15.4.10 ERR_THRESHOLD Register (Offset = 12h) [Reset = 00000000h]

ERR_THRESHOLD is shown in [Figure 13-22](#) and described in [Table 13-23](#).

Return to the [Summary Table](#).

8	ERR_TYPE	R	0h	Test mode ECC single bit error indicator. When 1, indicates that the single bit error is in check bits. When 0, indicates that the single bit error is in data bits (If SINGLE_ERR field is also set). Reset type: SYSRSn
7-2	DATA_ERR_POS	R	0h	Test mode single bit error position. Holds the bit position where the single bit error occurred. The position is interpreted depending on whether the CHK_ERR bit indicates a check bit or a data bit. If CHK_ERR indicates a check bit error, the error position could range from 0 to 7, or it could range from 0 to 63. Reset type: SYSRSn
1	UNC_ERR	R	0h	Test mode ECC double bit error. When 1 indicates that the ECC test resulted in an uncorrectable bit error. Reset type: SYSRSn
0	SINGLE_ERR	R	0h	Test mode ECC single bit error. When 1 indicates that the ECC test resulted in a single bit error. Reset type: SYSRSn

13.15.5 CM_FLASH_CTRL_REGS Registers

Table 13-34 lists the memory-mapped registers for the CM_FLASH_CTRL_REGS registers. All register offset addresses not listed in Table 13-34 should be considered as reserved locations and the register contents should not be modified.

Table 13-34. CM_FLASH_CTRL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	FRDCNTL	Flash Read Control Register	Yes	Go
1Eh	FBAC	Flash Bank Access Control Register	Yes	Go
20h	FBFALLBACK	Flash Bank Fallback Power Register	Yes	Go
22h	FBPRDY	Flash Bank Pump Ready Register	Yes	Go
24h	FPAC1	Flash Pump Access Control Register 1	Yes	Go
2Ah	FMSTAT	Flash Module Status Register	Yes	Go
17Eh	FRD_INTF_CTRL_LOCK	Lock register for FLASH_CTRL_REGS (Not including FRD_INTF_CTRL_LOCK).	No	Go
180h	FRD_INTF_CTRL	Flash Read Interface Control Register	Yes	Go

Complex bit access types are encoded to fit into small table cells. Table 13-35 shows the codes that are used for access types in this section.

Table 13-35. CM_FLASH_CTRL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

13.15.5.1 FRDCNTL Register (Offset = 0h) [Reset = 0000F00h]

Bit	Field	Type	Reset	Description
31-28	RESERVED	R	0h	Reserved
27-16	PSLEEP	R/W	4E2h	Pump sleep. These bits contain the starting count value for the charge pump sleep down counter. While the charge pump is in sleep mode, the power mode management logic holds the charge pump sleep counter at this value. When the charge pump exits sleep power mode, the down counter delays from 0 to PSLEEP prescaled CMCLK clock cycles before putting the charge pump into active power mode. Note: The pump sleep down counter uses the same prescaled clock as Bank sleep down counter which is divided by 2 of input CMCLK. Reset type: CM.RESETn
15-1	RESERVED	R	0h	Reserved
0	PMPPWR	R/W	0h	Flash Charge Pump Fallback Power Mode. This bit selects what power mode the charge pump enters after the pump active grace period (PAGP) counter has timed out. 0 Sleep (all pump circuits disabled) 1 Active (all pump circuits active) Note for devices with multiple flash banks: As the pump is shared between flash banks, if an access is made either bank, the value of this bit changes to 1 (active). Reset type: CM.RESETn

13.15.5.6 FMSTAT Register (Offset = 2Ah) [Reset = 00000000h]

FMSTAT is shown in [Figure 13-38](#) and described in [Table 13-41](#).

Return to the [Summary Table](#).

15	RESERVED	R	0h	Reserved
14	RESERVED	R	0h	Reserved
13	RESERVED	R	0h	Reserved
12	PGV	R	0h	When set, indicates that a word is not successfully programmed after the maximum allowed number of program pulses are given for program operation. Reset type: CM.RESETn
11	RESERVED	R	0h	Reserved
10	EV	R	0h	When set, indicates that a sector is not successfully erased after the maximum allowed number of erase pulses are given for erase operation. During Erase verify command, this flag is set immediately if a bit is found to be 0. Reset type: CM.RESETn
9	RESERVED	R	0h	Reserved
8	Busy	R	0h	When set, this bit indicates that a program, erase, or suspend operation is being processed. Reset type: CM.RESETn
7	ERS	R	0h	When set, this bit indicates that the flash module is actively performing an erase operation. This bit is set when erasing starts and is cleared when erasing is complete. It is also cleared when the erase is suspended and set when the erase resumes. Reset type: CM.RESETn

Table 13-41. FMSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	PGM	R	0h	When set, this bit indicates that the flash module is currently performing a program operation. This bit is set when programming starts and is cleared when programming is complete. It is also cleared when programming is suspended and set when programming resumes. Reset type: CM.RESETn
5	INVDAT	R	0h	When set, this bit indicates that the user attempted to program a 1 where a 0 was already present. This bit is cleared by the Clear Status command. Reset type: CM.RESETn
4	CSTAT	R	0h	Once the FSM starts any failure will set this bit. When set, this bit informs the host that the program, erase, or validate sector command failed and the command was stopped. This bit is cleared by the Clear Status command. For some errors, this will be the only indication of an FSM error because the cause does not fall within the other error bit types. Reset type: CM.RESETn
3	VOLTSTAT	R	0h	When set, this bit indicates that the core voltage generator of the pump power supply dipped below the lower limit allowable during a program or erase operation. This bit is cleared by the Clear Status command. Reset type: CM.RESETn
2	ESUSP	R	0h	When set, this bit indicates that the flash module has received and processed an erase suspend operation. This bit remains set until the erase resume command has been issued or until the Clear_More command is run. Reset type: CM.RESETn
1	PSUSP	R	0h	When set, this bit indicates that the flash module has received and processed a program suspend operation. This bit remains set until the program resume command has been issued or until the Clear_More command is run. Reset type: CM.RESETn
0	RESERVED	R	0h	Reserved

13.15.5.7 FRD_INTF_CTRL_LOCK Register (Offset = 17Eh) [Reset = 00000000h]

Complex bit access types are encoded to fit into small table cells. Table 13-45 shows the codes that are used for access types in this section.

Table 13-45. CM_FLASH_ECC_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 13-45. CM_FLASH_ECC_REGS Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

13.15.6.1 ECC_ENABLE Register (Offset = 0h) [Reset = 0000000Ah]

ECC_ENABLE is shown in [Figure 13-41](#) and described in [Table 13-46](#).

Return to the [Summary Table](#).

15-3	RESERVED	R	0h	Reserved
2	UNC_ERR_L_CLR	R-0/W1S	0h	Uncorrectable error clear. Writing a 1 to this bit will clear the UNC_ERR_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: CM.RESETn
1	FAIL_1_L_CLR	R-0/W1S	0h	Fail on 1 clear. Writing a 1 to this bit will clear the FAIL_1_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: CM.RESETn
0	FAIL_0_L_CLR	R-0/W1S	0h	Fail on 0 clear. Writing a 1 to this bit will clear the FAIL_0_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: CM.RESETn

13.15.6.9 ERR_CNT Register (Offset = 10h) [Reset = 00000000h]

ERR_CNT is shown in [Figure 13-49](#) and described in [Table 13-54](#).

Return to the [Summary Table](#).

Error Control

Figure 13-49. ERR_CNT Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ERR_CNT															
R-0h																R/W-0h															

Table 13-54. ERR_CNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-0	ERR_CNT	R/W	0h	Single bit error count. This counter increments with every single bit ECC error occurrence. Upon reaching the threshold value counter stops counting on single bit errors. ERR_CNT can be cleared (irrespective of whether threshold is met or not) using 'Single Err Int Clear' bit. This is applicable for ECC logic test mode and normal operational mode. In ECC logic test mode, ERR_CNT will keep incrementing for every cycle after a single bit error occurrence. So, in order to clear ERR_CNT in ECC logic test mode, ECC logic test mode has to be disabled prior to clearing the ERR_CNT using 'Single Err Int Clear' bit. Reset type: CM.RESETn

13.15.6.10 ERR_THRESHOLD Register (Offset = 12h) [Reset = 00000000h]

ERR_THRESHOLD is shown in [Figure 13-50](#) and described in [Table 13-55](#).

Return to the [Summary Table](#).

Error Threshold

Figure 13-50. ERR_THRESHOLD Register

Chapter 14

Embedded Real-time Analysis and Diagnostic (ERAD)

This chapter describes the features and operation of the embedded real-time analysis and diagnostic (ERAD) module. The ERAD module enhances the debug and system analysis capabilities of the device. The debug and system analysis enhancements provided by the ERAD module are implemented external to the CPU. The ERAD module consists of the enhanced bus comparator (EBC) units, the system event counter (SEC) units, and the cyclic redundancy check (CRC) units. The EBC units are used to generate hardware breakpoints, hardware watch points, and other output events. The SEC units are used to analyze and profile the system. The CRC units monitor CPU buses and compute the CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with the Software Test Library (STL). The ERAD module is accessible both by the debugger and the application software, which significantly increases the debug capabilities of many real-time systems, especially in situations where the debugger is not connected.

14.9 ERAD Registers.....	1621

14.1 Introduction

The ERAD module is shown in [Figure 14-1](#).

The ERAD enhances the debug and system analysis capabilities of the device external to the CPU. The CPU has two analysis resources; Analysis Unit 1 (AU1) and Analysis Unit 2 (AU2). The first analysis unit counts events or monitors address buses. The second analysis unit monitors address and data buses. The two analysis units can be configured for hardware breakpoints or hardware watch points, and additionally the first analysis unit can be configured as a benchmark counter or event counter. The ERAD module further expands this capability to provide additional hardware breakpoints, hardware watch points, and counters for profiling, as well as other advanced features. The ERAD module can be utilized by the debugger, and also by the application software. For many real-time systems, it is not always possible to connect a debugger and perform an intrusive debug. Under these situations, the user's code has the ability to set up and control the ERAD module to debug and profile the system without disturbing the end application.

The ERAD module consists of eight enhanced bus comparator (EBC) units and four system event counter (SEC) units. The EBC units monitor buses and generate output events. The SEC units can be used with EBC units to profile and analyze the system. These units are described in detail in the following sections.

14.2 Enhanced Bus Comparator Unit

The Enhanced Bus Comparator (EBC) units connect to the CPU using a direct memory interface. This includes the program address and data buses, the data address, write and read data buses, debug qualifiers for memory access, and the ability to set breakpoints, watch points, and trace points on the CPU. Typically, the EBC is owned and controlled by the debugger application (for example, Code Composer Studio™ IDE). A user application running on the CPU can also configure and use the EBC units to generate events and interrupts for real-time diagnostic purposes. Note that ownership is exclusive—the debugger and application software cannot simultaneously control an EBC unit. For more information on EBC unit ownership, see [Section 14.4](#).

The EBC units have the following capabilities:

- Generate hardware breakpoints
- Generate hardware watch points
- Generate trace tags for instruction fetch matches and generate real-time interrupts (RTOSINT)
- Monitor data address and read and write buses and generate real-time interrupts (RTOSINT)
- Generate event outputs that can be used by other modules.

The following features are not supported by the EBC units:

- Chained breakpoints
- Ability to monitor DMA transfers
- Ability to monitor CLA buses

Each EBC unit has the capability to monitor a range of addresses by defining masks and generating outputs based on greater than, less than, or equal events.

The EBC units can also be used with the System Event Counter (SEC) units for system or code profiling and analysis purposes.

14.2.1 Enhanced Bus Comparator Unit Operations

The following operations are supported by each EBC unit:

- **Hardware Breakpoints:** The EBC unit generates a breakpoint tag when the specified instruction address is accessed on the program address bus. When the instruction reaches the DECODE-2 (D2) stage of the pipeline, the CPU is halted.
- **Watch Points:** A watch point detects a read or write to specified locations in data memory, and halts the CPU. Unlike hardware breakpoints, watch points do not have precise timing for halting the CPU—this is entirely dependent on the current state of the CPU pipeline. The CPU halts at the next interruptible boundary.
- **Program Trace:** Program traces are very similar to hardware breakpoints. The difference here is that instead of halting the CPU, a program trace generates a real-time interrupt (RTOSINT) when the instruction reaches the D2 stage of the pipeline. If the instruction is discarded in the fetch buffer due to discontinuity, no RTOSINT is generated.
- **Data Trace:** A data trace is similar to a watch point, except that a data trace generates a real-time interrupt (RTOSINT) instead of halting the CPU on an access to the specified data memory.

Note that hardware breakpoints only halt the CPU if a debugger is connected.

14.2.2 Event Masking and Exporting

The events generated by different EBC units can be combined using OR and AND logic to generate new events as required. There are four AND and four OR combinations that can be exported using masks to suppress undesired events. These events can be configured to generate an RTOSINT. In addition, the AND and OR events can also be used to qualify CRC computation using the cyclic redundancy check unit. The AND and OR events are also available as inputs to the system event counter unit for event counting and system profiling.

Figure 14-2. EBC Units Event Masking

To use the AND and OR masks:

1. Configure the `GLBL_EVENT_AND_MASK` and `GLBL_OR_EVENT_MASK` registers to select the desired EBC unit outputs for any of the available four masks.
2. To enable an RTOSINT for the configured mask, write 1 to the corresponding bit in the `GLBL_AND_EVENT_INT_MASK` or `GLBL_OR_EVNT_INT_MASK` register.
3. To use the mask output as an input to the system event counter unit, configure the `CTM_INPUT_SEL` register with the mux value for the desired mask. The input mux values are listed in [Section 14.3.1.4](#).
4. To use the mask output as a qualifier to the CRC unit, configure the `CRC_QUALIFIER` register.

For example, to generate a real-time interrupt on MASK1 when EBC units 2, 3, AND 6 events are triggered, write 0x46 to `GLBL_EVENT_AND_MASK`, and then write 0x1 to `GLBL_AND_EVENT_INT_MSK`.

14.3 System Event Counter Unit

The SEC units provide system profiling, analysis, and debug capability. The SEC units contain counters that can enhance the debug and profiling process in various types of system scenarios such as:

- Profiling code segments
- Counting duration between specified memory reads and writes
- Counting system events (such as interrupts)
- Counting duration between system events
- System timer
- Measuring the number of wait states in code segments
- Measuring the maximum amount of time spent in between a pair of events, measured over multiple iterations
- Chaining counters to link events or create larger counters

Furthermore, the SEC unit has the capability to:

- Function as a counter capable of counting:
 - Any of the match events generated by the EBC units.
 - Events generated by the EBC units. These events can be used to start and stop the counting.
 - System events including the PIE interrupts, timer interrupts, and CLA task interrupts. These system events can be used to start and stop the counting.
 - More information on the input sources for the SEC units can be found in [Section 14.3.1.4](#).
- Generate an interrupt or a watch point if the count reaches a reference value.
- Perform counter operation in one of the following two modes:
 - Duration mode: The counter counts the CPU cycles as long as the event is active.
 - Event mode: The counter counts only the positive edge of the event signal. This is effectively counting the number of times the event transitions from inactive to active.

14.3.1 System Event Counter Modes

The following are the operating modes of the SEC unit. The counters are initialized to zero when the SEC module receives a reset input signal, and always count up.

- Continuous Count: In this mode, the counter continues to count as specified by the input selector. The counter can count the CPU cycles without any events selected. In this mode, the module can be used as a software-controlled SYSCLK counter. Continuous mode is active when CTM_CNTL.START_STOP_MODE and CTM_REF are both set to 0.
- Timer Mode Count: In this mode, the counter counts up to a set reference value, defined in the CTM_REF register. Upon reaching the reference value, the counter generates an event that can send an interrupt to the CPU or generate a watch point. The RST_ON_MATCH bit in the CTM_CNTL register configures the counter to either continue incrementing or reset when a match event occurs.
- Start-Stop Count: In this mode, two events are configured to act as start and stop indicators to the counter. The counter commences counting only when the defined start event occurs. The counter then continues to count up until the stop event occurs. Once the first start event has occurred, further start events are ignored until the stop event occurs.

In any of the counter modes of operation, there is a possibility that the 32-bit counter value overflows. If an overflow occurs, the counter value resets to zero and continues to count up, and the OVERFLOW bit in the CTM_STATUS register is set high. The OVERFLOW bit remains high until either the counter is reset, or the application writes 1 to the OVERFLOW_CLEAR bit of the CTM_CLEAR register.

14.3.1.1 Counting Active Levels Versus Edges

The SEC units can be configured to either count active levels or edges of the selected inputs.

Each SEC unit has eight inputs from the EBC units and many inputs from other events in the device. Each SEC unit can be configured to count any of the input events or just count up on every cycle. For example, if an input event occurs and is active for 25 cycles, the SEC unit counter increments only by 1 in event mode; whereas in the duration mode, the counter increments by 25.

14.3.1.2 Max Mode

Max mode is also supported by the SEC units. This mode allows the user to detect the maximum count that has occurred during various count iterations in start-stop mode. For example, a user can set up the counter in the start-stop count mode to count the duration of a critical code loop. Every time the stop event occurs and the counter stops, the counter value is checked against the current MAX_COUNT present in the register. If the new value is greater, then the MAX_COUNT register is updated. The counter always resets to zero at the stop event and is ready to start counting on the next start event. Therefore, the MAX_COUNT contains the maximum number of cycles that occurred between the start and stop condition over many iterations.

14.3.1.3 Cumulative Mode

The SEC units can be used to yield the cumulative count over several start and stop events. In this mode the, unlike Max mode, the counter does not reset due to a stop event. Instead it stops counting and resumes counting when a start event occurs. In cumulative count mode, the MAX_COUNT is not valid.

14.3.1.4 Input Signal Selection

The SEC inputs can be selected from various signals from in the system to enable debug and system analysis. [Figure 14-3](#) shows the SEC inputs. Each event selector MUX can select from various signals on in the system. These signals are shown in [Table 14-1](#).

14.3.2 Reset on Event

Resetting the counters on external events is also possible. Additionally all the counter event outputs are applied back to each of counter input MUX, which selects the event that can be used as a reset input. When enabled, an active high on the reset input causes the counter to reset. This gives a powerful feature that allows setting up threshold monitors. This can be used to flag an interrupt or a watch point, if the distance between two events crosses a certain threshold.

14.3.3 Operation Conditions

The SEC units count accurately only when the CPU is operating in normal conditions. If the counters are running and capturing the CPU cycles while the CPU is controlled through the debugger to single-step through the code, then the result can differ from when the CPU was executing the code in normal conditions.

Note that if the counters are set up to use the value of the raw program counter register (VPC) as the source for the start and stop events, the value of the CPU cycles measured can be off by a few cycles when the CALL instruction is executed.

14.4 ERAD Ownership, Initialization and Reset

Although the features of the ERAD module are typically used by the debugger, user applications can also take advantage of the capabilities to monitor buses and generate interrupts and events. There are three possible ownership scenarios:

1. The user elects to give ownership of the ERAD module to the application software or the debugger.
2. Both the application code and the debugger share use of the ERAD module. Only the current owner of the module (application code or debugger) is allowed to use the module at a given time. When ownership is shared between application and debugger, the user application has the responsibility of resolving any ownership conflicts.
3. There is no ERAD owner. In this mode, both application code and debugger can access the module at any given time. The software, both on the application side and the debugger side, to resolve any potential conflicts is critical. An example scenario in this mode can be for the debugger to use some of the EBC and SEC units, while the application software uses the remaining units.

The ERAD module initializes the internal states and all registers to the initial/reset states under the following conditions:

- At power-on-reset (POR)
- With DCON and SYSRSN
 - Debug logic disconnected when the debugger owns the module
 - Functional reset when application owns the module

14.5 ERAD Programming Sequence

The ERAD module can be used to set hardware breakpoints and hardware watch points. The programming sequences to set hardware breakpoints, hardware watch points, or to use the timers to profile and analyze the system are described in this section. The same sequences can be used by both the debugger software and user application code.

Refer to the Driverlib example projects in C2000Ware for JavaScript files to configure the ERAD module. Example projects are also available to showcase the usage of these script files. These examples can be found in the driverlib\2838x\examples\c28x\erad directory under the C2000Ware installation directory.

14.5.1 Hardware Breakpoint and Hardware Watch Point Programming Sequence

The programming sequence is identical when using the EBC units, regardless of whether the debug software or the application is programming the units. A typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected; if not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the address reference, mask, bus select and stop bits.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the EVENT_FIRED sticky bit. This takes the module back to the enabled state.

The example programming sequences for hardware breakpoints and hardware watch points are:

Set a hardware breakpoint on address 0x201000:

- Read GLBL_OWNER to confirm ownership.
- Read HWBP_STATUS to confirm the module is in IDLE state.
- Write 0x0 to HWBP_MASK.
- Write 0x201000 to HWBP_REF.
- Set HWBP_CNTL.STOP = 1 and HWBP_CNTL.BUS_SEL = 0000 (PAB). If a trace is to be generated instead of a breakpoint, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on read of addresses from 0x121010 to 0x12101F:

- Read GLBL_OWNER to confirm ownership.
- Read HWBP_STATUS to confirm the module is in IDLE state.
- Write 0xF to HWBP_MASK.
- Write 0x121010 to HWBP_REF.
- Write HWBP_CNTL.STOP = 1 and HWBP_CNTL.BUS_SEL = 0011 (DRAB). If an RTOSINTn is to be generated instead of a watch point, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on write to address 0xFF10101A:

- Read GLBL_OWNER to confirm ownership
- Read HWBP_STATUS to confirm the module is in IDLE state
- Write 0x0 to HWBP_MASK
- Write 0xFF10101A to HWBP_REF
- Write HWBP_CNTL.STOP = 1, HWBP_CNTL.BUS_SEL = 0010 (DWAB). If an RTOSINTn is to be generated instead of a watch point, set HWBP_CNTL.STOP = 0.
- Enable the corresponding module bit in the global enable register.

14.5.2 Timer and Counter Programming Sequence

The programming sequence is identical when using the SEC units, regardless of whether the debug software or the application is programming the units. Typical programming sequence for a unit is:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further if required.
- Make sure the unit is in IDLE mode.
- Set up the counter reference, counter registers (clear/reset if a clean start is required) and CTM_CNTL.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write 1 to clear the EVENT_FIRED sticky bit. This takes the module back to the enabled state.

Set up a free running counter:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Write 0x0 to CTM_INPUT_SEL.
- Write 0x0 to CTM_CNTL.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the duration spent between addresses 0x1000 and 0x1210:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x1000.
- Set up the EBC unit 2 to generate an event for VPC = 0x1210.
- Set up the start and stop input selects to use comparator event 1 and 2, respectively. This is achieved by writing CTM_INPUT_SEL.STA_INP_SEL = 0x0 and CTM_INPUT_SEL_2.STO_INP_SEL = 0x1.
- Enable the counter in the START_STOP_MODE of operation. This is achieved by writing CTM_CNTL.START_STOP_MODE = 1.
- Enable the module in the GLBL_ENABLE register.

Set up the counter to count the number of times a function at address 0x2010 is called and fire an RTOSINT if this count reaches 0x300:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x2010.
- Setup the counter to select comparator event 1 as the event to count. This is achieved by writing CTM_INPUT_SEL.CNT_INP_SEL = 0 and CTM_CNTL.CNT_INP_SEL_EN = 1.
- Write 0x300 CTM_REF.
- Enable the counter in the EVENT_MODE, and also allow the counter to generate an RTOSINT when the count matches the reference. This is achieved by writing 0x88 to CTM_CNTL (bit 3 = 1 and bit 7 = 1).
- Enable the module in the GLBL_ENABLE register.

14.6 Cyclic Redundancy Check Unit

The cyclic redundancy check (CRC) units monitor CPU buses and compute CRC when the self-test code is executed. This capability aids in achieving simpler, non-intrusive and interruptible self-test mechanisms with Software Test Library (STL). Each CRC unit is used to monitor a different CPU interface. For example, CRC unit 1 is used to monitor the Program Counter, while CRC unit 2 is used to monitor the data read address bus. [Table 14-2](#) identifies the CPU interface monitored by each of the CRC units.

Table 14-2. CPU Interfaces Monitored by CRC Units

CRC Unit	CPU Interface
CRC Unit 1	Program Counter Register
CRC Unit 2	Data Read Address Bus
CRC Unit 3	Data Read Data Bus
CRC Unit 4	Data Write Address Bus
CRC Unit 5	Data Write Data Bus
CRC Unit 6	Instruction Register Value (Unsecured)
CRC Unit 7	Instruction Register Value (Secure-Zone 1)
CRC Unit 8	Instruction Register Value (Secure-Zone 2)

The main purpose of the CRC units is to make sure that the CPU functionally remains intact when the CRC unit is executing the same software test library over multiple iterations. This is done by comparing the computed CRC values after each iteration, with a pre-computed golden value.

CRC units 7 and 8 are intended to compute the instruction register values for secure-zone 1 and secure-zone 2 instruction execution. Computed CRC values for the a given secure-zone is available only for accesses originating from that zone.

14.6.1 CRC Unit Qualifier

By default, all the valid events on a given interface enables a CRC unit for computation. However there are optional qualifiers that can be used to gate the CRC computation when valid events occur. If required, these qualifiers can be generated by masking the EBC units events. The AND/OR masks discussed in [Section 14.2.2](#) are used to generate these qualifiers. Refer to the CRC_QUALIFIER register for a full list of available qualifiers. [Figure 14-4](#) shows the connection between EBC event masking and exporting with the CRC qualifiers.

EBC units have the capability to monitor the Program Counter, data writes and data reads. CRC units can use the EBC units to decide when the check values can be calculated. For example, if required to calculate the check values only when the CPU is executing a specific function, the user can set up an EBC unit to monitor the PC and generate a CRC qualifier when that function is executed. This allows the CRC unit to calculated the check value only when desired.

Figure 14-4. Event Masking and Exporting for CRC Qualifiers

14.6.2 CRC Unit Programming Sequence

The following sequence can be used to initialize a CRC unit to calculate the check value for the corresponding CPU interface.

1. Initialize the CRC unit by writing a 1 to the corresponding CRC_INIT field in the CRC_GLOBAL_CTRL register.
2. Configure the seed value (if required) using CRC_SEED register (CRC_EN can be 0 for when modifying the CRC_SEED register).
3. Configure the CRC_QUALIFIER register if additional qualification from EBC units is required; If not additional qualification is not required, set the CRC_QUALIFIER register to 0.
4. Enable the CRC unit by setting the CRC_EN to 1 at the beginning of the software for which the CRC calculation is done.
5. Disable the CRC unit by setting the CRC_EN to 0 at the end of the software for which the CRC calculation is done.
6. Read the CRC_CURRENT register to record the computed CRC. This check value can be compared with previous check values to make sure no changes have occurred.
7. Repeat steps 1-7 periodically as needed.

Note

Sufficient NOP's must be added immediately after the CRC submodule is enabled to make sure the pipeline contains predictable code as soon as the CRC is enabled. Similarly, sufficient NOP's must be added before the CRC submodule is disabled. Disabling the CRC write access takes a few cycles, therefore there must be predictable code in the pipeline stages until the write takes place.

14.7 Program Counter Trace

The Program Counter (PC) Trace module can be used to keep track of PC discontinuities or jumps, as a means to trace an entire program execution sequence over a period of time. When trace is completed or stopped, trace data can be read out using a debugger and analyzed to reconstruct the code execution sequence. The PC Trace module provides multiple modes and controls to govern when to trace and when not to trace. The trace module is tightly coupled with the Enhanced Bus Comparator, the System Event Counter Unit, and certain critical system level event signals.

Trace data is stored in an addressable memory buffer that can be read by software or a debugger. The trace data stored in this buffer includes additional status information on trace validity that can be used to correctly reconstruct the code execution system. For each discontinuity, two PC values are stored: the source of the discontinuity, and the destination. [Figure 14-5](#) illustrates the operation of the PC trace module. The trace buffer is a circular buffer with overflow: when the buffer becomes full, new trace data is written starting from the top of the buffer, and an overflow status bit is set.

Figure 14-5. PC Trace Operation

14.7.1 Functional Block Diagram

Figure 14-6 describes the device PC trace architecture. The trace module is tightly coupled with the CPU, and receives the current program counter (VPC), program address (PAB), and various qualifying signals from the CPU interface. The Trace core captures these values whenever a PC discontinuity (for example, branch operation) is detected. The DCSM also interfaces with the PC Trace module, providing security zone data to prevent unauthorized trace information from being exposed in trace memory. The PC Trace module interfaces with the Enhanced Bus Comparator Unit and System Event Counter Unit, providing the ability to select events from these units as triggers to start a trace, stop a trace, or determine the bounding conditions for a windowed trace operation.

The Trace Core qualifies trace source and destination addresses, and stores these addresses sequentially in the trace memory buffer. Additionally, the Trace Core can generate hit events every time a new trace is stored in the memory buffer; this event signal is connected to the ERAD counter block so that the number of entries in the buffer can be tracked. This counter value can in turn be used to create a STOP event at a predefined threshold.

Note

Discontinuities that arise due to block repeats (RPTB instruction blocks) are not captured by the PC trace module.

Debugger accesses are always treated as unsecure accesses. Unlike other ERAD components, there is no concept of debug or application ownership in the PC Trace module.

The Trace Core generates a trace hit event for a discontinuity arising from a speculative instruction fetch, even if the fetched instruction does not reach the execution phase in the CPU pipeline. As a result, the BUFFER_FULL signal can be set prematurely due to a speculative prefetch. The user can always safely discard the oldest discontinuity pair present in the memory buffer when a full buffer is detected, to mitigate this scenario.

Figure 14-6. PC Trace Block Diagram

14.7.2 Trace Qualification Modes

There are three modes of trace qualification available:

1. Normal mode: In this mode, trace is enabled without any qualifiers. Trace control happens purely through software writing to the PCTRACE_GLOBAL register. When operating PC Trace in normal mode, The PCTRACE_LOGPC_SOFTENABLE captures the program counter value at the point when PCTRACE_GLOBAL.EN is set to 1, and the PCTRACE_LOGPC_SOFTDISABLE register captures the program counter value at the point PCTRACE_GLOBAL.EN is set to 0.
2. Windowed Trace mode: In windowed mode, PC Trace can be activated or stopped based on the value of a signal coming from the Event Bus Comparator, System Event Counter, or other system events. The WINDOWED_INP_SEL field in the PCTRACE_QUAL1 register specifies the input signal used to qualify PC Trace operation in windowed mode. By default trace is active when the input signal is high and inactive when the input signal is low; this behavior can be reversed by setting the PCTRACE_QUAL1.WINDOWED_INP_INV bit high.
3. Start-Stop mode: In this mode, one input signal starts the PC trace operation, and a different input signal stops the trace operation. Event Bus Comparator signals, System Event Counter signals and other system event signals can be used as inputs to start or stop the PC Trace. The START_INP_SEL and STOP_INP_SEL fields in the PCTRACE_QUAL2 register specify the input signals used to qualify PC Trace operation in start-stop mode. Once a start event arrives and PC trace operation begins, the PC Trace module ignores all further start events until a stop event is received. Trace start and stop operations are triggered on the rising edge of the input event; this behavior can be reversed by setting the START_INP_INV and STOP_INP_INV bits in the PCTRACE_QUAL1 register.

To set the PC Trace operation mode, write to the TRACE_MODE bit in the PCTRACE_QUAL1 register.

14.7.3 Trace Memory

PC Trace memory is a 32-bit-wide read-only memory buffer that holds each 22-bit PC value, together with a security BLOCKED status bit. The memory-map section of the device data sheet specifies the size of the PC Trace memory buffer. Trace memory entries are stored in pairs: the discontinuity source and destination addresses. [Table 14-3](#) describes the bit field structure of each trace memory entry.

Table 14-3. Trace Memory Entry Bit Fields

Bits	Field Name	Description
21:0	PROGRAM_COUNTER	Program counter source or destination address value where discontinuity occurred
22	BLOCKED	1 = PROGRAM_COUNTER[21:0] is invalid due to security permissions 0 = PROGRAM_COUNTER[21:0] is valid
31:23	RESERVED	Reserved

Note

For addresses that are blocked due to security zone restrictions, the PROGRAM_COUNTER value is set to 0.

Trace memory is intended solely for debug purposes and does not have parity or Error Correction Code (ECC) support.

14.7.4 Trace Input Signal Conditioning

The PC Trace module provides input conditioning options for signals that are used to qualify operation in Start-Stop or Windowed modes. For each of these (START, STOP, WINDOWED), there is a two-stage synchronizer for asynchronous input signals, and an inverter. The PC Trace input conditioning options are controllable using the PCTRACE_QUAL1 register with the following bits:

- **WINDOWED_INP_INV:** This bit inverts the input signal for Windowed trace mode selected in WINDOWED_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input, and stops on the rising edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input, and stops on the falling edge of the input.
- **WINDOWED_INP_SYNC:** This bit passes the input signal selected in WINDOWED_INP_SEL through a two-stage synchronizer.
- **START_INP_INV:** This bit inverts the input signal for trace START operation selected in PCTRACE_QUAL2.START_INP_SEL. When set to 1, the trace operation starts on the falling edge of the input. When this bit is set to 0, the trace operation starts on the rising edge of the input.
- **START_INP_SYNC:** This bit passes the input signal selected in PCTRACE_QUAL2.START_INP_SEL through a two-stage synchronizer.
- **STOP_INP_INV:** This bit inverts the input signal for trace STOP operation selected in PCTRACE_QUAL2.STOP_INP_SEL. When set to 1, the trace operation stops on the falling edge of the input. When this bit is set to 0, the trace operation stops on the rising edge of the input.
- **STOP_INP_SYNC:** This bit passes the input signal selected in PCTRACE_QUAL2.STOP_INP_SEL through a two-stage synchronizer.

Figure 14-7 describes the signal conditioning circuit available for each input qualifier signal.

Figure 14-7. Trace Qualifier Input Conditioning Circuit

14.7.5 PC Trace Software Operation

An example software sequence to perform PC Trace operation is as follows:

1. Initialize the PC Trace module by writing 1 to PCTRACE_GLOBAL.INIT. The trace initialize operation resets the buffer pointer and overflow flags, and clears the values of the PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers.
2. Start the PC Trace operation by writing 1 to PCTRACE_GLOBAL.EN.
3. Execute the desired code sequence to be profiled.
4. Stop the PC Trace operation by writing 0 to PCTRACE_GLOBAL.EN. This step is optional, as the PC Trace buffer can be read while trace operation is active.
5. To determine if there are valid entries in the trace buffer and how many:
 - a. Examine the buffer pointer by reading PCTRACE_BUFFER.PTR. If the pointer value is 0, then no discontinuities have been detected since PC Trace was initialized. A non-zero value indicates the number of locations in the buffer that contain valid entries. For instance, PTR=4 indicates that locations 0, 1, 2 and 3 contain valid entries (SRC, DST, SRC, DST).
 - b. Examine the BUFFER_FULL bit in the PCTRACE_BUFFER register. If BUFFER_FULL=1, then the following possibilities apply:
 - If PTR = 0, then the buffer is simply full and contains the maximum number of entries possible.
 - If PTR > 0, then a buffer overflow has occurred. The value of PTR indicates by how many entries the buffer has overflowed: this is a circular buffer.
6. Read PCTRACE_LOGPC_SOFTENABLE (and optionally PCTRACE_LOGPC_SOFTDISABLE) if needed to determine the bounding addresses of the trace operation, in case the code sequence being traced does not begin or end at a discontinuity boundary (for example, partial function trace).
7. Trace discontinuities are recorded in the trace buffer in pairs (SRC, DST). Use this data to reconstruct the code execution sequence. While reading the trace buffer, be sure to examine the BLOCKED status bit to confirm the validity of each trace entry.

14.7.6 Trace Operation in Debug Mode

PC Trace is designed to capture data while the CPU is executing code. Debugger operations such as halt, step, and manual PC modification can compromise the reliability of PC trace data collection. Only use or interpret PC Trace data in the context of a continuous CPU run without debugger interruption or intervention.

CPU execution does not preclude debugger operation of the PC trace module. While the CPU is running and executing code, the debugger can read and write PC Trace registers, read the trace buffer, and enable or disable PC trace operation. The PCTRACE_LOGPC_SOFTENABLE and PCTRACE_LOGPC_SOFTDISABLE registers record the start and stop PC addresses to provide accurate trace window information during manual trace starts or stops triggered by writing to the PCTRACE_GLOBAL.EN bit.

14.8 Software

14.8.1 ERAD Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/erad

Cloud access to these examples is available at the following link: dev.ti.com [C2000Ware Examples](#).

14.8.1.1 ERAD Profiling Interrupts

FILE: erad_ex1_profileinterrupts.c

This example configures CPU Timer0, 1, and 2 to be profiled using the ERAD module. Included is a JavaScript file, `profile_interrupts.js`, which is used with the scripting console to program ERAD registers and view profiling data.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- `var PROJ_NAME = "erad_debugger_ex1_profileinterrupts"`
- `var PROJ_WKSPC_LOC = "<proj_workspace_path>"`
- `var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"`

To run the ERAD script, use the following command in the scripting console:

- `loadJSFile("<proj_workspace_path>\\\erad_debugger_ex1_profileinterrupts\\erad_ex1_profile_interrupts.js", 0);`

The included JavaScript file, `erad_ex1_profile_interrupts.js`, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

Note that the script must be run after loading and running the .out on the C28x core. Only CPU timer 2 ISR is profiled in this example.

This example uses 2 HW breakpoints and 4 counters:

- **HWBP_1** : PC = start address of `cpuTimer2ISR`
- **HWBP_2** : PC = end address of `cpuTimer2ISR`
- **CTM_1** : Used to count the `cpuTimer2ISR` execution cycles. Configured in start-stop mode with start event as **HWBP_1** and stop event as **HWBP_2**
- **CTM_2** : Used to count the number of times the system event **TIMER2_TINT2** has occurred. Configured in rising-edge count mode with counting input as system event **TIMER2_TINT2** (**INP_SEL[25]**)
- **CTM_3** : Used to count the number of times `cpuTimer2ISR` executes. Configured in rising-edge count mode with counting input as **HWBP_1** (**INP_SEL[0]**)
- **CTM_4** : Used to count the latency from the system event **TIMER2_TINT2** to `cpuTimer2ISR` entry. Configured in start-stop mode with start event as **TIMER2_TINT2** and stop event as **HWBP_1**

External Connections

- None

Watch Variables

- `cpuTimer0IntCount`
- `cpuTimer1IntCount`
- `cpuTimer2IntCount`

Profiling Script Output

- Current ISR cycle count (**CTM_1**)
- Max ISR cycle count (maximum value of **CTM_1**)
- Interrupt occurrence count (**CTM_2**)
- ISR execution count (**CTM_3**)

- ISR entry delay cycle count (maximum value of CTM_4)

Note that the large difference between Interrupt occurrence count (CTM_2) and ISR execution count (CTM_3) is because the ISR takes more number of cycles than the actual interrupt period. ISR entry delay cycle count will also be higher due to the same reason.

14.8.1.2 ERAD Profile Function

FILE: erad_ex1_profile_function.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections

None

14.8.1.3 ERAD Profile Function

FILE: erad_ex1_profile_function_syscfg.c

This example uses BUSCOMP1, BUSCOMP2 and COUNTER1 of the ERAD module to profile a function (delayFunction). It calculates the CPU cycles taken between the the start address of the function to the end address of the function

Two dummy variable are written to inside the function - startCount and endCount. BUSCOMP3, BUSCOMP4 and COUNTER2 are used to profile the time taken between the access to startCount variable till the access to endCount variable.

Both the counters are setup to operate in START-STOP mode and count the number of CPU cycles spend between the respective bus comparator events.

Watch Variables

- cycles_Function - the maximum number of cycles between the start of function to the end of function
- cycles_Data - the maximum number of cycles taken between accessing startCount variable to endCount variable

External Connections

None

14.8.1.4 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

14.8.1.5 ERAD HWBP Monitor Program Counter

FILE: erad_ex2_bus_monitor_syscfg.c

In this example, the function delayFunction is called multiple times. The function does read and writes to the global variables startCount and endCount.

The BUSCOMP1 and COUNTER1 is used to count the number of times the function delayFunction was invoked. BUSCOMP2 is used to generate an interrupt when there is read access to the startCount variable and BUSCOMP3 is used to generate an interrupt when there is a write access to the endCount variable

Watch Variables

- funcCount - number of times the function delayFunction was invoked
- isrCount - number of times the ISR was invoked

External Connections

- None

14.8.1.6 ERAD Profile Function

FILE: erad_ex2_profilefunction.c

This example contains a basic FIR calculation and sorting algorithm to help demonstrate the function profiling capability of the ERAD peripheral. A number of FIR sums are calculated within a loop and are then sorted using the insertion sort algorithm. Cycle counts of both the FIR calculations and the sorting algorithm are output to the screen through the scripting console. In this example, it can be seen that sorting the data takes up a majority of the CPU cycles executed in this program.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex2_profilefunction"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\\\erad_debugger_ex2_profilefunction\\erad_ex2_profile_function.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex2_profile_function.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 4 HW breakpoints and 2 counters:

- HWBP_1 : PC = start address of performFIR
- HWBP_2 : PC = end address of performFIR
- HWBP_3 : PC = start address of sortMax
- HWBP_4 : PC = end address of sortMax
- CTM_1 : Used to count the performFIR execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the sortMax execution cycles. Configured in start-stop mode with start event as HWBP_3 and stop event as HWBP_4

External Connections

- None.

Watch Variables

- FIR_iterationCounter - A counter for the number of times FIR calculation and sorting was performed

Profiling Script Output

- Current FIR cycle count (CTM_1)
- Max FIR cycle count (maximum value of CTM_1)
- Current sorting function cycle count (CTM_2)
- Max sorting function cycle count (maximum value of CTM_2)

Note that the the counters are reset after the stop event. The counter value remains 0 till the next start event occurs. The javascript continuously reads the counter value in a while(1) and hence the current counter may return 0.

14.8.1.7 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections

None

14.8.1.8 ERAD HWBP Stack Overflow Detection

FILE: erad_ex3_stack_overflow_detect_syscfg.c

This example uses BUSCOMP1 to monitor the stack. The Bus comparator is set to monitor the data write access bus and generate an RTOS interrupt CPU when a write is detected to end of the STACK within a threshold.

Watch Variables

- functionCallCount - the number of times the recursive function overflowing the STACK is called.
- x indicates that the ISR has been entered

External Connections

None

14.8.1.9 ERAD Stack Overflow

FILE: erad_ex3_stackoverflow.c

This example shows the basic setup of CAN in order to transmit and receive messages on the CAN bus. The CAN peripheral is configured to transmit messages with a specific CAN ID. A message is then transmitted once per second, using a simple delay loop for timing. The message that is sent is a 2 byte message that contains an incrementing pattern.

This example sets up the CAN controller in External Loopback test mode. Data transmitted is visible on the CANTXA pin and is received internally back to the CAN Core.

A buffer is created to store message history up to 50 messages for the duration of the program. A logic error is intentionally made to allow the buffer to overflow, eventually causing a stack overflow. The included JavaScript file, stack_overflow.js, programs ERAD registers in order to detect the stack overflow and halt the CPU once the illegal write is made. The illegal write is made after 507 messages are received.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex3_stackoverflow"
- var PROJ_WKSPC_LOC = <proj_workspace_path>

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\lerad_debugger_ex3_stackoverflow\lerad_ex3_stack_overflow.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex3_stack_overflow.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 1 HW watchpoint :

- HWBP_1 : Data Write Address Bus = Stack end address + 1

External Connections

- None.

Watch Variables

- msgCount - A counter for the number of successful messages received
- txMsgData - An array with the data being sent
- rxMsgData - An array with the data that was received
- msgHistoryBuff - An array meant to store the last 50 messages received

Profiling Script Output

- "STACK OVERFLOW detected. Halting CPU." will be printed in the scripting console when a stack overflow occurs (that is, when the watchpoint is hit)

14.8.1.10 ERAD Profile Interrupts CLA

FILE: erad_ex4_profileinterrupts_cla.c

This example configures EPWM1A to run at 1 KHz (period = 1 ms) to trigger a start-of-conversion on ADC channel A0. This channel will, in turn, sample EPWM4A which is set to run at 100Hz. At the end-of-conversion the ADC interrupt is fired. The interrupt signal will be used to trigger a CLA task that runs an FIR filter. The filter is designed to be low pass with a cutoff frequency of 100Hz; it will remove the odd harmonics in the input signal smoothing the square wave to a sinusoidal shape. The CLA background task will continuously buffer the filtered output in a circular buffer.

This example also utilizes the ERAD peripheral to profile the Interrupt Service Routine (ISR) cla1ISR1 (on the C28x core). The ISR contains a loop that simulates storing a random amount of data to a location in order to introduce variability into the cycle measurements. The ERAD peripheral is also configured to count the number of times the system event CLA_INTERRUPT1 occurs.

To properly use the provided ERAD script, the following variables must be set in the scripting environment prior to launching the ERAD script:

- var PROJ_NAME = "erad_debugger_ex4_profileinterrupts_cla"
- var PROJ_WKSPC_LOC = "<proj_workspace_path>"
- var PROJ_CONFIG = "<name of active configuration [CPU1_FLASH|CPU1_RAM]>"

To run the ERAD script, use the following command in the scripting console:

- loadJSFile("<proj_workspace_path>\lerad_debugger_ex4_profileinterrupts_cla\lerad_ex4_profile_interrupts_cla.js", 0);

Note that the script must be run after loading and running the .out on the C28x core.

The included JavaScript file, erad_ex4_profile_interrupts_cla.js, uses Debug Server Scripting (DSS) features. For information on using the DSS, please visit: http://software-dl.ti.com/ccs/esd/documents/users_guide/sdto_dss_handbook.html

This example uses 4 HW breakpoints and 2 counters:

- HWBP_1 : PC = start address of cla1Isr1
- HWBP_2 : PC = end address of cla1Isr1
- CTM_1 : Used to count the cla1Isr1 execution cycles. Configured in start-stop mode with start event as HWBP_1 and stop event as HWBP_2
- CTM_2 : Used to count the number of times the system event CLA_INTERRUPT1 event has occurred. Configured in rising-edge count mode with counting input as system event CLA_INTERRUPT1 (INP_SEL[26])

External Connections

- connect A0 to EPWM4A

Watch Variables

- ISR_count - A counter that signifies how many times cla1ISR1 executes

Profiling Script Output

- Current ISR cycle count (CTM_1)
- Max ISR cycle count (maximum value of CTM_1)
- Interrupt occurrence count (CTM_2)

14.8.1.11 ERAD Profiling Interrupts

FILE: erad_ex4_profile_interrupt.c

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:

- BUSCOMP_1 : PC = start address of cpuTimer1ISR
- BUSCOMP_2 : PC = address of cpuTimer1IntCount variable access. This specifies the end address of the code of interest.
- COUNTER_1 : Used to count the cpuTimer1ISR execution cycles. Configured in start-stop mode with start event as BUSCOMP_1 and stop event as BUSCOMP_2
- COUNTER_2 : Used to count the number of times the system event TIMER1_TINT1 has occurred. Configured in rising-edge count mode with counting input as system event TIMER1_TINT1
- COUNTER_3 : Used to count the number of times cputimer2ISR executes. Configured in rising-edge count mode with counting input as BUSCOMP_1
- COUNTER_4 : Used to count the latency from the system event TIMER1_TINT1 to cpuTimer1ISR entry. Configured in start-stop mode with start event as TIMER1_TINT1 and stop event as BUSCOMP_1

We configure the COUNTER1 to generate an interrupt once it reaches a threshold value.

External Connections

- None

Profiling Output

- Current ISR cycle count (COUNTER_1)
- Interrupt occurrence count (COUNTER_2)
- ISR execution count (COUNTER_3)
- ISR entry delay cycle count (maximum value of COUNTER_4)
- x - To show that the ISR executed

14.8.1.12 ERAD Profiling Interrupts

FILE: erad_ex4_profile_interrupt_syscfg.c

This example shows how an ISR can be profiled by ERAD. The CPU timer generates interrupts periodically. We set up the counters to count the CPU cycles elapsed while executing the ISR, to count the number of interrupts, the number of ISR executions and the CPU cycles elapsed between the interrupt and the execution of the ISR.

This example uses 2 bus comparators and 4 counters:

- BUSCOMP_1 : PC = start address of cpuTimer1ISR
- BUSCOMP_2 : PC = address of cpuTimer1IntCount variable access. This specifies the end address of the code of interest.
- COUNTER_1 : Used to count the cpuTimer1ISR execution cycles. Configured in start-stop mode with start event as BUSCOMP_1 and stop event as BUSCOMP_2
- COUNTER_2 : Used to count the number of times the system event TIMER1_TINT1 has occurred. Configured in rising-edge count mode with counting input as system event TIMER1_TINT1
- COUNTER_3 : Used to count the number of times cputimer2ISR executes. Configured in rising-edge count mode with counting input as BUSCOMP_1
- COUNTER_4 : Used to count the latency from the system event TIMER1_TINT1 to cpuTimer1ISR entry. Configured in start-stop mode with start event as TIMER1_TINT1 and stop event as BUSCOMP_1

We configure the COUNTER1 to generate an interrupt once it reaches a threshold value.

External Connections

- None

Profiling Output

- Current ISR cycle count (COUNTER_1)
- Interrupt occurrence count (COUNTER_2)
- ISR execution count (COUNTER_3)
- ISR entry delay cycle count (maximum value of COUNTER_4)
- x - To show that the ISR executed

14.8.1.13 ERAD MEMORY ACCESS RESTRICT

FILE: erad_ex5_restricted_write_detect.c

This example uses BUSCOMP1 to monitor the Data Write Address Bus. It monitors the bus and generates an RTOS interrupt if a certain region of memory is accessed by the PC. The user may disable the Bus Comparator to access that region.

Use the COM port (Baud=9600) to try to write to the restricted area.

Watch Variables

- x : stores the number of times the region of memory is accessed

External Connections

- None

14.8.1.14 ERAD INTERRUPT ORDER

FILE: erad_ex6_interrupt_order.c

This example uses a COUNTER to monitor the sequence of ISRs executed. An interrupt is generated if the ISRs executed are not in the expected order. The expected order is CPUTimer0, then CPUTimer1 and then CPUTimer2

The counter is configured in Start-Stop Mode to count the number of times CPUTimer interrupt occurs between the CPUTimer1 interrupt and CPUTimer2 ISRs. Ideally, this count should be zero if the interrupts are occurring in the expected order. we configure a threshold value of 1 to generate an RTOS interrupt. This indicates that the CPUTimer2 interrupt has come out of order.

For demonstration purposes, this example disables CPUTimer1 to simulate this error.

Watch Variables

- cpuTimer0IntCount: Number of executions of ISR0
- cpuTimer1IntCount: Number of executions of ISR1
- cpuTimer2IntCount: Number of executions of ISR2

External Connections

- None

14.8.1.15 ERAD AND CLB

FILE: erad_ex7_reg_write_clb.c

This example uses 4 BUS COMPARATORS of ERAD along with the CLB. One bus comparator monitors a write to x, another one monitors a write to y. The other two monitor a write of 0x1 and 0x0. By using the LUTs in the CLB1 tile, we can monitor a write of 0x1 to x or 0x0 to x. These are used to change the state of FSM2 in the CLB1 tile. If y is accessed before writing a 0x1 to x, an interrupt is generated and y is changed to 0x0 again. The LED2 indicates when access to y is allowed(it is off at this point) The LED1 indicates if an invalid access is attempted. A COUNTER in ERAD is used to count the number of access attempts to y.

Watch Variables

- y
- x
- a - counts the number of access attempts to y

External Connections

None

14.8.1.16 ERAD PWM PROTECTION

FILE: erad_ex8_pwm_protection.c

This example uses a BUS COMPARATOR and the CLB to detect the event when the delay between the interrupt and the ISR execution is longer than expected. The PWM output is also tripped in this case.

Watch Variables

- adcAResults stores the results of the conversions from the ADC

External Connections

- Monitor the PWM output (GPIO0)

14.9 ERAD Registers

This section describes the Embedded Real-Time Analysis and Diagnostic Registers.

14.9.1 ERAD Base Address Table (C28)

Table 14-4. ERAD Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected

14.9.2 ERAD_GLOBAL_REGS Registers

Table 14-5 lists the memory-mapped registers for the ERAD_GLOBAL_REGS registers. All register offset addresses not listed in Table 14-5 should be considered as reserved locations and the register contents should not be modified.

Table 14-5. ERAD_GLOBAL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GLBL_EVENT_STAT	Global Event Status Register		Go
2h	GLBL_HALT_STAT	Global Halt Status Register		Go
4h	GLBL_ENABLE	Global Enable Register	EALLOW	Go
6h	GLBL_CTM_RESET	Global Counter Reset	EALLOW	Go
8h	GLBL_NMI_CTL	Global Debug NMI control	EALLOW	Go
Ah	GLBL_OWNER	Global Ownership	EALLOW	Go
Ch	GLBL_EVENT_AND_MASK	Global Bus Comparator Event AND Mask Register	EALLOW	Go
Eh	GLBL_EVENT_OR_MASK	Global Bus Comparator Event OR Mask Register	EALLOW	Go
10h	GLBL_AND_EVENT_INT_MASK	Global AND Event Interrupt Mask Register	EALLOW	Go
12h	GLBL_OR_EVENT_INT_MASK	Global OR Event Interrupt Mask Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 14-6 shows the codes that are used for access types in this section.

Table 14-6. ERAD_GLOBAL_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write

-n		Value after reset or the default value

14.9.2.1 GLBL_EVENT_STAT Register (Offset = 0h) [Reset = 0000h]

GLBL_EVENT_STAT is shown in [Figure 14-8](#) and described in [Table 14-7](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT_FIRED bit of the corresponding module. This facilitates software to just read one register and find out if any of the debug modules had fired.

14.9.2.2 GLBL_HALT_STAT Register (Offset = 2h) [Reset = 0000h]

GLBL_HALT_STAT is shown in [Figure 14-9](#) and described in [Table 14-8](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT_FIRED status bit. This facilitates software to just read one register and find out if any of the debug modules have fired.

14.9.2.3 GLBL_ENABLE Register (Offset = 4h) [Reset = 0000h]

GLBL_ENABLE is shown in [Figure 14-10](#) and described in [Table 14-9](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly acts as a global enable for the corresponding module. This bit has to be set to 1 for the module to be functional.

14.9.2.4 GLBL_CTM_RESET Register (Offset = 6h) [Reset = 0000h]

GLBL_CTM_RESET is shown in [Figure 14-11](#) and described in [Table 14-10](#).

Return to the [Summary Table](#).

This register contains one bit for each of the counter modules that are present in a device. Each bit directly acts as a reset for the counters for the corresponding module. (It does not affect anything else except resetting the counter.

Example: If the counter was previously incrementing before reset, then on a reset event the counter gets reset and continues to increment again).

14.9.2.5 GLBL_NMI_CTL Register (Offset = 8h) [Reset = 0000h]

GLBL_NMI_CTL is shown in [Figure 14-12](#) and described in [Table 14-11](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that can cause an NMI to the CPU. When the corresponding bit of a unit is set to 1, then if an event occurs from that module, then an NMI will be generated.

14.9.3 ERAD_HWBP_REGS Registers

Table 14-17 lists the memory-mapped registers for the ERAD_HWBP_REGS registers. All register offset addresses not listed in Table 14-17 should be considered as reserved locations and the register contents should not be modified.

Table 14-17. ERAD_HWBP_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	HWBP_MASK	HWBP (EBC) Mask Register	EALLOW	Go
2h	HWBP_REF	HWBP (EBC) Reference Register	EALLOW	Go
4h	HWBP_CLEAR	HWBP (EBC) Clear Register	EALLOW	Go
6h	HWBP_CNTL	HWBP (EBC) Control Register	EALLOW	Go
7h	HWBP_STATUS	HWBP (EBC) Status Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 14-18 shows the codes that are used for access types in this section.

Table 14-18. ERAD_HWBP_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

14.9.3.1 HWBP_MASK Register (Offset = 0h) [Reset = 00000000h]

HWBP_MASK is shown in [Figure 14-18](#) and described in [Table 14-19](#).

Return to the [Summary Table](#).

HWBP (EBC) Mask Register

Table 14-22. HWBP_CNTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-12	RESERVED	R	0h	Reserved
11	RESERVED	R/W	0h	Reserved
10	RESERVED	R	0h	Reserved
9-7	COMP_MODE	R/W	0h	Enhanced Bus Comparator (EBC) compare modes: 000 Regular masked compare HWBP_MSK will be ignored for the following modes: 100 Bus value GT HWBP_REF 101 Bus value GE HWBP_REF 110 Bus value LT HWBP_REF 111 Bus value LE HWBP_REF GT means Greater Than GE means Greater or Equal LT means Less Than LE means Lesser or Equal Reset type: ERAD_RESET
6	RTOSINT	R/W	0h	This bit decides whether the Enhanced Bus Comparator (EBC) unit will generate RTOSINTn interrupt when event matches occur. Note that the event outputs will always be generated regardless of the state of this bit. 0 The Enhanced Bus Comparator (EBC) unit will not cause any action towards the CPU. 1 The Enhanced Bus Comparator (EBC) unit will assert RTOSINTn for matching data accesses and trace tags for matching program fetches. Reset type: ERAD_RESET
5	STOP	R/W	0h	This bit decides whether the Enhanced Bus Comparator (EBC) unit will generate CPU halting signals when event matches occur. Note that the event outputs will always be generated regardless of the state of this bit. 0 The Enhanced Bus Comparator (EBC) unit will not cause any action towards halting the CPU. 1 The Enhanced Bus Comparator (EBC) unit will assert ANASTOP for matching data accesses and break tags for matching program fetches. These can cause the CPU to HALT Reset type: ERAD_RESET

Table 14-22. HWBP_CNTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4-1	BUS_SEL	R/W	0h	These bits are used to select which CPU buses will be used for comparison to generate the match events. For each bus selected, the corresponding strobes will automatically be selected to determine valid accesses. 0000 PAB for instruction fetches 0001 VPC 0010 DWAB for data write accesses 0011 DRAB for data read accesses 0100 DWDB for write data match 0101 DRDB for read data match 0110 VPC Instruction aligned match 0111 VPC R1 aligned match 1000 VPC R2 aligned match 1001 VPC W aligned match All other combinations are RESERVED. Reset type: ERAD_RESET
0	RESERVED	R	0h	Reserved

14.9.3.5 HWBP_STATUS Register (Offset = 7h) [Reset = 0400h]

HWBP_STATUS is shown in [Figure 14-22](#) and described in [Table 14-23](#).

Return to the [Summary Table](#).

HWBP (EBC) Status Register

Bit	Field	Type	Reset	Description
15-12	RESERVED	R	0h	Reserved
11	CNT_INP_SEL_EN	R/W	0h	0 = Disable using the input_select register for the count input. The counter will always count CPU cycles. 1 = Enable using the input_select register for the count input. The counter will count the event selected by the count input register. Reset type: ERAD_RESET
10	RST_EN	R/W	0h	This bit decides if the reset input is enabled or not. Setting this to 1 will cause the counter to reset to zero whenever the selected reset input goes active high. No event will be generated when the counter is reset. Setting this bit to 0 will cause the counter to ignore the reset inputs. Reset type: ERAD_RESET
9	RESERVED	R	0h	Reserved
8	START_STOP_CUMULATIVE	R/W	0h	This bit decides whether the counter counts to give the cumulative cycle count for 'n' number of successive start stop events or clears the counter on every stop event to record the MAX_COUNT across successive start stop sequences. 0 When in START_STOP mode counter gets cleared on every stop event and MAX_COUNT records the max value 1 When in START_STOP mode counter keeps counting between successive start stop events to generate a cumulative count w/o clearing the counter on any stop events. MAX_COUNT register is invalid when this bit is set. Reset type: ERAD_RESET
7	RTOSINT	R/W	0h	This bit decides whether the counter module will generate RTOSINTn interrupt when count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not cause any action towards the CPU. 1 The counter unit will assert RTOSINTn when the count value matches the reference value. Reset type: ERAD_RESET

Table 14-26. CTM_CNTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	STOP	R/W	0h	This bit decides whether the counter module will generate a watchpoint to the CPU when the count value matches the reference. Note that the event outputs will always be generated regardless of the state of this bit. 0 The counter unit will not generate a watchpoint. 1 The counter unit will assert ANASTOP when the count value matches the reference. Reset type: ERAD_RESET
5	RESERVED	R	0h	Reserved
4	RST_ON_MATCH	R/W	0h	This bit is used to decide whether the counter will reset to zero once it reaches the reference value. 0 Counter will stay at the reference value and the counter will go to COMPLETED state and further counting will be stopped. 1 The counter will reset to zero once it reaches the match value and will stay enabled. Reset type: ERAD_RESET
3	EVENT_MODE	R/W	0h	This bit is used to decide whether the counter will count the level of the event or the edge of the event. 0 Counter will increment the count as long as the count input is active high. 1 The counter will count only on the rising edge of the count input. Reset type: ERAD_RESET
2	START_STOP_MODE	R/W	0h	This bit is used to decide whether the counter will count in the START_STOP mode or not. 0 Normal count mode. The counter will not depend on the START and STOP events 1 This is the START-STOP mode of the counter. The counter will start counting only after the START input has been asserted. It will continue to count the selected event till the STOP event is seen. Reset type: ERAD_RESET
1-0	RESERVED	R	0h	Reserved

14.9.4.2 CTM_STATUS Register (Offset = 1h) [Reset = 0010h]

CTM_STATUS is shown in [Figure 14-24](#) and described in [Table 14-27](#).

Return to the [Summary Table](#).

Counter Status Register

15	14	13	12	11	10	9	8
STATUS				MODULE_ID			
R-0h				R-4h			
7	6	5	4	3	2	1	0
MODULE_ID						OVERFLOW	EVENT_FIRED
R-4h						R-0h	R-0h

Table 14-27. CTM_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-12	STATUS	R	0h	Counter unit status, 00 Idle 10 Enabled 11 Completed Reset type: ERAD_RESET
11-2	MODULE_ID	R	4h	These bits are always a constant representing a unique identification for the trigger unit. Reset type: ERAD_RESET
1	OVERFLOW	R	0h	This is a sticky bit which gets set every time the counter overflows and wraps around after reaching 0xffffffff. This bit will get cleared by writing a '1' to bit 9 of the CTM_CNTL register. Reset type: ERAD_RESET
0	EVENT_FIRED	R	0h	This is a sticky bit which gets set every time the CTM unit generates a match event. This will be used by software to figure out whether this CTM module fired an event or not. This bit will get cleared by writing a '1' to bit 9 of the CTM_CNTL register. Reset type: ERAD_RESET

14.9.4.3 CTM_REF Register (Offset = 2h) [Reset = 00000000h]

CTM_REF is shown in [Figure 14-25](#) and described in [Table 14-28](#).

Return to the [Summary Table](#).

Counter Reference Register

REF																															
R/W-0h																															

Table 14-28. CTM_REF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	REF	R/W	0h	This register contains the counter reference value for comparison. The counter will generate an event if the count value matches the reference register (considering both upper and lower half of the register). This register is writable by CPU only if application owns the unit and if EALLOW is set. Otherwise, the writes are ignored. The register is writable by the debugger only if the debugger owns this unit. Otherwise, the writes are ignored. Reference match is enabled only when a non zero value is programmed on one of the REF register. Reset type: ERAD_RESET

14.9.4.4 CTM_COUNT Register (Offset = 4h) [Reset = 00000000h]

CTM_COUNT is shown in [Figure 14-26](#) and described in [Table 14-29](#).

Return to the [Summary Table](#).

Chapter 15

General-Purpose Input/Output (GPIO)

The GPIO module controls the device's digital multiplexing, which uses shared pins to maximize application flexibility. The pins are named by the general-purpose I/O name (for example, GPIO0, GPIO25, GPIO58). These pins can be individually selected to operate as digital I/O (also called GPIO mode), or connected to one of several peripheral I/O signals. The input signals can be qualified to remove unwanted noise.

15.1 Introduction

Up to twelve independent peripheral signals are multiplexed on a single GPIO-enabled pin in addition to the CPU-controlled I/O capability. Each pin output can be controlled by either a peripheral or one of the four CPU masters.

- CPU1
- CPU1.CLA
- CPU2
- CPU2.CLA

There are up to 8 possible I/O ports:

- Port A consists of GPIO0-GPIO31
- Port B consists of GPIO32-GPIO63
- Port C consists of GPIO64-GPIO95
- Port D consists of GPIO96-GPIO127
- Port E consists of GPIO128-GPIO159
- Port F consists of GPIO160-GPIO191
- Port G consists of GPIO192-GPIO223
- Port H consists of GPIO224-GPIO255

Note

Some GPIO and I/O ports can be unavailable on particular devices. See the *GPIO Registers* section for available GPIO and I/O ports.

Figure 15-1 shows the GPIO logic for a single pin.

Note

High-speed SPI and AUXCLKIN use a different signal path that do not support inversion or qualification. For more details on high-speed SPI pins, see [Section 15.6](#).

The USB PHY pin muxing is not shown in [Figure 15-1](#). For more details on USB pins, see [Section 15.5](#).

There are two key features to note in [Figure 15-1](#). The first is that the input and output paths are entirely separate, connecting only at the pin. The second is that peripheral muxing takes place far from the pin. As a result, for both CPUs and CLAs to read the physical state of the pin independent of CPU mastering and peripheral muxing is possible. Likewise, external interrupts can be generated from peripheral activity. All pin options such as input qualification and open-drain output are valid for all masters and peripherals. However, the peripheral muxing, CPU muxing, and pin options can only be configured by CPU1. [Table 15-1](#) provides details of GPIO registers accessible by different masters.

A separate configuration is required for the USB signals. See [Section 15.5](#) for details.

Figure 15-1. GPIO Logic for a Single Pin

Table 15-1. GPIO access by different controllers

Register Type	Function	CPU	CLA	DMA	HIC	Comments
GPIO_CTRL	Peripheral muxing, Pull Control ,etc.	Yes	NO	NO	NO	-
GPIO_DATA	GPIODAT, SET, CLEAR, TOGGLE, and pin status, etc.	Yes	Yes	NO	No	Based on GPxCSEL configuration.
GPIO_DATA_READ	Read back of GPIODAT register	Yes	Yes	NO	Yes	-

15.2 Configuration Overview

I/O pin configuration consists of several steps:

1. **Plan the device pin-out:** Make a list of all required peripherals for the application. Using the peripheral mux information in the device data sheet, choose which GPIOs to use for the peripheral signals. Decide which of the remaining GPIOs to use as inputs and outputs for each CPU and CLA.

Once the peripheral muxing has been chosen, implement the mux by writing the appropriate values to the GPyMUX1/2 and GPyGMUX1/2 registers. When changing the GPyGMUX value for a pin, always set the corresponding GPyMUX bits to zero first to avoid glitching in the muxes. By default, all pins are general-purpose I/Os, not peripheral signals.

2. **(Optional) Enable internal pullup resistors:** To enable or disable the pullup resistors, write to the appropriate bits in the GPIO pullup disable registers (GPyPUD). All pullups are disabled by default. Pullups can be used to keep input pins in a known state when there is no external signal driving them.
3. **Select input qualification:** If the pin is used as an input, specify the required input qualification, if any. The input qualification sampling period is selected in the GPyCTRL registers, while the type of qualification is selected in the GPyQSEL1 and GPyQSEL2 registers. By default, all qualification is synchronous with a sampling period equal to PLLSYSCLK. For an explanation of input qualification, see [Section 15.4](#).
4. **Select the direction of any general-purpose I/O pins:** For each pin configured as a GPIO, specify the direction of the pin as either input or output using the GPyDIR registers. By default, all GPIO pins are inputs. Before changing a pin to an output, load the output latch with the value to be driven by writing that value to the GPySET, GPyCLEAR, or GPyDAT registers. Once the latch is loaded, write to GPyDIR to change the pin direction. By default, all output latches are zero.

The GPyDAT_R register can be used to read what value was written to the GPyDAT register.

5. **Select low-power mode wake-up sources:** GPIOs 0-63 can be used to wake the system up from low power modes. To select one or more GPIOs for wake-up, write to the appropriate bits in the GPIOLPMSEL0 and GPIOLPMSEL1 registers. These registers are part of the CPU system register space. For more information on low-power modes and GPIO wake-up, see the Low-Power Modes section in the *System Control and Interrupts* chapter.
6. **Select external interrupt sources:** Configuring external interrupts is a two-step process. First, the interrupts themselves must be enabled and the polarity must be configured using the XINTnCR registers. Second, the XINT1-5 GPIO pins must be set by selecting the sources for Input X-BAR signals 4, 5, 6, 13, and 14, respectively. For more information on the Input X-BAR architecture, see the *Crossbar (X-BAR)* chapter.

15.3 Digital General-Purpose I/O Control

The values on the pins that are configured as GPIO can be changed by using the following registers.

- **GPyDAT Registers**

Each I/O port has one data register. Each bit in the data register corresponds to one GPIO pin. No matter how the pin is configured (GPIO or peripheral function), the corresponding bit in the data register reflects the current state of the pin after qualification. Writing to the GPyDAT register clears or sets the corresponding output latch and if the pin is enabled as a general-purpose output (GPIO output), the pin is also driven either low or high. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin.

When using the GPyDAT register to change the level of an output pin, be cautious to not accidentally change the level of another pin. For example, to change the output latch level of GPIOA1 by writing to the GPADAT register bit 0 using a read-modify-write instruction, a problem can occur if another I/O port A signal changes level between the read and the write stage of the instruction. Following is an analysis of why this happens:

The GPyDAT registers reflect the state of the pin, not the latch. This means the register reflects the actual pin value. However, there is a lag between when the register is written to when the new pin value is reflected back in the register. This can pose a problem when this register is used in subsequent program statements to alter the state of GPIO pins. An example is shown below where two program statements attempt to drive two different GPIO pins that are currently low to a high state.

If Read-Modify-Write operations are used on the GPyDAT registers, because of the delay between the output and the input of the first instruction (I1), the second instruction (I2) reads the old value and writes the value back.

```
GpioDataRegs.GPADAT.bit.GPIO1 = 1; //I1 performs read-modify-write of GPADAT
GpioDataRegs.GPADAT.bit.GPIO2 = 1; //I2 also a read-modify-write of GPADAT
                                   //GPADAT gets the old value of GPIO1 due to the delay
```

The second instruction waits for the first to finish the write due to the write-followed-by-read protection on this peripheral frame. There is some lag, however, between the write of (I1) and the GPyDAT bit reflecting the new value (1) on the pin. During this lag, the second instruction reads the old value of GPIO1 (0) and writes the value back along with the new value of GPIO2 (1). Therefore, GPIO1 pin stays low.

One answer is to put some NOPs between instructions. A better answer is to use the GPySET/GPyCLEAR/GPyTOGGLE registers instead of the GPyDAT registers. These registers always read back a 0 and writes of 0 have no effect. Only bits that need to be changed can be specified without disturbing any other bits that are currently in the process of changing.

- **GPyDAT_R Registers**

The GPyDAT_R registers are read only registers that return the value written to the GPyDAT registers instead of pin status. Writes to these registers have no effect.

- **GPySET Registers**

The set registers are used to drive specified GPIO pins high without disturbing other pins. Each I/O port has one set register and each bit corresponds to one GPIO pin. The set registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the set register sets the output latch high and the corresponding pin is driven high. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the set registers has no effect.

- **GPyCLEAR Registers**

The clear registers are used to drive specified GPIO pins low without disturbing other pins. Each I/O port has one clear register. The clear registers always read back 0. If the corresponding pin is configured as a general-purpose output, then writing a 1 to the corresponding bit in the clear register clears the output latch and the pin is driven low. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the clear registers has no effect.

- **GPyTOGGLE Registers**

The toggle registers are used to drive specified GPIO pins to the opposite level without disturbing other pins. Each I/O port has one toggle register. The toggle registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the toggle register flips the output latch and pulls the corresponding pin in the opposite direction. That is, if the output pin is driven low, then writing a 1 to the corresponding bit in the toggle register pulls the pin high. Likewise, if the output pin is high, then writing a 1 to the corresponding bit in the toggle register pulls the pin low. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the toggle registers has no effect.

15.4 Input Qualification

The input qualification scheme has been designed to be very flexible. Select the type of input qualification for each GPIO pin by configuring the GPyQSEL1 and GPyQSEL2 registers. In the case of a GPIO input pin, the qualification can be specified as only synchronized to SYSCLKOUT or qualification by a sampling window. For pins that are configured as peripheral inputs, the input can also be asynchronous in addition to synchronized to SYSCLKOUT or qualified by a sampling window. The remainder of this section describes the options available.

15.4.1 No Synchronization (Asynchronous Input)

This mode is used for peripherals where input synchronization is not required or the peripheral performs the synchronization. Examples include communication ports McBSP, SCI, SPI, and I²C. In addition, the ePWM trip zone ($\overline{TZn}$) signals can function independent of the presence of SYSCLKOUT.

Note

Using input synchronization when the peripheral performs the synchronization can cause unexpected results. The user must make sure that the GPIO pin is configured for asynchronous in this case.

15.4.2 Synchronization to SYSCLKOUT Only

This is the default qualification mode of all the pins at reset. In this mode, the input signal is only synchronized to the system clock (SYSCLKOUT). Because the incoming signal is asynchronous, a SYSCLKOUT period of delay is needed for the input to the device to be changed. No further qualification is performed on the signal.

15.4.3 Qualification Using a Sampling Window

In this mode, the signal is first synchronized to the system clock (SYSCLKOUT) and then qualified by a specified number of cycles before the input is allowed to change. Figure 15-2 and Figure 15-3 show how the input qualification is performed to eliminate unwanted noise. Two parameters are specified by the user for this type of qualification: 1) the sampling period, or how often the signal is sampled, and 2) the number of samples to be taken.

Figure 15-2. Input Qualification Using a Sampling Window

Time between samples (sampling period):

To qualify the signal, the input signal is sampled at a regular period. The sampling period is specified by the user and determines the time duration between samples, or how often the signal is sampled, relative to the CPU clock (SYSCLKOUT).

The sampling period is specified by the qualification period (QUALPRDn) bits in the GPxCTRL register. The sampling period is configurable in groups of 8 input signals. For example, GPIO0 to GPIO7 use GPxCTRL[QUALPRD0] setting and GPIO8 to GPIO15 use GPxCTRL[QUALPRD1]. Table 15-2 and Table 15-3 show the relationship between the sampling period or sampling frequency and the GPxCTRL[QUALPRDn] setting.

Table 15-2. Sampling Period

Sampling Period	
If GPxCTRL[QUALPRDn] = 0	$1 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] ≠ 0	$2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT	

Table 15-3. Sampling Frequency

Sampling Frequency	
If GPxCTRL[QUALPRDn] = 0	$f_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] ≠ 0	$f_{\text{SYSCLKOUT}} \times 1 + (2 \times \text{GPxCTRL[QUALPRDn]})$
Where $f_{\text{SYSCLKOUT}}$ is the frequency of SYSCLKOUT	

From these equations, the minimum and maximum time between samples can be calculated for a given SYSCLKOUT frequency:

Example: Maximum Sampling Frequency:

If GPxCTRL[QUALPRDn] = 0

then the sampling frequency is $f_{\text{SYSCLKOUT}}$

If, for example, $f_{\text{SYSCLKOUT}} = 60\text{MHz}$

then the signal is sampled at 60MHz or one sample every 16.67ns.

Example: Minimum Sampling Frequency:

If GPxCTRL[QUALPRDn] = 0xFF (255)

then the sampling frequency is $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPxCTRL[QUALPRDn]})$

If, for example, $f_{\text{SYSCLKOUT}} = 60\text{MHz}$

then the signal is sampled at $60\text{MHz} \times 1 \div (2 \times 255)$ (117.647kHz) or one sample every 8.5μs.

Number of samples:

The number of times the signal is sampled is either three samples or six samples as specified in the qualification selection (GPAQSEL1, GPAQSEL2, GPBQSEL1, and GPBQSEL2) registers. When three or six consecutive cycles are the same, then the input change is passed through to the device.

Total Sampling-Window Width:

The sampling window is the time during which the input signal is sampled as shown in [Figure 15-3](#). By using the equation for the sampling period, along with the number of samples to be taken, the total width of the window can be determined.

For the input qualifier to detect a change in the input, the level of the signal must be stable for the duration of the sampling-window width or longer.

The number of sampling periods within the window is always one less than the number of samples taken. For a three-sample window, the sampling-window width is two sampling-periods wide where the sampling period is defined in [Table 15-2](#). Likewise, for a six-sample window, the sampling-window width is five sampling-periods wide. [Table 15-4](#) and [Table 15-5](#) show the calculations used to determine the total sampling-window width based on GPxCTRL[QUALPRDn] and the number of samples taken.

Table 15-4. Case 1: Three-Sample Sampling-Window Width

	Total Sampling-Window Width
If GPxCTRL[QUALPRDn] = 0	$2 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] ≠ 0	$2 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
	Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT

Table 15-5. Case 2: Six-Sample Sampling-Window Width

	Total Sampling-Window Width
If GPxCTRL[QUALPRDn] = 0	$5 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] ≠ 0	$5 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
	Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT

Note

The external signal change is asynchronous with respect to both the sampling period and SYSCLKOUT. Due to the asynchronous nature of the external signal, the input must be held stable for a time greater than the sampling-window width to make sure the logic detects a change in the signal. The extra time required can be up to an additional sampling period + $T_{\text{SYSCLKOUT}}$.

The required duration for an input signal to be stable for the qualification logic to detect a change is described in the data sheet.

Example Qualification Window:

For the example shown in Figure 15-3, the input qualification has been configured as follows:

- $\text{GPxQSEL1/2} = 1,0$. This indicates a six-sample qualification.
- $\text{GPxCTRL}[\text{QUALPRDn}] = 1$. The sampling period is $t_w(\text{SP}) = 2 \times \text{GPxCTRL}[\text{QUALPRDn}] \times T_{\text{SYSCLKOUT}} = 2 \times T_{\text{SYSCLKOUT}}$.

This configuration results in the following:

- The width of the sampling window is:

$$t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 2 \times \text{GPxCTRL}[\text{QUALPRDn}] \times T_{\text{SYSCLKOUT}} = 5 \times 2 \times T_{\text{SYSCLKOUT}}$$

- If, for example, $T_{\text{SYSCLKOUT}} = 16.67\text{ns}$, then the duration of the sampling window is:

$$\text{Sampling period, } t_w(\text{SP}) = 2 \times T_{\text{SYSCLKOUT}} = 2 \times 16.67\text{ns} = 33.3\text{ns}$$

$$\text{Sampling window, } t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 33.3\text{ns} = 166.7\text{ns}$$

- To account for the asynchronous nature of the input relative to the sampling period and SYSCLKOUT, up to a single additional sampling period and SYSCLK period is required to detect a change in the input signal. For this example:

$$t_w(\text{IQSW}) + t_w(\text{SP}) + T_{\text{SYSCLKOUT}} = 166.7\text{ns} + 33.3\text{ns} + 16.67\text{ns} = 216.7\text{ns}$$

- In Figure 15-3, the glitch (A) is shorter than the qualification window and is ignored by the input qualifier.

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The QUAL_SEL Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for $(5 \times \text{QUALPRD} \times 2) \times \text{SYSCLKOUT}$ cycles. That would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, an 13-SYSCLKOUT-wide pulse ensures reliable recognition.

Figure 15-3. Input Qualifier Clock Cycles

15.5 USB Signals

The USB module on this device has an internal physical layer transceiver (PHY). The I/O signals are not normal digital signals, and as a result, the signals do not connect to the pins through the normal GPIO mux path. Instead, a special analog mux is used. To connect the USB signals to the device pins, set the GPyAMSEL bits appropriately as shown in [Table 15-6](#). Do not enable pullups or any other special pin option when using the USB signals.

Table 15-6. USB I/O Signal Muxing

Signal	GPIO	AMSEL
USBDM	42	GPBAMSEL[10]
USBDP	43	GPBAMSEL[11]

15.6 SPI Signals

The SPI module on this device has a high-speed mode that enables 40 Mbps communication. To achieve the highest possible speed, a special GPIO configuration is used on a single GPIO mux option for each SPI. These GPIOs can also be used by the SPI when not in high-speed mode (HS_MODE = 0). [Table 15-7](#) shows which GPIOs have the special mux option to allow SPI high-speed mode.

To select these mux options, configure the GPyGMUX and GPyMUX registers as shown in [Table 15-7](#).

Table 15-7. GPIO Configuration for High-Speed SPI

GPIO	SPI Signal	Mux Configuration	
GPIO58	SPISIMOA	GPBGMUX2[21:20]=11	GPBMUX2[21:20]=11

15.7 GPIO and Peripheral Muxing

15.7.1 GPIO Muxing

Up to twelve different peripheral functions are multiplexed to each pin along with a general-purpose input/output (GPIO) function. This allows you to choose the peripheral mix and pinout that works best for your particular application. Refer to [Table 15-8](#) for muxing combinations and definitions.

Table 15-8. GPIO Muxed Pins

15.7.2 Peripheral Muxing

For example, multiplexing for the GPIO6 pin is controlled by writing to GPAGMUX[13:12] and GPAMUX[13:12]. By writing to these bits, GPIO6 is configured as either a general-purpose digital I/O or one of several different peripheral functions. An example of GPyGMUX and GPyMUX selection and options for a single GPIO are shown in [Table 15-9](#).

Note

The following table is for example only. Refer to the device data sheet to check the availability of GPIO6 on this device. If GPIO6 is available, the functions mentioned in the table may not match the actual functions available. See [Section 15.7.1](#) for correct list of GPIOs and corresponding mux options for this device.

Table 15-9. GPIO and Peripheral Muxing

GPAGMUX1[13:12]	GPAMUX1[13:12]	Pin Functionality
00	00	GPIO6
00	01	Peripheral 1
00	10	Peripheral 2
00	11	Peripheral 3
01	00	GPIO6
01	01	Peripheral 4
01	10	Peripheral 5
01	11	
10	00	GPIO6
10	01	
10	10	Peripheral 6
10	11	Peripheral 7
11	00	GPIO6
11	01	Peripheral 8
11	10	Peripheral 9
11	11	Peripheral 10

The devices have different multiplexing schemes. If a peripheral is not available on a particular device, that mux selection is reserved on that device and must not be used.

CAUTION

If a reserved GPIO mux configuration that is not mapped to either a peripheral or GPIO mode is selected, the state of the pin is undefined and the pin is driven. Unimplemented configurations are for future expansion and must not be selected. In the device mux table (see the data sheet), these options are indicated as Reserved or left blank.

Some peripherals can be assigned to more than one pin by way of the mux registers. For example, OUTPUTXBAR1 can be assigned to GPIOs p, q, or r (where p, q, and r are example GPIO numbers), depending on individual system requirements. An example of this is shown in [Table 15-10](#).

Note

The following table is for example only. Bit ranges cannot correspond to OUTPUTXBAR1 on this device. See [Section 15.7.1](#) for correct list of GPIOs and corresponding mux options for this device.

If none or more than one of the GPIO pins is configured as peripheral input pins, then that GPIO is set to a hard-wired default value.

Table 15-10. Peripheral Muxing (Multiple Pins Assigned)

GMUX Configuration	MUX Configuration	
Choice 1: GPIOp	GPyGMUX1[5:4]=01	GPyMUX1[5:4]=01
or Choice 2: GPIOq	GPyGMUX2[17:16]=00	GPyMUX2[17:16]=01
or Choice 3: GPIOr	GPyGMUX1[7:6]=01	GPyMUX1[7:6]=01

15.8 Internal Pullup Configuration Requirements

On reset, GPIOs are in input mode and have the internal pullups disabled. An un-driven input can float to a mid-rail voltage and cause wasted shoot-through current on the input buffer. The user must always put each GPIO in one of these configurations:

- Input mode and driven on the board by another component to a level above V_{ih} or below V_{il}
- Input mode with GPIO internal pullup enabled
- Output mode

On devices with lesser pin count packages, pull-ups on unbonded GPIOs are by default enabled to prevent floating inputs. The user must take care to avoid disabling these pullups in the application code.

On devices with larger pin count packages, the pullups for any internally unbonded GPIO must be enabled to prevent floating inputs. TI has provided functions in controlSUITE/C2000Ware that users can call to enable the pullup on any unbonded GPIO for the package in use. This function, `GPIO_EnabledUnbondedIOPullups()`, resides in the `(Device)_Sysctrl.c` file and is called by default from `InitSysCtrl()`. The user must take care to avoid disabling these pullups in the application code.

15.9 Software

15.9.1 GPIO Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/gpio

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

15.9.1.1 Device GPIO Setup

FILE: gpio_ex1_setup.c

Configures the device GPIO into two different configurations This code is verbose to illustrate how the GPIO could be setup. In a real application, lines of code can be combined for improved code size and efficiency.

This example only sets-up the GPIO. Nothing is actually done with the pins after setup.

In general:

- All pullup resistors are enabled. For ePWMs this may not be desired.
- Input qual for communication ports (CAN, SPI, SCI, I2C) is asynchronous
- Input qual for Trip pins (TZ) is asynchronous
- Input qual for eCAP and eQEP signals is synch to SYSCLKOUT
- Input qual for some I/O's and __interrupts may have a sampling window

15.9.1.2 Device GPIO Toggle

FILE: gpio_ex2_toggle.c

Configures the device GPIO through the sysconfig file. The GPIO pin is toggled in the infinite loop. In order to migrate the project within syscfg to any device, click the switch button under the device view and select your corresponding device to migrate, saving the project will auto-migrate your project settings.

: This example project has support for migration across our C2000 device families. If you are wanting to build this project from launchpad or controlCARD, please specify in the .syscfg file the board you're using. At any time you can select another device to migrate this example.

15.9.1.3 Device GPIO Interrupt

FILE: gpio_ex3_interrupt.c

Configures the device GPIOs through the sysconfig file. One GPIO output pin, and one GPIO input pin is configured. The example then configures the GPIO input pin to be the source of an external interrupt which toggles the GPIO output pin.

15.9.2 LED Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/led

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

15.9.2.1 LED Blinky Example (CM) - C28X_CM

FILE: led_ex1_c28x_cm_blinky_cm.c

This example demonstrates how to blink a LED using CM.

External Connections

- None.

Watch Variables

- None.

15.9.2.2 LED Blinky Example - C28X_DUAL

FILE: led_ex1_c28x_dual_blinky_cpu1.c

This example demonstrates how to blink a LED using CPU1 and blink another LED using CPU2 (led_ex1_blinky_cpu2.c).

External Connections

- None.

Watch Variables

- None.

15.9.2.3 LED Blinky Example - C28X_CM

FILE: led_ex1_c28x_cm_blinky_cpu1.c

This example demonstrates how to blink a LED using CPU1 and blink another LED using CM (led_ex1_blinky_cm.c).

External Connections

- None.

Watch Variables

- None.

15.9.2.4 LED Blinky Example with DCSM

FILE: led_ex2_blinky_dcsn.c

This example demonstrates how to blink a LED and program the DCSM OTP. Please refer f2838x_dcsn_z1otp.asm and f2838x_dcsn_z1otp.asm files for details on DCSM OTP programming.

External Connections

- None.

Watch Variables

- None.

15.9.2.5 LED Blinky Example - C28X_DUAL

FILE: led_ex2_blinky_sysconfig_cpu1.c

This example demonstrates how to blink a LED using CPU1 and blink another LED using CPU2 (led_ex1_blinky_cpu2.c).

External Connections

- None.

Watch Variables

- None.

15.10 GPIO Registers

This section describes the General-Purpose Input/Output Registers.

15.10.1 GPIO Base Address Table (C28)

Table 15-11. GPIO Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
GpioCtrlRegs	GPIO_CTRL_REGS	GPIOCTRL_BASE	0x0000_7C00	YES	-	-	-	YES
GpioDataRegs	GPIO_DATA_REGS	GPIODATA_BASE	0x0000_7F00	YES	YES	-	YES	YES

Table 15-11. GPIO Base Address Table (C28) (continued)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
GpioDataReadRegs	GPIO_DATA_READ_REGS	GPIODATAREAD_BASE	0x0000_7F80	YES	YES	-	YES	YES

15.10.2 CM GPIO Base Address Table (CM)

Table 15-12. CM GPIO Base Address Table (CM)

DriverLib Name	Base Address	μDMA Access	Ethernet DMA Access
GPIODATA_BASE	0x4008_3000	-	-
GPIODATAREAD_BASE	0x4008_3100	-	-

15.10.3 GPIO_CTRL_REGS Registers

Table 15-13 lists the memory-mapped registers for the GPIO_CTRL_REGS registers. All register offset addresses not listed in Table 15-13 should be considered as reserved locations and the register contents should not be modified.

Table 15-13. GPIO_CTRL_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GPACTRL	GPIO A Qualification Sampling Period Control (GPIO0 to 31)	EALLOW	Go
2h	GPAQSEL1	GPIO A Qualifier Select 1 Register (GPIO0 to 15)	EALLOW	Go
4h	GPAQSEL2	GPIO A Qualifier Select 2 Register (GPIO16 to 31)	EALLOW	Go
6h	GPAMUX1	GPIO A Mux 1 Register (GPIO0 to 15)	EALLOW	Go
8h	GPAMUX2	GPIO A Mux 2 Register (GPIO16 to 31)	EALLOW	Go
Ah	GPADIR	GPIO A Direction Register (GPIO0 to 31)	EALLOW	Go
Ch	GPAPUD	GPIO A Pull Up Disable Register (GPIO0 to 31)	EALLOW	Go
10h	GPAINV	GPIO A Input Polarity Invert Registers (GPIO0 to 31)	EALLOW	Go
12h	GPAODR	GPIO A Open Drain Output Register (GPIO0 to GPIO31)	EALLOW	Go
20h	GPAGMUX1	GPIO A Peripheral Group Mux (GPIO0 to 15)	EALLOW	Go
22h	GPAGMUX2	GPIO A Peripheral Group Mux (GPIO16 to 31)	EALLOW	Go
28h	GPACSEL1	GPIO A Core Select Register (GPIO0 to 7)	EALLOW	Go
2Ah	GPACSEL2	GPIO A Core Select Register (GPIO8 to 15)	EALLOW	Go
2Ch	GPACSEL3	GPIO A Core Select Register (GPIO16 to 23)	EALLOW	Go
2Eh	GPACSEL4	GPIO A Core Select Register (GPIO24 to 31)	EALLOW	Go
3Ch	GPALOCK	GPIO A Lock Configuration Register (GPIO0 to 31)	EALLOW	Go
3Eh	GPACR	GPIO A Lock Commit Register (GPIO0 to 31)	EALLOW	Go
40h	GPBCTRL	GPIO B Qualification Sampling Period Control (GPIO32 to 63)	EALLOW	Go
42h	GPBQSEL1	GPIO B Qualifier Select 1 Register (GPIO32 to 47)	EALLOW	Go
44h	GPBQSEL2	GPIO B Qualifier Select 2 Register (GPIO48 to 63)	EALLOW	Go
46h	GPBMUX1	GPIO B Mux 1 Register (GPIO32 to 47)	EALLOW	Go
48h	GPBMUX2	GPIO B Mux 2 Register (GPIO48 to 63)	EALLOW	Go
4Ah	GPBDIR	GPIO B Direction Register (GPIO32 to 63)	EALLOW	Go
4Ch	GPBPUD	GPIO B Pull Up Disable Register (GPIO32 to 63)	EALLOW	Go
50h	GPBINV	GPIO B Input Polarity Invert Registers (GPIO32 to 63)	EALLOW	Go
52h	GPBODR	GPIO B Open Drain Output Register (GPIO32 to GPIO63)	EALLOW	Go
54h	GPBAMSEL	GPIO B Analog Mode Select register (GPIO32 to GPIO63)	EALLOW	Go
60h	GPBGMUX1	GPIO B Peripheral Group Mux (GPIO32 to 47)	EALLOW	Go
62h	GPBGMUX2	GPIO B Peripheral Group Mux (GPIO48 to 63)	EALLOW	Go
68h	GPBCSEL1	GPIO B Core Select Register (GPIO32 to 39)	EALLOW	Go
6Ah	GPBCSEL2	GPIO B Core Select Register (GPIO40 to 47)	EALLOW	Go
6Ch	GPBCSEL3	GPIO B Core Select Register (GPIO48 to 55)	EALLOW	Go
6Eh	GPBCSEL4	GPIO B Core Select Register (GPIO56 to 63)	EALLOW	Go

Table 15-13. GPIO_CTRL_REGS Registers (continued)

Offset	Acronym	Register Name	Write Protection	Section
7Ch	GPBLOCK	GPIO B Lock Configuration Register (GPIO32 to 63)	EALLOW	Go

142h	GPFQSEL1	GPIO F Qualifier Select 1 Register (GPIO160 to 168)	EALLOW	Go
146h	GPFMUX1	GPIO F Mux 1 Register (GPIO160 to 168)	EALLOW	Go
14Ah	GPFDIR	GPIO F Direction Register (GPIO160 to 168)	EALLOW	Go
14Ch	GPFPUD	GPIO F Pull Up Disable Register (GPIO160 to 168)	EALLOW	Go
150h	GPFINV	GPIO F Input Polarity Invert Registers (GPIO160 to 168)	EALLOW	Go
152h	GPFODR	GPIO F Open Drain Output Register (GPIO160 to 168)	EALLOW	Go
160h	GPFGMUX1	GPIO F Peripheral Group Mux (GPIO160 to 168)	EALLOW	Go
168h	GPFCSEL1	GPIO F Core Select Register (GPIO160 to 167)	EALLOW	Go
16Ah	GPFCSEL2	GPIO F Core Select Register (GPIO168)	EALLOW	Go
17Ch	GPFLOCK	GPIO F Lock Configuration Register (GPIO160 to 168)	EALLOW	Go
17Eh	GPFCR	GPIO F Lock Commit Register (GPIO160 to 168)	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. [Table 15-14](#) shows the codes that are used for access types in this section.

Table 15-14. GPIO_CTRL_REGS Access Type Codes

Access Type	Code	Description
Read Type		

Table 15-14. GPIO_CTRL_REGS Access Type Codes (continued)

Access Type	Code	Description
R	R	Read
Write Type		
W	W	Write
WOnce	W Once	Write Write once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.10.3.1 GPACTRL Register (Offset = 0h) [Reset = 00000000h]

GPACTRL is shown in [Figure 15-4](#) and described in [Table 15-15](#).

Return to the [Summary Table](#).

GPIO A Qualification Sampling Period Control (GPIO0 to 31)

Figure 15-4. GPACTRL Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
QUALPRD3								QUALPRD2								QUALPRD1								QUALPRD0							
R/W-0h								R/W-0h								R/W-0h								R/W-0h							

Table 15-15. GPACTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	QUALPRD3	R/W	0h	Qualification sampling period for GPIO24 to GPIO31: 0x00, QUALPRDx = PLLSYSCLK 0x01, QUALPRDx = PLLSYSCLK/2 0x02, QUALPRDx = PLLSYSCLK/4 0xFF, QUALPRDx = PLLSYSCLK/510 Reset type: CPU1.SYSRSn
23-16	QUALPRD2	R/W	0h	Qualification sampling period for GPIO16 to GPIO23: 0x00, QUALPRDx = PLLSYSCLK 0x01, QUALPRDx = PLLSYSCLK/2 0x02, QUALPRDx = PLLSYSCLK/4 0xFF, QUALPRDx = PLLSYSCLK/510 Reset type: CPU1.SYSRSn
15-8	QUALPRD1	R/W	0h	Qualification sampling period for GPIO8 to GPIO15: 0x00, QUALPRDx = PLLSYSCLK 0x01, QUALPRDx = PLLSYSCLK/2 0x02, QUALPRDx = PLLSYSCLK/4 0xFF, QUALPRDx = PLLSYSCLK/510 Reset type: CPU1.SYSRSn
7-0	QUALPRD0	R/W	0h	Qualification sampling period for GPIO0 to GPIO7: 0x00, QUALPRDx = PLLSYSCLK 0x01, QUALPRDx = PLLSYSCLK/2 0x02, QUALPRDx = PLLSYSCLK/4 0xFF, QUALPRDx = PLLSYSCLK/510 Reset type: CPU1.SYSRSn

15.10.3.2 GPAQSEL1 Register (Offset = 2h) [Reset = 00000000h]

GPAQSEL1 is shown in [Figure 15-5](#) and described in [Table 15-16](#).

Return to the [Summary Table](#).

GPIO A Qualifier Select 1 Register (GPIO0 to 15)

Input qualification type:

0,0 Sync

0,1 Qualification (3 samples)

1,0 Qualification (6 samples)

1,1 Async (no Sync or Qualification)

15.10.3.4 GPAMUX1 Register (Offset = 6h) [Reset = 00000000h]

GPAMUX1 is shown in [Figure 15-7](#) and described in [Table 15-18](#).

Return to the [Summary Table](#).

GPIO A Mux 1 Register (GPIO0 to 15)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

Figure 15-7. GPAMUX1 Register

Table 15-18. GPAMUX1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	GPIO15	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
29-28	GPIO14	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
27-26	GPIO13	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
25-24	GPIO12	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
23-22	GPIO11	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
21-20	GPIO10	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
19-18	GPIO9	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
17-16	GPIO8	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
15-14	GPIO7	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
13-12	GPIO6	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
11-10	GPIO5	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
9-8	GPIO4	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
7-6	GPIO3	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
5-4	GPIO2	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
3-2	GPIO1	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

Table 15-18. GPAMUX1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	GPIO0	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.5 GPAMUX2 Register (Offset = 8h) [Reset = 00000000h]

GPAMUX2 is shown in [Figure 15-8](#) and described in [Table 15-19](#).

Return to the [Summary Table](#).

GPIO A Mux 2 Register (GPIO16 to 31)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

Bit	Field	Type	Reset	Description
1-0	GPIO16	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.6 GPADIR Register (Offset = Ah) [Reset = 00000000h]

GPADIR is shown in [Figure 15-9](#) and described in [Table 15-20](#).

Return to the [Summary Table](#).

GPIO A Direction Register (GPIO0 to 31)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

Figure 15-9. GPADIR Register

0	GPIO0	R/W	0h	Defines direction for this pin in GPIO mode Reset type: CPU1.SYSRSn

15.10.3.7 GPAPUD Register (Offset = Ch) [Reset = FFFFFFFFh]

GPAPUD is shown in [Figure 15-10](#) and described in [Table 15-21](#).

Return to the [Summary Table](#).

GPIO A Pull Up Disable Register (GPIO0 to 31)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

Figure 15-10. GPAPUD Register

15.10.3.8 GPAINV Register (Offset = 10h) [Reset = 00000000h]

GPAINV is shown in [Figure 15-11](#) and described in [Table 15-22](#).

Return to the [Summary Table](#).

GPIO A Input Polarity Invert Registers (GPIO0 to 31)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

Figure 15-11. GPAINV Register

15.10.3.9 GPAODR Register (Offset = 12h) [Reset = 00000000h]

GPAODR is shown in [Figure 15-12](#) and described in [Table 15-23](#).

Return to the [Summary Table](#).

GPIO Open Drain Output Register

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

CAUTION: Open Drain mode is not supported on this device. Keep this bit as 0. Open drain can be emulated by writing 0 to GPxDAT and enabling or disabling the output buffer with GPXDIR. (Peripherals such as I2C support Open Drain mode without issue).

Table 15-24. GPAGMUX1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	GPIO15	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
29-28	GPIO14	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
27-26	GPIO13	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
25-24	GPIO12	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
23-22	GPIO11	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
21-20	GPIO10	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
19-18	GPIO9	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
17-16	GPIO8	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
15-14	GPIO7	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
13-12	GPIO6	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
11-10	GPIO5	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
9-8	GPIO4	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
7-6	GPIO3	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
5-4	GPIO2	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
3-2	GPIO1	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
1-0	GPIO0	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.11 GPAGMUX2 Register (Offset = 22h) [Reset = 00000000h]

GPAGMUX2 is shown in [Figure 15-14](#) and described in [Table 15-25](#).

Return to the [Summary Table](#).

GPIO A Peripheral Group Mux (GPIO16 to 31)

Defines pin-muxing selection for GPIO.

Note: For complete pin-mux selection on GPIOx, GPAMUXy.GPIOx configuration is also required.

Figure 15-14. GPAGMUX2 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15-25. GPAGMUX2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	GPIO31	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
29-28	GPIO30	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
27-26	GPIO29	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
25-24	GPIO28	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
23-22	GPIO27	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
21-20	GPIO26	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
19-18	GPIO25	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
17-16	GPIO24	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
15-14	GPIO23	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
13-12	GPIO22	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
11-10	GPIO21	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
9-8	GPIO20	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
7-6	GPIO19	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
5-4	GPIO18	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
3-2	GPIO17	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
1-0	GPIO16	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.12 GPACSEL1 Register (Offset = 28h) [Reset = 00000000h]

GPACSEL1 is shown in [Figure 15-15](#) and described in [Table 15-26](#).

Return to the [Summary Table](#).

GPIO A Core Select Register (GPIO0 to 7)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

0000: CPU1 selected

0001: CPU1.CLA1 selected

0010: CPU2 selected

0011: CPU2.CLA1 selected

0100: CM selected

In single Core systems only GPACSEL[0] is used. Writing to GPACSEL[1] does not have effect and it will default to corresponding CPU or CLA control selection.

Figure 15-15. GPACSEL1 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15-31. GPACR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	GPIO19	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
18	GPIO18	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
17	GPIO17	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
16	GPIO16	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
15	GPIO15	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
14	GPIO14	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
13	GPIO13	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
12	GPIO12	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
11	GPIO11	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
10	GPIO10	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
9	GPIO9	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
8	GPIO8	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
7	GPIO7	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
6	GPIO6	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
5	GPIO5	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
4	GPIO4	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
3	GPIO3	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
2	GPIO2	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
1	GPIO1	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn
0	GPIO0	R/WOnce	0h	Configuration lock commit bit for this pin Reset type: CPU1.SYSRSn

15.10.3.18 GPBCTRL Register (Offset = 40h) [Reset = 00000000h]

GPBCTRL is shown in [Figure 15-21](#) and described in [Table 15-32](#).

Return to the [Summary Table](#).

GPIO B Qualification Sampling Period Control (GPIO32 to 63)

Figure 15-21. GPBCTRL Register

15.10.3.21 GPBMUX1 Register (Offset = 46h) [Reset = 00000000h]

GPBMUX1 is shown in [Figure 15-24](#) and described in [Table 15-35](#).

Return to the [Summary Table](#).

GPIO B Mux 1 Register (GPIO32 to 47)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

Figure 15-24. GPBMUX1 Register

Table 15-36. GPBMUX2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1-0	GPIO48	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.23 GPBDIR Register (Offset = 4Ah) [Reset = 00000000h]

GPBDIR is shown in [Figure 15-26](#) and described in [Table 15-37](#).

Return to the [Summary Table](#).

GPIO A Direction Register (GPIO0 to 31)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

Figure 15-26. GPBDIR Register

15.10.3.24 GPBPUD Register (Offset = 4Ch) [Reset = FFFFFFFFh]

GPBPUD is shown in [Figure 15-27](#) and described in [Table 15-38](#).

Return to the [Summary Table](#).

GPIO B Pull Up Disable Register (GPIO32 to 63)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

15.10.3.25 GPBINV Register (Offset = 50h) [Reset = 00000000h]

GPBINV is shown in [Figure 15-28](#) and described in [Table 15-39](#).

Return to the [Summary Table](#).

GPIO B Input Polarity Invert Registers (GPIO32 to 63)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

15.10.3.26 GPBODR Register (Offset = 52h) [Reset = 00000000h]

GPBODR is shown in [Figure 15-29](#) and described in [Table 15-40](#).

Return to the [Summary Table](#).

GPIO B Open Drain Output Register (GPIO32 to GPIO63)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

15.10.3.30 GPBCSEL1 Register (Offset = 68h) [Reset = 00000000h]

GPBCSEL1 is shown in [Figure 15-33](#) and described in [Table 15-44](#).

Return to the [Summary Table](#).

GPIO B Core Select Register (GPIO0 to 7)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

0000: CPU1 selected

0001: CPU1.CLA1 selected

0010: CPU2 selected

0011: CPU2.CLA1 selected

0100: CM selected

In single Core systems only GPBCSEL[0] is used. Writing to GPBCSEL[1] does not have effect and it will default to corresponding CPU or CLA control selection.

Return to the [Summary Table](#).

GPIO C Qualifier Select 2 Register (GPIO80 to 95)

Input qualification type:

0,0 Sync

0,1 Qualification (3 samples)

1,0 Qualification (6 samples)

1,1 Async (no Sync or Qualification)

15.10.3.39 GPCMUX1 Register (Offset = 86h) [Reset = 00000000h]

GPCMUX1 is shown in [Figure 15-42](#) and described in [Table 15-53](#).

Return to the [Summary Table](#).

GPIO C Mux 1 Register (GPIO64 to 79)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

Figure 15-42. GPCMUX1 Register

15.10.3.41 GPCDIR Register (Offset = 8Ah) [Reset = 00000000h]

GPCDIR is shown in [Figure 15-44](#) and described in [Table 15-55](#).

Return to the [Summary Table](#).

GPIO C Direction Register (GPIO64 to 95)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

Figure 15-44. GPCDIR Register

15.10.3.43 GPCINV Register (Offset = 90h) [Reset = 00000000h]

GPCINV is shown in [Figure 15-46](#) and described in [Table 15-57](#).

Return to the [Summary Table](#).

GPIO C Input Polarity Invert Registers (GPIO64 to 95)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

Figure 15-46. GPCINV Register

15.10.3.44 GPCODR Register (Offset = 92h) [Reset = 00000000h]

GPCODR is shown in [Figure 15-47](#) and described in [Table 15-58](#).

Return to the [Summary Table](#).

GPIO Open Drain Output Register

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

CAUTION: Open Drain mode is not supported on this device. Keep this bit as 0. Open drain can be emulated by writing 0 to GPxDAT and enabling or disabling the output buffer with GPXDIR. (Peripherals such as I2C support Open Drain mode without issue).

Table 15-60. GPCGMUX2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	GPIO95	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
29-28	GPIO94	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
27-26	GPIO93	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
25-24	GPIO92	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
23-22	GPIO91	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
21-20	GPIO90	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
19-18	GPIO89	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
17-16	GPIO88	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
15-14	GPIO87	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
13-12	GPIO86	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
11-10	GPIO85	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
9-8	GPIO84	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
7-6	GPIO83	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
5-4	GPIO82	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
3-2	GPIO81	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
1-0	GPIO80	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.47 GPCCSEL1 Register (Offset = A8h) [Reset = 00000000h]

GPCCSEL1 is shown in [Figure 15-50](#) and described in [Table 15-61](#).

Return to the [Summary Table](#).

GPIO C Core Select Register (GPIO0 to 7)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

0000: CPU1 selected

0001: CPU1.CLA1 selected

0010: CPU2 selected

0011: CPU2.CLA1 selected

0100: CM selected

In single Core systems only GPCCSEL[0] is used. Writing to GPCCSEL[1] does not have effect and it will default to corresponding CPU or CLA control selection.

Figure 15-50. GPCCSEL1 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15.10.3.58 GPDDIR Register (Offset = CAh) [Reset = 00000000h]

GPDDIR is shown in [Figure 15-61](#) and described in [Table 15-72](#).

Return to the [Summary Table](#).

GPIO D Direction Register (GPIO96 to 127)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

15.10.3.59 GPDPU Register (Offset = CCh) [Reset = FFFFFFFFh]

GPDPU is shown in [Figure 15-62](#) and described in [Table 15-73](#).

Return to the [Summary Table](#).

GPIO D Pull Up Disable Register (GPIO96 to 127)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

15.10.3.60 GPDINV Register (Offset = D0h) [Reset = 00000000h]

GPDINV is shown in [Figure 15-63](#) and described in [Table 15-74](#).

Return to the [Summary Table](#).

GPIO D Input Polarity Invert Registers (GPIO96 to 127)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

15.10.3.61 GPDODR Register (Offset = D2h) [Reset = 00000000h]

GPDODR is shown in [Figure 15-64](#) and described in [Table 15-75](#).

Return to the [Summary Table](#).

GPIO Open Drain Output Register

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

CAUTION: Open Drain mode is not supported on this device. Keep this bit as 0. Open drain can be emulated by writing 0 to GPxDAT and enabling or disabling the output buffer with GPXDIR. (Peripherals such as I2C support Open Drain mode without issue).

Table 15-77. GPDGMUX2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	GPIO127	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
29-28	GPIO126	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
27-26	GPIO125	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
25-24	GPIO124	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
23-22	GPIO123	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
21-20	GPIO122	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
19-18	GPIO121	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
17-16	GPIO120	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
15-14	GPIO119	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
13-12	GPIO118	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
11-10	GPIO117	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn
9-8	GPIO116	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

Table 15-77. GPDGMUX2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	GPIO115	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRStn
5-4	GPIO114	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRStn
3-2	GPIO113	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRStn
1-0	GPIO112	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRStn

15.10.3.64 GPDCSEL1 Register (Offset = E8h) [Reset = 00000000h]

GPDCSEL1 is shown in [Figure 15-67](#) and described in [Table 15-78](#).

Return to the [Summary Table](#).

GPIO D Core Select Register (GPIO0 to 7)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

0000: CPU1 selected

0001: CPU1.CLA1 selected

0010: CPU2 selected

0011: CPU2.CLA1 selected

0100: CM selected

In single Core systems only GPDCSEL[0] is used. Writing to GPDCSEL[1] does not have effect and it will default to corresponding CPU or CLA control selection.

Figure 15-67. GPDCSEL1 Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15.10.3.73 GPEMUX1 Register (Offset = 106h) [Reset = 00000000h]

GPEMUX1 is shown in [Figure 15-76](#) and described in [Table 15-87](#).

Return to the [Summary Table](#).

GPIO E Mux 1 Register (GPIO128 to 143)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

15.10.3.75 GPEDIR Register (Offset = 10Ah) [Reset = 00000000h]

GPEDIR is shown in [Figure 15-78](#) and described in [Table 15-89](#).

Return to the [Summary Table](#).

GPIO E Direction Register (GPIO128 to 159)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

Figure 15-78. GPEDIR Register

15.10.3.77 GPEINV Register (Offset = 110h) [Reset = 00000000h]

GPEINV is shown in [Figure 15-80](#) and described in [Table 15-91](#).

Return to the [Summary Table](#).

GPIO E Input Polarity Invert Registers (GPIO128 to 159)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

15.10.3.78 GPEODR Register (Offset = 112h) [Reset = 00000000h]

GPEODR is shown in [Figure 15-81](#) and described in [Table 15-92](#).

Return to the [Summary Table](#).

GPIO Open Drain Output Register

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

CAUTION: Open Drain mode is not supported on this device. Keep this bit as 0. Open drain can be emulated by writing 0 to GPxDAT and enabling or disabling the output buffer with GPxDIR. (Peripherals such as I2C support Open Drain mode without issue).

15.10.3.83 GPECSEL3 Register (Offset = 12Ch) [Reset = 00000000h]

GPECSEL3 is shown in [Figure 15-86](#) and described in [Table 15-97](#).

Return to the [Summary Table](#).

GPIO E Core Select Register (GPIO16 to 23)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

0000: CPU1 selected

0001: CPU1.CLA1 selected

0010: CPU2 selected

0011: CPU2.CLA1 selected

0100: CM selected

In single Core systems only GPECSEL[0] is used. Writing to GPECSEL[1] does not have effect and it will default to corresponding CPU or CLA control selection.

1-0	GPIO160	R/W	0h	Defines pin-muxing selection for GPIO Reset type: CPU1.SYSRSn

15.10.3.90 GPFDIR Register (Offset = 14Ah) [Reset = 00000000h]

GPFDIR is shown in [Figure 15-93](#) and described in [Table 15-104](#).

Return to the [Summary Table](#).

GPIO F Direction Register (GPIO160 to 168)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

15.10.3.93 GPFODR Register (Offset = 152h) [Reset = 00000000h]

GPFODR is shown in [Figure 15-96](#) and described in [Table 15-107](#).

Return to the [Summary Table](#).

GPIO Open Drain Output Register

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

CAUTION: Open Drain mode is not supported on this device. Keep this bit as 0. Open drain can be emulated by writing 0 to GPxDAT and enabling or disabling the output buffer with GPxDIR. (Peripherals such as I2C support Open Drain mode without issue).

2Ch	GPFCLEAR	GPIO F Data Clear Register (GPIO160 to 168)		Go
2Eh	GPFTOGGLE	GPIO F Data Toggle Register (GPIO160 to 168)		Go

Complex bit access types are encoded to fit into small table cells. Table 15-114 shows the codes that are used for access types in this section.

Table 15-114. GPIO_DATA_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

Table 15-114. GPIO_DATA_REGS Access Type Codes (continued)

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.10.4.1 GPADAT Register (Offset = 0h) [Reset = 00000000h]

GPADAT is shown in [Figure 15-102](#) and described in [Table 15-115](#).

Return to the [Summary Table](#).

GPIO A Data Register (GPIO0 to 31)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.4 GPATOGGLE Register (Offset = 6h) [Reset = 00000000h]

GPATOGGLE is shown in [Figure 15-105](#) and described in [Table 15-118](#).

Return to the [Summary Table](#).

GPIO A Data Toggle Register (GPIO0 to 31)

Writing a 1 will toggle GPIO0 output data latch 1 to 0 or 0 to 1.

Writes of 0 are ignored.

Always reads back a 0.

15.10.4.5 GPBDAT Register (Offset = 8h) [Reset = 00000000h]

GPBDAT is shown in [Figure 15-106](#) and described in [Table 15-119](#).

Return to the [Summary Table](#).

GPIO B Data Register (GPIO32 to 63)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode

A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.9 GPCDAT Register (Offset = 10h) [Reset = 00000000h]

GPCDAT is shown in [Figure 15-110](#) and described in [Table 15-123](#).

Return to the [Summary Table](#).

GPIO C Data Register (GPIO64 to 95)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode

A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.13 GPDDAT Register (Offset = 18h) [Reset = 00000000h]

GPDDAT is shown in [Figure 15-114](#) and described in [Table 15-127](#).

Return to the [Summary Table](#).

GPIO D Data Register (GPIO96 to 127)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode

A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.14 GPDSET Register (Offset = 1Ah) [Reset = 00000000h]

GPDSET is shown in Figure 15-115 and described in Table 15-128.

Return to the [Summary Table](#).

GPIO D Data Set Register (GPIO96 to 127)

Writing a 1 will force GPIO output data latch to 1.

Writes of 0 are ignored.

Always reads back a 0.

15.10.4.17 GPEDAT Register (Offset = 20h) [Reset = 00000000h]

GPEDAT is shown in [Figure 15-118](#) and described in [Table 15-131](#).

Return to the [Summary Table](#).

GPIO E Data Register (GPIO128 to 159)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode

A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.21 GPFDAT Register (Offset = 28h) [Reset = 00000000h]

GPFDAT is shown in [Figure 15-122](#) and described in [Table 15-135](#).

Return to the [Summary Table](#).

GPIO F Data Register (GPIO160 to 168)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode

A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

15.10.4.23 GPF CLEAR Register (Offset = 2Ch) [Reset = 00000000h]

GPF CLEAR is shown in [Figure 15-124](#) and described in [Table 15-137](#).

Return to the [Summary Table](#).

GPIO F Data Clear Register (GPIO160 to 168)

Writing a 1 will force GPIO0 output data latch to 0.

Writes of 0 are ignored.

Always reads back a 0.

15.10.5 GPIO_DATA_READ_REGS Registers

Table 15-139 lists the memory-mapped registers for the GPIO_DATA_READ_REGS registers. All register offset addresses not listed in Table 15-139 should be considered as reserved locations and the register contents should not be modified.

Table 15-139. GPIO_DATA_READ_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GPADAT_R	GPIO A Data Read Register		Go
2h	GPBDAT_R	GPIO B Data Read Register		Go
4h	GPCDAT_R	GPIO C Data Read Register		Go
6h	GPDDAT_R	GPIO D Data Read Register		Go
8h	GPEDAT_R	GPIO E Data Read Register		Go
Ah	GPFDAT_R	GPIO F Data Read Register		Go

Complex bit access types are encoded to fit into small table cells. Table 15-140 shows the codes that are used for access types in this section.

Table 15-140. GPIO_DATA_READ_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.10.5.1 GPADAT_R Register (Offset = 0h) [Reset = 00000000h]

GPADAT_R is shown in [Figure 15-126](#) and described in [Table 15-141](#).

Return to the [Summary Table](#).

GPIO A Data Read Register.

Returns the contents of GPADAT register on a read, write to this register has no effect

Figure 15-126. GPADAT_R Register

Complex bit access types are encoded to fit into small table cells. Table 15-148 shows the codes that are used for access types in this section.

Table 15-148. CM_GPIO_DATA_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

Table 15-148. CM_GPIO_DATA_REGS Access Type Codes (continued)

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.10.6.1 GPADAT Register (Offset = 0h) [Reset = 00000000h]

GPADAT is shown in [Figure 15-132](#) and described in [Table 15-149](#).

Return to the [Summary Table](#).

GPIO A Data Register (GPIO0 to 31)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.

15.10.6.5 GPBDAT Register (Offset = 10h) [Reset = 00000000h]

GPBDAT is shown in [Figure 15-136](#) and described in [Table 15-153](#).

Return to the [Summary Table](#).

GPIO B Data Register (GPIO32 to 63)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.

15.10.6.8 GPBTOGGLE Register (Offset = 1Ch) [Reset = 00000000h]

GPBTOGGLE is shown in [Figure 15-139](#) and described in [Table 15-156](#).

Return to the [Summary Table](#).

GPIO B Data Toggle Register (GPIO32 to 63)

Writing a 1 will toggle GPIO0 output data latch 1 to 0 or 0 to 1.

Writes of 0 are ignored.

Always reads back a 0.

15.10.6.9 GPCDAT Register (Offset = 20h) [Reset = 00000000h]

GPCDAT is shown in [Figure 15-140](#) and described in [Table 15-157](#).

Return to the [Summary Table](#).

GPIO C Data Register (GPIO64 to 95)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the

15.10.6.13 GPDDAT Register (Offset = 30h) [Reset = 00000000h]

GPDDAT is shown in [Figure 15-144](#) and described in [Table 15-161](#).

Return to the [Summary Table](#).

GPIO D Data Register (GPIO96 to 127)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the GPIODAT register.

15.10.6.17 GPEDAT Register (Offset = 40h) [Reset = 00000000h]

GPEDAT is shown in [Figure 15-148](#) and described in [Table 15-165](#).

Return to the [Summary Table](#).

GPIO E Data Register (GPIO128 to 159)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the

15.10.6.21 GPFDAT Register (Offset = 50h) [Reset = 00000000h]

GPFDAT is shown in [Figure 15-152](#) and described in [Table 15-169](#).

Return to the [Summary Table](#).

GPIO F Data Register (GPIO160 to 191)

Reading this register indicates the current status of the GPIO pin, irrespective of which mode the pin is in.

Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode, otherwise the value written is latched but ignored. The state of the output register latch will remain in its current state until the next write operation. A system reset will clear all bits and latched values to zero.

DESIGNER NOTE:

[1] Reading the GPIODAT register should reflect the state of the PIN (after qualification), not the state of the output latch of the

15.10.6.23 GPF CLEAR Register (Offset = 58h) [Reset = 00000000h]

GPF CLEAR is shown in [Figure 15-154](#) and described in [Table 15-171](#).

Return to the [Summary Table](#).

GPIO F Data Clear Register (GPIO160 to 191)

Writing a 1 will force GPIO0 output data latch to 0.

Writes of 0 are ignored.

Always reads back a 0.

15.10.7 CM_GPIO_DATA_READ_REGS Registers

Table 15-173 lists the memory-mapped registers for the CM_GPIO_DATA_READ_REGS registers. All register offset addresses not listed in Table 15-173 should be considered as reserved locations and the register contents should not be modified.

Table 15-173. CM_GPIO_DATA_READ_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	GPADAT_R	GPIO A Data Read Register		Go
4h	GPBDAT_R	GPIO B Data Read Register		Go
8h	GPCDAT_R	GPIO C Data Read Register		Go
Ch	GPDDAT_R	GPIO D Data Read Register		Go
10h	GPEDAT_R	GPIO E Data Read Register		Go
14h	GPFDAT_R	GPIO F Data Read Register		Go
18h	GPGDAT_R	GPIO G Data Read Register		Go
1Ch	GPHDAT_R	GPIO H Data Read Register		Go

Complex bit access types are encoded to fit into small table cells. Table 15-174 shows the codes that are used for access types in this section.

Table 15-174. CM_GPIO_DATA_READ_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

15.10.7.1 GPADAT_R Register (Offset = 0h) [Reset = 00000000h]

GPADAT_R is shown in [Figure 15-156](#) and described in [Table 15-175](#).

Return to the [Summary Table](#).

GPIO A Data Read Register.

Returns the contents of GPADAT register on a read, write to this register has no effect

Chapter 16

Interprocessor Communication (IPC)

The Interprocessor Communications (IPC) module allows communication between the two CPU subsystems.

16.1 Introduction.....	1985
16.2 Message RAMs.....	1985
16.3 IPC Flags and Interrupts.....	1988
16.4 IPC Command Registers.....	1988
16.5 Free-Running Counter.....	1988
16.6 IPC Communication Protocol.....	1989
16.7 Software.....	1990
16.8 IPC Registers.....	1993

16.1 Introduction

This section details the IPC features that each CPU can use to request and share information. The IPC features are:

- Message RAMs
- IPC flags and interrupts
- IPC command registers
- Flash pump semaphore
- Clock configuration semaphore
- Free-running counter

All IPC features are independent of each other, and most do not require any specific data format.

There are also two registers for boot mode and status communication. Please refer to the boot ROM chapter for more information on these registers.

This device has three cores (one M4 core, two C28x (CPU1, CPU2) cores). So, we have three different IPC modules

- CPU1_TO_CPU2 IPC architecture. See [Figure 16-1](#).
- CPUx_TO_CM IPC architecture (where x = 1, 2). See [Figure 16-2](#).

16.2 Message RAMs

There are two dedicated 2-kB blocks of message RAM. Each CPU and the DMA have read and write access to one RAM and read-only access to the other RAM, as shown in [Table 16-1](#), [Table 16-2](#), and [Table 16-3](#).

Reading or writing a message RAM does not trigger any events on the remote CPU.

Table 16-1. CPU1-CM IPC Message RAM Read / Write Access

	CPU1	CPU1.DMA	M4	M4-μDMA	Ethernet
CPU1TOCMMSGGRAM	Read / Write	Read / Write	Read / Debug writes are allowed	Read	Read
CMTOCPU1MSGGRAM	Read / Debug writes are allowed	Read	Read / Write	Read / Write	Read / Write

Table 16-2. CPU2-CM IPC Message RAM Read / Write Access

	CPU2	CPU2.DMA	M4	M4-μDMA	Ethernet
CPU2TOCMMSGGRAM	Read / Write	Read / Write	Read / Debug writes are allowed	Read	Read
CMTOCPU2MSGGRAM	Read / Debug writes are allowed	Read	Read / Write	Read / Write	Read / Write

Table 16-3. CPU1-CPU2 IPC Message RAM Read / Write Access

	CPU1	CPU1.DMA	CPU2	CPU2.DMA
CPU1TOCPU2MSGGRAM	Read / Write	Read / Write	Read / Debug writes are allowed	Read
CPU2TOCPU1MSGGRAM	Read / Debug writes are allowed	Read	Read / Write	Read / Write

Figure 16-2. CPuX_to_CM IPC Module

16.3 IPC Flags and Interrupts

There are 32 IPC event signals in each direction between the CPU pairs. These signals can be used for flag-based event polling. With the C28x core, four of them (IPC0 - IPC3) can be configured to generate IPC interrupts on the remote CPU. With the Arm® Cortex®-M4 core, eight of them (IPC0-IPC7) can be configured to generate IPC interrupt on the remote CPU.

16.4 IPC Command Registers

The IPC command registers provide a simple and flexible way for the CPUs to exchange more complex messages. Each CPU has eight dedicated registers; four for sending messages and four for receiving messages. The register names were chosen to support a simple command/response protocol, but can be used for any purpose. Only the read/write permissions are determined by hardware; the data format is entirely software-defined.

For sending messages, each CPU has three writable registers and one read-only register. Those same registers are accessible on the remote CPU as three read-only registers and one writable register. [Table 16-4](#) shows the command registers.

Table 16-4. IPC Command Registers

Local Register Name	Local CPU	Remote CPU	Remote Register Name
IPCSENDCOM	R/W	R	IPCRECVCOM
IPCSENDADDR	R/W	R	IPCRECVADDR
IPCSENDDATA	R/W	R	IPCRECVDATA
IPCREPLY	R	R/W	IPCREPLY

16.5 Free-Running Counter

A 64-bit free-running counter is present in the device and can be used to timestamp IPC events between processors. The counter is clocked by PLLSYSCLK and reset by SYSRSn. The counter is implemented as two 32-bit registers, IPCCOUNTERH and IPCCOUNTERL. When IPCCOUNTERL is read, the value of IPCCOUNTERH is saved. A subsequent read to IPCCOUNTERH returns this saved value. Therefore, the user must always read IPCCOUNTERL first then read IPCCOUNTERH next. This design prevents race conditions due to IPCCOUNTERL overflowing between reads of the two registers.

The free-running counter stops only when emulation is suspended (when debugger hits a breakpoint) on all CPUs. If any core is executing, the counter runs.

16.6 IPC Communication Protocol

This section describes the hardware support options for IPC communication between the two CPUs. These options can be used independently or in combination. All flag definitions and data formats are entirely user-defined.

- The flag system supports event-based communication via interrupts and register polling.
 - CPUx can raise an IPC event by writing to any of the 32 bits of the IPCSET register. This sets the corresponding bits in the CPUx IPCFLG register and CPUy IPCSTS register.
 - CPUy can signal the response to the event by setting the appropriate bit in the IPCACK register. This clears the corresponding bits in the CPUx IPCFLG register and the CPUy IPCSTS register.
 - If CPUx needs to cancel an event, CPUx can set the appropriate bit in the IPCCLR register. This has the same effect as CPUy writing to IPCACK.
 - For the CPU1_to_CPU2 IPC module, flags 0–3 (set using IPCSET[3:0]) fire interrupts to the remote CPU. The remote CPU must configure the ePIE module properly to receive an IPC interrupt. Flags 4–31 (set using IPCSET[31:4]) do not produce interrupts. Multiple flags can be set, acknowledged, and cleared simultaneously.
 - For CPU1_to_CM (or) CPU2_to_CM IPC module, flags 0-7 (set using IPCSET[7:0]) fire interrupts to the remote CPU. The remote CPU must configure the NVIC/ePIE module properly to receive an IPC interrupt. Flags 8–31 (set using IPCSET[31:8]) do not produce interrupts. Multiple flags can be set, acknowledged, and cleared simultaneously.
- The command registers support sending several distinct pieces of information and are named COM, ADDR, DATA, and REPLY for convenience only and can hold whatever data the application needs.
 - CPUx can write data to the IPCSENDCOM, IPCSENDADDR, and IPCSENDATA registers. CPUy receives these in the IPCRECVCOM, IPCRECVADDR, and IPCRECVDATA registers.
 - CPUy can respond by writing to the IPCREPLY register. CPUx receives this data in the IPCREPLY register.
- There is an additional pair of command-like registers offered for boot-time IPC or any other convenient use — IPCBOOTMODE and IPCBOOTSTS. Both CPUs can read these registers. CPUx can only write to IPCBOOTMODE, and CPUy can only write to IPCBOOTSTS.
- There are two shared memories for passing large amounts of data between the CPUs. Each CPU has a writable memory for sending data and a read-only memory for receiving data.
- Here is an example of how to use these features together. CPUx needs some data from CPUy's LS RAM. The data is at CPUy address 0x9400 and is 0x80 16-bit words long. The protocol can be implemented like this:
 - CPUx writes 0x1 to IPCSENDCOM, defined in software to mean "copy data from address". CPUx writes the address (0x9400) to IPCSENDADDR and the data length (0x80) to IPCSENDATA.
 - CPUx writes to IPCSET[3] and IPCSET[16]. Here, IPC flag 3 is configured to send an interrupt and IPCSET[16] is defined in software to indicate an incoming command. CPUx begins polling for IPCFLG[3] to go low.
 - CPUy receives the interrupt. In the interrupt handler, CPUy checks IPCSTS, finds that flag 16 is set, and runs a command processor.
 - CPUy reads the command (0x1) from IPCRECVCOM, the address (0x9400) from IPCRECVADDR, and the data length (0x80) from IPCRECVDATA. CPUy then copies the LS RAM data to an empty space in the writable shared memory starting at offset 0x210.
 - CPUy writes the shared memory address (0x210) to the IPCLOCALREPLY register. CPUy then writes to IPCACK[16] and IPCACK[3] to clear the flags and indicate completion of the command. CPUy's work is done.
 - CPUx sees IPCFLG[3] go low. CPUx reads IPCREMOTEPLY to get the shared memory offset of the copied data (0x210).

16.7 Software

16.7.1 IPC Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:
C2000Ware_VERSION#/driverlib/DEVICE_GPN/examples/CORE_IF_MULTICORE/ipc

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](https://dev.ti.com/C2000Ware/Examples).

16.7.1.1 IPC basic message passing example with interrupt - C28X_CM

FILE: ipc_ex1_basic_c28x1.c

This example demonstrates how to configure IPC and pass information from C28x to CM core without message queues. It is recommended to run the C28x1 core first, followed by the CM core.

External Connections

- None.

Watch Variables

- pass

16.7.1.2 IPC basic message passing example with interrupt - C28X_CM

FILE: ipc_ex1_basic_cm.c

This example demonstrates how to configure IPC and pass information from C28x to CM core without message queues. It is recommended to run the C28x1 core first, followed by the CM core.

External Connections

- None.

Watch Variables

- None.

16.7.1.3 IPC basic message passing example with interrupt - C28X_DUAL

FILE: ipc_ex1_basic_c28x1.c

This example demonstrates how to configure IPC and pass information from C28x1 to C28x2 core without message queues. It is recommended to run the C28x1 core first, followed by the C28x2 core.

External Connections

- None.

Watch Variables

- pass

16.7.1.4 IPC basic message passing example with interrupt - C28X_DUAL

FILE: ipc_ex1_basic_c28x2.c

This example demonstrates how to configure IPC and pass information from C28x1 to C28x2 core without message queues. It is recommended to run the C28x1 core first, followed by the C28x2 core.

External Connections

- None.

Watch Variables

- None.

16.7.1.5 IPC message passing example with interrupt and message queue - C28X_CM

FILE: ipc_ex2_msgqueue_c28x1.c

This example demonstrates how to configure IPC and pass information from C28x to CM core with message queues. It is recommended to run the C28x1 core first, followed by the CM core.

External Connections

- None.

Watch Variables

- pass

16.7.1.6 IPC message passing example with interrupt and message queue - C28X_CM

FILE: ipc_ex2_msgqueue_cm.c

This example demonstrates how to configure IPC and pass information from C28x to CM core with message queues. It is recommended to run the C28x1 core first, followed by the CM core.

External Connections

26	IPC26	R	0h	Indicates to CPU1 if the IPC26 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC26 bit. 0: No IPC26 event was set by CPU2 1: An IPC26 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
25	IPC25	R	0h	Indicates to CPU1 if the IPC25 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC25 bit. 0: No IPC25 event was set by CPU2 1: An IPC25 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
24	IPC24	R	0h	Indicates to CPU1 if the IPC24 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC24 bit. 0: No IPC24 event was set by CPU2 1: An IPC24 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
23	IPC23	R	0h	Indicates to CPU1 if the IPC23 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC23 bit. 0: No IPC23 event was set by CPU2 1: An IPC23 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
22	IPC22	R	0h	Indicates to CPU1 if the IPC22 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC22 bit. 0: No IPC22 event was set by CPU2 1: An IPC22 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
21	IPC21	R	0h	Indicates to CPU1 if the IPC21 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC21 bit. 0: No IPC21 event was set by CPU2 1: An IPC21 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
20	IPC20	R	0h	Indicates to CPU1 if the IPC20 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC20 bit. 0: No IPC20 event was set by CPU2 1: An IPC20 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-10. CPU2TOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CPU1 if the IPC19 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC19 bit. 0: No IPC19 event was set by CPU2 1: An IPC19 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
18	IPC18	R	0h	Indicates to CPU1 if the IPC18 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC18 bit. 0: No IPC18 event was set by CPU2 1: An IPC18 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
17	IPC17	R	0h	Indicates to CPU1 if the IPC17 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC17 bit. 0: No IPC17 event was set by CPU2 1: An IPC17 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
16	IPC16	R	0h	Indicates to CPU1 if the IPC16 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC16 bit. 0: No IPC16 event was set by CPU2 1: An IPC16 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
15	IPC15	R	0h	Indicates to CPU1 if the IPC15 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC15 bit. 0: No IPC15 event was set by CPU2 1: An IPC15 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
14	IPC14	R	0h	Indicates to CPU1 if the IPC14 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC14 bit. 0: No IPC14 event was set by CPU2 1: An IPC14 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
13	IPC13	R	0h	Indicates to CPU1 if the IPC13 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC13 bit. 0: No IPC13 event was set by CPU2 1: An IPC13 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
12	IPC12	R	0h	Indicates to CPU1 if the IPC12 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC12 bit. 0: No IPC12 event was set by CPU2 1: An IPC12 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-10. CPU2TOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CPU1 if the IPC11 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC11 bit. 0: No IPC11 event was set by CPU2 1: An IPC11 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
10	IPC10	R	0h	Indicates to CPU1 if the IPC10 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC10 bit. 0: No IPC10 event was set by CPU2 1: An IPC10 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
9	IPC9	R	0h	Indicates to CPU1 if the IPC9 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC9 bit. 0: No IPC9 event was set by CPU2 1: An IPC9 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
8	IPC8	R	0h	Indicates to CPU1 if the IPC8 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC8 bit. 0: No IPC8 event was set by CPU2 1: An IPC8 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
7	IPC7	R	0h	Indicates to CPU1 if the IPC7 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC7 bit. 0: No IPC7 event was set by CPU2 1: An IPC7 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
6	IPC6	R	0h	Indicates to CPU1 if the IPC6 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC6 bit. 0: No IPC6 event was set by CPU2 1: An IPC6 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
5	IPC5	R	0h	Indicates to CPU1 if the IPC5 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC5 bit. 0: No IPC5 event was set by CPU2 1: An IPC5 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
4	IPC4	R	0h	Indicates to CPU1 if the IPC4 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC4 bit. 0: No IPC4 event was set by CPU2 1: An IPC4 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-10. CPU2TOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CPU1 if the IPC3 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC3 bit. 0: No IPC3 event was set by CPU2 1: An IPC3 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
2	IPC2	R	0h	Indicates to CPU1 if the IPC2 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC2 bit. 0: No IPC2 event was set by CPU2 1: An IPC2 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
1	IPC1	R	0h	Indicates to CPU1 if the IPC1 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC1 bit. 0: No IPC1 event was set by CPU2 1: An IPC1 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
0	IPC0	R	0h	Indicates to CPU1 if the IPC0 event flag was set by CPU2. Reflects the state of CPU2TOCPU1IPCFLG.IPC0 bit. 0: No IPC0 event was set by CPU2 1: An IPC0 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

16.8.3.3 CPU1TOCPU2IPCSET Register (Offset = 4h) [Reset = 00000000h]

CPU1TOCPU2IPCSET is shown in [Figure 16-5](#) and described in [Table 16-11](#).

Return to the [Summary Table](#).

Set CPU1TOCPU2IPCFLG register

Table 16-11. CPU1TOCPU2IPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC31 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC30 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC29 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC28 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC27 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-11. CPU1TOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC26 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC25 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC24 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC23 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC22 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC21 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC20 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC19 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC18 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-11. CPU1TOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC17 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC16 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC15 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC14 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC13 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC12 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC11 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC10 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC9 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-11. CPU1TOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC8 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC7 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC6 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC5 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC4 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC3 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC2 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC1 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCPU2IPCFLG.IPC0 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

16.8.3.4 CPU1TOCPU2IPCCLR Register (Offset = 6h) [Reset = 00000000h]

CPU1TOCPU2IPCCLR is shown in [Figure 16-6](#) and described in [Table 16-12](#).

Return to the [Summary Table](#).

Clear CPU1TOCPU2IPCFLG register

Table 16-12. CPU1TOCPU2IPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC31 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC30 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC29 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC28 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC27 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-12. CPU1TOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC26 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC25 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC24 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC23 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC22 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC21 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC20 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC19 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC18 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-12. CPU1TOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC17 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC16 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC15 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC14 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC13 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC12 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC11 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC10 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCCLR.IPC9 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSTn

Table 16-12. CPU1TOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC8 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC7 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC6 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC5 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC4 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC3 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC2 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC1 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCPU2IPCFLG.IPC0 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRStn

16.8.3.5 CPU1TOCPU2IPCFLG Register (Offset = 8h) [Reset = 00000000h]

CPU1TOCPU2IPCFLG is shown in [Figure 16-7](#) and described in [Table 16-13](#).

Return to the [Summary Table](#).

RESERVED														SEM	
R-0-0h														R/W-0h	

Table 16-26. PUMPREQUEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	KEY	R-0/W	0h	In order to write to the semaphore bits, 0x5a5a must be written to these key bits at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every semaphore change. Reset type: CPU1.SYSRSn
15-2	RESERVED	R-0	0h	Reserved
1-0	SEM	R/W	0h	These bits decide which CPU has control of the flash pump, which allows write access to the flash memory. The possible values are: 00: Read-only state. CPU1 has control of the pump, but CPU2 and CM may seize control at any time. 01: CPU2 has exclusive control of the pump and of these semaphore bits. CPU2 can relinquish control by setting the bits back to 00. 10: CPU1 has exclusive control of the pump and of these semaphore bits. CPU1 can relinquish control by setting the bits back to 00. 11: CM has exclusive control of the pump and of these semaphore bits. CM can relinquish control by setting the bits back to 00. Going from 01->10/11 or 10->01/11 or 11->01/10 is not allowed. The semaphore bits [1:0] must be written along with the correct key in bits [31:16]. Note: This field will be reset by the respective CPU resets depending on who owns the PUMP. For example if CPU2 is owning the pump, then CPU2SYSRSN would reset this field. Reset type: CPU1.SYSRSn, CPU2.SYSRSn, CM.RESETn

16.8.4 CPU1TOCPU2_IPC_REGS_CPU2VIEW Registers

Table 16-27 lists the memory-mapped registers for the CPU1TOCPU2_IPC_REGS_CPU2VIEW registers. All register offset addresses not listed in Table 16-27 should be considered as reserved locations and the register contents should not be modified.

Table 16-27. CPU1TOCPU2_IPC_REGS_CPU2VIEW Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	CPU2TOCPU1IPCACK	CPU2TOCPU1IPCACK Register		Go
2h	CPU1TOCPU2IPCSTS	CPU1TOCPU2IPCSTS Register		Go
4h	CPU2TOCPU1IPCSET	CPU2TOCPU1IPCSET Register		Go
6h	CPU2TOCPU1IPCCLR	CPU2TOCPU1IPCCLR Register		Go
8h	CPU2TOCPU1IPCFLG	CPU2TOCPU1IPCFLG Register		Go
Ch	IPCCOUNTERL	IPCCOUNTERL Register		Go
Eh	IPCCOUNTERH	IPCCOUNTERH Register		Go
10h	CPU1TOCPU2IPCRCVCOM	CPU1TOCPU2IPCRCVCOM Register		Go
12h	CPU1TOCPU2IPCRCVADDR	CPU1TOCPU2IPCRCVADDR Register		Go
14h	CPU1TOCPU2IPCRCVDATA	CPU1TOCPU2IPCRCVDATA Register		Go
16h	CPU2TOCPU1IPCReply	CPU2TOCPU1IPCReply Register		Go
18h	CPU2TOCPU1IPCSENDCOM	CPU2TOCPU1IPCSENDCOM Register		Go
1Ah	CPU2TOCPU1IPCSENDADDR	CPU2TOCPU1IPCSENDADDR Register		Go
1Ch	CPU2TOCPU1IPCSENDDATA	CPU2TOCPU1IPCSENDDATA Register		Go
1Eh	CPU1TOCPU2IPCReply	CPU1TOCPU2IPCReply Register		Go
20h	CPU2TOCPU1IPCBOOTSTS	CPU2TOCPU1IPCBOOTSTS Register		Go
22h	CPU1TOCPU2IPCBOOTMODE	CPU1TOCPU2IPCBOOTMODE Register		Go
24h	PUMPREQUEST	PUMPREQUEST Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 16-28 shows the codes that are used for access types in this section.

**Table 16-28. CPU1TOCPU2_IPC_REGS_CPU2VIEW
Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

16.8.4.1 CPU2TOCPU1IPCAK Register (Offset = 0h) [Reset = 00000000h]

CPU2TOCPU1IPCAK is shown in [Figure 16-21](#) and described in [Table 16-29](#).

Return to the [Summary Table](#).

Table 16-29. CPU2TOCPU1IPCAK Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC31 bit. Reset type: CPU2.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC30 bit. Reset type: CPU2.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC29 bit. Reset type: CPU2.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC28 bit. Reset type: CPU2.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC27 bit. Reset type: CPU2.SYSRSn
26	IPC26	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC26 bit. Reset type: CPU2.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC25 bit. Reset type: CPU2.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC24 bit. Reset type: CPU2.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC23 bit. Reset type: CPU2.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC22 bit. Reset type: CPU2.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC21 bit. Reset type: CPU2.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC20 bit. Reset type: CPU2.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC19 bit. Reset type: CPU2.SYSRSn

Table 16-29. CPU2TOCPU1IPCACK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	IPC18	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC18 bit. Reset type: CPU2.SYSRSn
17	IPC17	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC17 bit. Reset type: CPU2.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC16 bit. Reset type: CPU2.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC15 bit. Reset type: CPU2.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC14 bit. Reset type: CPU2.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC13 bit. Reset type: CPU2.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC12 bit. Reset type: CPU2.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC11 bit. Reset type: CPU2.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC10 bit. Reset type: CPU2.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC9 bit. Reset type: CPU2.SYSRSn
8	IPC8	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC8 bit. Reset type: CPU2.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC7 bit. Reset type: CPU2.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC6 bit. Reset type: CPU2.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC5 bit. Reset type: CPU2.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC4 bit. Reset type: CPU2.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC3 bit. Reset type: CPU2.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC2 bit. Reset type: CPU2.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC1 bit. Reset type: CPU2.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCPU2IPCFLG.IPC0 bit. Reset type: CPU2.SYSRSn

16.8.4.2 CPU1TOCPU2IPCSTS Register (Offset = 2h) [Reset = 00000000h]

CPU1TOCPU2IPCSTS is shown in [Figure 16-22](#) and described in [Table 16-30](#).

Return to the [Summary Table](#).

Table 16-30. CPU1TOCPU2IPCSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R	0h	Indicates to CPU2 if the IPC31 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC31 bit. 0: No IPC31 event was set by CPU1 1: An IPC31 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R	0h	Indicates to CPU2 if the IPC30 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC30 bit. 0: No IPC30 event was set by CPU1 1: An IPC30 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R	0h	Indicates to CPU2 if the IPC29 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC29 bit. 0: No IPC29 event was set by CPU1 1: An IPC29 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R	0h	Indicates to CPU2 if the IPC28 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC28 bit. 0: No IPC28 event was set by CPU1 1: An IPC28 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-30. CPU1TOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	IPC27	R	0h	Indicates to CPU2 if the IPC27 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC27 bit. 0: No IPC27 event was set by CPU1 1: An IPC27 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
26	IPC26	R	0h	Indicates to CPU2 if the IPC26 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC26 bit. 0: No IPC26 event was set by CPU1 1: An IPC26 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R	0h	Indicates to CPU2 if the IPC25 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC25 bit. 0: No IPC25 event was set by CPU1 1: An IPC25 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R	0h	Indicates to CPU2 if the IPC24 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC24 bit. 0: No IPC24 event was set by CPU1 1: An IPC24 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R	0h	Indicates to CPU2 if the IPC23 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC23 bit. 0: No IPC23 event was set by CPU1 1: An IPC23 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R	0h	Indicates to CPU2 if the IPC22 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC22 bit. 0: No IPC22 event was set by CPU1 1: An IPC22 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R	0h	Indicates to CPU2 if the IPC21 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC21 bit. 0: No IPC21 event was set by CPU1 1: An IPC21 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R	0h	Indicates to CPU2 if the IPC20 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC20 bit. 0: No IPC20 event was set by CPU1 1: An IPC20 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-30. CPU1TOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CPU2 if the IPC19 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC19 bit. 0: No IPC19 event was set by CPU1 1: An IPC19 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R	0h	Indicates to CPU2 if the IPC18 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC18 bit. 0: No IPC18 event was set by CPU1 1: An IPC18 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
17	IPC17	R	0h	Indicates to CPU2 if the IPC17 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC17 bit. 0: No IPC17 event was set by CPU1 1: An IPC17 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
16	IPC16	R	0h	Indicates to CPU2 if the IPC16 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC16 bit. 0: No IPC16 event was set by CPU1 1: An IPC16 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
15	IPC15	R	0h	Indicates to CPU2 if the IPC15 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC15 bit. 0: No IPC15 event was set by CPU1 1: An IPC15 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
14	IPC14	R	0h	Indicates to CPU2 if the IPC14 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC14 bit. 0: No IPC14 event was set by CPU1 1: An IPC14 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
13	IPC13	R	0h	Indicates to CPU2 if the IPC13 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC13 bit. 0: No IPC13 event was set by CPU1 1: An IPC13 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
12	IPC12	R	0h	Indicates to CPU2 if the IPC12 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC12 bit. 0: No IPC12 event was set by CPU1 1: An IPC12 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-30. CPU1TOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CPU2 if the IPC11 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC11 bit. 0: No IPC11 event was set by CPU1 1: An IPC11 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
10	IPC10	R	0h	Indicates to CPU2 if the IPC10 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC10 bit. 0: No IPC10 event was set by CPU1 1: An IPC10 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
9	IPC9	R	0h	Indicates to CPU2 if the IPC9 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC9 bit. 0: No IPC9 event was set by CPU1 1: An IPC9 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
8	IPC8	R	0h	Indicates to CPU2 if the IPC8 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC8 bit. 0: No IPC8 event was set by CPU1 1: An IPC8 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
7	IPC7	R	0h	Indicates to CPU2 if the IPC7 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC7 bit. 0: No IPC7 event was set by CPU1 1: An IPC7 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
6	IPC6	R	0h	Indicates to CPU2 if the IPC6 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC6 bit. 0: No IPC6 event was set by CPU1 1: An IPC6 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
5	IPC5	R	0h	Indicates to CPU2 if the IPC5 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC5 bit. 0: No IPC5 event was set by CPU1 1: An IPC5 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
4	IPC4	R	0h	Indicates to CPU2 if the IPC4 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC4 bit. 0: No IPC4 event was set by CPU1 1: An IPC4 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-30. CPU1TOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CPU2 if the IPC3 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC3 bit. 0: No IPC3 event was set by CPU1 1: An IPC3 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
2	IPC2	R	0h	Indicates to CPU2 if the IPC2 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC2 bit. 0: No IPC2 event was set by CPU1 1: An IPC2 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
1	IPC1	R	0h	Indicates to CPU2 if the IPC1 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC1 bit. 0: No IPC1 event was set by CPU1 1: An IPC1 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
0	IPC0	R	0h	Indicates to CPU2 if the IPC0 event flag was set by CPU1. Reflects the state of CPU1TOCPU2IPCFLG.IPC0 bit. 0: No IPC0 event was set by CPU1 1: An IPC0 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

16.8.4.3 CPU2TOCPU1IPCSET Register (Offset = 4h) [Reset = 00000000h]

CPU2TOCPU1IPCSET is shown in [Figure 16-23](#) and described in [Table 16-31](#).

Return to the [Summary Table](#).

Table 16-31. CPU2TOCPU1IPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC31 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC30 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC29 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC28 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC27 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-31. CPU2TOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC26 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC25 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC24 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC23 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC22 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC21 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC20 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC19 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC18 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-31. CPU2TOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC17 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC16 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC15 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC14 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC13 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC12 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC11 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC10 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC9 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-31. CPU2TOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC8 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC7 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC6 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC5 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC4 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC3 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC2 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC1 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCPU1IPCFLG.IPC0 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

16.8.4.4 CPU2TOCPU1IPCCLR Register (Offset = 6h) [Reset = 00000000h]

CPU2TOCPU1IPCCLR is shown in [Figure 16-24](#) and described in [Table 16-32](#).

Return to the [Summary Table](#).

Table 16-32. CPU2TOCPU1IPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clear the CPU2TOCPU1IPCFLG.IPC31 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clear the CPU2TOCPU1IPCFLG.IPC30 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clear the CPU2TOCPU1IPCFLG.IPC29 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clear the CPU2TOCPU1IPCFLG.IPC28 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clear the CPU2TOCPU1IPCFLG.IPC27 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-32. CPU2TOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC26 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC25 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC24 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC23 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC22 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC21 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC20 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC19 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC18 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn

Table 16-32. CPU2TOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC17 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC16 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC15 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC14 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC13 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC12 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC11 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC10 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCCLR.IPC9 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn

Table 16-32. CPU2TOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC8 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC7 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC6 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC5 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC4 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC3 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC2 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC1 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCPU1IPCFLG.IPC0 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSTn

16.8.4.5 CPU2TOCPU1IPCFLG Register (Offset = 8h) [Reset = 00000000h]

CPU2TOCPU1IPCFLG is shown in [Figure 16-25](#) and described in [Table 16-33](#).

Return to the [Summary Table](#).

KEY															
R-0/W-0h															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														SEM	
R-0-0h														R/W-0h	

Table 16-46. PUMPREQUEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	KEY	R-0/W	0h	In order to write to the semaphore bits, 0x5a5a must be written to these key bits at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every semaphore change. Reset type: CPU1.SYSRSn
15-2	RESERVED	R-0	0h	Reserved
1-0	SEM	R/W	0h	These bits decide which CPU has control of the flash pump, which allows write access to the flash memory. The possible values are: 00: Read-only state. CPU1 has control of the pump, but CPU2 and CM may seize control at any time. 01: CPU2 has exclusive control of the pump and of these semaphore bits. CPU2 can relinquish control by setting the bits back to 00. 10: CPU1 has exclusive control of the pump and of these semaphore bits. CPU1 can relinquish control by setting the bits back to 00. 11: CM has exclusive control of the pump and of these semaphore bits. CM can relinquish control by setting the bits back to 00. Going from 01->10/11 or 10->01/11 or 11->01/10 is not allowed. The semaphore bits [1:0] must be written along with the correct key in bits [31:16]. Note: This field will be reset by the respective CPU resets depending on who owns the PUMP. For example if CPU2 is owning the pump, then CPU2SYSRSN would reset this field. Reset type: CPU1.SYSRSn, CPU2.SYSRSn, CM.RESETn

16.8.5 CPU1TOCM_IPC_REGS_CPU1VIEW Registers

Table 16-47 lists the memory-mapped registers for the CPU1TOCM_IPC_REGS_CPU1VIEW registers. All register offset addresses not listed in Table 16-47 should be considered as reserved locations and the register contents should not be modified.

Table 16-47. CPU1TOCM_IPC_REGS_CPU1VIEW Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	CPU1TOCMIPCACK	CPU1TOCMIPCACK Register		Go

Table 16-50. CMTOCPU1IPCSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R	0h	Indicates to CPU1 if the IPC31 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC31 bit. 0: No IPC31 event was set by CM 1: An IPC31 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R	0h	Indicates to CPU1 if the IPC30 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC30 bit. 0: No IPC30 event was set by CM 1: An IPC30 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R	0h	Indicates to CPU1 if the IPC29 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC29 bit. 0: No IPC29 event was set by CM 1: An IPC29 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R	0h	Indicates to CPU1 if the IPC28 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC28 bit. 0: No IPC28 event was set by CM 1: An IPC28 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-50. CMTOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	IPC27	R	0h	Indicates to CPU1 if the IPC27 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC27 bit. 0: No IPC27 event was set by CM 1: An IPC27 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
26	IPC26	R	0h	Indicates to CPU1 if the IPC26 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC26 bit. 0: No IPC26 event was set by CM 1: An IPC26 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R	0h	Indicates to CPU1 if the IPC25 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC25 bit. 0: No IPC25 event was set by CM 1: An IPC25 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R	0h	Indicates to CPU1 if the IPC24 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC24 bit. 0: No IPC24 event was set by CM 1: An IPC24 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R	0h	Indicates to CPU1 if the IPC23 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC23 bit. 0: No IPC23 event was set by CM 1: An IPC23 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R	0h	Indicates to CPU1 if the IPC22 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC22 bit. 0: No IPC22 event was set by CM 1: An IPC22 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R	0h	Indicates to CPU1 if the IPC21 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC21 bit. 0: No IPC21 event was set by CM 1: An IPC21 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R	0h	Indicates to CPU1 if the IPC20 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC20 bit. 0: No IPC20 event was set by CM 1: An IPC20 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-50. CMTOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CPU1 if the IPC19 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC19 bit. 0: No IPC19 event was set by CM 1: An IPC19 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R	0h	Indicates to CPU1 if the IPC18 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC18 bit. 0: No IPC18 event was set by CM 1: An IPC18 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
17	IPC17	R	0h	Indicates to CPU1 if the IPC17 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC17 bit. 0: No IPC17 event was set by CM 1: An IPC17 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R	0h	Indicates to CPU1 if the IPC16 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC16 bit. 0: No IPC16 event was set by CM 1: An IPC16 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R	0h	Indicates to CPU1 if the IPC15 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC15 bit. 0: No IPC15 event was set by CM 1: An IPC15 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R	0h	Indicates to CPU1 if the IPC14 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC14 bit. 0: No IPC14 event was set by CM 1: An IPC14 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R	0h	Indicates to CPU1 if the IPC13 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC13 bit. 0: No IPC13 event was set by CM 1: An IPC13 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R	0h	Indicates to CPU1 if the IPC12 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC12 bit. 0: No IPC12 event was set by CM 1: An IPC12 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-50. CMTOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CPU1 if the IPC11 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC11 bit. 0: No IPC11 event was set by CM 1: An IPC11 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R	0h	Indicates to CPU1 if the IPC10 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC10 bit. 0: No IPC10 event was set by CM 1: An IPC10 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R	0h	Indicates to CPU1 if the IPC9 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC9 bit. 0: No IPC9 event was set by CM 1: An IPC9 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
8	IPC8	R	0h	Indicates to CPU1 if the IPC8 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC8 bit. 0: No IPC8 event was set by CM 1: An IPC8 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R	0h	Indicates to CPU1 if the IPC7 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC7 bit. 0: No IPC7 event was set by CM 1: An IPC7 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R	0h	Indicates to CPU1 if the IPC6 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC6 bit. 0: No IPC6 event was set by CM 1: An IPC6 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R	0h	Indicates to CPU1 if the IPC5 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC5 bit. 0: No IPC5 event was set by CM 1: An IPC5 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R	0h	Indicates to CPU1 if the IPC4 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC4 bit. 0: No IPC4 event was set by CM 1: An IPC4 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-50. CMTOCPU1IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CPU1 if the IPC3 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC3 bit. 0: No IPC3 event was set by CM 1: An IPC3 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R	0h	Indicates to CPU1 if the IPC2 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC2 bit. 0: No IPC2 event was set by CM 1: An IPC2 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R	0h	Indicates to CPU1 if the IPC1 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC1 bit. 0: No IPC1 event was set by CM 1: An IPC1 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R	0h	Indicates to CPU1 if the IPC0 event flag was set by CM. Reflects the state of CMTOCPU1IPCFLG.IPC0 bit. 0: No IPC0 event was set by CM 1: An IPC0 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.5.3 CPU1TOCMIPCSET Register (Offset = 4h) [Reset = 00000000h]

CPU1TOCMIPCSET is shown in [Figure 16-41](#) and described in [Table 16-51](#).

Return to the [Summary Table](#).

Set CPU1TOCMIPCFLG register

Table 16-51. CPU1TOCMIPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC31 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC30 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC29 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC28 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC27 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-51. CPU1TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC26 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC25 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC24 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC23 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC22 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC21 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC20 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC19 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC18 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-51. CPU1TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC17 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC16 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC15 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC14 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC13 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC12 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC11 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC10 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC9 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-51. CPU1TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC8 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC7 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC6 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC5 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC4 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC3 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC2 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC1 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CPU1TOCMIPCFLG.IPC0 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

16.8.5.4 CPU1TOCMIPCCLR Register (Offset = 6h) [Reset = 00000000h]

CPU1TOCMIPCCLR is shown in [Figure 16-42](#) and described in [Table 16-52](#).

Return to the [Summary Table](#).

Table 16-52. CPU1TOCMIPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC31 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC30 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC29 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC28 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC27 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-52. CPU1TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC26 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC25 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC24 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC23 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC22 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC21 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC20 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC19 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC18 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-52. CPU1TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC17 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC16 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC15 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC14 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC13 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC12 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC11 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC10 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC9 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-52. CPU1TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC8 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC7 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC6 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC5 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC4 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC3 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC2 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC1 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CPU1TOCMIPCFLG.IPC0 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

16.8.5.5 CPU1TOCMIPCFLG Register (Offset = 8h) [Reset = 00000000h]

CPU1TOCMIPCFLG is shown in [Figure 16-43](#) and described in [Table 16-53](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. Table 16-67 shows the codes that are used for access types in this section.

**Table 16-67. CPU1TOCM_IPC_REGS_CMVIEW
Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

16.8.6.1 CMTOCPU1IPCAK Register (Offset = 0h) [Reset = 00000000h]

CMTOCPU1IPCAK is shown in [Figure 16-56](#) and described in [Table 16-68](#).

Return to the [Summary Table](#).

Table 16-68. CMTOCPU1IPCAK Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC31 bit. Reset type: CM.RESETn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC30 bit. Reset type: CM.RESETn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC29 bit. Reset type: CM.RESETn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC28 bit. Reset type: CM.RESETn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC27 bit. Reset type: CM.RESETn
26	IPC26	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC26 bit. Reset type: CM.RESETn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC25 bit. Reset type: CM.RESETn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC24 bit. Reset type: CM.RESETn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC23 bit. Reset type: CM.RESETn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC22 bit. Reset type: CM.RESETn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC21 bit. Reset type: CM.RESETn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC20 bit. Reset type: CM.RESETn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC19 bit. Reset type: CM.RESETn

Table 16-68. CMTOCPU1IPCACK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	IPC18	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC18 bit. Reset type: CM.RESETn
17	IPC17	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC17 bit. Reset type: CM.RESETn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC16 bit. Reset type: CM.RESETn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC15 bit. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC14 bit. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC13 bit. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC12 bit. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC11 bit. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC10 bit. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC9 bit. Reset type: CM.RESETn
8	IPC8	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC8 bit. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC7 bit. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC6 bit. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC5 bit. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC4 bit. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC3 bit. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC2 bit. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC1 bit. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit, will clear CPU1TOCMIPCFLG.IPC0 bit. Reset type: CM.RESETn

16.8.6.2 CPU1TOCMIPCSTS Register (Offset = 2h) [Reset = 00000000h]

CPU1TOCMIPCSTS is shown in [Figure 16-57](#) and described in [Table 16-69](#).

Return to the [Summary Table](#).

Table 16-69. CPU1TOCMIPCSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R	0h	Indicates to CM if the IPC31 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC31 bit. 0: No IPC31 event was set by CPU1 1: An IPC31 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
30	IPC30	R	0h	Indicates to CM if the IPC30 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC30 bit. 0: No IPC30 event was set by CPU1 1: An IPC30 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
29	IPC29	R	0h	Indicates to CM if the IPC29 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC29 bit. 0: No IPC29 event was set by CPU1 1: An IPC29 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
28	IPC28	R	0h	Indicates to CM if the IPC28 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC28 bit. 0: No IPC28 event was set by CPU1 1: An IPC28 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-69. CPU1TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	IPC27	R	0h	Indicates to CM if the IPC27 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC27 bit. 0: No IPC27 event was set by CPU1 1: An IPC27 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
26	IPC26	R	0h	Indicates to CM if the IPC26 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC26 bit. 0: No IPC26 event was set by CPU1 1: An IPC26 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
25	IPC25	R	0h	Indicates to CM if the IPC25 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC25 bit. 0: No IPC25 event was set by CPU1 1: An IPC25 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
24	IPC24	R	0h	Indicates to CM if the IPC24 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC24 bit. 0: No IPC24 event was set by CPU1 1: An IPC24 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
23	IPC23	R	0h	Indicates to CM if the IPC23 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC23 bit. 0: No IPC23 event was set by CPU1 1: An IPC23 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
22	IPC22	R	0h	Indicates to CM if the IPC22 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC22 bit. 0: No IPC22 event was set by CPU1 1: An IPC22 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
21	IPC21	R	0h	Indicates to CM if the IPC21 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC21 bit. 0: No IPC21 event was set by CPU1 1: An IPC21 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
20	IPC20	R	0h	Indicates to CM if the IPC20 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC20 bit. 0: No IPC20 event was set by CPU1 1: An IPC20 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-69. CPU1TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CM if the IPC19 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC19 bit. 0: No IPC19 event was set by CPU1 1: An IPC19 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
18	IPC18	R	0h	Indicates to CM if the IPC18 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC18 bit. 0: No IPC18 event was set by CPU1 1: An IPC18 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
17	IPC17	R	0h	Indicates to CM if the IPC17 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC17 bit. 0: No IPC17 event was set by CPU1 1: An IPC17 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
16	IPC16	R	0h	Indicates to CM if the IPC16 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC16 bit. 0: No IPC16 event was set by CPU1 1: An IPC16 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
15	IPC15	R	0h	Indicates to CM if the IPC15 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC15 bit. 0: No IPC15 event was set by CPU1 1: An IPC15 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
14	IPC14	R	0h	Indicates to CM if the IPC14 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC14 bit. 0: No IPC14 event was set by CPU1 1: An IPC14 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
13	IPC13	R	0h	Indicates to CM if the IPC13 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC13 bit. 0: No IPC13 event was set by CPU1 1: An IPC13 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
12	IPC12	R	0h	Indicates to CM if the IPC12 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC12 bit. 0: No IPC12 event was set by CPU1 1: An IPC12 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-69. CPU1TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CM if the IPC11 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC11 bit. 0: No IPC11 event was set by CPU1 1: An IPC11 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
10	IPC10	R	0h	Indicates to CM if the IPC10 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC10 bit. 0: No IPC10 event was set by CPU1 1: An IPC10 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
9	IPC9	R	0h	Indicates to CM if the IPC9 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC9 bit. 0: No IPC9 event was set by CPU1 1: An IPC9 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
8	IPC8	R	0h	Indicates to CM if the IPC8 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC8 bit. 0: No IPC8 event was set by CPU1 1: An IPC8 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
7	IPC7	R	0h	Indicates to CM if the IPC7 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC7 bit. 0: No IPC7 event was set by CPU1 1: An IPC7 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
6	IPC6	R	0h	Indicates to CM if the IPC6 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC6 bit. 0: No IPC6 event was set by CPU1 1: An IPC6 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
5	IPC5	R	0h	Indicates to CM if the IPC5 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC5 bit. 0: No IPC5 event was set by CPU1 1: An IPC5 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
4	IPC4	R	0h	Indicates to CM if the IPC4 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC4 bit. 0: No IPC4 event was set by CPU1 1: An IPC4 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

Table 16-69. CPU1TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CM if the IPC3 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC3 bit. 0: No IPC3 event was set by CPU1 1: An IPC3 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
2	IPC2	R	0h	Indicates to CM if the IPC2 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC2 bit. 0: No IPC2 event was set by CPU1 1: An IPC2 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
1	IPC1	R	0h	Indicates to CM if the IPC1 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC1 bit. 0: No IPC1 event was set by CPU1 1: An IPC1 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn
0	IPC0	R	0h	Indicates to CM if the IPC0 event flag was set by CPU1. Reflects the state of CPU1TOCMIPCFLG.IPC0 bit. 0: No IPC0 event was set by CPU1 1: An IPC0 event was set by CPU1 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU1.SYSRSn

16.8.6.3 CMTOCPU1IPCSET Register (Offset = 4h) [Reset = 00000000h]

CMTOCPU1IPCSET is shown in [Figure 16-58](#) and described in [Table 16-70](#).

Return to the [Summary Table](#).

Table 16-70. CMTOCPU1IPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC31 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC30 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC29 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC28 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC27 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-70. CMTOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC26 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC25 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC24 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC23 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC22 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC21 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC20 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC19 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC18 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-70. CMTOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC17 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC16 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC15 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC14 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC13 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC12 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC11 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC10 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC9 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-70. CMTOCPU1IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC8 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC7 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC6 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC5 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC4 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC3 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC2 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC1 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU1IPCFLG.IPC0 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.6.4 CMTOCPU1IPCCLR Register (Offset = 6h) [Reset = 00000000h]

CMTOCPU1IPCCLR is shown in [Figure 16-59](#) and described in [Table 16-71](#).

Return to the [Summary Table](#).

Table 16-71. CMTOCPU1IPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC31 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC30 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC29 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC28 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC27 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-71. CMTOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC26 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC25 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC24 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC23 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC22 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC21 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC20 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC19 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC18 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-71. CMTOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC17 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC16 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC15 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC14 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC13 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC12 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC11 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC10 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC9 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-71. CMTOCPU1IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC8 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC7 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC6 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC5 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC4 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC3 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC2 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC1 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU1IPCFLG.IPC0 event flag for CPU1. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.6.5 CMTOCPU1IPCFLG Register (Offset = 8h) [Reset = 00000000h]

CMTOCPU1IPCFLG is shown in [Figure 16-60](#) and described in [Table 16-72](#).

Return to the [Summary Table](#).

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED														SEM	
R-0-0h														R/W-0h	

Table 16-85. PUMPREQUEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	KEY	R-0/W	0h	In order to write to the semaphore bits, 0x5a5a must be written to these key bits at the same time. Otherwise, writes are ignored. The key is cleared immediately after writing, so it must be written again for every semaphore change. Reset type: CPU1.SYSRSn
15-2	RESERVED	R-0	0h	Reserved
1-0	SEM	R/W	0h	These bits decide which CPU has control of the flash pump, which allows write access to the flash memory. The possible values are: 00: Read-only state. CPU1 has control of the pump, but CPU2 and CM may seize control at any time. 01: CPU2 has exclusive control of the pump and of these semaphore bits. CPU2 can relinquish control by setting the bits back to 00. 10: CPU1 has exclusive control of the pump and of these semaphore bits. CPU1 can relinquish control by setting the bits back to 00. 11: CM has exclusive control of the pump and of these semaphore bits. CM can relinquish control by setting the bits back to 00. Going from 01->10/11 or 10->01/11 or 11->01/10 is not allowed. The semaphore bits [1:0] must be written along with the correct key in bits [31:16]. Note: This field will be reset by the respective CPU resets depending on who owns the PUMP. For example if CPU2 is owning the pump, then CPU2SYSRSN would reset this field. Reset type: CPU1.SYSRSn, CPU2.SYSRSn, CM.RESETn

16.8.7 CPU2TOCM_IPC_REGS_CPU2VIEW Registers

Table 16-86 lists the memory-mapped registers for the CPU2TOCM_IPC_REGS_CPU2VIEW registers. All register offset addresses not listed in Table 16-86 should be considered as reserved locations and the register contents should not be modified.

Table 16-86. CPU2TOCM_IPC_REGS_CPU2VIEW Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	CPU2TOCMIPCACK	CPU2TOCMIPCACK Register		Go
2h	CMTOCPU2IPCSTS	CMTOCPU2IPCSTS Register		Go
4h	CPU2TOCMIPCSET	CPU2TOCMIPCSET Register		Go
6h	CPU2TOCMIPCCLR	CPU2TOCMIPCCLR Register		Go
8h	CPU2TOCMIPCFLG	CPU2TOCMIPCFLG Register		Go
Ch	IPCCOUNTERL	IPCCOUNTERL Register		Go

Table 16-89. CMTOCPU2IPCSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R	0h	Indicates to CPU2 if the IPC31 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC31 bit. 0: No IPC31 event was set by CM 1: An IPC31 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R	0h	Indicates to CPU2 if the IPC30 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC30 bit. 0: No IPC30 event was set by CM 1: An IPC30 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R	0h	Indicates to CPU2 if the IPC29 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC29 bit. 0: No IPC29 event was set by CM 1: An IPC29 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R	0h	Indicates to CPU2 if the IPC28 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC28 bit. 0: No IPC28 event was set by CM 1: An IPC28 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-89. CMTOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	IPC27	R	0h	Indicates to CPU2 if the IPC27 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC27 bit. 0: No IPC27 event was set by CM 1: An IPC27 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
26	IPC26	R	0h	Indicates to CPU2 if the IPC26 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC26 bit. 0: No IPC26 event was set by CM 1: An IPC26 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R	0h	Indicates to CPU2 if the IPC25 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC25 bit. 0: No IPC25 event was set by CM 1: An IPC25 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R	0h	Indicates to CPU2 if the IPC24 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC24 bit. 0: No IPC24 event was set by CM 1: An IPC24 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R	0h	Indicates to CPU2 if the IPC23 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC23 bit. 0: No IPC23 event was set by CM 1: An IPC23 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R	0h	Indicates to CPU2 if the IPC22 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC22 bit. 0: No IPC22 event was set by CM 1: An IPC22 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R	0h	Indicates to CPU2 if the IPC21 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC21 bit. 0: No IPC21 event was set by CM 1: An IPC21 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R	0h	Indicates to CPU2 if the IPC20 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC20 bit. 0: No IPC20 event was set by CM 1: An IPC20 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-89. CMTOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CPU2 if the IPC19 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC19 bit. 0: No IPC19 event was set by CM 1: An IPC19 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R	0h	Indicates to CPU2 if the IPC18 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC18 bit. 0: No IPC18 event was set by CM 1: An IPC18 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
17	IPC17	R	0h	Indicates to CPU2 if the IPC17 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC17 bit. 0: No IPC17 event was set by CM 1: An IPC17 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R	0h	Indicates to CPU2 if the IPC16 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC16 bit. 0: No IPC16 event was set by CM 1: An IPC16 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R	0h	Indicates to CPU2 if the IPC15 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC15 bit. 0: No IPC15 event was set by CM 1: An IPC15 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R	0h	Indicates to CPU2 if the IPC14 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC14 bit. 0: No IPC14 event was set by CM 1: An IPC14 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R	0h	Indicates to CPU2 if the IPC13 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC13 bit. 0: No IPC13 event was set by CM 1: An IPC13 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R	0h	Indicates to CPU2 if the IPC12 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC12 bit. 0: No IPC12 event was set by CM 1: An IPC12 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-89. CMTOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CPU2 if the IPC11 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC11 bit. 0: No IPC11 event was set by CM 1: An IPC11 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R	0h	Indicates to CPU2 if the IPC10 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC10 bit. 0: No IPC10 event was set by CM 1: An IPC10 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R	0h	Indicates to CPU2 if the IPC9 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC9 bit. 0: No IPC9 event was set by CM 1: An IPC9 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
8	IPC8	R	0h	Indicates to CPU2 if the IPC8 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC8 bit. 0: No IPC8 event was set by CM 1: An IPC8 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R	0h	Indicates to CPU2 if the IPC7 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC7 bit. 0: No IPC7 event was set by CM 1: An IPC7 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R	0h	Indicates to CPU2 if the IPC6 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC6 bit. 0: No IPC6 event was set by CM 1: An IPC6 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R	0h	Indicates to CPU2 if the IPC5 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC5 bit. 0: No IPC5 event was set by CM 1: An IPC5 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R	0h	Indicates to CPU2 if the IPC4 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC4 bit. 0: No IPC4 event was set by CM 1: An IPC4 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-89. CMTOCPU2IPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CPU2 if the IPC3 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC3 bit. 0: No IPC3 event was set by CM 1: An IPC3 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R	0h	Indicates to CPU2 if the IPC2 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC2 bit. 0: No IPC2 event was set by CM 1: An IPC2 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R	0h	Indicates to CPU2 if the IPC1 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC1 bit. 0: No IPC1 event was set by CM 1: An IPC1 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R	0h	Indicates to CPU2 if the IPC0 event flag was set by CM. Reflects the state of CMTOCPU2IPCFLG.IPC0 bit. 0: No IPC0 event was set by CM 1: An IPC0 event was set by CM Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.7.3 CPU2TOCMIPCSET Register (Offset = 4h) [Reset = 00000000h]

CPU2TOCMIPCSET is shown in [Figure 16-76](#) and described in [Table 16-90](#).

Return to the [Summary Table](#).

Set CPU2TOCMIPCFLG register

Figure 16-76. CPU2TOCMIPCSET Register

Table 16-90. CPU2TOCMIPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC31 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC30 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC29 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC28 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC27 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-90. CPU2TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC26 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC25 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC24 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC23 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC22 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC21 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC20 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC19 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC18 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-90. CPU2TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC17 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC16 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC15 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC14 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC13 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC12 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC11 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC10 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC9 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-90. CPU2TOCMIPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC8 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC7 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC6 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC5 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC4 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC3 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC2 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC1 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CPU2TOCMIPCFLG.IPC0 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

16.8.7.4 CPU2TOCMIPCCLR Register (Offset = 6h) [Reset = 00000000h]

CPU2TOCMIPCCLR is shown in [Figure 16-77](#) and described in [Table 16-91](#).

Return to the [Summary Table](#).

Clear CPU2TOCMIPCFLG register

Table 16-91. CPU2TOCMIPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC31 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC30 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC29 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC28 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC27 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-91. CPU2TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC26 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC25 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC24 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC23 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC22 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC21 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC20 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC19 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC18 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-91. CPU2TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC17 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC16 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC15 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC14 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC13 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC12 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC11 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC10 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC9 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-91. CPU2TOCMIPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC8 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC7 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC6 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC5 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC4 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC3 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC2 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC1 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CPU2TOCMIPCFLG.IPC0 event flag for CM. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

16.8.7.5 CPU2TOCMIPCFLG Register (Offset = 8h) [Reset = 00000000h]

CPU2TOCMIPCFLG is shown in [Figure 16-78](#) and described in [Table 16-92](#).

Return to the [Summary Table](#).

15	IPC15	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC15 bit. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC14 bit. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC13 bit. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC12 bit. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC11 bit. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC10 bit. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC9 bit. Reset type: CM.RESETn
8	IPC8	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC8 bit. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC7 bit. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC6 bit. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC5 bit. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC4 bit. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC3 bit. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC2 bit. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC1 bit. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit, will clear CPU2TOCMIPCFLG.IPC0 bit. Reset type: CM.RESETn

16.8.8.2 CPU2TOCMIPCSTS Register (Offset = 2h) [Reset = 00000000h]

CPU2TOCMIPCSTS is shown in [Figure 16-90](#) and described in [Table 16-106](#).

Return to the [Summary Table](#).

Status of CMTOCPU2IPCFLG register

Table 16-106. CPU2TOCMIPCSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R	0h	Indicates to CM if the IPC31 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC31 bit. 0: No IPC31 event was set by CPU2 1: An IPC31 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
30	IPC30	R	0h	Indicates to CM if the IPC30 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC30 bit. 0: No IPC30 event was set by CPU2 1: An IPC30 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
29	IPC29	R	0h	Indicates to CM if the IPC29 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC29 bit. 0: No IPC29 event was set by CPU2 1: An IPC29 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
28	IPC28	R	0h	Indicates to CM if the IPC28 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC28 bit. 0: No IPC28 event was set by CPU2 1: An IPC28 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-106. CPU2TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	IPC27	R	0h	Indicates to CM if the IPC27 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC27 bit. 0: No IPC27 event was set by CPU2 1: An IPC27 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
26	IPC26	R	0h	Indicates to CM if the IPC26 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC26 bit. 0: No IPC26 event was set by CPU2 1: An IPC26 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
25	IPC25	R	0h	Indicates to CM if the IPC25 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC25 bit. 0: No IPC25 event was set by CPU2 1: An IPC25 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
24	IPC24	R	0h	Indicates to CM if the IPC24 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC24 bit. 0: No IPC24 event was set by CPU2 1: An IPC24 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
23	IPC23	R	0h	Indicates to CM if the IPC23 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC23 bit. 0: No IPC23 event was set by CPU2 1: An IPC23 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
22	IPC22	R	0h	Indicates to CM if the IPC22 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC22 bit. 0: No IPC22 event was set by CPU2 1: An IPC22 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
21	IPC21	R	0h	Indicates to CM if the IPC21 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC21 bit. 0: No IPC21 event was set by CPU2 1: An IPC21 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
20	IPC20	R	0h	Indicates to CM if the IPC20 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC20 bit. 0: No IPC20 event was set by CPU2 1: An IPC20 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-106. CPU2TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	IPC19	R	0h	Indicates to CM if the IPC19 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC19 bit. 0: No IPC19 event was set by CPU2 1: An IPC19 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
18	IPC18	R	0h	Indicates to CM if the IPC18 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC18 bit. 0: No IPC18 event was set by CPU2 1: An IPC18 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
17	IPC17	R	0h	Indicates to CM if the IPC17 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC17 bit. 0: No IPC17 event was set by CPU2 1: An IPC17 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
16	IPC16	R	0h	Indicates to CM if the IPC16 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC16 bit. 0: No IPC16 event was set by CPU2 1: An IPC16 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
15	IPC15	R	0h	Indicates to CM if the IPC15 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC15 bit. 0: No IPC15 event was set by CPU2 1: An IPC15 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
14	IPC14	R	0h	Indicates to CM if the IPC14 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC14 bit. 0: No IPC14 event was set by CPU2 1: An IPC14 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
13	IPC13	R	0h	Indicates to CM if the IPC13 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC13 bit. 0: No IPC13 event was set by CPU2 1: An IPC13 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
12	IPC12	R	0h	Indicates to CM if the IPC12 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC12 bit. 0: No IPC12 event was set by CPU2 1: An IPC12 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-106. CPU2TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	IPC11	R	0h	Indicates to CM if the IPC11 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC11 bit. 0: No IPC11 event was set by CPU2 1: An IPC11 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
10	IPC10	R	0h	Indicates to CM if the IPC10 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC10 bit. 0: No IPC10 event was set by CPU2 1: An IPC10 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
9	IPC9	R	0h	Indicates to CM if the IPC9 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC9 bit. 0: No IPC9 event was set by CPU2 1: An IPC9 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
8	IPC8	R	0h	Indicates to CM if the IPC8 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC8 bit. 0: No IPC8 event was set by CPU2 1: An IPC8 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
7	IPC7	R	0h	Indicates to CM if the IPC7 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC7 bit. 0: No IPC7 event was set by CPU2 1: An IPC7 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
6	IPC6	R	0h	Indicates to CM if the IPC6 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC6 bit. 0: No IPC6 event was set by CPU2 1: An IPC6 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
5	IPC5	R	0h	Indicates to CM if the IPC5 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC5 bit. 0: No IPC5 event was set by CPU2 1: An IPC5 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
4	IPC4	R	0h	Indicates to CM if the IPC4 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC4 bit. 0: No IPC4 event was set by CPU2 1: An IPC4 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

Table 16-106. CPU2TOCMIPCSTS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	IPC3	R	0h	Indicates to CM if the IPC3 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC3 bit. 0: No IPC3 event was set by CPU2 1: An IPC3 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
2	IPC2	R	0h	Indicates to CM if the IPC2 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC2 bit. 0: No IPC2 event was set by CPU2 1: An IPC2 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
1	IPC1	R	0h	Indicates to CM if the IPC1 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC1 bit. 0: No IPC1 event was set by CPU2 1: An IPC1 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn
0	IPC0	R	0h	Indicates to CM if the IPC0 event flag was set by CPU2. Reflects the state of CPU2TOCMIPCFLG.IPC0 bit. 0: No IPC0 event was set by CPU2 1: An IPC0 event was set by CPU2 Notes [1] IPC event flags 0-7 will trigger interrupts. Reset type: CPU2.SYSRSn

16.8.8.3 CMTOCPU2IPCSET Register (Offset = 4h) [Reset = 00000000h]

CMTOCPU2IPCSET is shown in [Figure 16-91](#) and described in [Table 16-107](#).

Return to the [Summary Table](#).

Set CMTOCPU2IPCFLG register

Table 16-107. CMTOCPU2IPCSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC31 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC30 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC29 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC28 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC27 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-107. CMTOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC26 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC25 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC24 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC23 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC22 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC21 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC20 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC19 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC18 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-107. CMTOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC17 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC16 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC15 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC14 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC13 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC12 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC11 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC10 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC9 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-107. CMTOCPU2IPCSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC8 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC7 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC6 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC5 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC4 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC3 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC2 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC1 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit sets the CMTOCPU2IPCFLG.IPC0 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.8.4 CMTOCPU2IPCCLR Register (Offset = 6h) [Reset = 00000000h]

CMTOCPU2IPCCLR is shown in [Figure 16-92](#) and described in [Table 16-108](#).

Return to the [Summary Table](#).

Table 16-108. CMTOCPU2IPCCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPC31	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC31 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
30	IPC30	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC30 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
29	IPC29	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC29 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
28	IPC28	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC28 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
27	IPC27	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC27 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-108. CMTOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	IPC26	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC26 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
25	IPC25	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC25 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
24	IPC24	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC24 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
23	IPC23	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC23 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
22	IPC22	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC22 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
21	IPC21	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC21 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
20	IPC20	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC20 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
19	IPC19	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC19 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
18	IPC18	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC18 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-108. CMTOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	IPC17	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC17 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
16	IPC16	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC16 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
15	IPC15	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC15 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
14	IPC14	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC14 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
13	IPC13	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC13 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
12	IPC12	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC12 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
11	IPC11	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC11 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
10	IPC10	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC10 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
9	IPC9	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC9 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

Table 16-108. CMTOCPU2IPCCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	IPC8	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC8 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
7	IPC7	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC7 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
6	IPC6	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC6 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
5	IPC5	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC5 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
4	IPC4	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC4 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
3	IPC3	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC3 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
2	IPC2	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC2 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
1	IPC1	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC1 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn
0	IPC0	R-0/W1S	0h	Writing 1 to this bit clears the CMTOCPU2IPCFLG.IPC0 event flag for CPU2. Writing 0 has no effect. Notes: [1] IPC event flags 0-7 will trigger interrupts. Reset type: CM.RESETn

16.8.8.5 CMTOCPU2IPCFLG Register (Offset = 8h) [Reset = 00000000h]

CMTOCPU2IPCFLG is shown in [Figure 16-93](#) and described in [Table 16-109](#).

Return to the [Summary Table](#).

The crossbars (referred to as X-BAR throughout this chapter) provide flexibility to connect device inputs, outputs, and internal resources in a variety of configurations.

The device contains a total of six X-BARs:

- Input X-BAR
- CLB Input X-BAR
- Output X-BAR
- CLB Output X-BAR
- CLB X-BAR
- ePWM X-BAR

Each of the X-BARs is named according to where the X-BAR takes signals. For example, the Input X-BAR and CLB Input X-BAR bring external signals “in” to the device. The Output X-BAR and CLB Output X-BAR take internal signals “out” of the device to a GPIO. The CLB X-BAR and ePWM X-BAR take signals to the CLB and ePWM modules, respectively.

17.1 Input X-BAR and CLB Input X-BAR	2190
17.2 ePWM, CLB, and GPIO Output X-BAR.....	2194
17.3 XBAR Registers.....	2204

17.1 Input X-BAR and CLB Input X-BAR

On this device, the Input X-BAR is used to route signals from a GPIO to many different IP blocks such as the ADC, eCAP, ePWM, and external interrupts. The input of each Input X-BAR instance (INPUTx) can be any GPIO, while the output of each instance connects to various IP blocks in the device. The digital input of AIOs are also available as inputs to the Input X-BAR. This flexibility relieves some of the constraints on peripheral muxing by allowing the user to connect any GPIO to the specified outputs of each Input X-BAR instance. Note that the GPIO selected by the Input X-BAR can be configured as either an input or an output. The Input X-BAR simply connects the signal on the input buffer to the output of the selected Input X-BAR instance. Therefore, you can do things such as route the output of an ePWM to the eCAP module for a frequency test).

The Input X-BAR is configured by way of the INPUTxSELECT registers. The destinations for each INPUTx are shown in [Figure 17-1](#) and [Table 17-1](#). For additional details on how each Input X-BAR connects to other IP blocks throughout the device, look for references to Input X-BAR in the chapter associated with that IP. Note that the destinations of each INPUTx are fixed and are not user-configurable. For more information on configuring the Input X-BAR, see the INPUT_XBAR_REGS register definitions in the *XBAR Registers* section.

Figure 17-1. Input X-BAR

Note

INPUTXBARx, INPUTXBAR_INPUTx, and INPUTx (when referenced in the context of Input X-BAR) are equivalent in all C2000 software and documentation.

Table 17-1. Input X-BAR Destinations

17.1.1 CLB Input X-BAR

The CLB Input X-BAR is architecturally identical to the Input X-BAR. The only difference is the destination for each INPUTx. The destination for each INPUTx is only the CLB Tiles as shown in [Table 17-2](#). This allows for GPIOs to be accessed by the CLB tiles without using the combination of Input X-BAR and CLB X-BAR.

Note

Signals routed into the CLB using the XBAR must be synchronized within the CLB.

17.2 ePWM, CLB, and GPIO Output X-BAR

This section describes the ePWM, CLB, and GPIO Output X-BAR. .

17.2.1 ePWM X-BAR

The ePWM X-BAR brings signals to the ePWM modules. Specifically, the ePWM X-BAR is connected to the Digital Compare (DC) submodule of each ePWM module for actions such as tripzones and syncing. Refer to the *Enhanced Pulse Width Modulator (ePWM)* chapter for more information on additional ways the DC submodule can be used. [Figure 17-2](#) shows the architecture of the ePWM X-BAR. Note that the architecture of the ePWM X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

17.2.1.1 ePWM X-BAR Architecture

The ePWM X-BAR has eight outputs that are routed to each ePWM module. [Figure 17-2](#) represents the architecture of a single output, but this output is identical to the architecture of all of the other outputs.

First, determine the signals that can be passed to the ePWM by referencing [Table 17-3](#). Select up to one signal per mux for each TRIPx output. Select the inputs to ePWM X-BAR using the TRIPxMUX0TO15CFG and TRIPxMUX16TO31CFG registers. To pass any signal through to the ePWM, enable the signal using the TRIPxMUXENABLE register. All signals that are enabled are logically ORed before being passed on to the respective TRIPx signal on the ePWM. To optionally invert the signal, use the TRIPOUTINV register.

Figure 17-2. ePWM X-BAR Architecture - Single Output

Note

Do not use "Reserved" signals in your application.

17.2.2 CLB X-BAR

The CLB X-BAR brings signals to the CLB modules. Figure 17-3 shows the architecture of the CLB X-BAR. Note that the architecture of the CLB X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

17.2.2.1 CLB X-BAR Architecture

The CLB X-BAR has eight outputs that are routed to each CLB module. Figure 17-3 represents the architecture of a single output, but the output is identical to the architecture of all of the other outputs.

First, determine the signals that can be passed to the CLB by referencing Table 17-4. Select up to one signal per mux (31 total muxes) for each AUXSIGx output. Select the inputs to each mux using the AUXSIGxMUX0TO15CFG and AUXSIGxMUX16TO31CFG registers. To pass any signal through to the CLB, enable the mux in the AUXSIGxMUXENABLE register. All muxes that are enabled are logically ORed before being passed on to the respective AUXSIGx signal on the CLB. To optionally invert the signal, use the AUXSIGOUTINV register.

17.2.3 GPIO Output X-BAR

The GPIO Output X-BAR takes signals from inside the device and brings them out to a GPIO. Figure 17-5 shows the architecture of the GPIO Output X-BAR. The X-BAR contains eight outputs and each contains at least one position on the GPIO mux, denoted as OUTPUTXBARx. The X-BAR allows the selection of a single input or a logical-OR of many inputs.

17.2.3.1 GPIO Output X-BAR Architecture

The GPIO Output X-BAR has eight outputs that are routed to the GPIO module. Figure 17-5 represents the architecture of a single output, but this output is identical to the architecture of all of the other outputs. Note that the architecture of the Output X-BAR (with the exception of the output latch) is similar to the architecture of the ePWM X-BAR.

First, determine the signals that can be passed to the GPIO by referencing Table 17-5. Select up to one signal per mux (32 total muxes) for each OUTPUTXBARx output. Select the inputs to each mux using the OUTPUTxMUX0TO15CFG and OUTPUTxMUX16TO31CFG registers. To pass any signal through to the GPIO, enable the mux in the OUTPUTxMUXENABLE register. All muxes that are enabled are logically ORed before being passed on to the respective OUTPUTx signal on the GPIO module. To optionally invert the signal, use the OUTPUTINV register. The final output is only recognized on the GPIO if the proper OUTPUTx muxing options are selected using the GPIO registers.

Figure 17-5. GPIO Output X-BAR Architecture

Note

Do not use "Reserved" signals in your application.

17.2.5 X-BAR Flags

With the exception of the CMPSS signals, the ePWM X-BAR and the Output X-BAR have all of the same input signals. Due to the inputs being similar between the ePWM X-BAR, CLB X-BAR, and Output X-BAR, all X-BAR modules leverage a single set of input flags to indicate which input signals have been triggered. This allows software to check the input flags when an event occurs. See [Figure 17-6](#) for more information. There is a bit allocated for each input signal in one of the XBARFLGx registers. The flag remains set until cleared through the appropriate XBARCLR_x register.

Note

Not all input sources are routed to all X-BAR modules. Refer to the X-BAR specific configuration tables for exact connections.

Figure 17-6. X-BAR Input Sources

17.3 XBAR Registers

This section describes the Crossbar registers.

17.3.1 XBAR Base Address Table (C28)

Table 17-7. XBAR Base Address Table (C28)

Bit Field Name		DriverLib Name	Base Address	CPU1	CPU2	DMA	CLA	Pipeline Protected
Instance	Structure							
EPwmXbarRegs	EPWM_XBAR_REGS	EPWMXBAR_BASE	0x0000_7A00	YES	-	-	-	YES

17.3.2 INPUT_XBAR_REGS Registers

Table 17-8 lists the memory-mapped registers for the INPUT_XBAR_REGS registers. All register offset addresses not listed in Table 17-8 should be considered as reserved locations and the register contents should not be modified.

Table 17-8. INPUT_XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	INPUT1SELECT	INPUT1 Input Select Register (GPIO0 to x)	EALLOW	Go
1h	INPUT2SELECT	INPUT2 Input Select Register (GPIO0 to x)	EALLOW	Go

1Eh	INPUTSELECTLOCK	Input Select Lock Register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 17-9 shows the codes that are used for access types in this section.

Table 17-9. INPUT_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

17.3.2.1 INPUT1SELECT Register (Offset = 0h) [Reset = FFFEh]

INPUT1SELECT is shown in [Figure 17-7](#) and described in [Table 17-10](#).

Return to the [Summary Table](#).

8	INPUT9SELECT	R/WOnce	0h	Lock bit for INPUT9SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
7	INPUT8SELECT	R/WOnce	0h	Lock bit for INPUT8SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
6	INPUT7SELECT	R/WOnce	0h	Lock bit for INPUT7SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
5	INPUT6SELECT	R/WOnce	0h	Lock bit for INPUT6SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
4	INPUT5SELECT	R/WOnce	0h	Lock bit for INPUT5SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
3	INPUT4SELECT	R/WOnce	0h	Lock bit for INPUT4SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
2	INPUT3SELECT	R/WOnce	0h	Lock bit for INPUT3SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
1	INPUT2SELECT	R/WOnce	0h	Lock bit for INPUT2SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn
0	INPUT1SELECT	R/WOnce	0h	Lock bit for INPUT1SELECT Register 0: Register is not locked 1: Register is locked Reset type: CPU1.SYSRSn

17.3.3 XBAR_REGS Registers

Table 17-27 lists the memory-mapped registers for the XBAR_REGS registers. All register offset addresses not listed in Table 17-27 should be considered as reserved locations and the register contents should not be modified.

Table 17-27. XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	XBARFLG1	X-Bar Input Flag Register 1		Go
2h	XBARFLG2	X-Bar Input Flag Register 2		Go
4h	XBARFLG3	X-Bar Input Flag Register 3		Go
6h	XBARFLG4	X-Bar Input Flag Register 4		Go
8h	XBARCLR1	X-Bar Input Flag Clear Register 1		Go
Ah	XBARCLR2	X-Bar Input Flag Clear Register 2		Go
Ch	XBARCLR3	X-Bar Input Flag Clear Register 3		Go
Eh	XBARCLR4	X-Bar Input Flag Clear Register 4		Go

Complex bit access types are encoded to fit into small table cells. Table 17-28 shows the codes that are used for access types in this section.

Table 17-28. XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

17.3.3.1 XBARFLG1 Register (Offset = 0h) [Reset = 00000000h]

XBARFLG1 is shown in [Figure 17-24](#) and described in [Table 17-29](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

Bit	Field	Type	Reset	Description
4	CMPSS3_CTRIPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CMPSS3_CTRIPL input was triggered 0: CMPSS3_CTRIPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
3	CMPSS2_CTRIPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CMPSS2_CTRIPH input was triggered 0: CMPSS2_CTRIPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
2	CMPSS2_CTRIPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CMPSS2_CTRIPL input was triggered 0: CMPSS2_CTRIPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
1	CMPSS1_CTRIPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CMPSS1_CTRIPH input was triggered 0: CMPSS1_CTRIPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
0	CMPSS1_CTRIPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CMPSS1_CTRIPL input was triggered 0: CMPSS1_CTRIPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

17.3.3.2 XBARFLG2 Register (Offset = 2h) [Reset = 00000000h]

XBARFLG2 is shown in [Figure 17-25](#) and described in [Table 17-30](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

Table 17-30. XBARFLG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ADCCEVT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCCEVT1 input was triggered 0: ADCCEVT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
30	ADCBEVT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCBEVT4 input was triggered 0: ADCBEVT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
29	ADCBEVT3	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCBEVT3 input was triggered 0: ADCBEVT3 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
28	ADCBEVT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCBEVT2 input was triggered 0: ADCBEVT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-30. XBARFLG2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	ADCB EVT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCBEVT1 input was triggered 0: ADCBEVT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
26	ADCAEVT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCAEVT4 input was triggered 0: ADCAEVT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
25	ADCAEVT3	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCAEVT3 input was triggered 0: ADCAEVT3 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
24	ADCAEVT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCAEVT2 input was triggered 0: ADCAEVT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
23	ADCAEVT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCAEVT1 input was triggered 0: ADCAEVT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
22	EXTSYN COUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: EXTSYN COUT input was triggered 0: EXTSYN COUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
21	ECAP6_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP6_OUT input was triggered 0: ECAP6_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
20	ECAP5_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP5_OUT input was triggered 0: ECAP5_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-30. XBARFLG2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	ECAP4_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP4_OUT input was triggered 0: ECAP4_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
18	ECAP3_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP3_OUT input was triggered 0: ECAP3_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
17	ECAP2_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP2_OUT input was triggered 0: ECAP2_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
16	ECAP1_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP1_OUT input was triggered 0: ECAP1_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
15	INPUT14	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT14 input was triggered 0: INPUT14 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
14	INPUT13	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT13 input was triggered 0: INPUT13 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
13	INPUT12	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT12 input was triggered 0: INPUT12 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
12	INPUT11	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT11 input was triggered 0: INPUT11 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-30. XBARFLG2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	INPUT10	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT10 input was triggered 0: INPUT10 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
10	INPUT9	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT9 input was triggered 0: INPUT9 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
9	INPUT8	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT8 input was triggered 0: INPUT8 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
8	INPUT7	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT7 input was triggered 0: INPUT7 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
7	ADCSOCB	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCSOCB input was triggered 0: ADCSOCB Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
6	ADCSOCA	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCSOCA input was triggered 0: ADCSOCA Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
5	INPUT6	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT6 input was triggered 0: INPUT6 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
4	INPUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT5 input was triggered 0: INPUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-30. XBARFLG2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	INPUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT4 input was triggered 0: INPUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
2	INPUT3	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT3 input was triggered 0: INPUT3 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
1	INPUT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT2 input was triggered 0: INPUT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
0	INPUT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: INPUT1 input was triggered 0: INPUT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

17.3.3.3 XBARFLG3 Register (Offset = 4h) [Reset = 00000000h]

XBARFLG3 is shown in [Figure 17-26](#) and described in [Table 17-31](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

Table 17-31. XBARFLG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SD1FLT4_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT4_DRINT input was triggered 0: SD1FLT4_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
30	SD1FLT4_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT4_COMPZ input was triggered 0: SD1FLT4_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
29	SD1FLT3_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT3_DRINT input was triggered 0: SD1FLT3_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-31. XBARFLG3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SD1FLT3_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT3_COMPZ input was triggered 0: SD1FLT3_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
27	SD1FLT2_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT2_DRINT input was triggered 0: SD1FLT2_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
26	SD1FLT2_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT2_COMPZ input was triggered 0: SD1FLT2_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
25	SD1FLT1_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT1_DRINT input was triggered 0: SD1FLT1_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
24	SD1FLT1_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT1_COMPZ input was triggered 0: SD1FLT1_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
23	ECAP7_OUT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECAP7_OUT input was triggered 0: ECAP7_OUT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
22	SD2FLT4_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT4_COMPH input was triggered 0: SD2FLT4_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
21	SD2FLT4_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT4_COMPL input was triggered 0: SD2FLT4_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-31. XBARFLG3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	SD2FLT3_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT3_COMPH input was triggered 0: SD2FLT3_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
19	SD2FLT3_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT3_COMPL input was triggered 0: SD2FLT3_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
18	SD2FLT2_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT2_COMPH input was triggered 0: SD2FLT2_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
17	SD2FLT2_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT2_COMPL input was triggered 0: SD2FLT2_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
16	SD2FLT1_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT1_COMPH input was triggered 0: SD2FLT1_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
15	SD2FLT1_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT1_COMPL input was triggered 0: SD2FLT1_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
14	SD1FLT4_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT4_COMPH input was triggered 0: SD1FLT4_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
13	SD1FLT4_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT4_COMPL input was triggered 0: SD1FLT4_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-31. XBARFLG3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SD1FLT3_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT3_COMPH input was triggered 0: SD1FLT3_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
11	SD1FLT3_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT3_COMPL input was triggered 0: SD1FLT3_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
10	SD1FLT2_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT2_COMPH input was triggered 0: SD1FLT2_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
9	SD1FLT2_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT2_COMPL input was triggered 0: SD1FLT2_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
8	SD1FLT1_COMPH	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT1_COMPH input was triggered 0: SD1FLT1_COMPH Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
7	SD1FLT1_COMPL	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD1FLT1_COMPL input was triggered 0: SD1FLT1_COMPL Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
6	ADCDEVT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCDEVT4 input was triggered 0: ADCDEVT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
5	ADCDEVT3	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCDEVT3 input was triggered 0: ADCDEVT3 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-31. XBARFLG3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ADCDEVT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCDEVT2 input was triggered 0: ADCDEVT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
3	ADCDEVT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCDEVT1 input was triggered 0: ADCDEVT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
2	ADCCEVT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCCEVT4 input was triggered 0: ADCCEVT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
1	ADCCEVT3	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCCEVT3 input was triggered 0: ADCCEVT3 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
0	ADCCEVT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ADCCEVT2 input was triggered 0: ADCCEVT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

17.3.3.4 XBARFLG4 Register (Offset = 6h) [Reset = 00000000h]

XBARFLG4 is shown in [Figure 17-27](#) and described in [Table 17-32](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

Table 17-32. XBARFLG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CLAHALT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLAHALT input was triggered 0: CLAHALT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
30	ECATSYNC1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECATSYNC1 input was triggered 0: ECATSYNC1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
29	ECATSYNC0	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ECATSYNC0 input was triggered 0: ECATSYNC0 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-32. XBARFLG4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	ERRORSTS_ERROR	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: ERRORSTS_ERROR input was triggered 0: ERRORSTS_ERROR Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
27	CLB6_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB6_OUT5 input was triggered 0: CLB6_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
26	CLB6_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB6_OUT4 input was triggered 0: CLB6_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
25	CLB5_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB5_OUT5 input was triggered 0: CLB5_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
24	CLB5_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB5_OUT4 input was triggered 0: CLB5_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
23	CLB4_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB4_OUT5 input was triggered 0: CLB4_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
22	CLB4_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB4_OUT4 input was triggered 0: CLB4_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
21	CLB3_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB3_OUT5 input was triggered 0: CLB3_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-32. XBARFLG4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	CLB3_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB3_OUT4 input was triggered 0: CLB3_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
19	CLB2_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB2_OUT5 input was triggered 0: CLB2_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
18	CLB2_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB2_OUT4 input was triggered 0: CLB2_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
17	CLB1_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB1_OUT5 input was triggered 0: CLB1_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
16	CLB1_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB1_OUT4 input was triggered 0: CLB1_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
15	CLB8_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB8_OUT5 input was triggered 0: CLB8_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
14	CLB8_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB8_OUT4 input was triggered 0: CLB8_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
13	CLB7_OUT5	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB7_OUT5 input was triggered 0: CLB7_OUT5 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-32. XBARFLG4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	CLB7_OUT4	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: CLB7_OUT4 input was triggered 0: CLB7_OUT4 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
11	MCANA_FEVT2	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: MCANA_FEVT2 input was triggered 0: MCANA_FEVT2 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
10	MCANA_FEVT1	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: MCANA_FEVT1 input was triggered 0: MCANA_FEVT1 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
9	MCANA_FEVT0	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: MCANA_FEVT0 input was triggered 0: MCANA_FEVT0 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
8	EMAC_PPS0	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: EMAC_PPS0 input was triggered 0: EMAC_PPS0 Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
7	SD2FLT4_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT4_DRINT input was triggered 0: SD2FLT4_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
6	SD2FLT4_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT4_COMPZ input was triggered 0: SD2FLT4_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
5	SD2FLT3_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT3_DRINT input was triggered 0: SD2FLT3_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

Table 17-32. XBARFLG4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SD2FLT3_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT3_COMPZ input was triggered 0: SD2FLT3_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
3	SD2FLT2_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT2_DRINT input was triggered 0: SD2FLT2_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
2	SD2FLT2_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT2_COMPZ input was triggered 0: SD2FLT2_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
1	SD2FLT1_DRINT	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT1_DRINT input was triggered 0: SD2FLT1_DRINT Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn
0	SD2FLT1_COMPZ	R	0h	This register is used to Flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered. 1: SD2FLT1_COMPZ input was triggered 0: SD2FLT1_COMPZ Input was not triggered Note: [1] setting of this bit has priority over clear by software Reset type: CPU1.SYSRSn

17.3.3.5 XBARCLR1 Register (Offset = 8h) [Reset = 00000000h]

XBARCLR1 is shown in [Figure 17-28](#) and described in [Table 17-33](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG1 register.

1: Clears the corresponding bit in the XBARFLG1 register.

0: Writing 0 has no effect

Table 17-33. XBARCLR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CMPSS8_CTRLPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS8_CTRLPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
30	CMPSS8_CTRLPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS8_CTRLPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
29	CMPSS7_CTRLPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS7_CTRLPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
28	CMPSS7_CTRLPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS7_CTRLPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
27	CMPSS6_CTRLPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS6_CTRLPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
26	CMPSS6_CTRLPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS6_CTRLPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-33. XBARCLR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	CMPSS5_CTRIPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS5_CTRIPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
24	CMPSS5_CTRIPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS5_CTRIPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
23	CMPSS4_CTRIPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS4_CTRIPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
22	CMPSS4_CTRIPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS4_CTRIPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
21	CMPSS3_CTRIPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS3_CTRIPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
20	CMPSS3_CTRIPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS3_CTRIPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
19	CMPSS2_CTRIPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS2_CTRIPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
18	CMPSS2_CTRIPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS2_CTRIPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
17	CMPSS1_CTRIPOUTH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS1_CTRIPOUTH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
16	CMPSS1_CTRIPOUTL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS1_CTRIPOUTL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
15	CMPSS8_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS8_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
14	CMPSS8_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS8_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
13	CMPSS7_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS7_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
12	CMPSS7_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS7_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-33. XBARCLR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CMPSS6_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS6_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
10	CMPSS6_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS6_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
9	CMPSS5_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS5_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
8	CMPSS5_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS5_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
7	CMPSS4_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS4_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
6	CMPSS4_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS4_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
5	CMPSS3_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS3_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
4	CMPSS3_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS3_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
3	CMPSS2_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS2_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
2	CMPSS2_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS2_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
1	CMPSS1_CTRIPH	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS1_CTRIPH bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
0	CMPSS1_CTRIPL	R-0/W1S	0h	Writing 1 to this bit clears the CMPSS1_CTRIPL bit in the XBARFLG1 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

17.3.3.6 XBARCLR2 Register (Offset = Ah) [Reset = 00000000h]

XBARCLR2 is shown in Figure 17-29 and described in Table 17-34.

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG2 register.

1: Clears the corresponding bit in the XBARFLG2 register.

0: Writing 0 has no effect

Table 17-34. XBARCLR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ADCCEVT1	R-0/W1S	0h	Writing 1 to this bit clears the ADCCEVT1 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
30	ADCB EVT4	R-0/W1S	0h	Writing 1 to this bit clears the ADCBEVT4 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
29	ADCB EVT3	R-0/W1S	0h	Writing 1 to this bit clears the ADCBEVT3 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
28	ADCB EVT2	R-0/W1S	0h	Writing 1 to this bit clears the ADCBEVT2 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
27	ADCB EVT1	R-0/W1S	0h	Writing 1 to this bit clears the ADCBEVT1 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
26	ADCAEVT4	R-0/W1S	0h	Writing 1 to this bit clears the ADCAEVT4 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
25	ADCAEVT3	R-0/W1S	0h	Writing 1 to this bit clears the ADCAEVT3 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-34. XBARCLR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	ADCAEVT2	R-0/W1S	0h	Writing 1 to this bit clears the ADCAEVT2 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
23	ADCAEVT1	R-0/W1S	0h	Writing 1 to this bit clears the ADCAEVT1 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
22	EXTSYNCOUT	R-0/W1S	0h	Writing 1 to this bit clears the EXTSYNCOUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
21	ECAP6_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP6_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
20	ECAP5_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP5_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
19	ECAP4_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP4_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
18	ECAP3_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP3_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
17	ECAP2_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP2_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
16	ECAP1_OUT	R-0/W1S	0h	Writing 1 to this bit clears the ECAP1_OUT bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
15	INPUT14	R-0/W1S	0h	Writing 1 to this bit clears the INPUT14 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
14	INPUT13	R-0/W1S	0h	Writing 1 to this bit clears the INPUT13 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
13	INPUT12	R-0/W1S	0h	Writing 1 to this bit clears the INPUT12 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
12	INPUT11	R-0/W1S	0h	Writing 1 to this bit clears the INPUT11 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
11	INPUT10	R-0/W1S	0h	Writing 1 to this bit clears the INPUT10 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
10	INPUT9	R-0/W1S	0h	Writing 1 to this bit clears the INPUT9 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-34. XBARCLR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	INPUT8	R-0/W1S	0h	Writing 1 to this bit clears the INPUT8 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
8	INPUT7	R-0/W1S	0h	Writing 1 to this bit clears the INPUT7 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
7	ADCSOCB	R-0/W1S	0h	Writing 1 to this bit clears the ADCSOCB bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
6	ADCSOCA	R-0/W1S	0h	Writing 1 to this bit clears the ADCSOCA bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
5	INPUT6	R-0/W1S	0h	Writing 1 to this bit clears the INPUT6 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
4	INPUT5	R-0/W1S	0h	Writing 1 to this bit clears the INPUT5 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
3	INPUT4	R-0/W1S	0h	Writing 1 to this bit clears the INPUT4 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
2	INPUT3	R-0/W1S	0h	Writing 1 to this bit clears the INPUT3 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
1	INPUT2	R-0/W1S	0h	Writing 1 to this bit clears the INPUT2 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
0	INPUT1	R-0/W1S	0h	Writing 1 to this bit clears the INPUT1 bit in the XBARFLG2 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

17.3.3.7 XBARCLR3 Register (Offset = Ch) [Reset = 00000000h]

XBARCLR3 is shown in [Figure 17-30](#) and described in [Table 17-35](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG3 register.

1: Clears the corresponding bit in the XBARFLG3 register.

0: Writing 0 has no effect

14	SD1FLT4_COMPH	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT4_COMPH bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
13	SD1FLT4_COMPL	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT4_COMPL bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
12	SD1FLT3_COMPH	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT3_COMPH bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-35. XBARCLR3 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SD1FLT3_COMPL	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT3_COMPL bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
10	SD1FLT2_COMPH	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT2_COMPH bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
9	SD1FLT2_COMPL	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT2_COMPL bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
8	SD1FLT1_COMPH	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT1_COMPH bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
7	SD1FLT1_COMPL	R-0/W1S	0h	Writing 1 to this bit clears the SD1FLT1_COMPL bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
6	ADCDEVT4	R-0/W1S	0h	Writing 1 to this bit clears the ADCDEVT4 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
5	ADCDEVT3	R-0/W1S	0h	Writing 1 to this bit clears the ADCDEVT3 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
4	ADCDEVT2	R-0/W1S	0h	Writing 1 to this bit clears the ADCDEVT2 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
3	ADCDEVT1	R-0/W1S	0h	Writing 1 to this bit clears the ADCDEVT1 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
2	ADCCEVT4	R-0/W1S	0h	Writing 1 to this bit clears the ADCCEVT4 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
1	ADCCEVT3	R-0/W1S	0h	Writing 1 to this bit clears the ADCCEVT3 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
0	ADCCEVT2	R-0/W1S	0h	Writing 1 to this bit clears the ADCCEVT2 bit in the XBARFLG3 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

17.3.3.8 XBARCLR4 Register (Offset = Eh) [Reset = 00000000h]

XBARCLR4 is shown in [Figure 17-31](#) and described in [Table 17-36](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG4 register.

1: Clears the corresponding bit in the XBARFLG4 register.

0: Writing 0 has no effect

Figure 17-31. XBARCLR4 Register

Table 17-36. XBARCLR4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CLAHALT	R	0h	Writing 1 to this bit clears the CLAHALT bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
30	ECATSYNC1	R-0/W1S	0h	Writing 1 to this bit clears the ECATSYNC1 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
29	ECATSYNC0	R-0/W1S	0h	Writing 1 to this bit clears the ECATSYNC0 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
28	ERRORSTS_ERROR	R-0/W1S	0h	Writing 1 to this bit clears the ERRORSTS_ERROR bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
27	CLB6_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB6_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
26	CLB6_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB6_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-36. XBARCLR4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	CLB5_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB5_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
24	CLB5_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB5_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
23	CLB4_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB4_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
22	CLB4_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB4_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
21	CLB3_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB3_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
20	CLB3_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB3_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
19	CLB2_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB2_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
18	CLB2_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB2_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
17	CLB1_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB1_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
16	CLB1_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB1_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
15	CLB8_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB8_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
14	CLB8_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB8_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
13	CLB7_OUT5	R-0/W1S	0h	Writing 1 to this bit clears the CLB7_OUT5 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
12	CLB7_OUT4	R-0/W1S	0h	Writing 1 to this bit clears the CLB7_OUT4 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

Table 17-36. XBARCLR4 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MCANA_FEVT2	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT2 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
10	MCANA_FEVT1	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT1 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
9	MCANA_FEVT0	R-0/W1S	0h	Writing 1 to this bit clears the MCANA_FEVT0 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
8	EMAC_PPS0	R-0/W1S	0h	Writing 1 to this bit clears the EMAC_PPS0 bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
7	SD2FLT4_DRINT	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT4_DRINT bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
6	SD2FLT4_COMPZ	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT4_COMPZ bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
5	SD2FLT3_DRINT	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT3_DRINT bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
4	SD2FLT3_COMPZ	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT3_COMPZ bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
3	SD2FLT2_DRINT	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT2_DRINT bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
2	SD2FLT2_COMPZ	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT2_COMPZ bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
1	SD2FLT1_DRINT	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT1_DRINT bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn
0	SD2FLT1_COMPZ	R-0/W1S	0h	Writing 1 to this bit clears the SD2FLT1_COMPZ bit in the XBARFLG4 register. Writing 0 has no effect Reset type: CPU1.SYSRSn

17.3.4 EPWM_XBAR_REGS Registers

Table 17-37 lists the memory-mapped registers for the EPWM_XBAR_REGS registers. All register offset addresses not listed in Table 17-37 should be considered as reserved locations and the register contents should not be modified.

Table 17-37. EPWM_XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	TRIP4MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP4	EALLOW	Go
2h	TRIP4MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP4	EALLOW	Go
4h	TRIP5MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP5	EALLOW	Go
6h	TRIP5MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP5	EALLOW	Go
8h	TRIP7MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP7	EALLOW	Go
Ah	TRIP7MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP7	EALLOW	Go
Ch	TRIP8MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP8	EALLOW	Go
Eh	TRIP8MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP8	EALLOW	Go
10h	TRIP9MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP9	EALLOW	Go
12h	TRIP9MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP9	EALLOW	Go
14h	TRIP10MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP10	EALLOW	Go
16h	TRIP10MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP10	EALLOW	Go
18h	TRIP11MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP11	EALLOW	Go
1Ah	TRIP11MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP11	EALLOW	Go
1Ch	TRIP12MUX0TO15CFG	ePWM XBAR Mux Configuration for TRIP12	EALLOW	Go
1Eh	TRIP12MUX16TO31CFG	ePWM XBAR Mux Configuration for TRIP12	EALLOW	Go
20h	TRIP4MUXENABLE	ePWM XBAR Mux Enable for TRIP4	EALLOW	Go
22h	TRIP5MUXENABLE	ePWM XBAR Mux Enable for TRIP5	EALLOW	Go
24h	TRIP7MUXENABLE	ePWM XBAR Mux Enable for TRIP7	EALLOW	Go
26h	TRIP8MUXENABLE	ePWM XBAR Mux Enable for TRIP8	EALLOW	Go
28h	TRIP9MUXENABLE	ePWM XBAR Mux Enable for TRIP9	EALLOW	Go
2Ah	TRIP10MUXENABLE	ePWM XBAR Mux Enable for TRIP10	EALLOW	Go
2Ch	TRIP11MUXENABLE	ePWM XBAR Mux Enable for TRIP11	EALLOW	Go
2Eh	TRIP12MUXENABLE	ePWM XBAR Mux Enable for TRIP12	EALLOW	Go
38h	TRIPOUTINV	ePWM XBAR Output Inversion Register	EALLOW	Go
3Eh	TRIPLOCK	ePWM XBAR Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 17-38 shows the codes that are used for access types in this section.

Table 17-38. EPWM_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

Table 17-38. EPWM_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

17.3.4.1 TRIP4MUX0TO15CFG Register (Offset = 0h) [Reset = 00000000h]

TRIP4MUX0TO15CFG is shown in [Figure 17-32](#) and described in [Table 17-39](#).

Return to the [Summary Table](#).

Table 17-44. TRIP7MUX16TO31CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux31: 00 : Select .0 input for Mux31 01 : Select .1 input for Mux31 10 : Select .2 input for Mux31 11 : Select .3 input for Mux31 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux30: 00 : Select .0 input for Mux30 01 : Select .1 input for Mux30 10 : Select .2 input for Mux30 11 : Select .3 input for Mux30 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux29: 00 : Select .0 input for Mux29 01 : Select .1 input for Mux29 10 : Select .2 input for Mux29 11 : Select .3 input for Mux29 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux28: 00 : Select .0 input for Mux28 01 : Select .1 input for Mux28 10 : Select .2 input for Mux28 11 : Select .3 input for Mux28 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux27: 00 : Select .0 input for Mux27 01 : Select .1 input for Mux27 10 : Select .2 input for Mux27 11 : Select .3 input for Mux27 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21-20	MUX26	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux26: 00 : Select .0 input for Mux26 01 : Select .1 input for Mux26 10 : Select .2 input for Mux26 11 : Select .3 input for Mux26 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-44. TRIP7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19-18	MUX25	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux25: 00 : Select .0 input for Mux25 01 : Select .1 input for Mux25 10 : Select .2 input for Mux25 11 : Select .3 input for Mux25 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux24: 00 : Select .0 input for Mux24 01 : Select .1 input for Mux24 10 : Select .2 input for Mux24 11 : Select .3 input for Mux24 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux23: 00 : Select .0 input for Mux23 01 : Select .1 input for Mux23 10 : Select .2 input for Mux23 11 : Select .3 input for Mux23 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux22: 00 : Select .0 input for Mux22 01 : Select .1 input for Mux22 10 : Select .2 input for Mux22 11 : Select .3 input for Mux22 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux21: 00 : Select .0 input for Mux21 01 : Select .1 input for Mux21 10 : Select .2 input for Mux21 11 : Select .3 input for Mux21 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux20: 00 : Select .0 input for Mux20 01 : Select .1 input for Mux20 10 : Select .2 input for Mux20 11 : Select .3 input for Mux20 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7-6	MUX19	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux19: 00 : Select .0 input for Mux19 01 : Select .1 input for Mux19 10 : Select .2 input for Mux19 11 : Select .3 input for Mux19 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux18: 00 : Select .0 input for Mux18 01 : Select .1 input for Mux18 10 : Select .2 input for Mux18 11 : Select .3 input for Mux18 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-44. TRIP7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	MUX17	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux17: 00 : Select .0 input for Mux17 01 : Select .1 input for Mux17 10 : Select .2 input for Mux17 11 : Select .3 input for Mux17 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Select Bits for EPWM-XBAR TRIP7 Mux16: 00 : Select .0 input for Mux16 01 : Select .1 input for Mux16 10 : Select .2 input for Mux16 11 : Select .3 input for Mux16 Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.7 TRIP8MUX0TO15CFG Register (Offset = Ch) [Reset = 00000000h]

TRIP8MUX0TO15CFG is shown in [Figure 17-38](#) and described in [Table 17-45](#).

Return to the [Summary Table](#).

Table 17-55. TRIP4MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-55. TRIP4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of Mux0 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.18 TRIP5MUXENABLE Register (Offset = 22h) [Reset = 00000000h]

TRIP5MUXENABLE is shown in [Figure 17-49](#) and described in [Table 17-56](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-56. TRIP5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.19 TRIP7MUXENABLE Register (Offset = 24h) [Reset = 00000000h]

TRIP7MUXENABLE is shown in [Figure 17-50](#) and described in [Table 17-57](#).

Return to the [Summary Table](#).

Table 17-57. TRIP7MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-57. TRIP7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.20 TRIP8MUXENABLE Register (Offset = 26h) [Reset = 00000000h]

TRIP8MUXENABLE is shown in [Figure 17-51](#) and described in [Table 17-58](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-58. TRIP8MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.21 TRIP9MUXENABLE Register (Offset = 28h) [Reset = 00000000h]

TRIP9MUXENABLE is shown in [Figure 17-52](#) and described in [Table 17-59](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP9

Table 17-59. TRIP9MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-59. TRIP9MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.22 TRIP10MUXENABLE Register (Offset = 2Ah) [Reset = 00000000h]

TRIP10MUXENABLE is shown in [Figure 17-53](#) and described in [Table 17-60](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-60. TRIP10MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.23 TRIP11MUXENABLE Register (Offset = 2Ch) [Reset = 00000000h]

TRIP11MUXENABLE is shown in [Figure 17-54](#) and described in [Table 17-61](#).

Return to the [Summary Table](#).

Table 17-61. TRIP11MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-61. TRIP11MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.4.24 TRIP12MUXENABLE Register (Offset = 2Eh) [Reset = 00000000h]

TRIP12MUXENABLE is shown in [Figure 17-55](#) and described in [Table 17-62](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. Table 17-66 shows the codes that are used for access types in this section.

Table 17-66. CLB_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

Table 17-66. CLB_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

17.3.5.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [Reset = 00000000h]

AUXSIG0MUX0TO15CFG is shown in [Figure 17-58](#) and described in [Table 17-67](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Group Select Bits for MUX31: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX31 01 : Select .1 input for MUX31 10 : Select .2 input for MUX31 11 : Select .3 input for MUX31 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Group Select Bits for MUX30: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX30 01 : Select .1 input for MUX30 10 : Select .2 input for MUX30 11 : Select .3 input for MUX30 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Group Select Bits for MUX29: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX29 01 : Select .1 input for MUX29 10 : Select .2 input for MUX29 11 : Select .3 input for MUX29 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Group Select Bits for MUX28: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX28 01 : Select .1 input for MUX28 10 : Select .2 input for MUX28 11 : Select .3 input for MUX28 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Group Select Bits for MUX27: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX27 01 : Select .1 input for MUX27 10 : Select .2 input for MUX27 11 : Select .3 input for MUX27 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-68. AUXSIG0MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-68. AUXSIG0MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG0 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.3 AUXSIG1MUX0TO15CFG Register (Offset = 4h) [Reset = 00000000h]

AUXSIG1MUX0TO15CFG is shown in [Figure 17-60](#) and described in [Table 17-69](#).

Table 17-77. AUXSIG5MUX0TO15CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX3	R/W	0h	Group Select Bits for MUX3: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX3 01 : Select .1 input for MUX3 10 : Select .2 input for MUX3 11 : Select .3 input for MUX3 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX2	R/W	0h	Group Select Bits for MUX2: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX2 01 : Select .1 input for MUX2 10 : Select .2 input for MUX2 11 : Select .3 input for MUX2 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX1	R/W	0h	Group Select Bits for MUX1: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX1 01 : Select .1 input for MUX1 10 : Select .2 input for MUX1 11 : Select .3 input for MUX1 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX0	R/W	0h	Group Select Bits for MUX0: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX0 01 : Select .1 input for MUX0 10 : Select .2 input for MUX0 11 : Select .3 input for MUX0 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.12 AUXSIG5MUX16TO31CFG Register (Offset = 16h) [Reset = 00000000h]

AUXSIG5MUX16TO31CFG is shown in [Figure 17-69](#) and described in [Table 17-78](#).

Return to the [Summary Table](#).

Table 17-78. AUXSIG5MUX16TO31CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Group Select Bits for MUX31: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX31 01 : Select .1 input for MUX31 10 : Select .2 input for MUX31 11 : Select .3 input for MUX31 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Group Select Bits for MUX30: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX30 01 : Select .1 input for MUX30 10 : Select .2 input for MUX30 11 : Select .3 input for MUX30 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Group Select Bits for MUX29: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX29 01 : Select .1 input for MUX29 10 : Select .2 input for MUX29 11 : Select .3 input for MUX29 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Group Select Bits for MUX28: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX28 01 : Select .1 input for MUX28 10 : Select .2 input for MUX28 11 : Select .3 input for MUX28 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Group Select Bits for MUX27: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX27 01 : Select .1 input for MUX27 10 : Select .2 input for MUX27 11 : Select .3 input for MUX27 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-78. AUXSIG5MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-78. AUXSIG5MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG5 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-81. AUXSIG7MUX0TO15CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX15	R/W	0h	Group Select Bits for MUX15: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX15 01 : Select .1 input for MUX15 10 : Select .2 input for MUX15 11 : Select .3 input for MUX15 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX14	R/W	0h	Group Select Bits for MUX14: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX14 01 : Select .1 input for MUX14 10 : Select .2 input for MUX14 11 : Select .3 input for MUX14 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX13	R/W	0h	Group Select Bits for MUX13: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX13 01 : Select .1 input for MUX13 10 : Select .2 input for MUX13 11 : Select .3 input for MUX13 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX12	R/W	0h	Group Select Bits for MUX12: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX12 01 : Select .1 input for MUX12 10 : Select .2 input for MUX12 11 : Select .3 input for MUX12 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX11	R/W	0h	Group Select Bits for MUX11: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX11 01 : Select .1 input for MUX11 10 : Select .2 input for MUX11 11 : Select .3 input for MUX11 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-81. AUXSIG7MUX0TO15CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX10	R/W	0h	Group Select Bits for MUX10: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX10 01 : Select .1 input for MUX10 10 : Select .2 input for MUX10 11 : Select .3 input for MUX10 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX9	R/W	0h	Group Select Bits for MUX9: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX9 01 : Select .1 input for MUX9 10 : Select .2 input for MUX9 11 : Select .3 input for MUX9 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX8	R/W	0h	Group Select Bits for MUX8: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX8 01 : Select .1 input for MUX8 10 : Select .2 input for MUX8 11 : Select .3 input for MUX8 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX7	R/W	0h	Group Select Bits for MUX7: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX7 01 : Select .1 input for MUX7 10 : Select .2 input for MUX7 11 : Select .3 input for MUX7 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX6	R/W	0h	Group Select Bits for MUX6: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX6 01 : Select .1 input for MUX6 10 : Select .2 input for MUX6 11 : Select .3 input for MUX6 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX5	R/W	0h	Group Select Bits for MUX5: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX5 01 : Select .1 input for MUX5 10 : Select .2 input for MUX5 11 : Select .3 input for MUX5 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX4	R/W	0h	Group Select Bits for MUX4: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX4 01 : Select .1 input for MUX4 10 : Select .2 input for MUX4 11 : Select .3 input for MUX4 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-81. AUXSIG7MUX0TO15CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX3	R/W	0h	Group Select Bits for MUX3: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX3 01 : Select .1 input for MUX3 10 : Select .2 input for MUX3 11 : Select .3 input for MUX3 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX2	R/W	0h	Group Select Bits for MUX2: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX2 01 : Select .1 input for MUX2 10 : Select .2 input for MUX2 11 : Select .3 input for MUX2 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX1	R/W	0h	Group Select Bits for MUX1: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX1 01 : Select .1 input for MUX1 10 : Select .2 input for MUX1 11 : Select .3 input for MUX1 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX0	R/W	0h	Group Select Bits for MUX0: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX0 01 : Select .1 input for MUX0 10 : Select .2 input for MUX0 11 : Select .3 input for MUX0 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.16 AUXSIG7MUX16TO31CFG Register (Offset = 1Eh) [Reset = 00000000h]

AUXSIG7MUX16TO31CFG is shown in [Figure 17-73](#) and described in [Table 17-82](#).

Return to the [Summary Table](#).

Table 17-82. AUXSIG7MUX16TO31CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	MUX31	R/W	0h	Group Select Bits for MUX31: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX31 01 : Select .1 input for MUX31 10 : Select .2 input for MUX31 11 : Select .3 input for MUX31 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX30	R/W	0h	Group Select Bits for MUX30: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX30 01 : Select .1 input for MUX30 10 : Select .2 input for MUX30 11 : Select .3 input for MUX30 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX29	R/W	0h	Group Select Bits for MUX29: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX29 01 : Select .1 input for MUX29 10 : Select .2 input for MUX29 11 : Select .3 input for MUX29 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX28	R/W	0h	Group Select Bits for MUX28: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX28 01 : Select .1 input for MUX28 10 : Select .2 input for MUX28 11 : Select .3 input for MUX28 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX27	R/W	0h	Group Select Bits for MUX27: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX27 01 : Select .1 input for MUX27 10 : Select .2 input for MUX27 11 : Select .3 input for MUX27 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-82. AUXSIG7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
21-20	MUX26	R/W	0h	Group Select Bits for MUX26: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX26 01 : Select .1 input for MUX26 10 : Select .2 input for MUX26 11 : Select .3 input for MUX26 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
19-18	MUX25	R/W	0h	Group Select Bits for MUX25: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX25 01 : Select .1 input for MUX25 10 : Select .2 input for MUX25 11 : Select .3 input for MUX25 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17-16	MUX24	R/W	0h	Group Select Bits for MUX24: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX24 01 : Select .1 input for MUX24 10 : Select .2 input for MUX24 11 : Select .3 input for MUX24 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15-14	MUX23	R/W	0h	Group Select Bits for MUX23: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX23 01 : Select .1 input for MUX23 10 : Select .2 input for MUX23 11 : Select .3 input for MUX23 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13-12	MUX22	R/W	0h	Group Select Bits for MUX22: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX22 01 : Select .1 input for MUX22 10 : Select .2 input for MUX22 11 : Select .3 input for MUX22 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
11-10	MUX21	R/W	0h	Group Select Bits for MUX21: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX21 01 : Select .1 input for MUX21 10 : Select .2 input for MUX21 11 : Select .3 input for MUX21 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9-8	MUX20	R/W	0h	Group Select Bits for MUX20: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX20 01 : Select .1 input for MUX20 10 : Select .2 input for MUX20 11 : Select .3 input for MUX20 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-82. AUXSIG7MUX16TO31CFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-6	MUX19	R/W	0h	Group Select Bits for MUX19: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX19 01 : Select .1 input for MUX19 10 : Select .2 input for MUX19 11 : Select .3 input for MUX19 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5-4	MUX18	R/W	0h	Group Select Bits for MUX18: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX18 01 : Select .1 input for MUX18 10 : Select .2 input for MUX18 11 : Select .3 input for MUX18 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
3-2	MUX17	R/W	0h	Group Select Bits for MUX17: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX17 01 : Select .1 input for MUX17 10 : Select .2 input for MUX17 11 : Select .3 input for MUX17 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1-0	MUX16	R/W	0h	Group Select Bits for MUX16: Selects 4X1 group output for AUXSIG7 of CLB-XBAR 00 : Select .0 input for MUX16 01 : Select .1 input for MUX16 10 : Select .2 input for MUX16 11 : Select .3 input for MUX16 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.17 AUXSIG0MUXENABLE Register (Offset = 20h) [Reset = 00000000h]

AUXSIG0MUXENABLE is shown in [Figure 17-74](#) and described in [Table 17-83](#).

Return to the [Summary Table](#).

Table 17-83. AUXSIG0MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-83. AUXSIG0MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG0 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG0 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG0 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.18 AUXSIG1MUXENABLE Register (Offset = 22h) [Reset = 00000000h]

AUXSIG1MUXENABLE is shown in [Figure 17-75](#) and described in [Table 17-84](#).

Return to the [Summary Table](#).

Table 17-84. AUXSIG1MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-84. AUXSIG1MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG1 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG1 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG1 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.19 AUXSIG2MUXENABLE Register (Offset = 24h) [Reset = 00000000h]

AUXSIG2MUXENABLE is shown in [Figure 17-76](#) and described in [Table 17-85](#).

Return to the [Summary Table](#).

31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-85. AUXSIG2MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG2 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG2 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG2 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.20 AUXSIG3MUXENABLE Register (Offset = 26h) [Reset = 00000000h]

AUXSIG3MUXENABLE is shown in [Figure 17-77](#) and described in [Table 17-86](#).

Return to the [Summary Table](#).

Table 17-86. AUXSIG3MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-86. AUXSIG3MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG3 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG3 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG3 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.21 AUXSIG4MUXENABLE Register (Offset = 28h) [Reset = 00000000h]

AUXSIG4MUXENABLE is shown in [Figure 17-78](#) and described in [Table 17-87](#).

Return to the [Summary Table](#).

19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-87. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-87. AUXSIG4MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG4 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG4 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG4 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.22 AUXSIG5MUXENABLE Register (Offset = 2Ah) [Reset = 00000000h]

AUXSIG5MUXENABLE is shown in [Figure 17-79](#) and described in [Table 17-88](#).

Return to the [Summary Table](#).

Table 17-88. AUXSIG5MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-88. AUXSIG5MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG5 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG5 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG5 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.23 AUXSIG6MUXENABLE Register (Offset = 2Ch) [Reset = 00000000h]

AUXSIG6MUXENABLE is shown in [Figure 17-80](#) and described in [Table 17-89](#).

Return to the [Summary Table](#).

Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-89. AUXSIG6MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG6 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG6 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG6 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.24 AUXSIG7MUXENABLE Register (Offset = 2Eh) [Reset = 00000000h]

AUXSIG7MUXENABLE is shown in [Figure 17-81](#) and described in [Table 17-90](#).

Return to the [Summary Table](#).

Table 17-90. AUXSIG7MUXENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of MUX31 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX31 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX31 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of MUX30 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX30 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX30 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of MUX29 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX29 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX29 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of MUX28 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX28 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX28 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of MUX27 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX27 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX27 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of MUX26 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX26 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX26 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of MUX25 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX25 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX25 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of MUX24 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX24 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX24 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of MUX23 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX23 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX23 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of MUX22 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX22 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX22 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of MUX21 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX21 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX21 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of MUX20 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX20 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX20 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of MUX19 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX19 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX19 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of MUX18 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX18 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX18 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of MUX17 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX17 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX17 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of MUX16 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX16 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX16 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of MUX15 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX15 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX15 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of MUX14 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX14 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX14 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of MUX13 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX13 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX13 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of MUX12 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX12 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX12 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of MUX11 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX11 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX11 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of MUX10 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX10 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX10 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of MUX9 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX9 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX9 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of MUX8 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX8 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX8 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of MUX7 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX7 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX7 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of MUX6 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX6 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX6 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of MUX5 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX5 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX5 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of MUX4 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX4 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX4 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

Table 17-90. AUXSIG7MUXENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of MUX3 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX3 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX3 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of MUX2 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX2 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX2 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of MUX1 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX1 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX1 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive AUXSIG7 of CLB-XBAR 0: Respective output of MUX0 is disabled to drive the AUXSIG7 of CLB-XBAR 1: Respective output of MUX0 is enabled to drive the AUXSIG7 of CLB-XBAR Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

17.3.5.25 AUXSIGOUTINV Register (Offset = 38h) [Reset = 00000000h]

AUXSIGOUTINV is shown in [Figure 17-82](#) and described in [Table 17-91](#).

Return to the [Summary Table](#).

R-0-0h							R/WOnce-0h

Table 17-92. AUXSIGLOCK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	KEY	R-0/W	0h	Bit-0 of this register can be set only if KEY= 0x5a5a Reset type: CPU1.SYSRSn
15-1	RESERVED	R-0	0h	Reserved
0	LOCK	R/WOnce	0h	Locks the configuration for CLB-XBAR. Once the configuration is locked, writes to the below registers for CLB-XBAR is blocked. Registers Affected by the LOCK mechanism: CLB-XBAROUTyMUX0TO15CFG CLB-XBAROUTyMUX16TO31CFG CLB-XBAROUTyMUXENABLE CLB-XBAROUTLATEN CLB-XBAROUTINV 0: Writes to the above registers are allowed 1: Writes to the above registers are blocked Note: [1] LOCK mechanism only applies to writes. Reads are never blocked. Reset type: CPU1.SYSRSn

17.3.6 OUTPUT_XBAR_REGS Registers

Table 17-93 lists the memory-mapped registers for the OUTPUT_XBAR_REGS registers. All register offset addresses not listed in Table 17-93 should be considered as reserved locations and the register contents should not be modified.

Table 17-93. OUTPUT_XBAR_REGS Registers

Offset	Acronym	Register Name	Write Protection	Section
0h	OUTPUT1MUX0TO15CFG	Output X-BAR Mux Configuration for Output 1	EALLOW	Go
2h	OUTPUT1MUX16TO31CFG	Output X-BAR Mux Configuration for Output 1	EALLOW	Go
4h	OUTPUT2MUX0TO15CFG	Output X-BAR Mux Configuration for Output 2	EALLOW	Go
6h	OUTPUT2MUX16TO31CFG	Output X-BAR Mux Configuration for Output 2	EALLOW	Go
8h	OUTPUT3MUX0TO15CFG	Output X-BAR Mux Configuration for Output 3	EALLOW	Go
Ah	OUTPUT3MUX16TO31CFG	Output X-BAR Mux Configuration for Output 3	EALLOW	Go
Ch	OUTPUT4MUX0TO15CFG	Output X-BAR Mux Configuration for Output 4	EALLOW	Go
Eh	OUTPUT4MUX16TO31CFG	Output X-BAR Mux Configuration for Output 4	EALLOW	Go
10h	OUTPUT5MUX0TO15CFG	Output X-BAR Mux Configuration for Output 5	EALLOW	Go
12h	OUTPUT5MUX16TO31CFG	Output X-BAR Mux Configuration for Output 5	EALLOW	Go
14h	OUTPUT6MUX0TO15CFG	Output X-BAR Mux Configuration for Output 6	EALLOW	Go
16h	OUTPUT6MUX16TO31CFG	Output X-BAR Mux Configuration for Output 6	EALLOW	Go
18h	OUTPUT7MUX0TO15CFG	Output X-BAR Mux Configuration for Output 7	EALLOW	Go
1Ah	OUTPUT7MUX16TO31CFG	Output X-BAR Mux Configuration for Output 7	EALLOW	Go
1Ch	OUTPUT8MUX0TO15CFG	Output X-BAR Mux Configuration for Output 8	EALLOW	Go
1Eh	OUTPUT8MUX16TO31CFG	Output X-BAR Mux Configuration for Output 8	EALLOW	Go
20h	OUTPUT1MUXENABLE	Output X-BAR Mux Enable for Output 1	EALLOW	Go
22h	OUTPUT2MUXENABLE	Output X-BAR Mux Enable for Output 2	EALLOW	Go
24h	OUTPUT3MUXENABLE	Output X-BAR Mux Enable for Output 3	EALLOW	Go
26h	OUTPUT4MUXENABLE	Output X-BAR Mux Enable for Output 4	EALLOW	Go
28h	OUTPUT5MUXENABLE	Output X-BAR Mux Enable for Output 5	EALLOW	Go
2Ah	OUTPUT6MUXENABLE	Output X-BAR Mux Enable for Output 6	EALLOW	Go
2Ch	OUTPUT7MUXENABLE	Output X-BAR Mux Enable for Output 7	EALLOW	Go
2Eh	OUTPUT8MUXENABLE	Output X-BAR Mux Enable for Output 8	EALLOW	Go
30h	OUTPUTLATCH	Output X-BAR Output Latch		Go
32h	OUTPUTLATCHCLR	Output X-BAR Output Latch Clear		Go
34h	OUTPUTLATCHFRC	Output X-BAR Output Latch Clear		Go
36h	OUTPUTLATCHENABLE	Output X-BAR Output Latch Enable	EALLOW	Go
38h	OUTPUTINV	Output X-BAR Output Inversion	EALLOW	Go
3Eh	OUTPUTLOCK	Output X-BAR Configuration Lock register	EALLOW	Go

Complex bit access types are encoded to fit into small table cells. Table 17-94 shows the codes that are used for access types in this section.

Table 17-94. OUTPUT_XBAR_REGS Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write

Table 17-94. OUTPUT_XBAR_REGS Access Type Codes (continued)

Access Type	Code	Description
W1S	W 1S	Write 1 to set
WSonce	W Sonce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

17.3.6.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [Reset = 00000000h]

OUTPUT1MUX0TO15CFG is shown in [Figure 17-84](#) and described in [Table 17-95](#).

Return to the [Summary Table](#).
