Bit	Field	Type	Reset	Description
31:3	RESERVED	NONE	0h	Reserved
2:0	OAM_LB_CTRL	R/W	0h	The oam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egressop of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotly requested and disabled.

Copyright © 2026 Texas Instruments Incorporated

5.2.2.383 CPSW_NC_ALE_EGRESSOP Register

5.2.2.383.1 CPSW_NC_ALE_EGRESSOP Register (Offset = 3E0FCh) [reset = 0h]

The Egress Operation register allows enabled classifiers with any match like IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host or is destined to any port without any errors, but matches a clasifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions. Care must be taken not to violate VLAN rules as this can redirect packets based on classifier matches.

Return to Summary Table

Table 5-938. CPSW_NC_ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23:21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19:3	RESERVED	NONE	0h	Reserved

5.2.2.390.1 CPSW_NC_ALE_POLICECFG7 Register (Offset = 3E11Ch) [reset = 0h]

The CIR counter is a 37 bit internal counter where ~icir_idle_inc_val is added every clock and the frame size << 18 is subtracted at EOF if not RED or YELLOW at LUT time. If the counter is positive the packet will be marked GREEN, else it can be YELLOW or RED based on the PIR counter. If only this counter is used (aka pir_idle_inc_val==0) Packet are marked YELLOW or GREEN based on CIR counter only.

Table 5-954. CPSW_NC_ALE_POLICETBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRITE_ENABLE	R/W	0h	Write Enable - Setting this bit will write the POLICECFG0-7 to the pol_tbl_idx selected policing/classifier entry. Clearing this bit will read the pol_tbl_idx selected policing/classifier entry into the POLICECFG0-7 registers.
30:5	RESERVED	NONE	0h	Reserved
4:0	POL_TBL_IDX	R/W	0h	Policer Entry Index - This field specifies the policing/classifier entry to be read or written. When writing to this field without setting the write_enable=1 will cause the selected policing/classifier entry to be loaded into the POLICECFG0-7 registers. When writing to this field with setting the write_enable=1 will cause the selected policing/classifier entry to be updated from the POLICECFG0-7 registers.

Table 5-956. CPSW_NC_ALE_POLICECONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7:0	NUDGE	R/W	0h	ESTFn Nudge Value - This two's complement number is added to the generate counter value to increase or decrease the length by the ts_estfN_nudge amount. Only a single high or low time is adjusted and the ts_estfN_nudge value is cleared to zero when the nudge has occurred.

Bit	Field	Type	Reset	Description
31:12	RESERVED	NONE	0h	Reserved
11:8	FIFO_NONERR	R/W	5h	Enables/disables FIFO writes without the error event on completion of comparison window. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101 Counter values are captured to non-full FIFO only upon Error event. Others 1010 : Write counter values to non-full FIFO upon completion of comparison window regardless of error or not. It is recommended to write 1010 to avoid single soft errors.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1052. MSS_DCC_DCCGCTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7:4	FIFO_READ	R/W	5h	Enables the counter read registers reflect FIFO output instead of the live counter value. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101 Counter value is read directly. Others 1010 : Counters FIFO output is read. It is recommended to write 1010 to avoid single soft errors.
3:0	CONT_ON_ERR	R/W	5h	Continues to next window of comparison despite the error condition. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Enable values: 0101 Comparison and counter reload is stopped from advancing if error is detected. Others 1010:Counters get reloaded with seed and continue counting despite the error condition. It is recommended to write 1010 to avoid single soft errors.

Bit	Field	Type	Reset	Description
31:16	PLS	R	FFFFh	This is the highest priority outstanding high priority pulse interrupt. Indicates what the highest priority High Priority interrupt caused by a pulse number is. The lowest event has the highest priority. i.e. if Global Events 0, 1, 2, 3, and 4 are pending, and Global Event 0, and are configured for High Priority while Global Events 2, 3, and 4 are configured for Low Priority, then the value of this field will be 0x2. value of all ones (0xFFFF) indicates that there are no low priority interrupts pending. This field is updated whenever a ew, higher priority event comes in. Software cannot read this field multiple times during an interrupt service routine to keep track of which interrupt is being serviced, because this field may have been updated with a higher priority event.
15:0	LVL	R	FFFFh	This is the highest priority outstanding high priority level interrupt. Indicates what the highest priority High Priority interrupt caused by a level number is. The lowest event has the highest priority. i.e. if Global Events 0, 1, 2, 3, and 4 are pending, and Global Event 0, and are configured for High Priority while Global Events 2, 3, and 4 are configured for Low Priority, then the value of this field will be 0x2. value of all ones (0xFFFF) indicates that there are no low priority interrupts pending. This field is updated whenever a ew, higher priority event comes in. Software cannot read this field multiple times during an interrupt service routine to keep track of which interrupt is being serviced, because this field may have been updated with a higher priority event.

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7:4	PWM_EN	R/W	0h	PWM enable. PWM mode enable. This field should only be modified when the ESM is disabled, from the Global Enable register. This field is only reset by a Power-On-Reset (not warm reset). 0x0:Error output pin is a level 0xF:Error output pin is a PWM signal All other are invalid

Copyright © 2026 Texas Instruments Incorporated

Table 5-1085. ESM_PIN_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:0	KEY	R/W	0h	Pin Control Key. This field controls behavior of the Error Pin. Note, during reset the field is 0x0, but the Error Pin is asserted (active low). Immediately after reset, the Error Pin de-asserts. This field is only reset by a Power-On-Reset (not warm reset). 0x0: Normal Mode - Error Pin will activate when an enabled Error Event occurs 0xA: Force Error Mode - Forces the Error Pin active. To clear the Error Pin (return to the ESM_IDLE state) write this field back to Normal Mode (Writing a CLEAR event will also work). You may only write to Force Error Mode while in IDLE. Attempting Force Error while in another state will have no effect 0x5 : CLEAR Event - generates a CLEAR event to the ESM state machine. Key will return to Normal Mode (0x0) on the next cycle. All Other Values - Normal Mode. Writing any of these values will have no effect. Reading any of these values indicate that one or more bits have experienced a single event upset and software should write the field back to 0x0. The ESM will continue to operate in Normal Mode

Copyright © 2026 Texas Instruments Incorporated

5.4.2.15 ESM_PIN_STS Register

5.4.2.15.1 ESM_PIN_STS Register (Offset = 44h) [reset = 0h]

This register reflects the status of the error_pin_n output.

Return to Summary Table

Table 5-1103. ESM_CRIT_DELAY_CNTR_PRE Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	COUNT	R/W	0h	Counter Pre-Load Value. This is the value that will be loaded in to the counter field of the Critical Priority Interrupt Delay Counter Value Register whenever there are no critical priority interrupt influential events left and the register count value is still non-zero. The default value is determined by a module tie-off crit_delay_cntr_ipcfg. If an immediate, no-delayed interrupt is needed, the tieoff value can be assigned to 0 or software can program the field to be 0. Note that the ESM clock is required to be active and that the ESM still requires 2-3 cycles to observe aninput error event. This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to crit_delay_cntr_ipcfg.

Table 5-1105. ESM_ERR_GRP_RAW_j Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	STS	R/W1TS	0h	This is the raw status/set for errors Group A. This is the raw status of the events in group N. Each bit corresponds to event Q where Q = N*32+Bit (Example: bit 0 is event N*32+0, bit 1 is N*32 + 1 etc). For Level events, the raw status is the event input synchronized to the ESM clock and stored in a multi-bit (for redundancy) internal register. For Pulse events, the raw status is multi-bit (for redundancy) internal register that is set when two of the three edge detection circuits on the redundant event capture a rising edge. This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to 0. Read: 0x0: Inactive 0x1: Active/Pending Write 0x1 to set interrupt raw status.

Bit	Field	Type	Reset	Description
31:0	MSK	R/W1TS	0h	This is the mask enable set for errors in Group A. This field is used to enable the mask of events in group N. Each bit corresponds to event Q where Q = N*32+Bit. If the corresponding bit and the global_enable are set, then then interrupt is unmasked. This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to 0. Read: 0x0: Disabled 0x1: Enabled Write 0x1 to set enable

Bit	Field	Type	Reset	Description
31:5	RESERVED	NONE	0h	Reserved
4	FLC_DON	R/W1TS	0h	The flc_don bit indicates a FLC has completed the transfer to the FLC range. Write 1 to set the flc_don status for diagnostic purposes. Writing a 0 has no effect.
3	FLC_WRERR	R/W1TS	0h	The flc_wrerr bit indicates a write error from FLC remote range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the flc_wrerr status for diagnostic purposes. Writing a 0 has no effect.
2	FLC_RDERR	R/W1TS	0h	The flc_rderr bit indicates a read error from FLC range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the flc_rderr status for diagnostic purposes. Writing a 0 has no effect.
1	WR_HIT	R/W1TS	0h	The wr_hit bit indicates a write to the cacheable range has occurred potentially causing a coherency issue and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the wr_hit status for diagnostic purposes. Writing a 0 has no effect.
0	WR_ERR	R/W1TS	0h	The wr_err bit indicates a write error has occurred to the remote cache data storage memory and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the wr_err status for diagnostic purposes. Writing a 0 has no effect.

Copyright © 2026 Texas Instruments Incorporated

5.5.2.9 RL2_IRQSTATUS_MSK Register

5.5.2.9.1 RL2_IRQSTATUS_MSK Register (Offset = 84h) [reset = 0h]

The Interrupt Masked Status Register holds the masked status for the FLC/RL2 status/error interrupts. Writing to this register will EOI the interrupt, that is if another interrupt is pending, a new pulse interrupt will be generated.

Return to Summary Table

Table 5-1140. Instance Table

5.5.2.18 RL2_REM_LEN_j Register

5.5.2.18.1 RL2_REM_LEN_j Register (Offset = 28h + formula) [reset = 0h]

The Remote 'n' length defines the amount of remote cache data storage memory in 64 byte aligned quanta used starting from the REMote 'n' Address. The RL2 consumes remote cache data storage memory ranges in numeric order. Range 0 is consumed prior to range 1, etc. This register is write protected when enable is set.

Return to Summary Table

Offset = 28h + (j * 10h); where j = 0 to 2d

5.7.2.4 FSS_FSAS_GENREGS_DP_ERR_INJ_CTRL Register

5.7.2.4.1 FSS_FSAS_GENREGS_DP_ERR_INJ_CTRL Register (Offset = 80h) [reset = 0h]

This register is used to setup double pumping error injection. Only one error injection enable field has to be set in this register at a given time. After error injection is enabled, a read must be issued to a valid flash address in order to trigger the error. Once triggered, the error will be reported using IRQ.STATUS register dp_cmd_err/ dp_ret_err fields and corresponding interrupt fsas_ecc_intr_err_pend/fsas_ecc_intr_err_req will be generated if enabled.

5.7.2.5 FSS_FSAS_GENREGS_IRQ_IRQ_EOI Register

5.7.2.5.1 FSS_FSAS_GENREGS_IRQ_IRQ_EOI Register (Offset = 10h) [reset = 0h]

The End of Interrupt (EOI) Register allows the CPU to acknowledge completion of fsas_ecc_intr_err_req pulse interrupt. When this register is written to 1'b0, INTD logic used for converting fsas_ecc_intr_err_pend level interrupt to pulse will be re-armed. That is, if interrupt sources remain after writing this register to 1'b0, another pulse interrupt will be triggered by INTD. Conversely, if this register is not written to 1'b0 after fsas_ecc_intr_err_req pulse interrupt is received, then another pulse interrupt will not be received as INTD has not been re-armed. This register will be reset one cycle after it has been written to. Please note that the reason for writing 1'b0 is because there is only one interrupt (no interrupt aggregation) associated with this EOI and the INTD vector associated with this interrupt is 1'b0.

5.7.2.9 FSS_FSAS_GENREGS_IRQ_IRQ_ENABLE_CLR Register

5.7.2.9.1 FSS_FSAS_GENREGS_IRQ_IRQ_ENABLE_CLR Register (Offset = 20h) [reset = 0h]

The IRQ_ENABLE_CLR register allows the interrupt sources associated with each bit in this register to be manually disabled when writing a 1 to a specific bit. This register corresponds to fsas_ecc_intr_err_pend (level) and fsas_ecc_intr_err_req (pulse) interrupt outputs. Write 0: No action Write 1: Disable event Read 0: Event is disabled Read 1: Event is enabled

Table 5-1250. FSS_FSAS_GENREGS_ERR_ECC_TYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ECC_ERR_VALID	R/W1TC	0h	When set indicates that there is valid ECC error information available, Writing a one to this register will pop the top of the stack
30:6	RESERVED	NONE	0h	Reserved
5	ECC_ERR_ADR	R	0h	When set indicates that there was a single error detected within the address field. Bits 0 and 1 in this register indicate whether it is single or double error.
4	ECC_ERR_MAC	R	0h	When set indicates that there was a single error detected within the MAC field. Bits 0 and 1 in this register indicate whether it is single or double error.
3	ECC_ERR_DA1	R	0h	When set indicates that there was a single error detected within the High Data word, which is bits 127 through 64 of the data word. Bits 0 and 1 in this register indicate whether it is single or double error.
2	ECC_ERR_DA0	R	0h	When set indicates that there was a single error detected within the Low Data word, which is bits 63 through 0 of the data word. Bits 0 and 1 in this register indicate whether it is single or double error.
1	ECC_ERR_DED	R	0h	When set indicates that there was a double error detected for the block

Copyright © 2026 Texas Instruments Incorporated

Table 5-1250. FSS_FSAS_GENREGS_ERR_ECC_TYPE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ECC_ERR_SEC	R	0h	When set indicates that there was a single error detected for the block. The fields that had single error are reported by bits 2 through 5 in this register. It is possible that single error is reported in multiple fields since the ECCM inputs are partitioned into four partitions and ECC code is separate for each partition. It is also possible that none of the fields report single error even though ecc_err_sec bit is set. This can happen if single bit error occurred on the ECC code.

Copyright © 2026 Texas Instruments Incorporated

5.7.2.14 FSS_FSAS_GENREGS_ERR_WRT_TYPE Register

5.7.2.14.1 FSS_FSAS_GENREGS_ERR_WRT_TYPE Register (Offset = 78h) [reset = 0h]

The ERR_WRT_TYPE register holds the current top of stack write error info. this is only valid when the wrt_err_valid is set

Return to Summary Table

Table 5-1266. FSAS_OTFA_REGS_CCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	MASTER_EN_RD	R/W	0h	This register controls the enabling and the functionality of this IP. Write 0:Request to Disabled and enter into Bypass mode. Read 0:Disabled and enter into Bypass mode is active When Disabled, then Bypass mux is enabled which will directly connect the otfa_emif4d ocp hp target port to the ocp hp initiator port. The OTFA core clock is gated in this mode. Write 1:Request to Enabled mode Read 1:Enabled mode is active When Enabled, all functionality is enabled and bypass mux will be disabled. Note: The SW most follow the defined programming procedure from switching states. Disable -> Enable and Enable -> Disable. See programming model for more details on the procedures that the SW needs to follow. The hw_disable_ctrl input port driven by Efuse bit will disable the ability for SW to set InitiatorEnable. hw_disable_ctrl = 1, then InitiatorEnable will be forced to 0, SW WRT will have no effect, SW will always read back 0. hw_disable_ctrl = 0, then InitiatorEnable state can get controlled by SW. Note: Optimization MMR should not be changed when InitiatorEnable is 0, after the first Disable -> Enable phase

Table 5-1266. FSAS_OTFA_REGS_CCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30:16	RESERVED	NONE	0h	Reserved
15	FE_PROC_EN	R/W	0h	This register allows the AES-CTR , GCM , GHASH modes to start the required AES jobs as soon as the RD CMD is passed through OTFA to help hide the AES op latency 0x0: Front End CMD AES start disable, only backend response , Legacy mode 0x1: Front End CMD AES start enabled, when enable only AES-CTR, GCM, and GHASH modes are supported
14:13	RESERVED	NONE	0h	Reserved
12	MAC_LSB_ALIGN_EN	R/W	0h	This register controls shift of mac data to always LSB independent of address. 0x0: Default mode 0x1: Set, for FSS use case, updated Opti flash.
11:10	MAC_SIZE	R/W	0h	This register defines the MAC size. 0x0: 4-bytes 0x1: 8-bytes 0x2: 12-bytes 0x3: 16-bytes.
8	OTFA_WAIT	R/W	0h	This register allows the ability to stop any new transactions from getting accepted and allow the current transactions to complete. Note: The otfa_emif has a one deep receive pipe stage, this will allow one new crypto cmd to get accepted before backpressure is asserted. Rules: Wait assertion can occur at any time. Wait de-assertion should only occur when CSTATUS.Busy is cleared SW needs to verify CSTATUS.Busy is cleared before it updates crypto region attributes. Non-Crypto transactions get accepted when Wait is asserted.
7	RESERVED	NONE	0h	Reserved
5	CACHE_EVICT_MODE	R/W	0h	cache evict mode
4	KEY_SIZE	R/W	0h	This register controls the key size used for all AES operations. 0x0: 128 Bit 0x1: 256 Bit

5.7.2.22 FSAS_OTFA_REGS_CSTATUS Register

5.7.2.22.1 FSAS_OTFA_REGS_CSTATUS Register (Offset = 1Ch) [reset = 0h]

This is the status register which can be used to fine tune the AES core allocation to the Rd Pipe and Wrt Pipe along with a global activity status. Performance Counters which counts the number of events which causes high latency.

Return to Summary Table

Table 5-1334. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE_FLD	R	1h	Serial interface and low level SPI pipeline is IDLE: This is a STATUS read-only bit. Note this is a retimed signal, so there will be some inherent delay on the generation of this status signal.
30	DUAL_BYTE_OPCODE_EN_FLD	R/W	0h	Dual-byte Opcode Mode enable bit This bit is to be set in case the target Flash Device supports dual byte opcode [i.e. Macronix MX25]. It is applicable for Octal I/O Mode or Protocol only so should be set back to low if the device is configured to work in another SPI Mode. If enabled, the supplementing bytes are taken from Opcode Extension Register [Lower] and from Opcode Extension Register [Upper].
29	CRC_ENABLE_FLD	R/W	0h	CRC enable bit This bit is to be set in case the target Flash Device supports CRC [Macronix MX25]. It is applicable for Octal DDR Protocol only so should be set back to low if the device is configured to work in another SPI Mode.
28:26	CONFIG_RESV2_FLD	R	0h	Reserved
25	PIPELINE_PHY_FLD	R/W	0h	Pipeline PHY Mode enable: This bit is relevant only for configuration with PHY Module. It should be asserted to 1 between consecutive PHY pipeline reads transfers and de-asserted to 0 otherwise.
24	ENABLE_DTR_PROTOCOL_FLD	R/W	0h	Enable DTR Protocol: This bit should be set if device is configured to work in DTR protocol.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1334. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	ENABLE_AHB_DECODER_FLD	R/W	0h	Enable AHB Decoder: Value 0 : Active target is selected based on Peripheral Chip Select Lines [bits [13:10]]. Value=1 Active target is selected based on actual AHB address [the partition for each device is calculated with respect to bits [28:21] of Device Size Configuration Register]
22:19	MSTR_BAUD_DIV_FLD	R/W	Fh	Master Mode Baud Rate Divisor: SPI baud rate = (master reference clock) baud_rate_divisor. Where BD is: 4b0000 = /2 4b0001 = /4 4b0010 = /6 4b0011 = /8 4b0100 = /10 4b0101 = /12 .. 4b1111 = /32 While the PHY Mode is enabled, clock from DLL is granted and consequently forwarded into external FLASH Device. Its frequency is equal to ref_clk i.e., value of /1 is used in PHY mode. Set this register up before enabling the Octal-SPI controller.
18	ENTER_XIP_MODE_IMM_FLD	R/W	0h	Enter XIP Mode immediately: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : Operate the device in XIP mode immediately Use this register when the external device wakes up in XIP mode [as per the contents of its non- volatile configuration register]. The controller will assume the next READ instruction will be passed to the device as an XIP instruction, and therefore will not require the READ opcode to be transferred. Note: To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only after the next READ instruction is executed. Software therefore should ensure that at least one READ instruction is requested after resetting this bit in order to be sure that XIP mode is exited.
17	ENTER_XIP_MODE_FLD	R/W	0h	Enter XIP Mode on next READ: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : If XIP is disabled, then setting to ?1? will inform the controller that the device is ready to enter XIP on the next READ instruction. The controller will therefore send the appropriate command sequence, including mode bits to cause the device to enter XIP mode. Use this register after the controller has ensured the FLASH device has been configured to be ready to enter XIP mode. Note : To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only AFTER the next READ instruction is executed. Software should therefore ensure that at least one READ instruction is requested after resetting this bit before it can be sure XIP mode in the device is exited.
16	ENB_AHB_ADDR_REMAP_FLD	R/W	0h	Enable AHB Address Re-mapping: [Direct Access Mode Only] When set to 1, the incoming AHB address will be adapted and sent to the FLASH device as [address + N], where N is the value stored in the remap address register.
15	ENB_DMA_IF_FLD	R/W	0h	Enable DMA Peripheral Interface: Set to 1 to enable the DMA handshaking logic. When enabled the controller will trigger DMA transfer requests via the DMA peripheral interface. Set to 0 to disable
14	WR_PROT_FLASH_FLD	R/W	0h	Write Protect Flash Pin: Set to drive the Write Protect pin of the FLASH device. This is resynchronized to the generated memory clock as necessary.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1334. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13:10	PERIPH_CS_LINES_FLD	R/W	0h	Peripheral Chip Select Lines: Peripheral chip select lines If pdec = 0, ss[3:0] are output thus: ss[3:0] n_ss_out[3:0] xxx0 1110xx01 1101x011 10110111 01111111 1111[no peripheral selected] else ss[3:0] directly drives n_ss_out[3:0]
9	PERIPH_SEL_DEC_FLD	R/W	0h	Peripheral select decode: 0 : only 1 of 4 selects n_ss_out[3:0] is active 1 : allow external 4-to-16 decode [n_ss_out = ss]
8	ENB_LEGACY_IP_MODE_FLD	R/W	0h	Legacy IP Mode Enable: 0 : Use Direct Access Controller/Indirect Access Controller 1 : legacy Mode is enabled. In this mode, any write to the controller via the AHB interface is serialized and sent to the FLASH device. Any valid AHB read will pop the internal RX-FIFO, retrieving data that was forwarded by the external FLASH device on the SPI lines,4,2 or 1 byte transfers are permitted and controlled via the HSIZE input.
7	ENB_DIR_ACC_CTLR_FLD	R/W	1h	Enable Direct Access Controller: 0 : disable the Direct Access Controller once current transfer of the data word [FF_W] is complete. 1 : enable the Direct Access Controller When the Direct Access Controller and Indirect Access Controller are both disabled, all AHB requested are completed with an error response.
6	RESET_CFG_FLD	R/W	0h	RESET pin configuration: 0 = RESET feature on DQ3 pin of the device 1 = RESET feature on dedicated pin of the device [controlling of 5th bit influences on reset_out output]
5	RESET_PIN_FLD	R/W	0h	Set to drive the RESET pin of the FLASH device and reset for de-activation of the RESET pin feature
4	HOLD_PIN_FLD	R/W	0h	Set to drive the HOLD pin of the FLASH device and reset for de-activation of the HOLD pin feature
3	PHY_MODE_ENABLE_FLD	R/W	0h	PHY mode enable: When enabled, the controller is informed that PHY Module is to be used for handling SPI transfers. This bit is relevant only for configuration with PHY Module.
2	SEL_CLK_PHASE_FLD	R/W	0h	Select Clock Phase: Selects whether the clock is in an active or inactive phase outside the SPI word. 0 : the SPI clock is active outside the word 1 : the SPI clock is inactive outside the word
1	SEL_CLK_POL_FLD	R/W	0h	Clock polarity outside SPI word: 0 : the SPI clock is quiescent low 1 : the SPI clock is quiescent high
0	ENB_SPI_FLD	R/W	1h	Octal-SPI Enable: 0 : disable the Octal-SPI, once current transfer of the data word [FF_W] is complete. 1 : enable the Octal-SPI, when spi_enable = 0, all output enables are inactive and all pins are set to input mode.

Bit	Field	Type	Reset	Description
31:24	D_NSS_FLD	R/W	0h	Clock Delay for Chip Select Deassert: Delay in initiator reference clocks for the length that the initiator mode chip select outputs are de-asserted between transactions. The minimum delay is always SCLK period to ensure the chip select is never re-asserted within an SCLK period.
23:16	D_BTWN_FLD	R/W	0h	Clock Delay for Chip Select Deactivation: Delay in initiator reference clocks between one chip select being de-activated and the activation of another. This is used to ensure a quiet period between the selection of two different targets and requires the transmit FIFO to be empty.
15:8	D_AFTER_FLD	R/W	0h	Clock Delay for Last Transaction Bit: Delay in initiator reference clocks between last bit of current transaction and deasserting the device chip select [n_ss_out]. By default, the chip select will be deasserted on the cycle following the completion of the current transaction.
7:0	D_INIT_FLD	R/W	0h	Clock Delay with n_ss_out: Delay in initiator reference clocks between setting n_ss_out low and first bit transfer.

5.7.2.61 OSPI_FLASH_CFG_SRAM_PARTITION_CFG_REG Register

5.7.2.61.1 OSPI_FLASH_CFG_SRAM_PARTITION_CFG_REG Register (Offset = 18h) [reset = 80h]

This register allows the user to allocate the SRAM area for indirect writes and reads. N in this register is the SRAM depth, configured in the cdns_ospi_flash_ctrl_defs_default.v. The default value of N is 8 what assumes that external SRAM hard macro has 2**8=256 memory locations with fixed data size of 32 bits. This register should be setup while the controller is idle.

Table 5-1348. OSPI_FLASH_CFG_IND_AHB_ADDR_TRIGGER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	ADDR_FLD	R/W	0h	This is the base address that will be used by the AHB controller. When the incoming AHB read access address matches a range of addresses from this trigger address to the trigger address + 15, then the AHB request will be completed by fetching data from the Indirect Controllers SRAM.

Table 5-1360. OSPI_FLASH_CFG_WRITE_COMPLETION_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	POLL_REP_DELAY_FLD	R/W	0h	Defines additional delay for maintain Chip Select de-asserted during auto-polling phase
23:16	POLL_COUNT_FLD	R/W	1h	Defines the number of times the controller should expect to see a true result from the polling in successive reads of the device register.
15	ENABLE_POLLING_EXP_FLD	R/W	0h	Set to '1' for enabling auto-polling expiration.
14	DISABLE_POLLING_FLD	R/W	0h	This switches off the automatic polling function
13	POLLING_POLARITY_FLD	R/W	0h	Defines the polling polarity. If '1', then the write transfer to the device will be complete if the polled bit is equal to '1'. If '0', then the write transfer to the device will be complete if the polled bit is equal to '0'.
12:11	WR_COMP_CTRL_RESV1_FLD	R	0h	Reserved
10:8	POLLING_BIT_INDEX_FLD	R/W	0h	Defines the bit index that should be polled. A value of 010 means that bit 2 of the returned data will be polled for.A value of 111 means that bit 7 of the returned data will be polled for.
7:0	OPCODE_FLD	R/W	5h	Defines the opcode that should be issued by the controller when it is automatically polling for device program completion. This command is issued followed all device write operations. By default, this will poll the standard device STATUS register using opcode 0x05

Copyright © 2026 Texas Instruments Incorporated

5.7.2.69 OSPI_FLASH_CFG_NO_OF_POLLS_BEF_EXP_REG Register

5.7.2.69.1 OSPI_FLASH_CFG_NO_OF_POLLS_BEF_EXP_REG Register (Offset = 3Ch) [reset = FFFFFFFFh]

This register defines maximum number of poll cycles. If the expected value of the bit being polled is not gotten after number defined in this register, the auto-polling is done on the next phase.

Return to Summary Table

5.7.2.70 OSPI_FLASH_CFG_IRQ_STATUS_REG Register

5.7.2.70.1 OSPI_FLASH_CFG_IRQ_STATUS_REG Register (Offset = 40h) [reset = 0h]

Interrupt Status Register: The status fields in this register are set when the described event occurs and the interrupt is enabled in the mask register. When any of these bit fields are set, the interrupt output is asserted high. The fields are each cleared by writing a 1 to the field. Note that bit fields 6 thru 10 are only valid when legacy SPI mode is active.

Bit	Field	Type	Reset	Description
31:20	IRQ_STAT_RESV_FLD	R	0h	Reserved
19	ECC_FAIL_FLD	R/W1TC	0h	ECC failure This interrupt informs the system that Flash Device reported ECC error.
18	TX_CRC_CHUNK_BRK_FLD	R/W1TC	0h	TX CRC chunk was broken This interrupt informs the system that program page SPI transfer was discontinued somewhere inside the chunk.
17	RX_CRC_DATA_VAL_FLD	R/W1TC	0h	RX CRC data valid New RX CRC data was captured from Flash Device
16	RX_CRC_DATA_ERR_FLD	R/W1TC	0h	RX CRC data error CRC data from Flash Device does not correspond to the one dynamically calculated by the controller.
15	IRQ_STAT_RESV1_FLD	R	0h	Reserved
14	STIG_REQ_INT_FLD	R/W1TC	0h	The controller is ready for getting another STIG request.
13	POLL_EXP_INT_FLD	R/W1TC	0h	The maximum number of programmed polls cycles is expired
12	INDRD_SRAM_FULL_FLD	R/W1TC	0h	Indirect Read Partition overflow: Indirect Read Partition of SRAM is full and unable to immediately complete indirect operation

Copyright © 2026 Texas Instruments Incorporated

Table 5-1364. OSPI_FLASH_CFG_IRQ_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RX_FIFO_FULL_FLD	R/W1TC	0h	Small RX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full 1 : FIFO is full
10	RX_FIFO_NOT_EMPTY_FLD	R/W1TC	0h	Small RX FIFO not empty: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has less than RX THRESHOLD entries, 1 : FIFO has >= THRESHOLD entries
9	TX_FIFO_FULL_FLD	R/W1TC	0h	Small TX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full, 1 : FIFO is full
8	TX_FIFO_NOT_FULL_FLD	R/W1TC	0h	Small TX FIFO not full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has >= THRESHOLD entries, 1 : FIFO has less than THRESHOLD entries
7	RECV_OVERFLOW_FLD	R/W1TC	0h	Receive Overflow: This should only occur in Legacy SPI mode. Set if an attempt is made to push the RX FIFO when it is full. This bit is reset only by a system reset and cleared only when this register is read. If a new push to the RX FIFO occurs coincident with a register read this flag will remain set. 0 : no overflow has been detected. 1 : an overflow has occurred.
6	INDIRECT_XFER_LEVEL_BREACH_FLD	R/W1TC	0h	Indirect Transfer Watermark Level Breached
5	ILLEGAL_ACCESS_DET_FLD	R/W1TC	0h	Illegal AHB access has been detected. AHB wrapping bursts and the use of SPLIT/RETRY accesses will cause this error interrupt to trigger.
4	PROT_WR_ATTEMPT_FLD	R/W1TC	0h	Write to protected area was attempted and rejected.
3	INDIRECT_READ_REJECT_FLD	R/W1TC	0h	Indirect operation was requested but could not be accepted. Two indirect operations already in storage.
2	INDIRECT_OP_DONE_FLD	R/W1TC	0h	Indirect Operation Complete: Controller has completed last triggered indirect operation
1	UNDERFLOW_DET_FLD	R/W1TC	0h	Underflow Detected: 0 : no underflow has been detected 1 : underflow is detected and an attempt to transfer data is made when the small TX FIFO is empty. This may occur when AHB write data is being supplied too slowly to keep up with the requested write operation This bit is reset only by a system reset and cleared only when the register is read.
0	MODE_M_FAIL_FLD	R/W1TC	0h	Mode M Failure: Mode M failure indicates the voltage on pin n_ss_in is inconsistent with the SPI mode. Set =1 if n_ss_in is low in initiator mode [multi-initiator contention]. These conditions will clear the spi_enable bit and disable the SPI. This bit is reset only by a system reset and cleared only when this register is read. 0 : no mode fault has been detected 1 : a mode fault has occurred

Copyright © 2026 Texas Instruments Incorporated

5.7.2.71 OSPI_FLASH_CFG_IRQ_MASK_REG Register

5.7.2.71.1 OSPI_FLASH_CFG_IRQ_MASK_REG Register (Offset = 44h) [reset = 0h]

Interrupt Mask: 0 : the interrupt for the corresponding interrupt status register bit is disabled.
1 : the interrupt for the corresponding interrupt status register bit is enabled.

Table 5-1394. OSPI_FLASH_CFG_FLASH_CMD_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	CMD_OPCODE_FLD	R/W	0h	Command Opcode: The command opcode field should be setup before triggering the command. For example, 0x20 maps to SubSector Erase. Writing to the execute field [bit 0] of this register launches the command. NOTE : Using this approach to issue commands to the device will make use of the instruction type of the device instruction configuration register. If this field is set to 2'b00, then the command opcode, command address, command dummy bytes and command data will all be transferred in a serial fashion. If this field is set to 2'b01, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0 and DQ1 pins. If this field is set to 2'b10, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0, DQ1, DQ2 and DQ3 pins.
23	ENB_READ_DATA_FLD	R/W	0h	Read Data Enable: Set to 1 if the command specified in the command opcode field [bits 31:24] requires read data bytes to be received from the device.
22:20	NUM_RD_DATA_BYTES_FLD	R/W	0h	Number of Read Data Bytes: Up to 8 data bytes may be read using this command. Set to 0 for 1 byte and 7 for 8 bytes.
19	ENB_COMD_ADDR_FLD	R/W	0h	Command Address Enable: Set to 1 if the command specified in bits 31:24 requires an address. This should be setup before triggering the command via Writing a 1 to the execute field.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1422. FOTA_GENREGS_FOTA_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED	NONE	0h	Reserved
5	MCU_STALL_EN	R/W	0h	Reserved field. This field SHALL be retained at 0, which is the default value.
4	FUNC_MODE	R/W	1h	This bit is used for selection functional or debug mode. 1'b1 - M8051EW uses functional mode for regular operation. 1'b0 - M8051EW uses debug mode for debug using JTAG.
3	PDMEM_INIT_DONE	R	0h	This bit indicates that FOTA program/data memory RAM initialization is done. Until this bit is set, access to program/data memory should not be performed by software.
2	MEMACCESS	R/W	1h	This bit provides SOC CPU access to program/data memory and internal memory through FSS config interface when set. If clear, these M8051EW memories are not accessible through config interface and is fully under the control of M8051EW. Software has to ensure that M8051EW is in reset by setting bit 0 of this register when memaccess is set.
1	CLKDIS	R/W	0h	This bit holds M8051EW core clock gated when set to 1'b1. Clock to M8051EW is enabled at reset. SOC software sets this bit to put M8051EW and other FOTA logic in low power state when not used by enabling clock gating.
0	RESET	R/W	1h	This bit holds M8051EW core in reset when set to 1'b1. System firmware clears this bit after setting up program and data memories.

0h							0h

Table 5-1424. FOTA_GENREGS_FOTA_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	GO	R/W1TS	0h	SOC CPU sets this bit to indicate to M8051EW firmware that it can start the next FOTA page write. Once go is set, SOC software has to ensure that it is set again only after receiving an interrupt (completion or error) from M8051EW. If this requirement is not followed, it could result in M8051EW firmware repeating the FOTA write erroneously. A write to this register causes an indirect write to ESFR space for M8051EW. Firmware polls until ESFR GO bit is set and then starts the FOTA write sequence. This bit is cleared by hardware when the MCU has acknowledged GO through a write to the GO_ACK ESFR bit.

5.7.2.101 FOTA_GENREGS_FOTA_ERR_INFO Register

5.7.2.101.1 FOTA_GENREGS_FOTA_ERR_INFO Register (Offset = 8h) [reset = 0h]

This register contains information from FOTA logic used when servicing fsas_fota_stat_err_pend/ fsas_fota_stat_err_req interrupt. This information is used in conjunction with FOTA interrupt status register ERR_STS_IRQ_STATUS_RAW. Software is expected to clear the fields in this register as it is not auto cleared by hardware.

5.7.2.104 FOTA_GENREGS_FOTA_ADDR Register

5.7.2.104.1 FOTA_GENREGS_FOTA_ADDR Register (Offset = 18h) [reset = 0h]

FOTA operation write address register. SOC can write to this register to preload address for FOTA write instead of having 8051 firmware to setup address. Writing this register causes an indirect write to MCU_DAT_ADDR0-MCU_DAT_ADDR3 ESFR registers that are used by the VBUSM initiator as address for the FOTA write operation. Preloading these ESFR registers through this register removes the burden from 8051 firmware and reduces 8051 code size.

5.7.2.105 FOTA_GENREGS_FOTA_CNT Register

5.7.2.105.1 FOTA_GENREGS_FOTA_CNT Register (Offset = 1Ch) [reset = 0h]

FOTA operation write byte count. SOC can write to this register to preload byte count based on the page size of the flash memory used. Writing this register causes an indirect write to MCU_DAT_CNT0-MCU_DAT_CNT1 ESFR registers that are used by the VBUSM initiator as the overall byte count for the FOTA write operation. VBUSM initiator performs the required number of 32-byte writes to match this overall byte count. Preloading these ESFR registers through this register removes the burden from 8051 firmware and reduces 8051 code size.

5.7.2.106 FOTA_GENREGS_STS_IRQ_IRQ_EOI Register

5.7.2.106.1 FOTA_GENREGS_STS_IRQ_IRQ_EOI Register (Offset = 20h) [reset = 0h]

The End of Interrupt (EOI) Register allows the CPU to acknowledge completion of fsas_fota_stat_intr_req pulse interrupt. When this register is written to 1'b0, INTD logic used for converting fsas_ecc_intr_err_pend level interrupt to pulse will be re-armed. That is, if interrupt sources remain after writing this register to 1'b0, another pulse interrupt will be triggered by INTD. Conversely, if this register is not written to 1'b0 after fsas_fota_stat_intr_req pulse interrupt is received, then another pulse interrupt will not be received as INTD has not been re-armed. This register will be reset one cycle after it has been written to. Please note that the reason for writing 1'b0 is because there is only one interrupt (no interrupt aggregation) associated with this EOI and the INTD vector associated with this interrupt is 1'b0.

Bit	Field	Type	Reset	Description
31:7	RESERVED	NONE	0h	Reserved
6	MCU_ERR	R/W1TS	0h	MCU error raw status flag. This is used to communicate error conditions encountered by 8051 firmware to SOC CPU. Error code is captured in FOTA_ERR_INFO.mcu_err_code field. If 8051 firmware runs into any error conditions, it sets the FOTA_ERR_STAT.mcu_err ESFR bit to 1'b1 and writes the corresponding error code into FOTA_ERR_STAT.mcu_err_code field. This causes an indirect writes to STATUS_RAW.mcu_err MMR and FOTA_ERR_INFO.mcu_err_code MMR. M8051EW firmware defines the error codes that result in this error. Please refer to FOTA_ERR_INFO.mcu_err_code MMR description for suggested encoding.
5	DAT_WRITE_ERR	R/W1TS	0h	Data interface write status error raw status flag. This error flag gets set when M8051EW performs a data write and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.dat_err_sstatus register.
4	DAT_READ_ERR	R/W1TS	0h	Data interface read status error raw status flag. This error flag gets set when M8051EW performs a data read and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.dat_err_rstatus register.

5.7.2.115 FOTA_GENREGS_ERR_STS_IRQ_IRQ_ENABLE_CLR Register

5.7.2.115.1 FOTA_GENREGS_ERR_STS_IRQ_IRQ_ENABLE_CLR Register (Offset = 50h) [reset = 0h]

The IRQ_ENABLE_CLR register allows the interrupt sources to be manually disabled when writing a 1 to a specific bit. This register corresponds to fsas_fota_stat_err_pend/fsas_fota_stat_err_req interrupt output. Write 0: No action Write 1: Disable event Read 0: Event is disabled Read 1: Event is enabled

0h		0h	0h	0h	0h	0h	0h

Table 5-1619. I2C_ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:15	NU2	NU2	0h	Reserved
14	SDIR	R/W	0h	Target Direction. This bit is clear to '0' indicating the I2C is a controller transmitter/receiver or a target receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C target is a transmitter. In DLB mode [which the configuration should be controller-transmitter target-receiver] this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	R/W	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT 0:A No Acknowledge is not sent. NACKSNT 1:A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	R/W	0h	Bus Busy. This bit indicates the state of the serial bus. BB 0:The bus is free. BB 1:The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset [IRS_=0]. If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - [RW]

Copyright © 2026 Texas Instruments Incorporated

Table 5-1619. I2C_ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RSFULL	R/W	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register [ICRSR] is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when Reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer [ICRSR and ICDRR] behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of Reading the ICDRR. - [RW]
10	XSMT	R/W	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register [ICXSR] is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of Writing to ICDXR. In repeat mode if the I2C in controller transmitter mode is holding transfer with XSMT_=0 [i.e. waiting for further action] and the STT or STP bit is set XSMT_ is set to"1" by hardware.
9	AAS	R/W	0h	Address As Target. This bit is set to 1 by the device when it has recognized its own target address or an address of all [8] zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - [RW]
8	AD0	R/W	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all [8] zeros [i.e. general call]. The AD0 bit is reset to 0 [default value] when a"start" or"stop" condition is detected. - [RW]
7:6	NU1	NU1	0h	Reserved
5	SCD	R/W	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by Reading ICIVR [as 110] or Writing '1' to itself.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register [ICXSR]. ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	R/W	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the controller mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode[FDF=1] ARDY is set just after Start condition. This bit is automatically cleared by hardware when Writing data to ICDXR in transmit mode Reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	R/W	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "controller" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR [as 010] will clear it.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1619. I2C_ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	AL	R/W	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "controller" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB [bus busy] is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a target. Write '1' or Read the ICIVR [as 001] will clear it.

Table 5-1633. I2C_ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	NU2	NU2	0h	Reserved
15	NACKMOD	R/W	0h	No Acknowledge [NACK] mode. This bit is used to send an Acknowledge [ACK] or a No Acknowledge [NACK] to the transmitter. This bit is only applicable when the I2C is in receiver mode. In controller receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The controller receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit [bit 8] if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	R/W	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE 0:[default] Stops immediately if SCL is low and keep driving SCL low whether I2C is controller transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a target it will stop when the transmission/receiving completes. FREE 1:The I2C runs free.

Table 5-1633. I2C_ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	STT	R/W	0h	Start Condition [Controller only mode]. This bit can be set to a"1" by the CPU to generate a Start condition. In controller mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/ Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. STT___STP____Conditions_____Bus Activities _1_____0_____Start_____S-A-D _0_____1_____Stop_____P _1_____1_____Start-Stop [ICCNT= n]_____S-A-D..[n]..D-P _1_____0_____Start [ICCNT= n]_____S-A-D..[n]..D
12	NU1	NU1	0h	Reserved for IDLEEN [IDLE Enable on 5509. - [RW]
11	STP	R/W	0h	Stop Condition [Controller mode only]. This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode[RM=0].
10	MST	R/W	0h	Controller. MST 0:The I 2 C peripheral is in the"target" mode and clock is received from the"controller" device. MST 1:The I 2 C peripheral is in the"controller" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	R/W	0h	Transmitter. TRX 0:The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX 1:The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes [not in FDF mode] are defined as follows. In FDF mode TRX must be configured even if the I2C is in target mode because there is no address/ direction byte in FDF mode. MST___TRX___Operating Modes _0_____x_____"target receiver" _0_____x_____"target transmitter" _1_____0_____"controller receiver" _1_____1_____"controller transmitter"
8	XA	R/W	0h	Expanded Address. XA 0:[default] 7-bit address mode [normal address mode]. XA 1:10-bit address mode [expanded address mode] Please note that XA needs to be configured even if the I2C is in target mode.
7	RM	R/W	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in target mode. RM___STT___STP___Conditions_____Bus Activities_____Mode _0_____0_____0_____Idle_____None_____NA _0_____0_____1_____Stop_____P_____NA _0_____1_____0_____[Re]Start_____S-A-D..[n]..D____Repeat n _0_____1_____1_____[Re]Start-Stop___S-A-D..[n]..D-P__Repeat n _1_____0_____0_____Idle_____none_____NA _1_____0_____1_____Stop_____P _____NA _1_____1_____0_____[Re]Start_____S-A-D-D-D..____Continuous _1_____1_____1_____Reserved_____None_____NA

Table 5-1633. I2C_ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	DLB	R/W	0h	Digital Loop Back [in controller transmit mode only]. This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after [[CPU freq/I2C freq]8] CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	R/W	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang [SDA and SCL are tri-stated].
4	STB	R/W	0h	Start Byte [Controller only mode]. The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001" regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	R/W	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. FDF MST TRX Operating mode 0 0 x Target in non FDF mode 0 1 0 Controller receive in non FDF mode 0 1 1 Controller transmit in non FDF mode 1 0 0 Target receiver in FDF mode 1 0 1 Target transmitter in FDF mode 1 1 0 Controller receiver in FDF mode 1 1 1 Controller transmitter in FDF mode
2:0	BC2_BC1_BC0	R/W	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb [excluding the acknowledge bit] of the next byte which are yet to be received or transmitted. Table 5-1635. I2C_ICIVR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	INTCODE	R/W	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY[011] RRDY[100] and XRDY[101]. Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag Reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read [clear] the ICIVR before doing another start otherwise the ICIVR could contain incorrect [old interrupt flags] value. Interrupt Code Interrupt Occurred _000_[default] None _001_[highest priority] Arbitration Lost interrupt _010 No Acknowledgement interrupt _011 Register Access Ready interrupt _100 Receive Data Ready interrupt _101 Transmit Data Ready interrupt _110 Stop Condition Detection _111_[lowest priority] Address As Target - [RW]

Bit	Field	Type	Reset	Description
31:1	NU	R/W	0h	Reserved.
0	PFUNC0	R/W	0h	Controls the function of the I2C SCL and SDA pins. 0 = Pins function as SCL and SDA 1 = Pins functions as GPIO Note: No hardware protection is required to disable I2C function when the PFUNC[0] and IRS_ bits are both set to one. When PFUNC[0] is"1" [GPIO mode] the sub-module which controls the I2C function receives the value"1" for SCL and SDA. IRS_ can be set to"1" regardless of PFUNC[0] and the I2C function works whenever the IRS_ bit is"1". The user is expected to hold I2C in reset via IRS_ bit when changing to/from GPIO mode via the PFUNC[0] bit.

Table 5-1665. LIN_SCIGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:26	RESERVED_3	R	0h	Reserved
25	TXENA	R/W	0h	Transmit enable. This bit is effective in LIN and SCI modes. Data is transferred from SCITD or the TDy [with y=0, 1,...7] buffers in LIN mode to the SCITXSHF shift out register only when the TXENA bit is set. Note: Data written to SCITD or the transmit multi-buffer before TXENA is set is not transmitted. If TXENA is cleared while transmission is ongoing, the data previously written to SCITD is sent [including the checksum byte in LIN mode]. 0 Disable transfers from SCITD or TDy to SCITXSHF 1 Enable transfers of data from SCITD or TDy to SCITXSHF

Copyright © 2026 Texas Instruments Incorporated

Table 5-1665. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	RXENA	R/W	0h	Receive enable. This bit is effective in LIN or SCI-compatible mode. RXENA allows or prevents the transfer of data from SCIRXSHF to SCIRD or the receive multibuffers. Note: Clearing RXENA stops received characters from being transferred into the receive buffer or multi-buffers, prevents the RX status flags [see Table 7] from being updated by receive data, and inhibits both receive and error interrupts. However, the shift register continues to assemble data regardless of the state of RXENA. Note: If RXENA is cleared before the time the reception of a frame is complete, the data from the frame is not transferred into the receive buffer. Note: If RXENA is set before the time the reception of a frame is complete, the data from the frame is transferred into the receive buffer. If RXENA is set while SCIRXSHF is in the process of assembling a frame, the status flags are not guaranteed to be accurate for that frame. To ensure that the status flags correctly reflect what was detected on the bus during a particular frame, RXENA should be set before the detection of that frame 0 Prevents the receiver from transferring data from the shift buffer to the receive buffer or multi-buffers 1 Allows the receiver to transfer data from the shift buffer to the receive buffer or multi-buffers
23:18	RESERVED_2	R	0h	Reserved
17	CONT	R/W	0h	Continue on suspend. This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI/LIN operates when the program is suspended. This bit affects the LIN counters. When this bit is set, the counters are not stopped during debug. When this bit is cleared, the counters are stopped during debug. 0 When debug mode is entered, the SCI/LIN state machine is frozen. Transmissions and LIN counters are halted and resume when debug mode is exited. 1 When debug mode is entered, the SCI/LIN continues to operate until the current transmit and receive functions are complete.
16	LOOPBACK	R/W	0h	Loopback bit. This bit is effective in LIN or SCI-compatible mode. The self-checking option for the SCI/LIN can be selected with this bit. If the LINTX and LINRX pins are configured with SCI/LIN functionality, then the LINTX pin is internally connected to the LINRX pin. Externally, during loop back operation, the LINTX pin outputs a high value and the LINRX pin is in a high-impedance state. If this bit value is changed while the SCI/LIN is transmitting or receiving data, errors may result. 0 Loopback mode is disabled. 1 Loopback mode is enabled.
15:14	RESERVED_1	R	0h	Reserved
13	STOPEXTFRAME	R/W	0h	Stop extended frame communication. This bit is effective in LIN mode only. This bit can be written only during extended frame communication. When the extended frame communication is stopped, this bit is cleared automatically. 0 No effect 1 Extended frame communication will be stopped, once current frame transmission/reception is completed.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1665. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	HGENCTRL	R/W	0h	HGEN control bit. This bit is effective in LIN mode only. This bit controls the type of mask filtering comparison. 0 ID filtering using ID-Byte. RECEIVEDID and IDBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in NO match. 1 ID filtering using ID-SlaveTask byte (Recommended). RECEIVEDID and IDSLAVETASKBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in ALWAYS match
11	CTYPE	R/W	0h	Checksum type. This bit is effective in LIN mode only. This bit controls the type of checksum to be used: classic or enhanced. 0 Classic checksum is used. This checksum is compatible with LIN 1.3 slave nodes. The classic checksum contains the modulo-256 sum with carry over all data bytes. Frames sent with Identifier 60 (0x3C) to 63 (0x3F) must allways use the classic checksum. 1 Enhanced checksum is used. The enhanced checksum is compatible with LIN 2.0 and newer slave nodes. The enhanced checksum contains the modulo-256 sum with carry over all data bytes AND the protected Identifier.
10	MBUFMODE	R/W	0h	Multibuffer mode. This bit is effective in LIN or SCI-compatible mode. This bit controls receive/transmit buffer usage, that is, whether the RX/TX multibuffers are used or a single register, RD0/TD0, is used. 0 The multi-buffer mode is disabled. 1 The multi-buffer mode is enabled.
9	ADAPT	R/W	0h	Adapt mode enable. This mode is effective in LIN mode only. This bit has an effect during the detection of the Sync Field. There are two LIN protocol bit rate modes that could be enabled with this bit according to the Node capability file definition: automatic or select. Software and network configuration will decide which of the previous two modes. When this bit is cleared, the LIN 2.0 protocol fixed bit rate should be used. If the ADAPT bit is set, a LIN slave node detecting the baudrate will compare it to the prescalers in BRSR register and update it if they are different. The BRSR register will be updated with the new value. If this bit is not set there will be no adjustment to the BRSR register. This field is writable in LIN mode only. 0 Automatic baudrate adjustment is disabled. 1 Automatic baudrate adjustment is enabled.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1665. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SLEEP	R/W	0h	SCI sleep. SCI compatibility mode only. In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode. The receiver still operates when the SLEEP bit is set; however, RXRDY is updated and SCIRD is loaded with new data only when an address frame is detected. The remaining receiver status flags are updated and an error interrupt is requested if the corresponding interrupt enable bit is set, regardless of the value of the SLEEP bit. In this way, if an error is detected on the receive data line while the SCI is asleep, software can promptly deal with the error condition. The SLEEP bit is not automatically cleared when an address byte is detected. This field is writable in SCI mode only. 0 Sleep mode is disabled. 1 Sleep mode is enabled.
7	SWNRST	R/W	0h	Software reset [active low]. This bit is effective in LIN or SCI-compatible mode. The SCI/LIN should only be configured while SWnRST = 0. Only the following configuration bits can be changed in runtime [i.e., while SWnRESET = 1]: - STOP EXT Frame [SCIGCR1[13]] - CC bit [SCIGCR2[17]] - SC bit [SCIGCR2[16]] 0 The SCI/LIN is in its reset state; no data will be transmitted or received. Writing a 0 to this bit intializes the SCI/LIN state machines and operating flags. All affected logic is held in the reset state until a 1 is written to this bit. 1 The SCI/LIN is in its ready state; transmission and reception can occur. After this bit is set to 1, the configuration of the module should not change.
6	LINMODE	R/W	0h	LIN mode This bit controls the mode of operation of the module. 0 LIN mode is disabled; SCI compatibility mode is enabled. 1 LIN mode is enabled; SCI compatibility mode is disabled.
5	CLK_MASTER	R/W	0h	SCI internal clock enable or LIN Master/Slave configuration. In the SCI mode, this bit enables the clock to the SCI module. In LIN mode, this bit determines whether a LIN node is a slave or master. 0 SCI-compatible mode: Reserved. LIN mode: The module is in slave mode. 1 SCI-compatible mode: Enable clock to the SCI module. LIN mode: The node is in master mode.
4	STOP	R/W	0h	SCI number of stop bits. This bit is effective in SCI-compatible mode only. Note: The receiver checks for only one stop bit. However in idle-line mode, the receiver waits until the end of the second stop bit [if STOP = 1] to begin checking for an idle period. This field is writable in SCI mode only. 0 One stop bit is used. 1 Two stop bits are used.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1665. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	PARITY	R/W	0h	SCI parity odd/even selection. This bit is effective in SCI-compatible mode only. If the PARITY ENA bit [SCIGCR1.2] is set, PARITY designates odd or even parity. The parity bit is calculated based on the data bits in each frame and the address bit [in address-bit mode]. The start and stop fields in the frame are not included in the parity calculation. This field is writable in SCI mode only. 0 Odd parity is used. The SCI transmits and expects to receive a value in the parity bit that makes odd the total number of bits in the frame with the value of 1. 1 Even parity is used. The SCI transmits and expects to receive a value in the parity bit that makes even the total number of bits in the frame with the value of 1.
2	PARITYENA	R/W	0h	Parity enable. Enables or disables the parity function. 0 SCI-compatible mode: Parity disabled; no parity bit is generated during transmission or is expected during reception. LIN mode: ID-parity verification is disabled. 1 SCI compatible mode: Parity enabled. A parity bit is generated during transmission and is expected during reception. LIN mode: ID-parity verification is enabled.
1	TIMINGMODE	R/W	0h	SCI timing mode bit. This bit is effective in SCI-compatible mode only. It must be set to 1 when the SCI mode is used. This bit configures the SCI for asynchronous operation. 0 Reserved. 1 Must be set to 1 when module is configured for SCI operation
0	COMMMODE	R/W	0h	SCI/LIN communication mode bit. In compatibility mode, it selects the SCI communication mode. In LIN mode it selects length control option for ID-field bits ID4 and ID5. 0 SCI-compatible mode: Idle-line mode is used. LIN mode: ID4 and ID5 are not used for length control. 1 SCI-compatible mode: Address-bit mode is used. LIN mode: ID4 and ID5 are used for length control.

5.11.2.3 LIN_SCIGCR2 Register

5.11.2.3.1 LIN_SCIGCR2 Register (Offset = 8h) [reset = 0h]

The SCIGCR2 register is used to send or compare a checksum byte during extended frames, to generate a wakeup and for low-power mode control of the LIN module.

Return to Summary Table

Table 5-1667. LIN_SCIGCR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	CC	R/W	0h	Compare Checksum. This mode is effective in LIN mode only. This bit is used by the receiver for extended frames to trigger a checksum compare. The user will initiate this transaction by Writing a one to this bit. In non multibuffer mode, once the CC bit is set, the checksum will be compared on the byte that is currently being received, expected to be the checkbyte. During Multi-buffer mode, following are the scenarios associated with the CC bit : - If CC bit is set during the reception of the data, then the byte that is received after the reception of the programmed no. of data bytes indicated by SCIFORMAT[18:16], is treated as a checksum byte. - If CC bit is set during the IDLE period [i.e. during inter-frame space], then the next immediate byte will be treated as a checksum byte. A CE will immediatly be flagged if there is a checksum error. This bit is automatically cleared once the checksum is successfully compared. 0 No effect 1 Compare checksum on expected checkbyte
16	SC	R/W	0h	Send Checksum This mode is effective in LIN mode only. This bit is used by the transmitter with extended frames to send a checkbyte. In non multibuffer mode the checkbyte will be sent after the current byte transmission. In multibuffer mode the checkbyte will be sent after the last byte count, indicated by the SCIFORMAT[18:16]]. This field is writable in LIN mode only. 0 No checkbyte will be sent. 1 A checkbyte will be sent. This bit will automatically get cleared after the checkbyte is transmitted. The checksum will not be sent if this bit is set before transmitting the very first byte, that is, during interframe space.
15:9	RESERVED_2	R	0h	Reserved
8	GENWU	R/W	0h	Generate wakeup signal. This bit controls the generation of a wakeup signal, by transmitting the TDO buffer value. This bit is cleared on reception of a valid sync break. 0 No effect 1 Transmit TDO for wakeup. This bit will be cleared on a SWnRST (SCIGCR1.7)
7:1	RESERVED_1	R	0h	Reserved
0	POWERDOWN	R/W	0h	Power down. This bit is effective in LIN or SCI-compatible mode. When the powerdown bit is set, the SCI/LIN module attempts to enter local low-power mode. If the POWERDOWN bit is set while the receiver is actively receiving data and the wakeup interrupt is disabled, then the SCI/LIN will delay low-power mode from being entered until completion of reception. In LIN mode the user may set the POWERDOWN bit on Sleep Command reception or on idle bus detection [more than 4 seconds, i.e. 80,000 cycles at 20kHz] 0 Normal operation 1 Request local low-power mode

Table 5-1669. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	SETCEINT	R/W1TS	0h	Set checksum-error Interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a checksum error. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
28	SETISFEINT	R/W1TS	0h	Set inconsistent-sync-field-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is an inconsistent sync field error. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
27	SETNREINT	R/W1TS	0h	Set no-response-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a no-response error occurs. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
26	SETFEINT	R/W1TS	0h	Set framing-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a framing error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
25	SETOEINT	R/W1TS	0h	Set overrun-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when an overrun error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
24	SETPEINT	R/W1TS	0h	Set parity interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a parity error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
23:19	RESERVED_5	R	0h	Reserved
18	SET_RX_DMA_ALL	R/W1TS	0h	Set receiver DMA for Address & Data frames. This bit is effective in LIN or SCI-compatible mode. To enable RX DMA request for address and data frames this bit must be set. If it is cleared, RX interrupt request is generated for address frames and DMA requests are generated for data frames. 0 Receiver DMA request is disabled for address frames (RX interrupt request is enabled for address frames). Writing a 0 to this bit has no effect. 1 Receiver DMA request is enabled for address and data frames

Table 5-1669. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	SET_RX_DMA	R/W1TS	0h	Set receiver DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the receiver this bit must be set. If it is cleared, interrupt requests are generated depending on SETRXINT. 0 Receiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 Receiver DMA request is enabled.
16	SET_TX_DMA	R/W1TS	0h	Set transmit DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SETTXINT. 0 Transmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 Transmit DMA request is enabled
15:14	RESERVED_4	R	0h	Reserved
13	SETIDINT	R/W1TS	0h	Set Identification interrupt. This bit is effective in LIN mode only. This bit is set to enable interrupt once a valid matching identifier is received. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
12:10	RESERVED_3	R	0h	Reserved
9	SETRXINT	R/W1TS	0h	Set Receiver interrupt. Setting this bit enables the SCI/LIN to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
8	SETTXINT	R/W1TS	0h	Set Transmitter interrupt. Setting this bit enables the SCI/LIN to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
7	SETTOA3WUSINT	R/W1TS	0h	Set Timeout After 3 Wakeup Signals interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after 3 wakeup signals have been sent. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
6	SETTOAWUSINT	R/W1TS	0h	Set Timeout After Wakeup Signal interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after one wakeup signal has been sent. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
5	RESERVED_2	R	0h	Reserved

Table 5-1669. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SETTIMEOUTINT	R/W1TS	0h	Set timeout interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when no LIN bus activity [bus idle] occurs for at least 4 seconds. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
3:2	RESERVED_1	R	0h	Reserved
1	SETWAKEUPINT	R/W1TS	0h	Set wake-up interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN to generate a wake-up interrupt and thereby exit low-power mode. The wake-up interrupt is asserted on falling edge of the wake-up pulse. If enabled, the wake-up interrupt is asserted when local low-power mode is requested while the receiver is busy or if a low level is detected on the SCIRX pin during low-power mode. Wake-up interrupt is not asserted upon a wakeup pulse if the module is not in power down mode. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
0	SETBRKDTINT	R/W1TS	0h	Set break-detect interrupt. This bit is effective in SCI-compatible mode only. Setting this bit enables the SCI/LIN to generate an interrupt if a break condition is detected on the LINRX pin. This field is writable in SCI mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.

Table 5-1673. LIN_SCISETINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	SETISFEINTLVL	R/W1TS	0h	Set Inconsistent-Sync-Field-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Inconsistent-Sync-Field-Error interrupt level to the INT1 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
27	SETNREINTLVL	R/W1TS	0h	Set No-Reponse-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the No-Response-Error interrupt level to the INT1 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
26	SETFEINTLVL	R/W1TS	0h	Set Framing-Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Framing-Error interrupt level to the INT1 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
25	SETOEINTLVL	R/W1TS	0h	Set Overrun-Error Interrupt Level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Overrun-Error interrupt level to the INT1 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
24	SETPEINTLVL	R/W1TS	0h	Set Parity Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Parity error interrupt level to the INT1 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
23:19	RESERVED_7	R	0h	Reserved
18	RESERVED_6	R	0h	Reserved
17:16	RESERVED_5	R	0h	Reserved
15:14	RESERVED_4	R	0h	Reserved
13	SETIDINTLVL	R/W1TS	0h	Set ID interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the ID interrupt level to the INT1 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
12:10	RESERVED_3	R	0h	Reserved
9	SETRXINTOVO	R/W1TS	0h	Set Receiver interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the receiver interrupt level to the INT1 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
8	SETTXINTLVL	R/W1TS	0h	Set Transmitter interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the transmitter interrupt level to the INT1 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.
7	SETTOA3WUSINTLVL	R/W1TS	0h	Set Timeout After 3 Wakeup Signals interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout after 3 wakeup signals interrupt level to the INT1 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line.

Table 5-1675. LIN_SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	CLRCEINTLVL	R/W1TC	0h	Clear Checksum-error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Checksum-error interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
28	CLRISFEINTLVL	R/W1TC	0h	Clear Inconsistent-Sync-Field-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the Inconsistent-Sync-Field-Error interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
27	CLRNREINTLVL	R/W1TC	0h	Clear No-Reponse-Error interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the No-Response-Error interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
26	CLRFEINTLVL	R/W1TC	0h	Clear Framing-Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Framing-Error interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
25	CLROEINTLVL	R/W1TC	0h	Clear Overrun-Error Interrupt Level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Overrun-Error interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
24	CLRPEINTLVL	R/W1TC	0h	Clear Parity Error interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Parity Error interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.

Table 5-1675. LIN_SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	CLRRXINTLVL	R/W1TC	0h	Clear Receiver interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the receiver interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
8	CLRTXINTLVL	R/W1TC	0h	Clear Transmitter interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the transmitter interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
7	CLRTOA3WUSINTLVL	R/W1TC	0h	Clear Timeout After 3 Wakeup Signals interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout after 3 wakeup signals interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
6	CLRTOAWUSINTLVL	R/W1TC	0h	Clear Timeout After Wakeup Signal interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the the timeout after wakeup interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
5	RESERVED_2	R	0h	Reserved
4	CLRTIMEOUTINTLVL	R/W1TC	0h	Clear Timeout interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
3:2	RESERVED_1	R	0h	Reserved
1	CLRWAKEUPINTLVL	R/W1TC	0h	Clear Wake-up interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Wake-up interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. Writing a 0 to this bit has no effect. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
0	CLRBRKDTINTLVL	R/W1TC	0h	Clear Break-detect interrupt level. This bit is effective in SCI-compatible mode only. Writing to this bit maps the Break-detect interrupt level to the INT0 line. This field is writable in SCI mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.

Table 5-1677. LIN_SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BE	R/W1TC	0h	Bit Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a bit error. This is detected by the bit monitor in the internal bit monitor. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No bit error detected. 1 Bit error detected.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	PBE	R/W1TC	0h	Physical Bus Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a physical bus error. This is detected by the bit monitor in TED. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break Note: thie PBE will ony be flagged if no sync break can be generated. [because of a bus shortage to VBAT] or if no sync break delimeter can be generated [because of a bus shortage to GND]. This field is writable in LIN mode only. 0 No physiscal bus error detected. 1 Physical bus error detected.
29	CE	R/W1TC	0h	Checksum Error Flag. This bit is effective in LIN mode only. This bit is set when there is checksum error detected by a receiving node. The type of checksum to be used depends on the SCIGCR1.CTYPE bit. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No Checksum error detected. 1 Checksum error detected.
28	ISFE	R/W1TC	0h	Inconsistent Sync Field Error Flag. This bit is effective in LIN mode only. This bit is set when there has been an inconsistent Sync Field error detected by the synchronizer during header reception. See the "Header Reception and Adaptive Baudrate" section for more information. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No Inconsistent Sync Field error detected. 1 Inconsistent Sync Field error detected.
27	NRE	R/W1TC	0h	No-Response Error Flag. This bit is effective in LIN mode only. This bit is set when there is no response to a master's header completed within TFRAME_MAX. This timeout period is applied for message frames of unknown length [identifiers 0 to 61]. This error is detected by the synchronizer of the module. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No No-Response error detected. 1 No-Response error detected.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	FE	R/W1TC	0h	Framing error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when an expected stop bit is not found. In SCI compatible mode, only the first stop bit is checked. The missing stop bit indicates that synchronization with the start bit has been lost and that the character is incorrectly framed. Detection of a framing error causes the SCI to generate an error interrupt if the RXERR INT ENA bit is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new character [SCI-compatible mode], or frame [LIN mode] In multibuffer mode the frame is defined in the SCIFORMAT register. 0 No framing error detected. 1 Framing error detected.
25	OE	R/W1TC	0h	Overrun error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD or the RDy buffers. Detection of an overrun error causes the LIN to generate an error interrupt if the SET OE INT bit is one. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit 0 No overrun error detected. 1 Overrun error detected.
24	PE	R/W1TC	0h	Parity error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when a parity error is detected in the received data. In SCI address-bit mode, the parity is calculated on the data and address bit fields of the received frame. In idle-line mode, only the data is used to calculate parity. An error is generated when a character is received with a mismatch between the number of 1s and its parity bit. For more information on parity checking, see the "SCI Global Control Register [SCIGCR1]" description. If the parity function is disabled [that is, SCIGCR1.2 = 0], the PE flag is disabled and read as 0. Detection of a parity error causes the LIN to generate an error interrupt if the SET PE INT bit = 1. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reception of a new charcter [SCI-compatible mode] or frame [LIN mode] - Writing a 1 to this bit 0 No parity error or parity disabled. 1 Parity error detected.
23:16	RESERVED_3	R	0h	Reserved
15	RESERVED_2	R	0h	Reserved

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	IDRXFLAG	R/W1TC	0h	Identifier On Receive Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with an RX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on an RX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 0 No valid ID received. 1 Valid ID RX received in LINID[23:16] on RX match.
13	IDTXFLAG	R/W1TC	0h	Identifier On Transmit Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with a TX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on a TX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - RESET bit [SCIGCR0.0] - Setting SWnRESET - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 0 No valid ID received. 1 Valid ID received in LINID[23:16] on TX match.
12	RXWAKE	R	0h	Receiver wakeup detect flag. This bit is effective in SCI-compatible mode only. The SCI sets this bit to indicate that the data currently in SCIRD is an address. This bit is cleared by: - RESET bit - Setting the SWnRESET bit [SCIGCR1.7] - System reset - Receipt of a data frame This bit is writable in SCI mode only. 0 The data in SCIRD is not an address. 1 The data in SCIRD is an address. See [1] Section 3.4.4, Sleep Mode for Multiprocessor Communication, on page 16 for more information on using the RXWAKE bit with sleep mode.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TXEMPTY	R	1h	Transmitter Empty flag. The value of this flag indicates the contents of the transmitter's buffer register[s] [SCITD/TDy] and shift register [SCITXSHF]. In multibuffer mode, this flag indicates the value of the TDx registers and shift register [SCITXSHF]. In non multibuffer mode, this flag indicates the value of LINTD0 [byte] and shift register [SCITXSHF]. This bit is set by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET bit [SCIGCR1.7] - System reset. Note: This bit does not cause an interrupt request. 0 Compatible mode or LIN with no multibuffer: Transmitter buffer or shift register (or both) are loaded with data. In LIN mode using multibuffer mode: Multibuffer or shift register (or all) are loaded with data. 1 Compatible mode or LIN with no multibuffer: Transmitter buffer and shift registers are both empty. In LIN mode using multibuffer mode: Multibuffer and shift registers are all empty.
10	TXWAKE	R/W	0h	SCI transmitter wakeup method select. This bit is effective in SCI-compatible mode only. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format. This bit is set to 1 or 0 by software before a byte is written to SCITD and is cleared by the SCI when data is transferred from SCITD to SCITXSHF or by a system reset. TXWAKE is not cleared by the SWnRESET bit [SCIGCR1.7]. 0 Address-bit mode: Frame to be transmitted will be data (address bit = 0). Idle-line mode: Frame to be transmitted will be data. 1 Address-bit mode: Frame to be transmitted will be an address (address bit=1). Idle-line mode: Following frame to be transmitted will be an address (writing a 1 to this bit followed by writing dummy data to the SCITD will result in a idle period of 11 bit periods before the next frame is transmitted).

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	RXRDY	R/W1TC	0h	Receiver ready flag. In SCI compatibility mode, the receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU. In LIN mode, RXRDY is set once a valid frame is received in multibuffer mode, a valid frame being a message frame received with no errors. In non multibuffer mode RXRDY is set for each received byte and will be set for the last byte of the frame if there are no errors. The SCI/LIN generates a receive interrupt when RXRDY flag bit is set if the interrupt-enable bit is set [SCISETINT.9]. RXRDY is cleared by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET - System reset - Writing a 1 to this bit - Reading SCIRD in while in SCI compatibility mode - Reading last data byte RDy of the response in LIN mode Note: The RXRDY flag cannot be cleared by Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. 0 No new data in SCIRD/RDy. 1 New data ready to be read from SCIRD.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer[s] register [SCITD in compatibility mode and LINTD0, LINTD1 in MBUF mode] is/are ready to get another character from a CPU write. In SCI compatibility mode, Writing data to SCITD automatically clears this bit. In LIN mode, this bit is cleared once byte 0 [TD0] is written to LINTD0. This bit is set after the data of the TX buffer are shifted into the SCITXSHF register. This event can trigger a transmit DMA event if the DMA enable bit is set. This bit is set to 1 by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET [SCIGCR1.7] - System reset Note: The TXRDY flag cannot be cleared by Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. Note: The transmit interrupt request can be eliminated until the next series of data is written into the transmit buffers LINTD0 and LINTD1, by disaLINg the corresponding interrupt via the SCICLEARINT register or by disaLINg the transmitter via the TXENA bit [SCIGCR1.25=0]. 0 Compatible mode: SCITD is full. LIN mode: The multibuffers are full. 1 Compatible mode: SCITD is ready to receive the next character. LIN mode: The multibuffers are ready to receive the next character(s).
7	TOA3WUS	R/W1TC	0h	Timeout After 3 Wakeup Signals flag. This bit is effective in LIN mode only. This flag is set if there is no Sync Break received after 3 wakeup signals and a period of 1.5 seconds have passed. Such expiration time is used before issuing another round of wakeup signals. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No timeout after 3 wakeup signals. 1 Timeout after 3 wakeup signals and 1.5s time.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	TOAWUS	R/W1TC	0h	Timeout After Wakeup Signal flag. This bit is effective in LIN mode only. This bit is set if there is no Sync Break received after a wakeup signal has been sent. A minimum of 150 ms expiration time is used before issuing another wakeup signal. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No timeout after one wakeup signal (150 ms). 1 Timeout after one wakeup signal.
5	RESERVED_1	R	0h	Reserved
4	TIMEOUT	R/W1TC	0h	LIN Bus IDLE timeout flag. This bit is effective in LIN mode only. This bit is set if there is no LIN bus activity for at least 4 seconds. LIN bus activity being a transition from recessive to dominant. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No bus idle detected. 1 LIN bus idle detected.
3	BUSY	R	0h	Bus BUSY flag. This bit is effective in LIN mode and SCI-compatible mode. This bit indicates whether the receiver is in the process of receiving a frame. As soon as the receiver detects the beginning of a start bit, the BUSY bit is set to 1. When the reception of a frame is complete, the BUSY bit is cleared. If SET WAKEUP INT is set and power down is requested while this bit is set, the SCI/LIN automatically prevents low-power mode from being entered and generates wakeup interrupt. The BUSY bit is controlled directly by the SCI receiver but can be cleared by: - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset. 0 Receiver is not currently receiving a frame. 1 Receiver is currently receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. This bit is effective in SCI-compatible mode only. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream. The receiver does not receive any data while the bit is set. The bus must be idle for 11 bit periods to clear this bit. The SCI enters this state: - After a system reset - Setting the SWnRESET bit [SCIGCR1.7] - After coming out of power down This bit is writable in SCI mode only. 0 Idle period detected, the SCI is ready to receive. 1 Idle period not detected, the SCI will not receive any data.

Table 5-1677. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	WAKEUP	R/W1TC	0h	Wake-up flag. This bit is effective in LIN mode only. This bit is set by the SCI/LIN when receiver or transmitter activity has taken the module out of power-down mode. An interrupt is generated if the SET WAKEUP INT bit [SCISETINT.1] is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit. This field is writable in LIN mode only. 0 Do not wake up from power-down mode. 1 Wake up from power-down mode.
0	BRKDT	R/W1TC	0h	SCI break-detect flag. This bit is effective in SCI-compatible mode only. This bit is set when the SCI detects a break condition on the LINRX pin. A break condition occurs when the LINRX pin remains continuously low for at least 10 bits after a missing first stop bit, that is, after a framing error. Detection of a break condition causes the SCI to generate an error interrupt if the BRKDT INT ENA bit is set. The BRKDT bit is cleared by the following: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - By Writing a 1 to this bit. This bit is writable in SCI mode only. 0 No break condition detected. 1 Break condition detected.

Bit	Field	Type	Reset	Description
31:19	RESERVED_2	R	0h	Reserved
18:16	LENGTH	R/W	0h	Frame length control bits. In LIN mode, these bits indicate the number of bytes in the response field from 1 to 8 bytes. In buffered SCI mode, these bits indicate the number of characters. When these bits are used to indicate LIN response length [SCIGCR1[0] = 1], then when there is an ID RX match, this value should be updated with the expected length of the response. In buffered SCI mode, these bits indicate the number of characters with SCIFORMAT[2:0] bits per character. i.e. these bits indicate the transmitter/receiver format for the number of characters: 1 to 8. There can be up to eight characters with eight bits each. 0 The response field has 1 bytes/characters. 1 The response field has 2 bytes/characters. 2 The response field has 3 bytes/characters. 3 The response field has 4 bytes/characters. 4 The response field has 5 bytes/characters. 5 The response field has 6 bytes/characters. 6 The response field has 7 bytes/characters. 7 The response field has 8 bytes/characters.

Table 5-1689. LIN_SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	RD	R	0h	Received Data. This bit is effective in SCI-compatible mode only. When a frame has been completely received, the data in the frame is transferred from the receiver shift register SCIRXSHF to this register. As this transfer occurs, the RXRDY flag is set and a receive interrupt is generated if RX INT ENA [SCISETINT0.9] is set. When the data is read from SCIRD, the RXRDY flag is automatically cleared. When the SCI receives data that is fewer than eight bits in length, it loads the data into this register in a left justified format padded with trailing zeros. Therefore, your software should perform a logical shift on the data by the correct number of positions to make it right justified.

Table 5-1719. LIN_LINID Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RESERVED_1	R	0h	Reserved
23:16	RECEIVEDID	R	0h	Received ID. This bit is effective in LIN mode only. This byte contains the current message identifier. During header reception the received ID is copied from the SCIRXSHF register to this byte if there is no ID-parity error and there has been an RX/TX match. Note: If a framing error [FE] is detected during ID reception, the received ID will also not be copied to the LINID register.
15:8	IDSLAVETASKBYTE	R/W	0h	ID Slave Task byte. This field is effective in LIN mode only. This byte contains the identifier to which the received ID of an incoming header will be compared in order to decide whether a RX response, a TX response, or no action needs to be done by the LIN node. These bits are writable in LIN mode only.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1719. LIN_LINID Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7:0	IDBYTE	R/W	0h	ID byte. This field is effective in LIN mode only. This byte is the LIN mode message ID. On a master node, a write to this register by the CPU initiates a header transmission. For a slave task, this byte is used for message filtering when HGENCTRL [SCIGCR1.12] is '0'. These bits are writable in LIN mode only.

Table 5-1725. LIN_MBRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:13	RESERVED_1	R	0h	Reserved
12:0	MBR	R/W	DACh	Maximum Baud Rate Prescaler. This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase [see the "Header Reception and Adaptive Baudrate" section] of a slave module if the ADAPT bit is set. In this way, a SCI/LIN slave using an automatic or select bit rate modes detects any LIN bus legal rate automatically. The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break. The default value is for a 70MHz LINCLK [0xDAC]. This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.

Table 5-1729. LIN_IODFTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BERRENA	R/W	0h	Bit Errror Enable bit. This bit is effective in LIN mode only. This bit is used to create a Bit error. When this bit is set, the bit received is ORed with 1 and passed to the Bit monitor circuitry.
30	PBERRENA	R/W	0h	Physical Bus Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a Physical Bus Error. When this bit is set, the bit received during Sync Break field transmission is ORed with 1 and passed to the Bit monitor circuitry
29	CERRENA	R/W	0h	Checksum Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a checksum error. When this bit is set, the polarity of the CTYPE [checksum type] in the receive checksum calculator is changed so that a checksum error is generated.
28	ISFERRENA	R/W	0h	Inconsistent Sync Field Error Enable bit. This bit is effective in LIN mode only. This bit is used to create an ISF error. When this bit is set, the bit widths in the sync field are varied so that the ISF check fails and the error flag is set.
27	RESERVED_4	R	0h	Reserved

Table 5-1729. LIN_IODFTCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	FERRENA	R/W	0h	This bit is used to create a Frame Error. This bit is effective in SCI-compatible mode only. When this bit is set, the stop bit received is ANDed with '0' and passed to the stop bit check circuitry.
25	PERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create a Parity Error. When this bit is set, in compatible mode, the parity bit received is toggled so that a parity error occurs.
24	BRKDTERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create BRKDT error [SCI mode only]. When this bit is set, the stop bit of the frame is ANDed with '0' and passed to the RSM so that a frame error occurs. Then the RX Pin is forced to continuous low for 10 Tbits so that a BRKDT error occurs.
23:21	RESERVED_3	R/W	0h	Reserved
20:19	PINSAMPLEMASK	R/W	0h	Pin sample mask. These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples correctly with the majority detection circuitry. Note: During IODFT mode testing for the pin sample mask, the prescalar P must be programmed to be greater than 2. 0 No Mask 1 Invert the TX Pin value at TBIT_CENTER 2 Invert the TX Pin value at TBIT_CENTER + SCLK 3 Invert the TX Pin value at TBIT_CENTER + 2 SCLK
18:16	TXSHIFT	R/W	0h	Transmit shift. These bits define the delay by which the value on LINTX is delayed so that the value on LINRX is asynchronous. [Not applicable to Start Bit] 0 No Delay 1 Delay by 1 SCLK 2 Delay by 2 SCLK 3 Delay by 3 SCLK 4 Delay by 4 SCLK 5 Delay by 5 SCLK 6 Delay by 6 SCLK 7 Delay by 7 SCLK
15:12	RESERVED_2	R	0h	Reserved
11:8	IODFTENA	R/W	5h	IO DFT Enable Key This field is used to enable the IODFT mode of the SCI/LIN module for testing. 0 IODFT is disabled 1 IODFT is disabled 2 IODFT is disabled 3 IODFT is disabled 4 IODFT is disabled 5 IODFT is disabled 6 IODFT is disabled 7 IODFT is disabled 8 IODFT is disabled 9 IODFT is disabled 10 IODFT is enabled 11 IODFT is disabled 12 IODFT is disabled 13 IODFT is disabled 14 IODFT is disabled 15 IODFT is disabled

Table 5-1729. LIN_IODFTCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	LPBENA	R/W	0h	Module loopback enable. In analog loopback mode the complete communication path through the I/Os can be tested, whereas in digital loopback mode the I/O buffers are excluded from this path. 0 Digital loopback is enabled. 1 Analog loopback is enabled in module I/O DFT mode (when IODFTENA = 1010)
0	RXPENA	R/W	0h	Module Analog loopback through receive pin enable. This bit defines whether the I/O buffers for the transmit or the receive pin are included in the communication path in analog loopback mode only. 0 Analog loopback through the transmit pin is enabled. 1 Analog loopback through the receive pin is enabled.

Table 5-1760. MSS_MCRC_CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	
15:0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number.

Table 5-1838. MSS_MCRC_CRC_CURSEC_REG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	
15:0	CRC_CURSEC4	R/W	0h	Channel 4 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro-neous sector number.

Table 5-1865. MCSPI_HL_REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	Used to distinguish between old scheme and current
29:28	RSVD	R	0h	Reserved These bits are initialized to zero, and writes to them are ignored
27:16	FUNC	R	30h	Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned
15:11	R_RTL	R	3h	RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYRZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments

Table 5-1865. MCSPI_HL_REV Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10:8	X_MAJOR	R	2h	Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Controller Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters
7:6	CUSTOM	R	0h	Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers
5:0	Y_MINOR	R	Bh	Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes

Bit	Field	Type	Reset	Description
31:4	RSVD	R	0h	Reserved
3:2	IDLEMODE	R/W	2h	Configuration of the local target state management mode By definition, target can handle read/write transaction as long as it is out of IDLE state 0 Force-idle mode: local target's IDLE state follows (acknowledges) the system's clock stop requests unconditionally, that is, regardless of the IP module's internal requirements. Backup mode, for debug only. 1 No-idle mode: local target never enters IDLE state. Backup mode, for debug only. 2 Smart-idle mode: local target's IDLE state eventually follows (acknowledges) the system's clock stop requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wake-up events.

Table 5-1873. MCSPI_SYSCONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4:3	SIDLEMODE	R/W	2h	Power management 0 If an IDLE request is detected, the MCSPI acknowledges it unconditionally and goes in inactive mode. Interrupt, DMA requests and wake-up lines are unconditionally deasserted and the module wake-up capability is deactivated even if the MCSPI_SYSCONFIG[2] ENAWAKEUP bit is set. 1 If an IDLE request is detected, the request is ignored and the module does not switch to wake-up mode, and keeps on behaving normally. 2 If an IDLE request is detected, the module will switch to wake-up mode based on its internal activity, and the wake-up capability can be used if the bit MCSPI_SYSCONFIG[2] ENAWAKEUP is set. 3 Reserved - do not use.
2	ENAWAKEUP	R/W	1h	WakeUp feature control 0 Wake-up capability is disabled. 1 Wake-up capability is enabled.
1	SOFTRESET	R/W	0h	Software reset During reads it always returns 0 0 (write) Normal mode 1 (write) Set this bit to 1 to trigger a module reset. The bit is automatically reset by the hardware.
0	AUTOIDLE	R/W	1h	Internal OCP Clock gating strategy 0 Interface clock is free-running. 1 Automatic interface clock gating strategy is applied, based on the configuration interface activity.

Bit	Field	Type	Reset	Description
31:9	RESERVED_11	R	0h	Reads returns 0
8	FDAA	R/W	0h	FIFO DMA Address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256 bit aligned address If this bit is set the enabled channel which uses the FIFO has its datas managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX[i] and MCSPI_RX[i] registers 0 FIFO data managed by MCSPI_TX(i) and MCSPI_RX(i) registers. 1 FIFO data managed by MCSPI_DAFTX and MCSPI_DAFRX registers.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1885. MCSPI_MODULCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	MOA	R/W	0h	Multiple word ocp access: This register can only be used when a channel is enabled using a FIFO It allows the system to perform multiple SPI word access for a single 32-bit OCP word access This is possible for WL < 16 0 Multiple word access disabled 1 Multiple word access enabled with FIFO
6:4	INITDLY	R/W	0h	Initial spi delay for first transfer: This register is an option only available in SINGLE controller mode, The controller waits for a delay to transmit the first spi word after channel enabled and corresponding TX register filled This Delay is based on SPI output frequency clock, No clock output provided to the boundary and chip select is not active in 4 pin mode within this period 0 No delay for first MCSPI transfer. 1 The controller wait 4 MCSPI bus clock 2 The controller wait 8 MCSPI bus clock 3 The controller wait 16 MCSPI bus clock 4 The controller wait 32 MCSPI bus clock
3	SYSTEM_TEST	R/W	0h	Enables the system test mode 0 Functional mode 1 System test mode (SYSTEST)
2	MS	R/W	1h	Controller/ Responder 0 Controller - The module generates the SPICLK and SPIEN[3:0]. 1 Peripheral - The module receives the SPICLK and SPIEN[3:0].
1	PIN34	R/W	0h	Pin mode selection: This register is used to configure the SPI pin mode, in controller or responder mode If asserted the controller only use SIMO,SOMI and SPICLK clock pin for spi transfers 0 SPIEN is used as a chip-select. 1 SPIEN is not used. In this mode all related options to chip-select have no meaning.
0	SINGLE	R/W	0h	Single channel / Multi Channel [controller mode only] 0 More than one channel will be used in controller mode. 1 Only one channel will be used in controller mode. This bit must be set in Force SPIEN[i] mode.

5.13.2.34 MCSPI_DAFRX Register

5.13.2.34.1 MCSPI_DAFRX Register (Offset = 1A0h) [reset = 0h]

This register contains the SPI words to received on the serial link when FIFO used and DMA address is aligned on 256 bit.This register is an image of one of MCSPI_RX(i) register corresponding to the channel which have its FIFO enabled.

5.14.2.4 MMC_CSRE Register

5.14.2.4.1 MMC_CSRE Register (Offset = 124h) [reset = 0h]

Card Status Response Error
This register enables the host controller to detect card status errors of response type R1, R1b for all cards and of R5, R5b and R6 response for cards types SD or SDIO.
When a bit MMCHS_CSRE[i] is set to 1, if the corresponding bit at the same position in the response MMCHS_RSP0[i] is set to 1, the host controller indicates a card error (MMCHS_STAT[CERR]) interrupt status to avoid the host driver reading the response register (MMCHS_RSP0).
Note: No automatic card error detection for autoCMD12 is implemented; the host system has to check autoCMD12 response register (MMCHS_RESP76) for possible card errors.

5.14.2.5 MMC_SYSTEST Register

5.14.2.5.1 MMC_SYSTEST Register (Offset = 128h) [reset = 0h]

System Test Register
This register is used to control the signals that connect to I/O pins when the module is configured in system test (SYSTEST) mode for boundary connectivity verification.
Note: In SYSTEST mode, a write into MMCHS_CMD register will not start a transfer. The buffer behaves as a stack accessible only by the local host (push and pop operations). In this mode, the Transfer Block Size (MMCHS_BLK[BLEN]) and the Blocks count for current transfer (MMCHS_BLK[NBLK]) are needed to generate a Buffer write ready interrupt (MMCHS_STAT[BWR]) or a Buffer read ready interrupt (MMCHS_STAT[BRR]) and DMA requests if enabled.

5.14.2.6 MMC_CON Register

5.14.2.6.1 MMC_CON Register (Offset = 12Ch) [reset = 600h]

Configuration Register
This register is used:
- to select the functional mode or the SYSTEST mode for any card.
- to send an initialization sequence to any card.
- to enable the detection on DAT[1] of a card interrupt for SDIO cards only.
and also to configure :
- specific data and command transfers for MMC cards only.
- the parameters related to the card detect and write protect input signals.

Table 5-1944. MMC_CON Register Field Descriptions

Bit	Field	Type	Reset	Description
31:22	RESERVED	R	0h	
21	SDMA_LNE	R/W	0h	Slave DMA Level/Edge Request: The waveform of the DMA request can be configured either edge sensitive with early de-assertion on first access to MMCSD_DATA register or late de-assertion, request remains active until last allowed data written into MMCSD_DATA. 0 Slave DMA edge sensitive, Early DMA de-assertion 1 Slave DMA level sensitive, Late DMA de-assertion

Copyright © 2026 Texas Instruments Incorporated

Table 5-1944. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	DMA_MNS	R/W	0h	DMA Master or Slave selection: When this bit is set and the controller is configured to use the DMA, Ocp master interface is used to get datas from system using ADMA2 procedure [direct access to the memory].This option is only available if generic parameter MADMA_EN is asserted to '1'. 0 The controller is slave on data transfers with system. 1 The controller is master on data exchange with system, controller must be configured as using DMA.
19	DDR	R/W	0h	Dual Data Rate mode: When this register is set, the controller uses both clock edge to emit or receive data. Odd bytes are transmitted on falling edges and even bytes are transmitted on rise edges. It only applies on Data bytes and CRC, Start, end bits and CRC status are kept full cycle. This bit field is only meaningful and active for even clock divider ratio of MMCSD_SYSCTL[CLKD], it is insensitive to MMCSD_HCTL[HSPE] setting. 0 Standard mode : data are transmitted on a single edge depending on MMCHS_HCTRL[HSPE]. 1 Data Bytes and CRC are transmitted on both edge.
18	BOOT_CF0	R/W	0h	Boot status supported: This register is set when the CMD line need to be forced to '0' for a boot sequence. CMD line is driven to '0' after Writing in MMCSD_CMD. The line is released when this bit field is de-asserted and abort data transfer in case of a pending transaction. 0 CMD line is released when it was previously forced to '0' by a boot sequence. 0 CMD line not forced 1 CMD line forced to '0' is enabled and will be active after writing into MMCHS_CMD 1 CMD line forced to '0' is enabled
17	BOOT_ACK	R/W	0h	Book acknowledge received: When this bit is set the controller should receive a boot status on DAT0 line after next command issued. If no status is received a data timeout will be generated. 0 No acknowledge to be received 1 A boot status will be received on DAT0 line after issuing a command.
16	CLKEXTFREE	R/W	0h	External clock free running: This register is used to maintain card clock out of transfer transaction to enable slave module for example to generate a synchronous interrupt on DAT[1]. The Clock will be maintain only if MMCSD_SYSCTL[CEN] is set. 0 External card clock is cut off outside active transaction period. 1 External card clock is maintain even out of active transaction period only if MMCHS_SYSCTL[CEN] is set.
15	PADEN	R/W	0h	Control Power for MMC Lines: This register is only useful when MMC PADs contain power saving mechanism to minimize its leakage power. It works as a GPIO that directly control the ACTIVE pin of PADs. Excepted for DAT[1], the signal is also combine outside the module with the dedicated power control MMCSD_CON[CTPL] bit. 0 ADPIDLE module pin is not forced, it is automatically generated by the MMC fsms. 1 ADPIDLE module pin is forced to active state.

Table 5-1944. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	OBIE	R/W	0h	Out-of-Band Interrupt Enable MMC cards only: This bit enables the detection of Out-of-Band Interrupt on MMCOBI input pin. The usage of the Out-of-Band signal [OBI] is optional and depends on the system integration. 0 Out-of-Band interrupt detection disabled 1 Out-of-Band interrupt detection enabled
13	OBIP	R/W	0h	Out-of-Band Interrupt Polarity MMC cards only: This bit selects the active level of the out-of-band interrupt coming from MMC cards. The usage of the Out-of-Band signal [OBI] is optional and depends on the system integration. 0 Active high level 1 Active low level
12	CEATA	R/W	0h	CE-ATA control mode MMC cards compliant with CE-ATA:By default, this bit is set to 0. It is use to indicate that next commands are considered as specific CE-ATA commands that potentially use 'command completion' features. 0 Standard MMC/SD/SDIO mode. 1 CE-ATA mode next commands are considered as CE-ATA commands.
11	CTPL	R/W	0h	Control Power for DAT[1] line MMC and SD cards: By default, this bit is set to 0 and the host controller automatically disables all the input buffers outside of a transaction to minimize the leakage current. SDIO cards: When this bit is set to 1, the host controller automatically disables all the input buffers except the buffer of DAT[1] outside of a transaction in order to detect asynchronous card interrupt on DAT[1] line and minimize the leakage current of the buffers. 0 Disable all the input buffers outside of a transaction. 1 Disable all the input buffers except the buffer of DAT[1] outside of a transaction.
10:9	DVAL	R/W	3h	Debounce filter value All cards This register is used to define a debounce period to filter the card detect input signal [SDCD]. The usage of the card detect input signal [SDCD] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 33 us debounce period 1 231 us debounce period 2 1 ms debounce period 3 8,4 ms debounce period
8	WPP	R/W	0h	Write protect polarity For SD and SDIO cards only This bit selects the active level of the write protect input signal [SDWP]. The usage of the write protect input signal [SDWP] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 Active high level 1 Active low level

Copyright © 2026 Texas Instruments Incorporated

Table 5-1944. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	CDP	R/W	0h	Card detect polarity All cards This bit selects the active level of the card detect input signal [SDCD]. The usage of the card detect input signal [SDCD] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 Active low level 1 Active high level
6	MIT	R/W	0h	MMC interrupt command Only for MMC cards. This bit must be set to 1, when the next write access to the command register [MMCSD_CMD] is for Writing a MMC interrupt command [CMD40] requiring the command timeout detection to be disabled for the command response. 0 Command timeout enabled 1 Command timeout disabled
5	DW8	R/W	0h	8-bit mode MMC select For SD/SDIO cards, this bit must be set to 0. For MMC card, this bit must be set following a valid SWITCH command [CMD6] with the correct value and extend CSD index written in the argument. Prior to this command, the MMC card configuration register [CSD and EXT_CSD] must be verified for compliancy with MMC standard specification 4.x [see section 3.6]. 0 1-bit or 4-bit Data width (DAT[0] used, MMC, SD cards) 1 8-bit Data width (DAT[7:0] used, MMC cards)
4	MODE	R/W	0h	Mode select All cards These bits select between Functional mode and SYSTEST mode. 0 Functional mode. Transfers to the MMC/SD/SDIO cards follow the card protocol. MMC clock is enabled. MMC/SD transfers are operated under the control of the CMD register. 1 SYSTEST mode The signal pins are configured as general-purpose input/output and the 1024-byte buffer is configured as a stack memory accessible only by the local host or system DMA. The pins retain their default type (input, output or in-out). SYSTEST mode is operated under the control of the SYSTEST register.
3	STR	R/W	0h	Stream command Only for MMC cards. This bit must be set to 1 only for the stream data transfers [read or write] of the adtc commands. Stream read is a class 1 command [CMD11: READ_DAT_UNTIL_STOP]. Stream write is a class 3 command [CMD20: WRITE_DAT_UNTIL_STOP]. 0 Block oriented data transfer 1 Stream oriented data transfer

Copyright © 2026 Texas Instruments Incorporated

Table 5-1944. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	HR	R/W	0h	Broadcast host response Only for MMC cards. This register is used to force the host to generate a 48-bit response for bc command type. It can be used to terminate the interrupt mode by generating a CMD40 response by the core [see section 4.3, "Interrupt Mode", in the MMC [1] specification]. In order to have the host response to be generated in open drain mode, the register MMCSD_CON[OD] must be set to 1. When MMCSD_CON[CEATA] is set to 1 and MMCSD_ARG set to 0x00000000 when Writing 0x00000000 into MMCSD_CMD register, the host controller performs a 'command completion signal disable' token i.e. CMD line held to '0' during 47 cycles followed by a 1. 0 The host does not generate a 48-bit response instead of a command. 1 The host generates a 48-bit response instead of a command or a command completion signal disable token.
1	INIT	R/W	0h	Send initialization stream All cards. When this bit is set to 1, and the card is idle, an initialization sequence is sent to the card. An initialization sequence consists of setting the CMD line to 1 during 80 clock cycles. The initialization sequence is mandatory - but it is not required to do it through this bit - this bit makes it easier. Clock divider [MMCSD_SYSCTL[CLKD]] should be set to ensure that 80 clock periods are greater than 1ms. [see section 9.3, "Power-Up", in the MMC card specification [1], or section 6.4 in the SD card specification [2]]. Note: in this mode, there is no command sent to the card and no response is expected 0 The host does not send an initialization sequence. 1 The host sends an initialization sequence.
0	OD	R/W	0h	Card open drain mode. Only for MMC cards. This bit must be set to 1 for MMC card commands 1, 2, 3 and 40, and if the MMC card bus is operating in open-drain mode during the response phase to the command sent. Typically, during card identification mode when the card is either in idle, ready or ident state. It is also necessary to set this bit to 1, for a broadcast host response [see Broadcast host response register MMCSD_CON[HR]] 0 No Open Drain 1 Open Drain or Broadcast host response

Table 5-1950. MMC_SDMASA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	SDMA_ARG2	R/W	0h	SDMA System Address / Argument 2 This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23. [1] SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing [i.e., after a transaction has stopped]. Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register 003h is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. [2] Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.

Table 5-1956. MMC_CMD Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:22	CMD_TYPE	R/W	0h	Command type This register specifies three types of special command: Suspend, Resume and Abort. These bits shall be set to 00bfor all other commands. 0 Others Commands 1 CMD52 for writing "Bus Suspend" in CCCR 2 CMD52 for writing "Function Select" in CCCR 3 Abort command CMD12, CMD52 for writing " I/O Abort" in CCCR
21	DP	R/W	0h	Data present select This register indicates that data is present and DAT line shall be used. It must be set to 0 in the following conditions: - command using only CMD line - command with no data transfer but using busy signal on DAT[0] - Resume command 0 Command with no data transfer 1 Command with data transfer
20	CICE	R/W	0h	Command Index check enable This bit must be set to 1 to enable index check on command response to compare the index field in the response against the index of the command. If the index is not the same in the response as in the command, it is reported as a command index error [MMCSD_STAT[CIE] set to1] Note: The register CICE cannot be configured for an Auto CMD12, then index check is automatically checked when this command is issued. 0 Index check disable 1 Index check enable
19	CCCE	R/W	0h	Command CRC check enable This bit must be set to 1 to enable CRC7 check on command response to protect the response against transmission errors on the bus. If an error is detected, it is reported as a command CRC error [MMCSD_STAT[CCRC] set to 1]. Note: The register CCCE cannot be configured for an Auto CMD12, and then CRC check is automatically checked when this command is issued. 0 CRC7 check disable 1 CRC7 check enable
18	RESERVED1	R	0h	
17:16	RSP_TYPE	R/W	0h	Response type This bits defines the response type of the command 0 No response 1 Response Length 136 bits 2 Response Length 48 bits 3 Response Length 48 bits with busy after response
15:6	RESERVED	R	0h	
5	MSBS	R/W	0h	Multi/Single block select This bit must be set to 1 for data transfer in case of multi block command. For any others command this bit shall be set to 0. 0 Single block. If this bit is 0, it is not necessary to set the register MMCHS_BLK[NBLK]. 1 Multi block. When Block Count is disabled (MMCHS_CMD[BCE] is set to 0) in Multiple block transfers (MMCHS_CMD[MSBS] is set to 1), the module can perform infinite transfer.

Table 5-1956. MMC_CMD Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DDIR	R/W	0h	Data transfer Direction Select This bit defines either data transfer will be a read or a write. 0 Data Write (host to card) 1 Data Read (card to host)
3:2	ACEN	R/W	0h	Auto CMD Enable - SD card only. This field determines use of auto command functions. There are two methods to stop Multiple-block read and write operation [1] Auto CMD12 Enable When this field is set to 01b the Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the Auto CMD Error Status register. The Host Driver shall not set this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. [2] Auto CMD23 Enable When this bit field is set to 10b the Host Controller issues a CMD23 automatically before issuing a command specified in the Command Register. The Host Controller Version 3.00 and later shall support this function. The following conditions are required to use the Auto CMD23. Auto CMD23 Supported [Host Controller Version is 3.00 or later] A memory card that supports CMD23 [SCR[33]=1] If DMA is used, it shall be ADMA. Only when CMD18 or CMD25 is issued [Note, the Host Controller does not check command index.] Auto CMD23 can be used with or without ADMA. By Writing the Command register, the Host Controller issues a CMD23 first and then issues a command specified by the Command Index in Command register. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the Auto CMD Error Status register. 32-bit block count value for CMD23 is set to SDMA System Address / Argument 2 register. 0 Auto Command Disabled 1 Auto CMD12 enable or CCS detection enabled. 2 Auto CMD23 Enable 3 Reserved
1	BCE	R/W	0h	Block Count Enable Multiple block transfers only. This bit is used to enable the block count register [MMCSD_BLK[NBLK]]. When Block Count is disabled [MMCSD_CMD[BCE] is set to 0] in Multiple block transfers [MMCSD_CMD[MSBS] is set to 1], the module can perform infinite transfer. 0 Block count disabled for infinite transfer. 1 Block count enabled for multiple block transfer with known number of blocks
0	DE	R/W	0h	DMA Enable This bit is used to enable DMA mode for host data access. 0 DMA mode disable 1 DMA mode enable

5.14.2.17 MMC_DATA Register

5.14.2.17.1 MMC_DATA Register (Offset = 220h) [reset = 0h]

Data Register
This register is the 32-bit entry point of the buffer for read or write data transfers.
The buffer size is 32bits x256(1024 bytes). Bytes within a word are stored and read in little endian format. This buffer can be used as two 512 byte buffers to transfer data efficiently without reducing the throughput.
Sequential and contiguous access is necessary to increment the pointer correctly. Random or skipped access is not allowed. In little endian, if the local host accesses this register byte-wise or 16bit-wise, the least significant byte (bits [7:0]) must always be written/read first. The update of the buffer address is done on the most significant byte write for full 32-bit DATA register or on the most significant byte of the last word of block transfer.
Example 1: Byte or 16-bit access
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1100 (2-bytes) OK
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=0100 (1-byte) OK
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1000 (1-byte) Bad .

24	CLEV	R	0h	CMD line signal level This status is used to check the CMD line level to recover from errors, and for debugging. The value of this register after reset depends on the CMD line level at that time. 0 The CMD line level is 0. 1 The CMD line level is 1.
23:20	DLEV	R	0h	DAT[3:0] line signal level DAT[3] => bit 23 DAT[2] => bit 22 DAT[1] => bit 21 DAT[0] => bit 20 This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. The value of these registers after reset depends on the DAT lines level at that time.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1968. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	WP	R	0h	Write protect switch pin level For SDIO cards only. This bit reflects the write protect input pin [SDWP] level. The value of this register after reset depends on the protect input pin [SDWP] level at that time. 0 If MMCHS_CON[WPP] is set to 0 (default), the card is write protected, otherwise the card is not protected. 1 If MMCHS_CON[WPP] is set to 0 (default), the card is not write protected, otherwise the card is protected.
18	CDPL	R	1h	Card detect pin level This bit reflects the inverse value of the card detect input pin [SDCD], debouncing is not performed on this bit and bit is valid only when Card State Stable [MMCSD_PSTAE[CSS]] is set to 1. Use of this bit is limited to testing since it must be debounced y software. The value of this register after reset depends on the card detect input pin [SDCD] level at that time. 0 The value of the card detect input pin (SDCD) is 1 1 The value of the card detect input pin (SDCD) is 0
17	CSS	R	0h	Card State Stable This bit is used for testing. It is set to 1 only when Card Detect Pin Level is stable [MMCSD_PSTATE[CDPL]]. Debouncing is performed on the card detect input pin [SDCD] to detect card stability. This bit is not affected by a software reset. 0 Reset or Debouncing 1 No card or card inserted
16	CINS	R	0h	Card inserted This bit is the debounced value of the card detect input pin [SDCD]. An inactive to active transition of the card detect input pin [SDCD] will generate a card insertion interrupt [MMCSD_STAT[CINS]]. A active to inactive transition of the card detect input pin [SDCD] will generate a card removal interrupt [MMCSD_STAT[REM]]. This bit is not affected by a software reset. 0 If MMCHS_CON[CDP] is set to 1, no card is detected. The card may have been removed from the card slot. If MMCHS_CON[CDP] is set to 0, the card has been inserted. 1 If MMCHS_CON[CDP] is set to 1, the card has been inserted from the card slot. If MMCHS_CON[CDP] is set to 0 no card is detected. The card may have been removed from the card slot.
15:12	RESERVED1	R	0h	
11	BRE	R	0h	Buffer read enable This bit is used for non-DMA read transfers. It indicates that a complete block specified by MMCSD_BLK[BLEN] has been written in the buffer and is ready to be read. It is set to 0 when the entire block is read from the buffer. It is set to 1 when a block data is ready in the buffer and generates the Buffer read ready status of interrupt [MMCSD_STAT[BRR]]. 0 Read BLEN bytes disable 1 Read BLEN bytes enable. Readable data exists in the buffer.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1968. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	BWE	R	0h	Buffer Write enable This status is used for non-DMA write transfers. It indicates if space is available for write data. 0 There is no room left in the buffer to write BLEN bytes of data. 1 There is enough space in the buffer to write BLEN bytes of data.
9	RTA	R	0h	Read transfer active This status is used for detecting completion of a read transfer. It is set to 1 after the end bit of read command or by activating a continue request [MMCSD_HCTL[CR]] following a stop at block gap request. This bit is set to 0 when all data have been read by the local host after last block or after a stop at block gap request. 0 No valid data on the DAT lines. 1 read data transfer on going.
8	WTA	R	0h	Write transfer active This status indicates a write transfer active. It is set to 1 after the end bit of write command or by activating a continue request [MMCSD_HCTL[CR]] following a stop at block gap request. This bit is set to 0 when CRC status has been received after last block or after a stop at block gap request. 0 No valid data on the DAT lines. 1 Write data transfer on going.
7:4	RESERVED	R	0h	
3	RTR	R	0h	Re-Tuning Request Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This bit is cleared when a command is issued with setting Execute Tuning in the Host Control 2 register. Changing of this bit from 0 to 1 generates Re-Tuning Event. Refer to Normal Interrupt Status registers for more detail. This bit isn't set to 1 if Sampling Clock Select in the Host Control 2 register is set to 0 [using fixed sampling clock]. Refer to Re-Tuning Modes in the Capabilities register for more detail. 0 Fixed or well tuned sampling clock 1 Sampling clock needs re-tuning
2	DLA	R	0h	DAT line active This status bit indicates whether one of the DAT line is in use. In the case of read transactions [card to host]: This bit is set to 1 after the end bit of read command or by activating continue request MMCSD_HCTL[CR]. This bit is set to 0 when the host controller received the end bit of the last data block or at the beginning of the read wait mode. In the case of write transactions [host to card]: This bit is set to 1 after the end bit of write command or by activating continue request MMCSD_HCTL[CR]. This bit is set to 0 on the end of busy event for the last block; host controller must wait 8 clock cycles with line not busy to really consider not "busy state" or after the busy block as a result of a stop at gap request. 0 DAT Line inactive 1 DAT Line active

Copyright © 2026 Texas Instruments Incorporated

Table 5-1968. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DATI	R	0h	Command inhibit[DAT] This status bit is generated if either DAT line is active [MMCSD_PSTATE[DLA]] or Read transfer is active [MMCSD_PSTATE[RTA]] or when a command with busy is issued. This bit prevents the local host to issue a command. A change of this bit from 1 to 0 generates a transfer complete interrupt [MMCSD_STAT[TC]]. 0 Issuing of command using the DAT lines is allowed 1 Issuing of command using DAT lines is not allowed
0	CMDI	R	0h	Command inhibit[CMD] This status bit indicates that the CMD line is in use. This bit is set to 0 when the most significant byte is written into the command register. This bit is not set when Auto CMD12 is transmitted. This bit is set to 0 in either the following cases: - After the end bit of the command response, excepted if there is a command conflict error [MMCSD_STAT[CCRC] or MMCSD_STAT[CEB] set to 1] or a Auto CMD12 is not executed [MMCSD_AC12[ACNE]]. - After the end bit of the command without response [MMCSD_CMD[RSP_TYPE] set to "00"] In case of a command data error is detected [MMCSD_STAT[CTO] set to 1], this register is not automatically cleared. 0 Issuing of command using CMD line is allowed 1 Issuing of command using CMD line is not allowed

27	OBWE	R/W	0h	Wakeup event enable for 'Out-of-Band' Interrupt. This bit enables wakeup events for 'Out-of-Band' assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. The write to this register is ignored when MMCSD_CON[OBIE] is not set. 0 Disable wakeup on 'Out-of-Band' Interrupt 1 Enable wakeup on 'Out-of-Band' Interrupt
26	REM	R/W	0h	Wakeup event enable on SD card removal This bit enables wakeup events for card removal assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card removal 1 Enable wakeup on card removal

Copyright © 2026 Texas Instruments Incorporated

Table 5-1970. MMC_HCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	INS	R/W	0h	Wakeup event enable on SD card insertion This bit enables wakeup events for card insertion assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card insertion 1 Enable wakeup on card insertion
24	IWE	R/W	0h	Wakeup event enable on SD card interrupt This bit enables wakeup events for card interrupt assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card interrupt 1 Enable wakeup on card interrupt
23:20	RESERVED2	R	0h	
19	IBG	R/W	0h	Interrupt block at gap This bit is valid only in 4-bit mode of SDIO card to enable interrupt detection in the interrupt cycle at block gap for a multiple block transfer. For MMC cards and for SD card this bit should be set to 0. 0 Disable interrupt detection at the block gap in 4-bit mode 1 Enable interrupt detection at the block gap in 4-bit mode
18	RWC	R/W	0h	Read wait control The read wait function is optional only for SDIO cards. If the card supports read wait, this bit must be enabled, then requesting a stop at block gap [MMCSD_HCTL[SBGR]] generates a read wait period after the current end of block. Be careful, if read wait is not supported it may cause a conflict on DAT line. 0 Disable Read Wait Control. Suspend/Resume cannot be supported. 1 Enable Read Wait Control
17	CR	R/W	0h	Continue request This bit is used to restart a transaction that was stopped by requesting a stop at block gap [MMCSD_HCTL[SBGR]]. Set this bit to 1 restarts the transfer. The bit is automatically set to 0 by the host controller when transfer has restarted i.e DAT line is active [MMCSD_PSTATE[DLA]] or transferring data [MMCSD_PSTATE[WTA]]. The Stop at block gap request must be disabled [MMCSD_HCTL[SBGR]=0] before setting this bit. 0 No affect 1 transfer restart
16	SBGR	R/W	0h	Stop at block gap request This bit is used to stop executing a transaction at the next block gap. The transfer can restart with a continue request [MMHS_HCTL[CR]] or during a suspend/resume sequence. In case of read transfer, the card must support read wait control. In case of write transfer, the host driver shall set this bit after all block data written. Until the transfer completion [MMCSD_STAT[TC] set to 1], the host driver shall leave this bit set to 1. If this bit is set, the local host shall not write to the data register [MMCSD_DATA]. 0 Transfer mode 1 Stop at block gap
15:12	RESERVED1	R	0h

Table 5-1970. MMC_HCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DTW	R/W	0h	Data transfer width For MMC card, this bit must be set following a valid SWITCH command [CMD6] with the correct value and extend CSD index written in the argument. Prior to this command, the MMC card configuration register [CSD and EXT_CSD] must be verified for compliance with MMC standard specification 4.x [see section 3.6]. This register has no effect when the MMC 8-bit mode is selected [register MMCSD_CON[DW8] set to1], For SD/SDIO cards, this bit must be set following a valid SET_BUS_WIDTH command [ACMD6] with the value written in bit 1 of the argument. Prior to this command, the SD card configuration register [SCR] must be verified for the supported bus width by the SD card. 0 1-bit Data width (DAT[0] used) 1 4-bit Data width (DAT[3:0] used)
0	LED	R	0h	Reserved bit. LED control feature is not supported This bit is initialized to zero, and writes to it are ignored.

5.14.2.20 MMC_SYSCTL Register

5.14.2.20.1 MMC_SYSCTL Register (Offset = 22Ch) [reset = 0h]

SD System Control Register
This register defines the system controls to set software resets, clock frequency management and data timeout.
MMCHS_SYSCTL[31:24] = Software resets
MMCHS_SYSCTL[23:16] = Timeout control
MMCHS_SYSCTL[15:0] = Clock control.

Return to Summary Table

Table 5-1972. MMC_SYSCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	SRA	R/W	0h	Software reset for all This bit is set to 1 for reset , and released to 0 when completed. This reset affects the entire host controller except for the card detection circuit and capabilities registers. 0 Reset completed 1 Software reset for all the design
23:20	RESERVED1	R	0h	
19:16	DTO	R/W	0h	Data timeout counter value and busy timeout. This value determines the interval by which DAT lines timeouts are detected. The host driver needs to set this bitfield based on - the maximum read access time [NAC] [Refer to the SD Specification Part1 Physical Layer], - the data read access time values [TAAC and NSAC] in the card specific data register [CSD] of the card, - the timeout clock base frequency [MMCSD_CAPA[TCF]]. If the card does not respond within the specified number of cycles, a data timeout error occurs [MMCSD_STA[DTO]]. The MMCSD_SYSCTL[DTO] register is also used to check busy duration, to generate busy timeout for commands with busy response or for busy programming during a write command. Timeout on CRC status is generated if no CRC token is present after a block write. 0 TCF x 2^13 1 TCF x 2^14 14 TCF x 2^27 15 Reserved
15:6	CLKD	R/W	0h	Clock frequency select These bits define the ratio between a reference clock frequency [system dependant] and the output clock frequency on the CLK pin of either the memory card [MMC, SD or SDIO]. 0 Clock Ref bypass 1 Clock Ref bypass 2 Clock Ref / 2 3 Clock Ref / 3 1023 Clock Ref / 1023
5	CGS	R	0h	Clock Generator Select - For SD cards Host Controller Version 3.00 supports this bit. This bit is used to select the clock generator mode in SDCLK Frequency Select. If the Programmable Clock Mode is supported [non-zero value is set to Clock Multiplier in the Capabilities register], this bit attribute is RW, and if not supported, this bit attribute is RO and zero is read. This bit depends on the setting of Preset Value Enable in the Host Control 2 register. If the Preset Value Enable = 0, this bit is set by Host Driver. If the Preset Value Enable = 1, this bit is automatically set to a value specified in one of Preset Value registers.
4:3	RESERVED	R	0h	
2	CEN	R/W	0h	Clock enable This bit controls if the clock is provided to the card or not. 0 The clock is not provided to the card . Clock frequency can be changed . 1 The clock is provided to the card and can be automatically gated when MMCHS_SYSCONFIG[AUTOIDLE] is set to 1 (default value) . The host driver shall wait to set this bit to 1 until the Internal clock is stable (MMCHS_SYSCTL[ICS]).

Copyright © 2026 Texas Instruments Incorporated

Table 5-1972. MMC_SYSCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ICS	R	0h	Internal clock stable [status] This bit indicates either the internal clock is stable or not. 0 The internal clock is not stable. 1 The internal clock is stable after enabling the clock (MMCHS_SYSCTL[ICE]) or after changing the clock ratio (MMCHS_SYSCTL[CLKD]).
0	ICE	R/W	0h	Internal clock enable This register controls the internal clock activity. In very low power state, the internal clock is stopped. Note: The activity of the debounce clock [used for wakeup events] and the OCP clock [used for reads and writes to the module register map] are not affected by this register. 0 The internal clock is stopped (very low power state). 1 The internal clock oscillates and can be automatically gated when MMCHS_SYSCONFIG[AUTOIDLE] is set to 1 (default value) .

Bit	Field	Type	Reset	Description
31:30	RESERVED3	R	0h	
29	BADA	R/W	0h	Bad access to data space This bit is set automatically to indicate a bad access to buffer when not allowed: -This bit is set during a read access to the data register [MMCSD_DATA] while buffer reads are not allowed [MMCSD_PSTATE[BRE] =0] -This bit is set during a write access to the data register [MMCSD_DATA] while buffer writes are not allowed [MMCSD_STATE[BWE] =0] 0 No Interrupt. 0 Status bit unchanged 1 Bad Access 1 Status is cleared

Copyright © 2026 Texas Instruments Incorporated

Table 5-1974. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	CERR	R/W	0h	Card error This bit is set automatically when there is at least one error in a response of type R1, R1b, R6, R5 or R5b. Only bits referenced as type E[error] in status field in the response can set a card status error. An error bit in the response is flagged only if corresponding bit in card status response error MMCSD_CSRE in set. There is no card error detection for autoCMD12 command. The host driver shall read MMCSD_RSP76 register to detect error bits in the command response. 0 No Error 0 Status bit unchanged 1 Card error 1 Status is cleared
27	RESERVED2	R	0h	
26	TE	R/W	0h	Tuning Error This bit is set when an unrecoverable error is detected in a tuning circuit except during tuning procedure [Occurrence of an error during tuning procedure is indicated by Sampling Select]. By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock shall be set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Tuning Error, the Host Driver should discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from tuning circuit error. The bit is set if the lock is lost [but not during the tuning process] or if the lock counter expires without the lock being asserted. If the latter happens, the SW can decide to ignore the interrupt and wait some more for the lock to be set. 0 No Error 1 Error
25	ADMAE	R/W	0h	ADMA Error: This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register.In addition, the Host Controller generates this interrupt when it detects invalid descriptor data [Valid=0] at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. 0 No Interrupt. 0 Status bit unchanged 1 ADMA error 1 Status is cleared
24	ACE	R/W	0h	Auto CMD error Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. 0 No Error. 0 Status bit unchanged 1 Auto CMD error 1 Status is cleared
23	CLE	R	0h	Reserved. Current limit error is not supported. These bits are initialized to zero, and writes to them are ignored.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1974. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	DEB	R/W	0h	Data End Bit error This bit is set automatically when detecting a 0 at the end bit position of read data on DAT line or at the end position of the CRC status in write mode. 0 No Error 0 Status bit unchanged 1 Data end bit error 1 Status is cleared
21	DCRC	R/W	0h	Data CRC Error This bit is set automatically when there is a CRC16 error in the data phase response following a block read command or if there is a 3-bit CRC status different of a position "010" token during a block write command. 0 No Error. 0 Status bit unchanged 1 Data CRC error 1 Status is cleared
20	DTO	R/W	0h	Data timeout error This bit is set automatically according to the following conditions: - busy timeout for R1b, R5b response type - busy timeout after write CRC status - write CRC status timeout - read data timeout 0 No error. 0 Status bit unchanged 1 Time out 1 Status is cleared
19	CIE	R/W	0h	Command index error This bit is set automatically when response index differs from corresponding command index previously emitted. It depends on the enable in MMCSD_CMD[CICE] register. 0 No error. 0 Status bit unchanged 1 Command index error 1 Status is cleared
18	CEB	R/W	0h	Command end bit error This bit is set automatically when detecting a 0 at the end bit position of a command response. 0 No error. 0 Status bit unchanged 1 Command end bit error 1 Status is cleared
17	CCRC	R/W	0h	Command CRC Error This bit is set automatically when there is a CRC7 error in the command response depending on the enable in MMCSD_CMD[CCCE] register. 0 No Error. 0 Status bit unchanged 1 Command CRC error 1 Status is cleared
16	CTO	R/W	0h	Command Timeout Error This bit is set automatically when no response is received within 64 clock cycles from the end bit of the command. For commands that reply within 5 clock cycles - the timeout is still detected at 64 clock cycles. 0 No error 0 Status bit unchanged 1 Time Out 1 Status is cleared

Copyright © 2026 Texas Instruments Incorporated

Table 5-1974. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	ERRI	R	0h	Error Interrupt If any of the bits in the Error Interrupt Status register [MMCSD_STAT[24:15]] are set, then this bit is set to 1. Therefore the host driver can efficiently test for an error by checking this bit first. Writes to this bit are ignored. 0 No Interrupt. 1 Error interrupt event(s) occurred
14:11	RESERVED	R	0h	
10	BSR	R/W	0h	Boot status received interrupt This bit is set automatically when MMCSD_CON[BOOT] is set 0x1 or 0x2 and a boot status is received on DAT[0] line. This interrupt is only useful for MMC card. 0 No Interrupt. 0 Status bit unchanged 1 Boot status received interrupt. 1 Status is cleared
9	OBI	R/W	0h	Out-Of-Band interrupt This bit is set automatically when MMCSD_CON[OBIE] is set and an Out-of-Band interrupt occurs on OBI pin. The interrupt detection depends on polarity controlled by MMCSD_CON[OBIP]. This interrupt is only useful for MMC card. The Out-of-Band interrupt signal is a system specific feature for future use, this signal is not required for existing specification implementation. 0 No Out-Of-Band interrupt. 0 Status bit unchanged 1 Interrupt Out-Of-Band occurs 1 Status is cleared
8	CIRQ	R	0h	Card interrupt This bit is only used for SD and SDIO and CE-ATA cards. In 1-bit mode, interrupt source is asynchronous [can be a source of asynchronous wakeup]. In 4-bit mode, interrupt source is sampled during the interrupt cycle. In CE-ATA mode, interrupt source is detected when the card drives CMD line to zero during one cycle after data transmission end.All modes above are fully exclusive. The controller interrupt must be clear by setting MMCSD_IE[CIRQ] to 0, then the host driver must start the interrupt service with card [clearing card interrupt status] to remove card interrupt source. Otherwise the Controller interrupt will be reasserted as soon as MMCSD_IE[CIRQ] is set to 1. Writes to this bit are ignored. 0 No card interrupt 1 Generate card interrupt
7	CREM	R/W	0h	Card removal This bit is set automatically when MMCSD_PSTATE[CINS] changes from 1 to 0. A clear of this bit doesn't effect Card inserted present state [MMCSD_PSTATE[CINS]]. 0 Card state stable or Debouncing 0 Status bit unchanged 1 Card removed 1 Status is cleared

Copyright © 2026 Texas Instruments Incorporated

Table 5-1974. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	CINS	R/W	0h	Card insertion This bit is set automatically when MMCSD_PSTATE[CINS] changes from 0 to 1. A clear of this bit doesn't effect Card inserted present state [MMCSD_PSTATE[CINS]]. 0 Card state stable or debouncing 0 Status bit unchanged 1 Card inserted 1 Status is cleared
5	BRR	R/W	0h	Buffer read ready This bit is set automatically during a read operation to the card [see class 2 - block oriented read commands] when one block specified by MMCSD_BLK[BLEN] is completely written in the buffer. It indicates that the memory card has filled out the buffer and that the local host needs to empty the buffer by Reading it. Note: If the DMA receive-mode is enabled, this bit is never set; instead a DMA receive request to the main DMA controller of the system is generated. 0 Not Ready to read buffer 0 Status bit unchanged 1 Ready to read buffer 1 Status is cleared
4	BWR	R/W	0h	Buffer write ready This bit is set automatically during a write operation to the card [see class 4 - block oriented write command] when the host can write a complete block as specified by MMCSD_BLK[BLEN]. It indicates that the memory card has emptied one block from the buffer and that the local host is able to write one block of data into the buffer. Note: If the DMA transmit mode is enabled, this bit is never set; instead, a DMA transmit request to the main DMA controller of the system is generated. 0 Not Ready to write buffer 0 Status bit unchanged 1 Ready to write buffer 1 Status is cleared
3	DMA	R/W	0h	DMA interrupt : This status is set when an interrupt is required in the ADMA instruction and after the data transfer completion. 0 Dma interrupt detected 0 Status bit unchanged 1 No dma interrupt 1 Status is cleared
2	BGE	R/W	0h	Block gap event When a stop at block gap is requested [MMCSD_HCTL[SBGR]], this bit is automatically set when transaction is stopped at the block gap during a read or write operation. This event does not occur when the stop at block gap is requested on the last block. In read mode, a 1-to-0 transition of the DAT Line active status [MMCSD_PSTATE[DLA]] between data blocks generates a Block gap event interrupt. 0 No block gap event 0 Status bit unchanged 1 Transaction stopped at block gap 1 Status is cleared

Copyright © 2026 Texas Instruments Incorporated

Table 5-1974. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TC	R/W	0h	Transfer completed This bit is always set when a read/write transfer is completed or between two blocks when the transfer is stopped due to a stop at block gap request [MMCSD_HCTL[SBGR]]. In Read mode: This bit is automatically set on completion of a read transfer [MMCSD_PSTATE[RTA]]. In write mode: This bit is set automatically on completion of the DAT line use [MMCSD_PSTATE[DLA]]. 0 No transfer complete 0 Status bit unchanged 1 Data transfer complete 1 Status is cleared
0	CC	R/W	0h	Command complete This bit is set when a 1-to-0 transition occurs in the register command inhibit [MMCSD_PSTATE[CMDI]] If the command is a type for which no response is expected, then the command complete interrupt is generated at the end of the command. A command timeout error [MMCSD_STAT[CTO]] has higher priority than command complete [MMCSD_STAT[CC]]. If a response is expected but none is received, then a command timeout error is detected and signaled instead of the command complete interrupt. 0 No Command complete 0 Status bit unchanged 1 Command complete 1 Status is cleared

5.14.2.24 MMC_AC12 Register

5.14.2.24.1 MMC_AC12 Register (Offset = 23Ch) [reset = 0h]

Host Control 2 Register and Auto CMD Error Status Register
This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD23. The Host driver can determine what kind of Auto CMD12 / CMD23 errors occur by this register. Auto CMD23 errors are indicated in bit 04-01.This register is valid only when the Auto CMD Error is set.

Table 5-1980. MMC_AC12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PV_ENABLE	R/W	0h	Preset Value Enable Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set, automatic SDCLK frequency generation and driver strength selection is performed without considering system specific conditions. This bit enables the functions defined in the Preset Value registers. If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers. 0 SDCLK and Driver Strength are controlled by Host Driver. 1 Automatic Selection by Preset Value are Enabled.

Copyright © 2026 Texas Instruments Incorporated

Table 5-1980. MMC_AC12 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	AI_ENABLE	R/W	0h	Asynchronous Interrupt Enable This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode [and zero is set to Interrupt Pin Select in the Shared Bus Control register]. If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver the Card Interrupt to the host when it is asserted by the Card. 0 Disabled 1 Enabled
29:24	RESERVED2	R	0h	
23	SCLK_SEL	R/W	0h	Sampling Clock Select Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is set by tuning procedure and valid after the completion of tuning [when Execute Tuning is cleared]. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by Writing to 0. This bit can be cleared with setting Execute Tuning. Once the tuning circuit is reset, it will take time to complete tuning sequence. Therefore, Host Driver should keep this bit to 1 to perform re-tuning sequence to compete re-tuning sequence in a short time. Change of this bit is not allowed while the Host Controller is receiving response or a read data block. 0 Fixed clock is used to sample data 1 Tuned clock is used to sample data
22	ET	R/W	0h	Execute Tuning This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by Writing 0. This is Read-Write with automatic clear register 0 Not Tuned or Tuning Completed 1 Execute Tuning
21:20	DS_SEL	R/W	0h	Driver Strength Select Host Controller output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the Capabilities register. This bit depends on setting of Preset Value Enable. If Preset Value Enable = 0, this field is set by Host Driver. If Preset Value Enable = 1, this field is automatically set by a value specified in the one of Preset Value registers. 0 Driver Type B is selected (Default) 1 Driver Type A is selected 2 Driver Type C is selected 3 Driver Type D is selected
19	V1V8_SIGEN	R/W	0h	1.8V Signaling Enable This bit controls voltage regulator for I/O cell. 3.3V is supplied to the card regardless of signaling voltage. Setting this bit from 0 to 1 starts changing signal voltage from 3.3V to 1.8V. 1.8V regulator output shall be stable within 5ms. Host Controller clears this bit if switching to 1.8V signaling fails. Clearing this bit from 1 to 0 starts changing signal voltage from 1.8V to 3.3V. 3.3V regulator output shall be stable within 5ms. Host Driver can set this bit to 1 when Host Controller supports 1.8V signaling [One of support bits is set to 1:SDR50, SDR104 or DDR50 in the Capabilities register] and the card or device supports UHS-I [S18A=1. Refer to Bus Signal Voltage Switch Sequence in the Physical Layer Specification Version 3.0x]. 0 3.3V Signaling 1 1.8V Signaling

Table 5-1984. MMC_CAPA2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:14	RTM	R	0h	Re-Tuning Modes This field selects re-tuning method and limits the maximum data length. Bit47-46 Re-Tuning Mode Re-Tuning Method Data Length There are two re-tuning timings: Re-Tuning Request controlled by the Host Controller and expiration of a Re-Tuning Timer controlled by the Host Driver. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue. The maximum data length per read/write command is restricted so that re-tuning procedures can be inserted during data transfers. [1] Re-Tuning Mode 1 The host controller does not have any internal logic to detect when the re-tuning needs to be performed. In this case, the Host Driver should maintain all re-tuning timings by using a Re-Tuning Timer. To enable inserting the re-tuning procedure during data transfers, the data length per read/write command shall be limited up to 4MB. [2] Re-Tuning Mode 2 The host controller has the capability to indicate the re-tuning timing by Re-Tuning Request during data transfers. Then the data length per read/write command shall be limited up to 4MB. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled. [3] Re-Tuning Mode 3 The host controller has the capability to take care of the re-tuning during data transfer [Auto Re-Tuning]. Re-Tuning Request shall not be generated during data transfers and there is no limitation to data length per read/write command. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled. Re-Tuning Timer Control Example for Re-Tuning Mode 1 The initial value of re-tuning timer is provided by Timer Count for Re-Tuning field in this register. The timer starts counting by loading the initial value. When the timer expires, the Host Driver marks an expiration flag. On receiving a command request, the Host driver checks the expiration flag. If the expiration flag is set, then the Host Driver should perform the re-tuning procedure before issuing a command. If the expiration flag is not set, then the Host Driver issues a command without performing the re-tuning procedure. Every time the re-tuning procedure is performed, the timer loads the new initial value and the expiration flag is cleared. Re-Tuning Timer Control Example for Re-Tuning Mode 2 and Mode 3 The timer control is almost the same as Re-Tuning Mode 1 except the timer loads the new initial value after data transfer [when receiving Transfer Complete]. In case of Mode 3, Timer Count for Re-Tuning is set either smaller value: Tuning effective time after re-tuning procedure or after data transfer. If a Host System goes into power down mode, the Host Driver should stop the re-tuning timer and set the expiration flag to 1 when the Host System resumes from power down mode. 0 Timer - Max data length 4MB 1 Timer and Re-Tuning Request - Max data length 4MB 2 Auto Re-Tuning (for transfer) - Timer and Re-Tuning Request 3 Reserved
13	TSDR50	R	0h	Use Tuning for SDR50 If this bit is set to 1, this Host Controller requires tuning to operate SDR50. [Tuning is always required to operate SDR104.] 0 SDR50 does not require tuning. 1 SDR50 requires tuning.

5.14.2.28 MMC_FE Register

5.14.2.28.1 MMC_FE Register (Offset = 250h) [reset = 0h]

Force Event Register for Auto CMD Error Status and Error Interrupt status
The Force Event Register is not a physically implemented register. Rather, it is an address at which the Auto CMD Error Status Register can be written.
Writing 1 : set each bit of the Auto CMD Error Status Register
Writing 0 : no effect
Rather, it is an address at which the Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.
Writing 1 : set each bit of the Error Interrupt Status Register
Writing 0 : no effect
Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

5.14.2.29 MMC_ADMAES Register

5.14.2.29.1 MMC_ADMAES Register (Offset = 254h) [reset = 0h]

ADMA Error Status Register
When ADMA Error Interrupt is occurred, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. For recovering the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:
ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
ST_CADR: This sate is never set because do not generate ADMA error in this state.
ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address
In case of write operation, the Host Driver should use ACMD22 to get the number of written block rather than using this information, since unwritten data may exist in the Host Controller. The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Bit	Field	Type	Reset	Description
31:0	ADMA_A32B	R/W	0h	ADMA System address 32 bits.This register holds byte address of executing command of the Descriptor table. 32-bit Address Descriptor uses lower 32-bit of this register. At the start of ADMA, the Host Driver shall set start address of the Descriptor table. The ADMA increments this register address, which points to next line, when every fetching a Descriptor line. When the ADMA Error Interrupt is generated, this register shall hold valid Descriptor address depending on the ADMA state. The Host Driver shall program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores lower 2-bit of this register and assumes it to be 00b

Bit	Field	Type	Reset	Description
31:29	RESERVED3	R	0h	Always read as 0
28	LOCK	R/W	0h	this field is used for locking the corresponding MPU region configurations. Write 1 to lock the configurations along with the lock bit. Writing 1 is alllowed once per boot. Lock bit will clear on reset only. Once locked SW can not modify the MPU configurations along with lock bit.
27:26	RESERVED2	R	0h	Always read as 0.
25:10	AID15_0	R/W	0h	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	R/W	0h	Additional AIDs checked. Defaults to input value.
8	RESERVED1	R	0h	Always read as 0.
7	NS	R/W	0h	Non-secure permission. Defaults to input value.
6	EMU	R/W	0h	Debug permission. Defaults to input value.
5	SR	R/W	0h	Supervisor read permission. Defaults to input value.
4	SW	R/W	0h	Supervisor write permission. Defaults to input value.
3	SX	R/W	0h	Supervisor executable permission. Defaults to input value.
2	UR	R/W	0h	User read permission. Defaults to input value.

5.20.2.1 ECC_AGGR_AGGR_REVISION Register

5.20.2.1.1 ECC_AGGR_AGGR_REVISION Register (Offset = 0h) [reset = 66A0C200h]

The Revision Register contains the major and minor revisions for the ECC aggregator module. It does not support byte accesses.

Return to Summary Table

Table 5-2297. ECC_AGGR_AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	RESERVED	NONE	0h	Reserved
3:2	TIMEOUT	R/WI	0h	2-bit saturating counter of the number of timeout errors that have occurred since last cleared. 2'b00 - No timeout errors have occurred 2'b01 - 1 timeout error has occurred 2'b10 - 2 timeout error has occurred 2'b11 - 3 or more timeout errors have occurred A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

Table 5-2304. RTI_RTIGCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19:16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode [read]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0 Privilege mode [write]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode [read]: 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode [write]: 0 = stop counters in debug mode 1 = continue counting in debug mode
14:2	RESERVED1	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 [UC1 and FRC1]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address [physical].
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 [UC0 and FRC0]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bits source address [physical].

Bit	Field	Type	Reset	Description
31:2	RESERVED3	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock

Copyright © 2026 Texas Instruments Incorporated

Table 5-2306. RTI_RTITBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

Table 5-2314. RTI_RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode [read]: value of the counter when the Free Running Counter 0 was read Privilege mode [write]: the counter can be preset by Writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

Table 5-2324. RTI_RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC1	R/W	0h	UC1: Up Counter 1. This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1. User and privilege mode [read]: value of the counter when the Free Running Counter 1 was read Privilege mode [write]: the counter can be preset by Writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

Table 5-2344. RTI_RTICOMP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	COMP3	R/W	0h	COMP3: compare 3. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode [read]: current compare value Privilege mode [write]: update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

Table 5-2350. RTI_RTITBHCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TBHCOMP	R/W	0h	TBHCOMP: Timebase High Compare Value. This value determines when the edge detection circuit will stop monitoring the NTUx signal. It will be compared with Up Counter 0. RTITBHCOMP has to be less than RTICPUC0, since RTIUC0 will be reset when RTICPUC0 is reached. Example: The NTUx edge detection circuit should be active +/- 10 RTICLK cycles around RTICPUC0. RTICPUC0 = 0x00000050 RTITBLCOMP = 0x000046 RTITBHCOMP = 0x00000009 User and privilege mode [read]: current compare value Privilege mode [write when TBEXT = 0]: the compare value is updated Privilege mode [write when TBEXT = 1]: the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

Table 5-2362. RTI_RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.

Copyright © 2026 Texas Instruments Incorporated

Table 5-2362. RTI_RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

Table 5-2368. RTI_RTIWWDRXNCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode [read], privileged mode [write]: 0x5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

Table 5-2370. RTI_RTIWWDSIZECTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	WWDSIZE	R/W	0h	WWDSIZE: Digital Windowed Watchdog Window Size. User and privilege mode [read], privileged mode [write]: Value written to WWDSIZE Window Size 0x00000005 100% [Functionality same as the time-out digital watchdog.] 0x00000050 50% 0x00000500 25% 0x00005000 12.5% 0x00050000 6.25% 0x00500000 3.125% Any other value 3.125% Note: Incorrect value being written to watchdog window size control register If an incorerct value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%. This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration. Note: Configuration of DWWD Window Size The DWWD window size can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDSIZE is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

5.26.2.2 UART_RHR Register

5.26.2.2.1 UART_RHR Register (Offset = 0h) [reset = 0h]

The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character.
Note: If an overflow occurs the data in the RHR is not overwritten.

5.26.2.3 UART_THR Register

5.26.2.3.1 UART_THR Register (Offset = 0h) [reset = 0h]

The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.

5.26.2.7 UART_IER_UART Register

5.26.2.7.1 UART_IER_UART Register (Offset = 4h) [reset = 0h]

The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, RHR interrupt, THR interrupt, XOFF received and CTS*/RTS* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.

0h	0h	0h	0h	0h			

Table 5-2422. UART_EFR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7	AUTO_CTS_EN	R/W	0h	Auto-CTS enable bit. 0:Normal operation. 1:Auto-CTS flow control is enabled i.e. transmission is halted when the CTS* pin is high (inactive).
6	AUTO_RTS_EN	R/W	0h	Auto-RTS enable bit. 0:Normal operation. 1:Auto- RTS flow control is enabled i.e. RTS* pin goes high (inactive) when the receiver FIFO HALT trigger level, TCR[3:0], is reached, and goes low (active) when the receiver FIFO RESTORE transmission trigger level is reached.
5	SPECIAL_CHAR_DETECT	R/W	0h	0: Normal operation. 1:Special character detect enable. Received data is compared with XOFF2 data. If a match occurs the received data is transferred to RX FIFO and IIR bit 4 is set to 1 to indicate a special character has been detected.

Table 5-2440. UART_LSR_IRDA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7	THR_EMPTY	R	1h	0 Transmit holding register (TX FIFO) is not empty 1 Transmit hold register (TX FIFO) is empty. The transmission is not necessarily completed
6	STS_FIFO_FULL	R	0h	0 Status FIFO not full 1 Status FIFO full
5	RX_LAST_BYTE	R	0h	0 The RX FIFO (RHR) does not contain the last byte of the frame to be read 1 The RX FIFO (RHR) contains the last byte of the frame to be read.This bit is only set when the last byte of a frame is available to be read. It is used to determine the frame boundary. It is cleared on a single read of the LSR register

Copyright © 2026 Texas Instruments Incorporated

Table 5-2440. UART_LSR_IRDA Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	FRAME_TOO_LONG	R	0h	0 No frame-too-long error in frame 1 Frame-too-long error in the frame at the top of the STATUS FIFO, [next character to be read]. This bit is set to 1 when a frame exceeding the maximum length (set by RXFLH and RXFLL registers) has been received. When this error is detected, current frame reception is terminated. Reception is stopped until the next START flag is detected
3	ABORT	R	0h	0 No abort pattern error in frame 1 Abort pattern is received. SIR & MIR: Abort pattern. FIR: Illegal symbol
2	CRC	R	0h	0 No CRC error in frame 1 CRC error in the frame at the top of the STATUS FIFO (next character to be read)
1	STS_FIFO_E	R	1h	0 Status FIFO not empty 1 Status FIFO empty
0	RX_FIFO_E	R	1h	0 No data in the receive FIFO 1 At least one data character in the RX FIFO

5.26.2.26 UART_MDR1 Register

5.26.2.26.1 UART_MDR1 Register (Offset = 20h) [reset = 7h]

The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation.
Note: If the module is disabled by setting the MODE_SELECT field to.

Return to Summary Table

Copyright © 2026 Texas Instruments Incorporated

5.26.2.27 UART_MDR2 Register

5.26.2.27.1 UART_MDR2 Register (Offset = 24h) [reset = 0h]

IR-IrDA and IR-CIR modes only.
MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].
Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.

5.26.2.30 UART_RESUME Register

5.26.2.30.1 UART_RESUME Register (Offset = 2Ch) [reset = 0h]

IR-IrDA and IR-CIR modes only.
This register is used to clear internal flags, which halt transmission/reception when an underrun/overrun error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.

Return to Summary Table

5.26.2.31 UART_TXFLH Register

5.26.2.31.1 UART_TXFLH Register (Offset = 2Ch) [reset = 0h]

IrDA modes only.
The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.

Return to Summary Table

5.26.2.32 UART_RXFLL Register

5.26.2.32.1 UART_RXFLL Register (Offset = 30h) [reset = 0h]

IrDA modes only.
The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is n bytes, then program RXFLL and RXFLH to be n + 3 in SIR or MIR modes and n + 6 in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).

5.26.2.33 UART_SFREGL Register

5.26.2.33.1 UART_SFREGL Register (Offset = 30h) [reset = 0h]

IrDA modes only.
The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.

5.26.2.36 UART_BLR Register

5.26.2.36.1 UART_BLR Register (Offset = 38h) [reset = 40h]

IrDA modes only.
Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).

31:8	RESERVED_24	R	0h	Reserved
7	PULSE_TYPE	R/W	0h	SIR pulse width select: 0 3/16 of baud-rate pulse width 1 1.6us
6	SD_MOD	R/W	0h	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. 0 SD pin is set to high 1 SD pin is set to low
5	DIS_IR_RX	R/W	0h	0 Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation). 1 Disables RX input (permanent state - independent of transmit).

Copyright © 2026 Texas Instruments Incorporated

Table 5-2482. UART_ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DIS_TX_UNDERRUN	R/W	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line. 0 Long stop bits cannot be transmitted, TX underrun is enabled 1 Long stop bits can be transmitted, TX underrun is disabled
3	SEND_SIP	R/W1TS	0h	MIR/FIR Modes only.Send Serial Infrared Interaction Pulse [SIP] If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it.This bit automatically gets cleared at the end of the SIP transmission. 0 No action 1 Send SIP pulse.
2	SCTX_EN	R/W1TS	0h	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing.
1	ABORT_EN	R/W	0h	Frame Abort. The LH can intentionally abort transmission of a frame by Writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame.
0	EOT_EN	R/W1TS	0h	EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO].

Copyright © 2026 Texas Instruments Incorporated

5.26.2.39 UART_SCR Register

5.26.2.39.1 UART_SCR Register (Offset = 40h) [reset = 0h]

Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.

5.26.2.41 UART_EBLR Register

5.26.2.41.1 UART_EBLR Register (Offset = 48h) [reset = 0h]

IR-IrDA and IR-CIR modes only.
In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.
In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).
In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to.

Return to Summary Table

5.26.2.42 UART_MVR Register

5.26.2.42.1 UART_MVR Register (Offset = 50h) [reset = 47424E03h]

The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returned
Notes:
UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification).
UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification).
UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).
For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8

5.26.2.43 UART_SYSC Register

5.26.2.43.1 UART_SYSC Register (Offset = 54h) [reset = 0h]

The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.

5.26.2.45 UART_WER Register

5.26.2.45.1 UART_WER Register (Offset = 5Ch) [reset = FFh]

The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.

5.26.2.46 UART_CFPS Register

5.26.2.46.1 UART_CFPS Register (Offset = 60h) [reset = 69h]

Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.

Return to Summary Table

MDR3[2] SET_TX_DMA_THRESHOLD must be one and
must be value + tx_trigger_level <= 64 (TX FIFO size).
If not, 64-tx_trigger_level will be used w/o modifying
the value of this register.

1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock

Copyright © 2026 Texas Instruments Incorporated

Table 5-2546. WDT_RTITBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

Table 5-2554. WDT_RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode [read]: value of the counter when the Free Running Counter 0 was read Privilege mode [write]: the counter can be preset by Writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

Table 5-2560. WDT_RTICAUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	CAUC0	R/W	0h	CAUC0: Capture Up Counter 0. This registers captures the current value of the Up Counter 0 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 0 and Free Running Counter 0. So the RTICAFRC0 register has to be read first, before the RTICAUC0 register is read. This sequence ensures that the value of the RTICAUC0 register is the corresponding value to the RTICAFRC0 register, even if another capture event happens in between the two reads. User and privilege mode [read]: value of Up Counter 0 on a capture event

Table 5-2564. WDT_RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC1	R/W	0h	UC1: Up Counter 1. This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1. User and privilege mode [read]: value of the counter when the Free Running Counter 1 was read Privilege mode [write]: the counter can be preset by Writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

Bit	Field	Type	Reset	Description
31:0	DWDCTRL	R/W	0h	DWDCTRL: Digital Watchdog Control. User and priviledge mode [read]: 0x5312ACED = DWD counter is disabled. This is the default value. 0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged [enabled or disabled] Priviledge mode [write]: 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged [stays enabled or disabled] Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this registermore than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.

Table 5-2602. WDT_RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.

Copyright © 2026 Texas Instruments Incorporated

Table 5-2602. WDT_RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

Table 5-2604. WDT_RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

Table 5-2608. WDT_RTIWWDRXNCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode [read], privileged mode [write]: 0x5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

Table 5-2610. WDT_RTIWWDSIZECTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	WWDSIZE	R/W	0h	WWDSIZE: Digital Windowed Watchdog Window Size. User and privilege mode [read], privileged mode [write]: Value written to WWDSIZE Window Size 0x00000005 100% [Functionality same as the time-out digital watchdog.] 0x00000050 50% 0x00000500 25% 0x00005000 12.5% 0x00050000 6.25% 0x00500000 3.125% Any other value 3.125% Note: Incorrect value being written to watchdog window size control register If an incorerct value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%. This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration. Note: Configuration of DWWD Window Size The DWWD window size can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDSIZE is made when the watchdog service window is already open, then

6 Revision History

DATE	REVISION	NOTES
November 2023	*	Initial Release

Copyright © 2026 Texas Instruments Incorporated

DATE	REVISION	NOTES
March 2025	A	• Updated register names with nomenclature used in other register addenda. • Updated EPWM register compaction by maintaining only one EPWM Instance table . • Removed OTTOCAL, DEBUGSS register chapters. • ADC_CFG and ADC_RESULT_REGS have been compacted into ADC. Similar compaction is done for ADC_R. • Updated CMPSSB register names to align with CMPSSA register names. • Top Level Register Name updates: – r5ss_core to R5SS – PWMXBAR to CONTROLSS_PWMXBAR – PWMSYNCOUTXBAR to CONTROLSS_PWMSYNCOUTXBAR – OUTPUTXBAR to CONTROLSS_OUTPUTXBAR – ICLXBAR to CONTROLSS_ICLXBAR – INTXBAR to CONTROLSS_INTXBAR – MDLXBAR to CONTROLSS_MDLXBAR – TOP_ESM to ESM – fss to FSS_TIMEOUT_CFG – fss_of_ul to FSS – mmchs to MMCSD – ECC_AGG to ECC_AGGR – rl2_of to RL2 – MBOX_RAM to MSS_MBOX • Updated IP and instance names across large portions of the document. • Updated register name to align with software names applied across large portions of the document. • Updated document-wide issues with incorrect reset values and offsets. • Updated PBIST Registers Base Address from "0x53300200" to "0x53300000". • Added AM263Px collateral links.
June 2025	B	• Corrected the region name in Device Memory Map chapter by changing "R5SS0_STC" to "R5SS1_STC" for the region starting at address 0x5351 0000 • Added the OTTOCAL register chapter. • Added the description for the following TOP_CTRL registers. – EFUSE1_ROW_12 – EFUSE_OVERRIDE_LDO_TRIM – MASK_ANA_ISO • Updates the PBIST register classifications. • Fixed physical address error in the following IPs – RL2 – CPSW – FSS – ESM

Copyright © 2026 Texas Instruments Incorporated

DATE	REVISION	NOTES
November 2026	C	• Added a PG_VER bitfield to identify silicon version in TOP_CTRL_EFUSE1_ROW_15 register. • Added a EFUSE_MODE_CTRL bitfield in TOP_CTRL_HW_SPARE_RW0 register. • Updated the description for bitfields, OE_OVERIRIDE, OE_OVERRIDE_CTRL, IE_OVERRIDE and IE_OVERRIDE_CTRL, in all CFG_REG registers. • Added bitfileds description in IOMUX_PADGLBL_CFG_REG register. • Declassified MSS_CTRL_DEBUGSS_STM_NSGUAREN. • Updated the description of bitfield, WWDSIZE, in RTI_RTIWWDSIZECTRL register. • Updated signal name in description of PWMXBARx_G0_SEL bitfield in CONTROLSS_PWMXBARx_G0 register. • Updated signal name in description of PWMXBARx_G1_SEL bitfield in CONTROLSS_PWMXBARx_G0 register. • Updated signal name in description of INTXBARx_G8_SEL bitfield in CONTROLSS_INTXBARx_G8 register. • Updated signal name in description of INTXBARx_G9_SEL bitfield in CONTROLSS_INTXBARx_G9 register. • Updated signal name in description of OUTPUTXBARx_G6_SEL bitfield in CONTROLSS_OUTPUTXBARx_G6 register. • Updated signal name in description of OUTPUTXBARx_G7_SEL bitfield in CONTROLSS_OUTPUTXBARx_G7 register. • Updated register names in ERR_GRP, ERR_EXT_GRP region in ESM . • Updated EDMA register offsets and structures.
