3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

Table 4-371. VIM0_INTTYPE_M Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level [default] or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event [see 3.4 Interrupt Handling]. The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level [default] 1 Pulse

Table 4-375. VIM0_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-421. VIM1_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

4.1.2.199 ECC_AGG_CORE0_AGGR_REVISION Register

4.1.2.199.1 ECC_AGG_CORE0_AGGR_REVISION Register (Offset = 0h) [reset = 66A0C200h]

Revision parameters register. The Revision Register contains the major and minor revisions for the ECC aggregator module. It does not
support byte accesses.

Return to Summary Table

Table 4-541. STC_STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	INTCOUNT_B16	R/W	1h	Number of intervals of the self test run [RWP - Read, Priviledge Mode Write only] Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out complete indication once it runs all of the intervals programmed in this field. INTCOUNT_B16=0 is an invalid configuration for a selftest.
15:11	NU0	R	0h	Reserved bits
10:8	CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only] Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7:5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only]. *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock [scan_en going high to func_clk_en generation] and misr_log_clk [scan_en going high to misr_log_en generation] generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.

Table 4-545. STC_STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TO_PRELOAD	R/W	FFFFFFFFh	Self test time out preload [RWP - Read, Priviledge Mode Write only] This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value [preload count value] gets loaded into the self test timeout down counter whenever a self test run is initiated [ST_ENA is enabled]. and gets disabled on completion of a self test run.

Bit	Field	Type	Reset	Description
31:2	NU12	R	0h	Reserved bits
1:0	SEGID_PLOAD	R/W	0h	Segment number for which preload is to be started [RWP - Read, Priviledge Mode Write only] This specifies the segment for which the address of its First interval will be pre-loaded into the NSTC ROM address counter. The 1st address of each segment are defined in SEGx_START_ADDR register.The address of the 1st interval of the selected segment is loaded into the NSTC ROM address counter when the RS_CNT_B1 bits of STC_GCR0 are set to 1X 00 = Preload the address of the 1st interval of segment 0. 01 = Preload the address of the 1st interval of segment 1. 10 = Preload the address of the 1st interval of segment 2. 11 = Preload the address of the 1st interval of segment 3.

Table 4-625. STC_CORE1_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C1MISR27	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	This identifies the scheme revision ID register type implemented for this module
29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

31:16	RESERVED_2	R	0h	Reserved
15:4	RESERVED_1	R	0h	Reserved
3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

4.2.2.225 ICSSM_PR1_ICSSS_UART_UART_SLV_RBR Register

4.2.2.225.1 ICSSM_PR1_ICSSS_UART_UART_SLV_RBR Register (Offset = 0h) [reset = 0h]

Receiver Buffer Register (read only)
The UART receiver section consists of a receiver shift register (RSR) and a receiver buffer register (RBR). When the UART is in the FIFO mode, RBR is a 16-byte FIFO. Timing is supplied by the 16x receiver clock or 13x receiver clock by programming OSM_SEL bit field of MDR register. Receiver section control is a function of the line control register (LCR).
RSR receives serial data from the UARTn_RXD pin. Then RSR concatenates the data and moves it into RBR (or the receiver FIFO). In the non-FIFO mode, when a character is placed in RBR and the receiver data-ready interrupt is enabled (DR = 1 in IER), an interrupt is generated. This interrupt is cleared when the character is read from RBR. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register (FCR), and it is cleared when the FIFO contents drop below the trigger level.

4.2.2.227 ICSSM_PR1_ICSSS_UART_UART_SLV_IIR Register

4.2.2.227.1 ICSSM_PR1_ICSSS_UART_UART_SLV_IIR Register (Offset = 8h) [reset = 1h]

The interrupt identification register (IIR) is a read-only register at the same address as the FIFO control register (FCR), which is a write-only register. When an interrupt is generated and enabled in the interrupt enable register (IER), IIR indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading IIR clears any THR empty (THRE) interrupts that are pending.

Table 4-1474. ICSSM_PR1_ICSSS_UART_UART_SLV_LCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	BC	R/W	0h	Break Control 0 Break condition is disabled 1 Break condition is transmitted to the receiving UART. A break condition is a condition where the UARTn_TXD signal is forced to the spacing (cleared) state.
5	SP	R/W	0h	Stick parity. The SP bit works in conjunction with the EPS and PEN bits. 0 Stick parity is disabled 1 Stick parity is enabled -When odd parity is selected (EPS = 0), the PARITY bit is transmitted and checked as set. -When even parity is selected (EPS = 1), the PARITY bit is transmitted and checked as cleared.
4	EPS	R/W	0h	Even parity select. Selects the parity when parity is enabled (PEN = 1). The EPS bit works in conjunction with the SP and PEN bits. 0 Odd parity is selected (an odd number of logic 1s is transmitted or checked in the data and PARITY bits). 1 Even parity is selected (an even number of logic 1s is transmitted or checked in the data and PARITY bits).
3	PEN	R/W	0h	Parity enable. The PEN bit works in conjunction with the SP and EPS bits. 0 No PARITY bit is transmitted or checked. 1 Parity bit is generated in transmitted data and is checked in received data between the last data word bit and the first STOP bit.
2	STB	R/W	0h	Number of STOP bits generated. STB specifies 1, 1.5, or 2 STOP bits in each transmitted character. When STB = 1, the WLS bit determines the number of STOP bits. The receiver clocks only the first STOP bit, regardless of the number of STOP bits selected. 0 1 STOP bit is generated. 1 WLS bit determines the number of STOP bits: -When WLS = 0, 1.5 STOP bits are generated. -When WLS = 1h, 2h, or 3h, 2 STOP bits are generated.
1	WLS1	R/W	0h	Word Length Select Bit 1
0	WLS	R/W	0h	Word length select. Number of bits in each transmitted or received serial character. When STB = 1, the WLS bit determines the number of STOP bits. 0 5 bits 1 6 bits 2 7 bits 3 8 bits

7	RXFIFOE	R	0h	Receiver FIFO error. *In non-FIFO mode:* 0 = There has been no error, or RXFIFOE was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 1 = There is a parity error, framing error, or break indicator in the receiver buffer register (RBR). *In FIFO mode:* 0 = There has been no error, or RXFIFOE was cleared because the CPU read the erroneous character from the receiver FIFO and there are no more errors in the receiver FIFO. 1 = At least one parity error, framing error, or break indicator in the receiver FIFO.

Copyright © 2026 Texas Instruments Incorporated

Table 4-1478. ICSSM_PR1_ICSSS_UART_UART_SLV_LSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	TEMT	R	1h	Transmitter empty (TEMT) indicator. *In non-FIFO mode:* 0 = Either the transmitter holding register (THR) or the transmitter shift register (TSR) contains a data character. 1 = Both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty. *In FIFO mode:* 0 = Either the transmitter FIFO or the transmitter shift register (TSR) contains a data character. 1 = Both the transmitter FIFO and the transmitter shift register (TSR) are empty.
5	THRE	R	1h	Transmitter holding register empty (THRE) indicator. If the THRE bit is set and the corresponding interrupt enable bit is set (ETBEI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = Transmitter holding register (THR) is not empty. THR has been loaded by the CPU. 1 = Transmitter holding register (THR) is empty (ready to accept a new character). The content of THR has been transferred to the transmitter shift register (TSR). *In FIFO mode:* 0 = Transmitter FIFO is not empty. At least one character has been written to the transmitter FIFO. You can write to the transmitter FIFO if it is not full. 1 = Transmitter FIFO is empty. The last character in the FIFO has been transferred to the transmitter shift register (TSR).
4	BI	R	0h	Break indicator. The BI bit is set whenever the receive data input (UARTn_RXD) was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the START, data, PARITY, and STOP bits. If the BI bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 1 = A break has been detected with the character in the receiver buffer register (RBR). *In FIFO mode:* 0 = No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver FIFO and the next character to be read from the FIFO has no break indicator. 1 = A break has been detected with the character at the top of the receiver FIFO.

Copyright © 2026 Texas Instruments Incorporated

Table 4-1478. ICSSM_PR1_ICSSS_UART_UART_SLV_LSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	FE	R	0h	Framing error (FE) indicator. A framing error occurs when the received character does not have a valid STOP bit. In response to a framing error, the UART sets the FE bit and waits until the signal on the RX pin goes high. Once the RX signal goes high, the receiver is ready to detect a new START bit and receive new data. If the FE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1 = A framing error has been detected with the character in the receiver buffer register (RBR). *In FIFO mode:* 0 = No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no framing error. 1 = A framing error has been detected with the character at the top of the receiver FIFO.
2	PE	R	0h	Parity error (PE) indicator. A parity error occurs when the parity of the received character does not match the parity selected with the EPS bit in the line control register (LCR). If the PE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1 = A parity error has been detected with the character in the receiver buffer register (RBR). *In FIFO mode:* 0 = No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no parity error. 1 = A parity error has been detected with the character at the top of the receiver FIFO.
1	OE	R	0h	Overrun error (OE) indicator. An overrun error in the non-FIFO mode is different from an overrun error in the FIFO mode. If the OE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1 = Overrun error has been detected. Before the character in the receiver buffer register (RBR) could be read, it was overwritten by the next character arriving in RBR. *In FIFO mode:* 0 = No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1 = Overrun error has been detected. If data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The new character overwrites the character in the shift register, but it is not transferred to the FIFO.

Copyright © 2026 Texas Instruments Incorporated

Table 4-1478. ICSSM_PR1_ICSSS_UART_UART_SLV_LSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	DR	R	0h	Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated. *In non-FIFO mode:* 0 = Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR). 1 = Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR). *In FIFO mode:* 0 = Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read. 1 = Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.

1	DDSR	R	0h	Change in DSR indicator bit. DDSR indicates that the DSR input has changed state since the last time it was read by the CPU. When DDSR is set and the modem status interrupt is enabled, a modem status interrupt is generated.
0	DCTS	R	0h	Change in CTS indicator bit. DCTS indicates that the CTS input has changed state since the last time it was read by the CPU. When DCTS is set (autoflow control is not enabled and the modem status interrupt is enabled), a modem status interrupt is generated. When autoflow control is enabled, no interrupt is generated.

4.2.2.238 ICSSM_PR1_ICSSS_UART_UART_SLV_THR Register

4.2.2.238.1 ICSSM_PR1_ICSSS_UART_UART_SLV_THR Register (Offset = 0h) [reset = 0h]

The transmitter holding register (THR) (write only)
The UART transmitter section consists of a transmitter hold register (THR) and a transmitter shift register (TSR). When the UART is in the FIFO mode, THR is a 16-byte FIFO. Transmitter section control is a function of the line control register (LCR).
THR receives data from the internal data bus and when TSR is idle, the UART moves the data from THR to TSR. The UART serializes the data in TSR and transmits the data on the TX pin. In the non-FIFO mode, if THR is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in IER), an interrupt is generated. This interrupt is cleared when a character is loaded into THR or the interrupt identification register (IIR) is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or IIR is read.

Bit	Field	Type	Reset	Description
31:27	FILTER	R	0h	
26	APWMPOL	R/W	0h	APWM Output Polarity Select: Note: This is applicable only in APWM operating mode. 0 Output is Active High (Compare value defines High time) 1 Output is Active Low (Compare value defines Low time)
25	CAP_APWM	R/W	0h	CAP/APWM Operating Mode Select: 0 ECAP module operates in Capture mode. This mode forces the following configuration:1. Inhibits the TSCNT register resets via PRD event.2. Inhibits the Shadow loads on the CAP1 and CAP2 registers.3. Permits user to enable the CAP1 to CAP4 register load.4. CAPx/APWMx pin operates as a Capture input. 1 ECAP module operates in APWM mode. This mode forces the following configuration:1. Resets the TSCNT register on PRD event (period boundary)2. Permits Shadow loading on the CAP1 and CAP2 registers.3. Disables loading of Time-stamps into the CAP1 - CAP4 registers4. CAPx/APWMx pin operates as a APWM output.

Table 4-1728. ICSSM_PR1_ICSS_ECAP0_ECAP_SLV_ECCTL2_ECCTL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	SWSYNC	R/W	0h	Software Forced Counter (TSCNT) Synchronizing: Note: This provides a convenient software method to synchronize some or all ECAP timebases in APWM mode. The Syncing can also be done via the PRD_EQ Event. 0 Writing a zero has no effect. Reading will always return a zero. 1 Writing a one will force a TSCNT shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0h. After writing a 1, this bit returns to a 0.
23:22	SYNCO_SEL	R/W	0h	SyncOut Select: Note: Selection PRD is meaningful only in APWM mode, however can still be chosen in CAP mode if user believes it to be useful. 0 Select SyncIn event to be the SyncOut signal (pass through) 1 Select PRD event to be the SyncOut signal 2 Disable SyncOut Signal 3 Disable SyncOut Signal
21	SYNCI_EN	R/W	0h	Counter (TSCNT) SyncIn select mode: 0 Disable SyncIn option 1 Enable Counter (TSCNT) to be loaded from the CNTPHS register upon either a SYNCI signal or a software force event.
20	TSCNTSTP	R/W	0h	Counter Stop (freeze) Control: 0 Counter Stopped 1 Counter Free Running
19	REARM_RESET	R/W	0h	One-Shot Re-arming Control Wait for stop trigger: 0 Has no effect. Reading always returns a 0h 1 Arms the One-Shot sequence:1. Resets the Mod4 counter to zero.2. Un-freezes the Mod4 counter.3. Enables Capture Register Loads.
18:17	STOPVALUE	R/W	3h	Stop Value for One-Shot Mode: This is the number (between 1 and 4) of captures allowed to occur before the CAP1 through CAP4 registers are frozen (capture sequence is stopped). Notes: [1] STOPVALUE is compared to Mod4 counter, when equal, two actions occur: 1. Mod4 Counter is stopped (frozen) 2. Capture register loads are inhibited [2] In one shot mode, further interrupt events are blocked until we re-arm, once the number of events captured has been reached. 0 Stop after Capture Event 1 1 Stop after Capture Event 2 2 Stop after Capture Event 3 3 Stop after Capture Event 4
16	CONT_ONESHT	R/W	0h	Continuous or One-shot Mode Control (applicable only in Capture mode): 0 Operate in Continuous mode 1 Operate in One-Shot mode
15	FREE	R/W	0h	Emulation Control 0 TSCNT Counter stops immediately on emulation suspend 1 TSCNT Counter runs until = 0h 3 TSCNT Counter is unaffected by emulation suspend (Run Free)

Copyright © 2026 Texas Instruments Incorporated

4.4.2.6 TPCC_EMR Register

4.4.2.6.1 TPCC_EMR Register (Offset = 300h) [reset = 0h]

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

4.4.2.24 TPCC_ER Register

4.4.2.24.1 TPCC_ER Register (Offset = 1000h) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.4.2.29 TPCC_ESRH Register

4.4.2.29.1 TPCC_ESRH Register (Offset = 1014h) [reset = 0h]

Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.

4.4.2.30 TPCC_CER Register

4.4.2.30.1 TPCC_CER Register (Offset = 1018h) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.4.2.32 TPCC_EER Register

4.4.2.32.1 TPCC_EER Register (Offset = 1020h) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.4.2.42 TPCC_IER Register

4.4.2.42.1 TPCC_IER Register (Offset = 1050h) [reset = 0h]

Int Enable Register: IER.In is not directly writeable. Interrupts can be enabled via writes to IESR and can be disabled via writes to IECR register. IER.In = 0: IPR.In is NOT enabled for interrupts. IER.In = 1: IPR.In IS enabled for interrupts.

4.4.2.48 TPCC_IPR Register

4.4.2.48.1 TPCC_IPR Register (Offset = 1068h) [reset = 0h]

Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.

Return to Summary Table

4.4.2.53 TPCC_QER Register

4.4.2.53.1 TPCC_QER Register (Offset = 1080h) [reset = 0h]

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

4.4.2.57 TPCC_QSER Register

4.4.2.57.1 TPCC_QSER Register (Offset = 1090h) [reset = 0h]

QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0: Event is not currently in the Event Queue. En = 1: Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

4.4.2.58 TPCC_QSECR Register

4.4.2.58.1 TPCC_QSECR Register (Offset = 1094h) [reset = 0h]

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

31:25	RES55	R	0h	RESERVE FIELD
24	THRXCD	R	0h	Threshold Exceeded: 0 - Threshold specified by QWMTHR[A B].Qn has not been exceeded. 1 - Threshold specified by QWMTHR[A B].Qn has been exceeded. QSTATN_j.THRXCD is cleared via CCERRCLR.QTHRXCD(j) bit.
23:21	RES56	R	0h	RESERVE FIELD
20:16	WM	R	0h	Watermark for Maximum Queue Usage: Watermark tracks the most entries that have been in Queue(j) since reset or since the last time that the watermark [WM] was cleared. QSTATN(j). WM is cleared via CCERRCLR.QTHRXCD(j) bit. Legal values = 0x0 [empty] to 0x10 [full]
15:13	RES57	R	0h	RESERVE FIELD
12:8	NUMVAL	R	0h	Number of Valid Entries in Queue(j): Represents the total number of entries residing in the Queue Manager FIFO at a given instant. Always enabled. Legal values = 0x0 [empty] to 0x10 [full]
7:4	RES58	R	0h	RESERVE FIELD
3:0	STRTPTR	R	0h	Start Pointer: Represents the offset to the head entry of Queue(j) in units of entries. Always enabled. Legal values = 0x0 [0th entry] to 0xF [15th entry]

4.4.2.83 TPCC_ER_RN_j Register

4.4.2.83.1 TPCC_ER_RN_j Register (Offset = 2000h + formula) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

Return to Summary Table

4.4.2.89 TPCC_CER_RN_j Register

4.4.2.89.1 TPCC_CER_RN_j Register (Offset = 2018h + formula) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

Return to Summary Table

Offset = 2018h + (j * 200h); where j = 0 to 7d

4.4.2.91 TPCC_EER_RN_j Register

4.4.2.91.1 TPCC_EER_RN_j Register (Offset = 2020h + formula) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

Return to Summary Table

4.4.2.100 TPCC_SECRH_RN_j Register

4.4.2.100.1 TPCC_SECRH_RN_j Register (Offset = 2044h + formula) [reset = 0h]

Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.

Return to Summary Table

Offset = 2044h + (j * 200h); where j = 0 to 7d

4.4.2.112 TPCC_QER_RN_j Register

4.4.2.112.1 TPCC_QER_RN_j Register (Offset = 2080h + formula) [reset = 0h]

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Return to Summary Table

Offset = 2080h + (j * 200h); where j = 0 to 7d

4.4.2.113 TPCC_QEER_RN_j Register

4.4.2.113.1 TPCC_QEER_RN_j Register (Offset = 2084h + formula) [reset = 0h]

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Return to Summary Table

Offset = 2084h + (j * 200h); where j = 0 to 7d

ACNT							
R/W							
0h							

Table 4-2275. TPCC_ABCNT_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 [64K-1 arrays]. BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...

Copyright © 2026 Texas Instruments Incorporated

Table 4-2275. TPCC_ABCNT_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes [64K-1 bytes]. ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation [to translate between a word count and a byte count] will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

Table 4-2281. TPCC_LNK_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT [conceptually] reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.

Copyright © 2026 Texas Instruments Incorporated

Table 4-2281. TPCC_LNK_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination [i.e. after count fields are decremented to '0'] with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case [5-lsbs] behavior is undefined for the user [i.e. don't have to test it]. In the former case [2 msbs] user should be able to take advantage of this feature [i.e. do have to test it]. If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

Table 4-2283. TPCC_CIDX_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	DCIDX	R/W	0h	Destination Frame Index: DCIDX is a 16-bit signed value [2's complement] used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array [pointed to by DST address] to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15:0	SCIDX	R/W	0h	Source Frame Index: SCIDX is a 16-bit signed value [2's complement] used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array [pointed to by SRC address] to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

Bit	Field	Type	Reset	Description
31:16	RES86	R	0h	RESERVE FIELD
15:0	CCNT	R/W	0h	CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 [64K-1 frames]. CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.

5.1.2.17 CFG_DBTP Register

5.1.2.17.1 CFG_DBTP Register (Offset = 20Ch) [reset = A33h]

Data Bit Timing & Prescaler Register.
Configuration of data phase bit timing, transmitter delay compensation enable. This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 MCAN functional clock periods. tq = (MCAN_DBTP[20-16] DBRP + 1) mtq (minimum time quantum = CAN clock period (MCAN functional clock)). The MCAN_DBTP[12-8] DTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_DBTP[7-4] DTSEG2 field is Phase_Seg2. Therefore the length of the bit time is (programmed values) [MCAN_DBTP[12-8] DTSEG1 + MCAN_DBTP[7-4] DTSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq. The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.
Note: With a CAN clock (MCAN functional clock) of 8 MHz, the reset value of 0000 0A33h configures the MCAN module for a data phase bit rate of 500 kbit/s.
Note: The bit rate configured for the CAN FD data phase via the MCAN_DBTP register must be higher or equal to the bit rate configured for the arbitration phase via the MCAN_DBTP register.

Table 5-49. CFG_CCCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11:10	NU17	R	0h	Reserved
9	BRSE	R/W	0h	Bit Rate Switch Enable 1'b0 = Bit rate switching for transmissions disabled 1'b1 = Bit rate switching for transmissions enabled Note: When CAN FD operation is disabled the MCAN_CCCR[8] FDOE = 1'b0, the MCAN_CCCR[9] BRSE bit is not evaluated.
8	FDOE	R/W	0h	FD Operation Enable 1'b0 = FD operation disabled 1'b1 = FD operation enabled
7	TEST	R/W	0h	Test Mode enable 1'b0 = Normal operation. The MCAN_TEST register holds reset values. 1'b1 = Test Mode. Write access to the MCAN_TEST register enabled
6	DAR	R/W	0h	Disable Automatic Regransmission 1'b0 = Automatic retransmission of messages not transmitted successfully enabled 1'b1 = Automatic retransmission disabled
5	MON	R/W	0h	Bus Monitoring Mode The MCAN_CCCR[5] MON bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time. 1'b0 = Bus Monitoring Mode is disabled 1'b1 = Bus Monitoring Mode is enabled
4	CSR	R/W	0h	Clock Stop Request 1'b0 = No clock stop is requested 1'b1 = Clock stop requested. When clock stop is requested, first the MCAN_CCCR[0] INIT bit and then the MCAN_CCCR[3] CSA bit will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	R	0h	Clock Stop Acknowledge 1'b0 = No clock stop acknowledged 1'b1 = The MCAN module may be set in power down by stopping MCAN interface clock and MCAN functional clock
2	ASM	R/W	0h	Restriced Operation Mode The MCAN_CCCR[2] ASM bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time. For a description of the Restricted Operation Mode, see Restricted Operation Mode. 1'b0 = Normal CAN operation 1'b1 = Restricted Operation Mode active
1	CCE	R/W	0h	Configuration Change Enable 1'b0 = The Host CPU has no write access to the protected configuration registers 1'b1 = The Host CPU has write access to the protected configuration registers (while the MCAN_CCCR[0] INIT = 1)
0	INIT	R/W	1h	Initialization 1'b0 = Normal Operation 1'b1 = Initialization is started Note: Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to the MCAN_CCCR[0] INIT bit can be read back. Therefore the software has to assure that the previous value written to the MCAN_CCCR[0] INIT bit has been accepted by Reading the MCAN_CCCR[0] INIT bit before setting the MCAN_CCCR[0] INIT bit to a new value.

5.1.2.21 CFG_NBTP Register

5.1.2.21.1 CFG_NBTP Register (Offset = 21Ch) [reset = 6000A03h]

Nominal Bit Timing & Prescaler Register. Configuration of arbitration phase bit timing.
This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 MCAN functional clock periods. tq = (MCAN_NBTP[24-16] NBRP + 1) mtq. The MCAN_NBTP[15-8] NTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_NBTP[6-0] NTSEG2 field is Phase_Seg2.
Therefore the length of the bit time is (programmed values) [MCAN_NBTP[15-8] NTSEG1 + MCAN_NBTP[6-0] NTSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.
The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Table 5-55. CFG_TSCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	NU22	R	0h	Reserved
15:0	TSC	R/W	0h	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When the MCAN_TSCC[1-0] TSS = 2'b01, the Timestamp Counter is incremented in multiples of CAN bit times [1-16] depending on the configuration of the MCAN_TSCC[19-16] TCP field. A wrap around sets interrupt flag MCAN_IR[16] TSW. Write access resets the counter to zero. When the MCAN_TSCC[1-0] TSS = 2'b10, the MCAN_TSCV[15-0] TSC field reflects the external Timestamp Counter value. A write access has no impact. Note: A 'wrap around' is a change of the Timestamp Counter value from non-zero to zero not caused by write access to the MCAN_TSCV register.

31:24	NU25	R	0h	Reserved
23:16	CEL	R	0h	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to the MCAN_ECR[23-16] CEL field. The counter stops at FFh; the next increment of the MCAN_ECR[7-0] TEC or MCAN_ECR[14-8] REC fields sets interrupt flag MCAN_IR[22] ELO.
15	RP	R	0h	Recieve Error Passive 1'b0 = The Receive Error Counter is below the error passive level of 128 1'b1 = The Receive Error Counter has reached the error passive level of 128
14:8	REC	R	0h	Recieve Error Counter Actual state of the Receive Error Counter, values between 0 and 127.

Copyright © 2026 Texas Instruments Incorporated

Table 5-61. CFG_ECR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7:0	TEC	R	0h	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255. Note: When the MCAN_CCCR[2] ASM bit is set, the CAN protocol controller does not increment the MCAN_ECR[7-0] TEC and MCAN_ECR[14-8] REC fields when a CAN protocol error is detected, but the MCAN_ECR[23-16] CEL field is still incremented.

Bit	Field	Type	Reset	Description
31:23	NU27	R	0h	Reserved
22:16	TDCV	R	0h	Transmitter Delay Compensation Value Position of the secondary sample point, defined by the sum of the measured delay from the MCAN TX to MCAN RX pins and the MCAN_TDCR[14-8] TDCO field. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq.
15	NU26	R	0h	Reserved
14	PXE	R	0h	Protocol Exception Event 1'b0 = No protocol exception event occurred since last read access 1'b1 = Protocol exception event occurred

Copyright © 2026 Texas Instruments Incorporated

Table 5-63. CFG_PSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	RFDF	R	0h	Recieved a CAN FD Message This bit is set independent of acceptance filtering. 1'b0 = Since this bit was reset by the Host CPU, no CAN FD message has been received 1'b1 = Message in CAN FD format with FDF flag set has been received
12	RBRS	R	0h	BRS flag of last recieved CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 1'b0 = Last received CAN FD message did not have its BRS flag set 1'b1 = Last received CAN FD message had its BRS flag set
11	RESI	R	0h	ESI flag of last recieved CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 1'b0 = Last received CAN FD message did not have its ESI flag set 1'b1 = Last received CAN FD message had its ESI flag set
10:8	DLEC	R	7h	Data Phase Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for the MCAN_PSR[2-0] LEC field. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	R	0h	Bus_Off status 1'b0 = The MCAN module is not Bus_Off 1'b1 = The MCAN module is in Bus_Off state
6	EW	R	0h	Warning Status 1'b0 = Both error counters are below the Error_Warning limit of 96 1'b1 = At least one of error counter has reached the Error_Warning limit of 96
5	EP	R	0h	Error Passive 1'b0 = The MCAN module is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1'b1 = The MCAN module is in the Error_Passive state
4:3	ACT	R	0h	Activity Monitors the module's CAN communication state. 2'b00 = Synchronizing - node is synchronizing on CAN communication 2'b01 = Idle - node is neither receiver nor transmitter 2'b10 = Receiver - node is operating as receiver 2'b11 = Transmitter - node is operating as transmitter Note: ACT is set to 0 by a Protocol Exception Event.

Copyright © 2026 Texas Instruments Incorporated

Table 5-63. CFG_PSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	LEC	R	7h	Last Error Code The MCAN_PSR[2-0] LEC field indicates the type of the last error to occur on the CAN bus. This field will be cleared to 0hwhen a message has been transferred (reception or transmission) without error. 3'b000 = No Error: No error occurred since the MCAN_PSR[2-0] LEC field has been reset by successful reception or transmission. 3'b001 = Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 3'b010 = Form Error: A fixed format part of a received frame has the wrong format. 3'b011 = AckError: The message transmitted by the MCAN module was not acknowledged by another node. 3'b100 = Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 3'b101 = Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the Host CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 3'b110 = CRCError: The CRC check sum of a received message was incorrect. The CRC of an incom-ing message does not match with the CRC calculated from the received data. 3'b111 = NoChange: Any read access to the Protocol Status Register re-initializes the MCAN_PSR[2-0] LEC field to 3'b111. When the MCAN_PSR[2-0] LEC field shows the value 3'b111, no CAN bus event was detected since the last Host CPU read access to the Protocol Status Register. Note: When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in the MCAN_PSR[10-8] DLEC field instead of the MCAN_PSR[2-0] LEC field. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.

Bit	Field	Type	Reset	Description
19	DRX	R/W	0h	Message stored to Dedicated Rx Buffer
18	TOO	R/W	0h	Timeout Occurred
17	MRAF	R/W	0h	Message RAM Access Failure The flag is set, when the Rx Handler: i. has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. ii. was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated respectively the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN module is switched into Restricted Operation Mode (see Restricted Operation Mode). To leave Restricted Operation Mode, the Host CPU has to reset the MCAN_CCCR[2] ASM bit. 1'b0 = No Message RAM access failure occurred 1'b1 = Message RAM access failure occurred

5.1.2.37 CFG_HPMS Register

5.1.2.37.1 CFG_HPMS Register (Offset = 294h) [reset = 0h]

High Priority Message Status. Status monitoring of incoming high priority messages. This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Return to Summary Table

5.1.2.38 CFG_NDAT1 Register

5.1.2.38.1 CFG_NDAT1 Register (Offset = 298h) [reset = 0h]

New Data 1 register. NewData flags of dedicated Rx buffers 0-31. The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host CPU clears them. Aflag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register .

Copyright © 2026 Texas Instruments Incorporated

5.1.2.51 CFG_TXBRP Register

5.1.2.51.1 CFG_TXBRP Register (Offset = 2CCh) [reset = 0h]

Tx Buffer Request Pending register. PendingTx buffers with pending transmission request. Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via the MCAN_TXBAR register. The bits are reset after a requested transmission has completed or has been cancelled via the MCAN_TXBCR register. The MCAN_TXBRP bits are set only for those Tx Buffers configured via the MCAN_TXBC register. After a MCAN_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

5.1.2.52 CFG_TXBAR Register

5.1.2.52.1 CFG_TXBAR Register (Offset = 2D0h) [reset = 0h]

Tx Buffer Add Request register. Add transmission requests. Each Tx Buffer has its own Add Request bit. Writing 1h will set the corresponding Add Request bit; writing a 0h has no impact. This enables the Host CPU to set transmission requests for multiple Tx Buffers with one write to the MCAN_TXBAR register. The MCAN_TXBAR bits are set only for those Tx Buffers configured via the MCAN_TXBC register. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. Note: If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this add request is ignored.

Table 5-169. ECC_AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	NU17	R	0h	Reserved
3:2	TIMEOUT	R/W	0h	2-bit saturating counter of the number of timeout errors that have occurred since last cleared. 2'b00 - No timeout errors have occurred 2'b01 - 1 timeout erro has occurred 2'b10 - 2 timeout error has occurred 2'b11 - 3 or more timeout errors have occurred A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

Bit	Field	Type	Reset	Description
31:4	NU18	R	0h	Reserved
3:2	TIMEOUT	R/W	0h	2'b00 - No timeout errors have occurred 2'b01 - 1 timeout erro has occurred 2'b10 - 2 timeout error has occurred 2'b11 - 3 or more timeout errors have occurred A write of a non-zero value to this register decrements that many from the timeout fields. If the resulting written value is non zero, then the pending level interrupt stays asserted. A new pulse interrupt will nto be asserted, you must write the eoi register for that to occur. If you write a value more than the counter value the result will be zero.

Table 5-176. CPSW_SS_SYNCE_COUNT_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	SYNCE_CNT	R/W	0h	SyncE Count Value - This value determines the toggle rate of the TS_SYNCE output. When this value is zero the TS_SYNCE output is disabled (low). When this value is non-zero, the TS_SYNCE output toggles each time the synce count value is reached. If this value is to be changed to another non-zero value then it should be written with a zero value before Writing the new non-zero value.

Table 5-194. CPSW_MDIO_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1 by the hardware when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	NONE	0h	Reserved
28:24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest useraccess channel that is available in the module and is currently set to 1. This implies that MDIOUserAccess1 is the highest available user access channel.
23:21	RESERVED	NONE	0h	Reserved
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles in clause 22 mode of operation. This bit has no effect in clause 45 mode of operation.
19	FAULT	R/W	0h	Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable. This bit can be set to 1 to enable the host to set the userint and linkint bits for test purposes.

Table 5-196. CPSW_MDIO_ALIVE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	ALIVE	R/W	0h	MDIO Alive. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are intended to be used to give an indication of the presence or not of the PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect.

Table 5-198. CPSW_MDIO_LINK_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	LINK	R	0h	MDIO Link state. This register is updated after a read of the Generic Status Register of a PHY. The corresponding bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is cleared to zero if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, in Normal Mode Operation, the status of the two PHYs specified in the MDIOUserPhySel registers can be determined using the MLINK input pins. This is determined by the linksel bit in the MDIOUserPhySel register. In State Change Mode the MLINK input pins are unused.

Bit	Field	Type	Reset	Description
31:2	RESERVED	NONE	0h	Reserved
1:0	LINKINTRAW	R/W	0h	MDIO link change event raw value. Normal mode operation: When asserted, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register. linkintraw[0] and linkintraw[1] correspond to MDIOUserPhySel0 and MDIOUserPhysel1, respectively. Writing a 1 will clear the event and writing 0 has no effect. If the int_test bit in the MDIOControl register is set, the host may set linkintraw bits to a 1 which may be used for test purposes. MDIO link change event raw value. State Change Mode operation: The linkintraw[0] bit will be asserted when any bit (for any PHY) in the MDIOAlive or MDIOLink registers changes due to MDIO operations. The linkintraw[1] bit is unused in State Change Mode. State Change Mode allows any state change in any PHY to issue an interrupt. If the int_test bit in the MDIOControl register is set, the host may set the linkintraw[0] bit high which may be used for test purposes.

Bit	Field	Type	Reset	Description
31:2	RESERVED	NONE	0h	Reserved
1:0	LINKINTMASKED	R/W	0h	MDIO link change interrupt masked value. Normal mode operation: When asserted, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register and the corresponding linkint_enable bit was set. linkintmasked[0] and linkintmasked[1] correspond to MDIOUserPhySel0 and MDIOUserPhysel1, respectively. Writing a 1 will clear the interrupt and writing 0 has no effect. These masked interrupt bits are the MDIO_LINKINT[1:0] pin values. MDIO link change interrupt masked value. State Change Mode operation: The linkintmasked[0] bit will be asserted when linkintraw[0] is asserted and when the linkintmaskset bit is set to 1. Writing a 1 will clear linkintmasked[0] (and the MDIO_LINKINT[0] output) and writing 0 has no effect. The linkintmasked[1] bit is not used in State Change Mode (MDIO_LINKINT[1] is therefore also unused in State Change Mode).

Table 5-348. CPSW_NC_TX_PRI2_MAXLEN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:14	RESERVED	NONE	0h	Reserved
13:0	TX_PRI2_MAXLEN	R/W	7E8h	This value determines the maximum packet length that will be transmitted on priority 2 Ethernet egress for all Ethernet ports. The packet length compared to the maximum length value is the ingress packet length (not the actual egress packet length which is the length before VLAN addition or removal or any other egress processing). Packets on a priority that are larger than this value are dropped.

Table 5-360. CPSW_MDIO_USER_GROUP_USER_ACCESS_REG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31	GO	R/W	0h	Go. Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1. If byte access is being used, the go bit should be written last.
30	WRITE	R/W	0h	Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.
29	ACK	R/W	0h	Acknowledge. This bit is set if the PHY acknowledged the read transaction.
28:26	RESERVED	NONE	0h	Reserved
25:21	REGADR	R/W	0h	Register address. This field specifies the PHY register to be accessed for this transaction in clause 22 mode or the MMD value in clause 45 mode.
20:16	PHYADR	R/W	0h	PHY address. This field specifies the PHY to be accessed for this transaction.
15:0	DATA	R/W	0h	User data. The data value read from or to be written to the specified PHY register.

Table 5-376. CPSW_NC_CPPI_P0_FH_MAXLEN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:14	RESERVED	NONE	0h	Reserved
13:0	FH_MAXLEN	R/W	5EEh	Port 0 Ingress Maximum Frame Length - This field determines the maximum length of a received frame. The reset value is 1518 (dec). Frames with byte counts greater than p0_fh_maxlen are long frames. Long frames with no errors are oversized frames. Long frames with CRC, code, or alignment error are jabber frames. The maximum value is 9604 (including VLAN) when the CPSW is configured with 1 = 4. When 1 = 1 the maximum value is 2024 (including VLAN).

Bit	Field	Type	Reset	Description
31:19	RESERVED	NONE	0h	Reserved
18	EST_BUFACT	R	0h	EST RAM active buffer - Indicates the active 64-word fetch buffer when pn_est_onebuf is cleared to zero. Indicates the fetch ram address MSB when pn_est_onebuf set to one.
17	EST_ADD_ERR	R	0h	EST Address Error - Indicates that the fetch ram was read again after the previous maximum buffer address read (the previous fetch from the maximum address is reused).
16	EST_CNT_ERR	R	0h	EST Fetch Count Error - Indicates that insufficient clocks were programmed into the fetch count and that another fetch was commanded before the previous fetch finished.
15:8	TX_E_MAC_ALLOW	R	FFh	Transmit mac allow - Bus that indicates the actual priorities assigned to the express queue (and inversely the priorities assigned to the prempt queue). The pn_mac_prempt[7:0] field in the Enet_Pn_IET_Control register indicates which priorities should be assigned to the express/prempt queues. The switch between queues happens only when the priority is empty and the actual assignment is shown in this field.
7:0	TX_PRI_ACTIVE	R	0h	Transmit Priority Active - Bus that indicates which priorities have packets (non-empty) at the time of the register read.

0h			0h	0h	0h	0h	0h

Table 5-442. CPSW_NC_ETH_MAC_PN_EST_CONTROL_REG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:26	RESERVED	NONE	0h	Reserved
25:16	EST_FILL_MARGIN	R/W	0h	EST Fill Margin - Sets the fill margin (in bytes) required to ensure that the Ethernet wire is clear so that the timed EST express packet can egress at the correct required time. Setting this value too high will put an unnecessary gap on the wire. Setting this value too low will cause the express packet to egress at a time later than intended (pushed out by non express traffic that did not have sufficient time to finish).
15:9	EST_PREMPT_COMP	R/W	0h	EST Prempt Comparison Value - When the count in a zero allow is less than or equal to this value in bytes (times 8), prempt packets are cleared from the wire. This is the prempt clear margin value.
8	EST_FILL_EN	R/W	0h	EST Fill Enable - Enable EST fill mode when set.
7:5	EST_TS_PRI	R/W	0h	EST Timestamp Express Priority - Selects the express priority that timestamp(s) will be generated on when pn_est_ts_onepri is set.
4	EST_TS_ONEPRI	R/W	0h	EST Timestamp One Express Priority - When set, timestamps are only enabled on packets on the express priority selected by pn_est_ts_pri. When cleared to zero, express packet selection for timestamps is independent of priority.

Copyright © 2026 Texas Instruments Incorporated

Table 5-442. CPSW_NC_ETH_MAC_PN_EST_CONTROL_REG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	EST_TS_FIRST	R/W	0h	EST Timestamp First Express Packet only - Generate a timestamp only on the first selected express packet in each EST time interval when express timestamps are enabled. (If pn_est_ts_onepri is also set then the timestamp is generated only on the first packet on pn_est_ts_pri).
2	EST_TS_EN	R/W	0h	EST Timestamp Enable - Enable express timestamps (when est_en and pn_est_port_en are set).
1	EST_BUFSEL	R/W	0h	EST Buffer Select - If pn_est_onebuf is cleared, this bit selects the upper (when set) or the lower (when cleared) 64-word fetch buffer. The actual fetch buffer used changes only at the start of the EST time interval and can be read in the Enet_Pn_FIFO_Status register pn_est_bufact bit.
0	EST_ONEBUF	R/W	0h	EST One Fetch Buffer - When set indicates that all 128 fetch words are used in one buffer. When cleared, indicates that the 128 fetch words are split into two 64-word fetch buffers. The pn_est_bufsel selects the buffer to be used when pn_est_onebuf is cleared to zero. Two buffers allows software to change a buffer while the hardware is using the other buffer.

Table 5-484. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:25	RESERVED	NONE	0h	Reserved
24	RX_CMF_EN	R/W	0h	RX Copy MAC Control Frames Enable - Enables MAC control frames to be transferred to memory. MAC control frames are normally acted upon (if enabled), but not copied/transferred to memory. MAC control frames that are pause frames will be acted upon if enabled in the MacControl register, regardless of the value of pn_rx_cmf_en. Frames transferred to memory due to pn_rx_cmf_en will have the mac_control bit set in their EOP buffer descriptor. 0 - MAC control frames are filtered (but are acted upon if enabled). 1 - MAC control frames are transferred to the host.
23	RX_CSF_EN	R/W	0h	RX Copy Short Frames Enable - Enables frames or fragments shorter than 64 bytes to be sent to the host. Frames transferred to the host due to pn_rx_csf_en will have the fragment or undersized bit set in their buffer descriptor. Short and fragment frame transfer is not guaranteed for all packet conditions and is best case only. Frames shorter than 33 bytes will be dropped in all cases. Fragments are short frames that contain CRC/align/code errors and undersized are short frames without errors. The pn_rx_cef_en bit must also be set to transfer fragment frames. 0 - Short frames are filtered. 1 - Short frames are transferred to the host.

Copyright © 2026 Texas Instruments Incorporated

Table 5-484. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	RX_CEF_EN	R/W	0h	RX Copy Error Frames Enable - Enables frames containing errors to be transferred to memory. The appropriate error bit will be set in the frame receive buffer descriptor. Frames containing errors will be filtered when this bit is not set. 0 - Frames containing errors are filtered. 1 - Frames containing errors are transferred to the host.
21	TX_SHORT_GAP_LIM_EN	R/W	0h	Transmit Short Gap Limit Enable - When set this bit limits the number of short gap packets transmitted to 100ppm. The pn_tx_short_gap_en bit must also be set. Each time a short gap packet is sent, a counter is loaded with 10,000 and decremented on each wireside clock. Another short gap packet will not be sent out until the counter decrements to zero. This mode is included to preclude the host from filling up the FIFO and sending every packet out with short gap which would violate the maximum number of packets per second allowed. This bit is used only with GMII (not XGMII).
20	EXT_TX_FLOW_EN	R/W	0h	External Transmit Flow Control Enable - Enables the pn_tx_flow_en to be selected from the EXT_TX_FLOW_EN input signal and not from the pn_tx_flow_en bit in this register.
19	EXT_RX_FLOW_EN	R/W	0h	External Receive Flow Control Enable - Enables the pn_rx_flow_en to be selected from the EXT_RX_FLOW_EN input signal and not from the pn_rx_flow_en bit in this register.
18	EXT_EN	R/W	0h	External Control Enable - Enables the fullduplex and gigabit mode to be selected from the FULLDUPLEX_IN and GIG_IN input signals and not from the pn_fullduplex and pn_gig bits in this register. The FULLDUPLEX_MODE bit reflects the actual fullduplex mode selected.
17	GIG_FORCE	R/W	0h	Gigabit Mode Force - This bit is used to force the Enet Mac into gigabit mode if the input GMII_MTCLK has been stopped by the PHY. 0 - GIG mode not forced 1 - GIG mode forced regardless of transmit clock
16	IFCTL_B	R/W	0h	Interface Control B - Intended as a general purpose output bit to be used to control external gaskets associated with the GMII (GMII to RGMII etc).
15	IFCTL_A	R/W	0h	Interface Control A - Intended as a general purpose output bit to be used to control external gaskets associated with the GMII (GMII to RGMII etc).
14:13	RESERVED	NONE	0h	Reserved
12	CRC_TYPE	R/W	0h	Port CRC Type - 0 - Ethernet CRC. 1 - Castagnoli CRC.
11	CMD_IDLE	R/W	0h	Command Idle - 0 - Idle not commanded. 1 - Idle Commanded (read pn_idle in Enet_Pn_Mac_Status).
10	TX_SHORT_GAP_ENABLE	R/W	0h	Transmit Short Gap Enable 0 - Transmit with a short IPG is disabled. 1 - Transmit with a short IPG is enabled.
9:8	RESERVED	NONE	0h	Reserved
7	GIG	R/W	0h	Gigabit Mode - 0 - 10/100 mode. 1 - Gigabit mode (full duplex only) The GIG_OUT output is the value of this bit. This bit is a don't care when pn_xgig is set.
6	TX_PACE	R/W	0h	Transmit Pacing Enable - 0 - Transmit Pacing Disabled. 1 - Transmit Pacing Enabled

Copyright © 2026 Texas Instruments Incorporated

Table 5-484. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	GMII_EN	R/W	0h	GMII Enable - 0 - GMII RX and TX held in reset. 1 - GMII RX and TX released from reset. This bit should be written with a logic high before the other bits in this register are written.
4	TX_FLOW_EN	R/W	0h	Transmit Flow Control Enable - Determines if incoming pause frames are acted upon in full-duplex mode. Incoming pause frames are not acted upon in half-duplex mode regardless of this bit setting. The RX_MBP_Enable bits determine whether or not received pause frames are transferred to memory. 0 - Transmit Flow Control Disabled. Full-duplex mode - Incoming pause frames are not acted upon. 1 - Transmit Flow Control Enabled . Full-duplex mode - Incoming pause frames are acted upon.
3	RX_FLOW_EN	R/W	0h	Receive Flow Control Enable - 0 - Receive Flow Control Disabled: Half-duplex mode - No flow control generated collisions are sent. Full-duplex mode - No outgoing pause frames are sent. 1 - Receive Flow Control Enabled: Half-duplex mode - Collisions are initiated when receive flow control is triggered. Full-duplex mode - Outgoing pause frames are sent when receive flow control is triggered.
2	MTEST	R/W	0h	Manufacturing Test mode - This bit must be set to allow writes to the Backoff_Test and PauseTimer registers.
1	LOOPBACK	R/W	0h	Loop Back Mode - Loopback mode forces internal fullduplex mode regardless of whether the pn_fullduplex bit is set or not. The pn_loopback bit should be changed only when pn_gmii_en is de-asserted. Loopback is used only with GMII (not XGMII). Loopback is not compatible with timestamp operations (CPTS). 0 - Loop Back Mode disabled. 1 - Loop Back Mode enabled.
0	FULLDUPLEX	R/W	0h	Full Duplex mode - Gigabit mode forces fullduplex mode regardless of whether the pn_fullduplex bit is set or not. The FULLDUPLEX_OUT output is the value of this register bit. 0 - half duplex mode. 1 - full duplex mode.

Table 5-490. CPSW_NC_ETH_MAC_PN_MAC_BOFFTEST_REG_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	NONE	0h	Reserved
30:26	PACEVAL	R/W	0h	Pacing Current Value - A non-zero value in this field indicates that transmit pacing is active. A transmit frame collision or deferral causes paceval to loaded with decimal 31, good frame transmissions (with no collisions or deferrals) cause paceval to be decremented down to zero. When paceval is nonzero, the transmitter delays 4 IPGs between new frame transmissions after each successfully transmitted frame that had no deferrals or collisions. Transmit pacing helps reduce capture effects improving overall network bandwidth.
25:16	RNDNUM	R/W	0h	Backoff Random Number Generator - This field allows the Backoff Random Number Generator to be read (or written in test mode only). This field can be written only when pn_mtest has previously been set. Reading this field returns the generator's current value. The value is reset to zero and begins counting on the clock after the de-assertion of reset.
15:12	COLL_COUNT	R	0h	Collision Count - The number of collisions the current frame has experienced.
11:10	RESERVED	NONE	0h	Reserved
9:0	TX_BACKOFF	R	0h	Backoff Count - This field allows the current value of the backoff counter to be observed for test purposes. This field is loaded automatically according to the backoff algorithm, and is decremented by one for each slot time after the collision.

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15	DECREMENT_TTL	R/W	0h	Decrement Time To Live - When set, the Time To Live (TTL) field in the header is decremented. IPV4 - Decrement the TTL byte and update the Header Checksum. IPV6 - Decrement the Hop Limit. note: When this bit is set, the ALE should be configured to send any IPv4/6 packet with a zero or one TTL field to the host with the ALE egress operation ttl_check bit.When this bit is cleared the TTL/Hop Limit fields are not checked or modified.
14	DEST_FORCE_UNTAGGED_EGRESS	R/W	0h	Destination VLAN Force Untagged Egress - When set, this bit indicates that the VLAN should be removed on egress for the routed packet. The replace_vid bit should be set for this bit to be used, otherwise force untagged egress comes from the address lookup engine.
13	REPLACE_DA_SA	R/W	0h	Replace Destination Address and Source Address - When set this bit indicates that the routed packet destination address should be replaced by da[47:0] and the source address should be replaced by sa[47:0].
12	REPLACE_VID	R/W	0h	Replace VLAN ID - When set this bit indicates that the VLAN ID should be replaced for the routed packet.

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	SOFT_RESET	R/W	0h	Software reset - Writing a one to this bit causes the entire CPSW logic to be reset. Software reset occurs when the DMA Controllers are in an idle state to avoid locking up the VBUSP bus. After writing a one to this bit, it may be polled to determine if the reset has occurred. If a one is read, the reset has not yet occurred. If a zero is read then reset has occurred.

Table 5-534. CPSW_NC_CPDMA_REGS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:9	RESERVED	NONE	0h	Reserved
8	FH_OWNERSHIP	R/W	0h	CPDMA FHost Ownership Write Bit Value. 0 - The CPDMA writes the FHost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 - The CPDMA writes the FHost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.
7	TH_CH_OVERRIDE	R/W	0h	CPDMA THost Channel Classification Match Override Enable 0 - The THost channel is not overridden with the ALE classification match. 1 - The THOST channel is overridden with the lower 3-bits of the ALE classification match value (if a classification match occurred).
6	TH_TS_ENCAP	R/W	0h	CPDMA THost Packet Timestamp Encapsulation 0 - THost packets do not contain a 64-bit timestamp 1 - THost packets contain a 64-bit timestamp prepended to the packet data (32-bit lsword first).
5	TH_VLAN_ENCAP	R/W	0h	CPDMA THost Packet VLAN Encapsulation 0 - THost packets are not VLAN encapsulated 1 - THost packets are VLAN encapsulated

Copyright © 2026 Texas Instruments Incorporated

Table 5-534. CPSW_NC_CPDMA_REGS_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	TH_CEF	R/W	0h	CPDMA THost Copy Error Frames Enable - Enables THost DMA overrun frames to be transferred to memory (up to the point of buffer overrun). The overrun error bit will be set in the frame EOP buffer descriptor. Overrun frame data will be filtered when thost_cef is not set. THost frames with other error bits set are not affected by this bit. This is related only to frames that overrun on the THost DMA due to buffer limitations. 0 - Frames containing overrun errors are filtered. 1 - Frames containing overrun errors are transferred to memory.
3	CMD_IDLE	R/W	0h	CPDMA Command Idle 0 - Idle not commanded 1 - Idle Commanded (read idle in CPDMA_Status register)
2	TH_OFFLEN_BLOCK	R/W	0h	CPDMA THost Offset/Length word write block 0 - Do not block the DMA writes to the THost buffer descriptor offset/buffer length word. The offset/buffer length word is written as specified in CPPI 3.0. 1 - Block all CPDMA DMA controller writes to the THost buffer descriptor offset/buffer length words during CPPI packet processing. When this bit is set, the CPDMA will never write the third word to any THost buffer descriptor.
1	TH_OWNERSHIP	R/W	0h	CPDMA THost Ownership Write Bit Value 0 - The CPDMA writes the THost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 - The CPDMA writes the THost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.
0	FH_PTYPE	R/W	0h	CPDMA FHost Queue Priority Type 0 - The queue uses a round robin scheme to select the next channel. 1 - The queue uses a fixed (channel 7 highest priority) priority scheme to select the next channel.

Table 5-538. CPSW_NC_CPDMA_REGS_TH_BUFFER_OFFSET_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED	NONE	0h	Reserved
11:0	TH_BUFFER_OFFSET	R/W	0h	CPDMA THost Buffer Offset Value - The thost_buffer_offset will be written by the port into each frame SOP buffer descriptor buffer_offset field. The frame data will begin after the thost_buffer_offset value of bytes. A value of 0x0 indicates that there are no unused bytes at the beginning of the data and that valid data begins on the first byte of the buffer. A value of 0xF (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. This value is used for all channels.

5.2.2.190 CPSW_NC_CPDMA_INT_EOI_VECTOR_REG Register

5.2.2.190.1 CPSW_NC_CPDMA_INT_EOI_VECTOR_REG Register (Offset = 34094h) [reset = 0h]

The CPDMA_EOI_VECTOR(4:0) output bus reflects the value written to this location one VBUSP_GCLK cycle after a write to this location. The EOI_WR signal is asserted for a single clock cycle after a latency of two VBUSP_GCLK cycles when a write is performed to this location.

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15:0	TH0_FREEBUFFER	R/W	0h	This field contains the count of host free buffers available. The th(0..7)_pendthresh value is compared with this field to determine if the THost threshold pending interrupt should be asseted (if enabled). This is a write to increment field. This field rolls over to zero on overflow. If THost threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel). The port decrements (by the number of buffers in the frame) the associated channel register for each frame. This is a write to increment field. The host must write this field with the number of buffers that have been freed due to host processing.

Table 5-598. CPSW_NC_CPDMA_INT_TH6_FREEBUFFER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15:0	TH6_FREEBUFFER	R/W	0h	This field contains the count of host free buffers available. The th(0..7)_pendthresh value is compared with this field to determine if the THost threshold pending interrupt should be asseted (if enabled). This is a write to increment field. This field rolls over to zero on overflow. If THost threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel). The port decrements (by the number of buffers in the frame) the associated channel register for each frame. This is a write to increment field. The host must write this field with the number of buffers that have been freed due to host processing.

Table 5-858. CPSW_NC_CPTS_TS_PUSH_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	TS_PUSH	W	0h	Time stamp event push - When a logic high is written to this bit a time stamp event is pushed onto the event FIFO. The time stamp value is the time of the write of this register, not the time of the event read. The time stamp value can then be read on interrupt via the event registers. Software should not push a second time stamp event onto the event FIFO until the first time stamp value has been read from the event FIFO (there should be only one time stamp event in the event FIFO at any given time). This bit is write only and always reads zero.

Table 5-860. CPSW_NC_CPTS_TS_LOAD_VAL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TS_LOAD_VAL	R/W	0h	Time Stamp Load Low Value - Writing the ts_load_en bit causes ts_load[63:0] to be written into the time stamp. The time stamp value is read by initiating a time stamp push event, not by reading this register. When reading this register, the value read is not the time stamp, but is the value that was last written to this register.

5.2.2.365 CPSW_NC_ALE_STATUS Register

5.2.2.365.1 CPSW_NC_ALE_STATUS Register (Offset = 3E004h) [reset = 80000400h]

The ALE status provides information on the ALE configuration and state. The ramdepth is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry Hi is designated by the odd slice index and Lo is designated by the even slice index. The slice index is above the ram depth like {SliceIndex,RamIndex}. So, for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|(0x040) and the Lo portion is located at 0x005 & (~0x040).

Table 5-904. CPSW_NC_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28:26	RESERVED	NONE	0h	Reserved
25:24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the mirror_top port.

Copyright © 2026 Texas Instruments Incorporated

Table 5-904. CPSW_NC_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:21	UPD_BW_CTRL	R/W	0h	The upd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the upd_bw_ctrl can be programmed more aggressive. If the upd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20:18	RESERVED	NONE	0h	Reserved
17:16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	LRN_HOST_DST	R/W	0h	Learn Host Destination - This field is set to only learn unicast packet source addresses that are destined to the host port. This bit is only valid for 3 port switches and allows the ALE table to only contain addresses the host port is concerned about. This bit is affectively disabled when en_host_uni_flood is set since any unknown unicast is also sent to the host port for extended bridging operations.
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the mirror_midx entry index will have that traffic also sent to the mirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the mirror_dp port will have its transmit traffic also sent to the mirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the pX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the mirror_top port.
9	RESERVED	NONE	0h	Reserved
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.

Copyright © 2026 Texas Instruments Incorporated

Table 5-904. CPSW_NC_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

Table 5-906. CPSW_NC_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	NONE	0h	Reserved
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
26	RESERVED	NONE	0h	Reserved
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.

Copyright © 2026 Texas Instruments Incorporated

Table 5-906. CPSW_NC_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ALE_NXT_HDR register values.
19	RESERVED	NONE	0h	Reserved
18:16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the trk_en_dst, trk_en_src, trk_en_pri and trk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the italic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - 00000000 2 - 01010101 3 - 02102102 4 - 03210321
15	MULTIHOST	R/W	0h	The ~multihost allows host traffic to be sent bact to the host if the DA is market for the host port.
14:9	RESERVED	NONE	0h	Reserved
8:0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the mirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

5.2.2.371 CPSW_NC_ALE_TBLCTL Register

5.2.2.371.1 CPSW_NC_ALE_TBLCTL Register (Offset = 3E020h) [reset = 0h]

The ALE table control register is used to read or write that ALE table entries. After writing to this register any read or write to any ALE register will be stalled until the read or write operation completes.

Return to Summary Table

Bit	Field	Type	Reset	Description
31	TABLEWR	R/W	0h	Table Write - This bit is used to write the table words to the lookup table. 0 - Table Read Operation is performed. The contents of the TABLEIDX entry will be read into the ALE_TBLWx registers 1 - Table write operation is performed. This will take the current contents from the ALE_TBLWx registers and write them to the table at the specified TABLEIDX.
30:9	RESERVED	NONE	0h	Reserved
8:0	TABLEIDX	R/W	0h	The table index is used to determine which lookup table entry is read or written.

Table 5-922. CPSW_NC_ALE_I0_PORTCTL0_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23:16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The mcast_limit is the number of Multicast packets that will be forwaded per ale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.

Copyright © 2026 Texas Instruments Incorporated

Table 5-922. CPSW_NC_ALE_I0_PORTCTL0_j Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with maconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the p0_maconly bit set and the p0_no_learn also set. If p0_maconly bit is set and the p0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the p0_trunken its set and having the same p0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9:8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the p0_trunken is also set. Ports with the same trunk number that have the p0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the mirror_top port.
6	RESERVED	NONE	0h	Reserved
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
