

The CLC730038 and CLC730036 evaluation boards are designed to aid in the characterization of Comlinear's 8-pin, dual monolithic amplifiers.

- CLC730038 - DIP packages
Uses all through-hole components
- CLC730036 - SOIC packages
Uses all surface-mount components

Both boards have identical circuit configurations and are designed for non-inverting gains. Inverting gains or other circuit configurations can be obtained with slight modifications to the boards. Use the evaluation boards as a:

- Guide for high frequency layout
- Tool to aid in device testing and characterization

Basic Operation

Figure 1 shows the non-inverting schematic for both boards. The input signal is brought into the board through SMA connectors to the non-inverting input of the amplifier. The resistor R_{in} is used to set the input termination resistance to the op amp. The non-inverting gain is set by the following equation:

$$\text{Non-inverting Gain: } 1 + \frac{R_f}{R_g}$$

The value of the feedback resistor, R_f , has a strong influence on AC performance. Refer to the product data sheet for feedback resistor selection. The output of the op amp travels through a series resistance, R_{out} , and then leaves the board through an SMA connector. The series resistance, R_{out} , matches transmission lines or isolates the output from capacitive loads.

Figure 1: Non-inverting Gain Configurations

Inverting Gain Operation

The evaluation boards can be modified to provide an inverting gain configuration. Complete these steps to modify the board:

1. Cut the input trace as shown in Figure 2
2. Use 25Ω for R_{in}
3. Terminate R_g at the input trace instead of ground (See Figure 2)
4. Add R_t for desired input impedance (input impedance = $R_g || R_t$)

Figure 2: Modifications for Inverting Gains (CLC730038 board shown)

Figure 3 illustrates the inverting schematic for both boards.

Select R_t to yield desired input impedance = $R_g || R_t$

Figure 3: Inverting Gain Configurations

Isolation and Channel Matching Performance

For maximum isolation between channels, proper power supply decoupling is required. Always include the bypass capacitors C1, C2, C3, and C4. The use of good quality capacitors also helps to achieve better isolation performance.

The evaluation boards have also been designed to minimize channel-to-channel crosstalk. The input and output pins of the amplifier are sensitive to the coupling of parasitic capacitances caused by power or ground planes and traces. To reduce the influence of these parasitics, the ground plane has been removed around these sensitive nodes. In multilayer boards, remove both the ground and power traces and planes around the input and output pins.

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. When designing your own board, use the evaluation board as a guide and follow these steps as a basis for high frequency layout:

1. Use a ground plane.
2. Include 6.8 μ F tantalum and 0.1 μ F ceramic capacitors on both supplies.
3. Place the 6.8 μ F capacitors within 0.75 inches of the power pins.
4. Place the 0.1 μ F capacitors less than 0.1 inches from the power pins.
5. Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance.
6. Minimize all trace lengths to reduce series inductances.
7. Use individual flush-mount sockets, for prototyping.

Measurement Hints

If 50 Ω coax and 50 Ω R_{in}/R_{out} resistors are used, many of the typical performance plots found in the product data sheets can be reproduced.

When SMA connectors and cables are not available to evaluate the amplifier, do not use normal oscilloscope probes. Use low impedance resistive divider probes of 100 to 500 Ω . If a low impedance probe is not available, then a section of 50 Ω coaxial cable and a low impedance resistor (10 Ω to 50 Ω) may be used. Follow these 3 steps to create a "cable/resistor" probe:

1. Connect one end of the coax's center to a test measurement box terminated in 50 Ω .
2. Connect the other end of the cable's center conductor to the low impedance resistor. (The open side of the resistor is now a probe.)
3. Connect the ground shield of the cable to evaluation board ground and test box ground.

Figure 4: "Cable/Resistor" Probe Configuration

This "cable/resistor" probe, shown in Figure 4, forms a voltage attenuator between the resistor and the 50 Ω termination resistance of the test box. This method allows measurements to be performed directly on the output pin of the amplifier.

When evaluating only one channel on the board, complete the following on the unused channel:

1. Included R_f and R_g as shown in Figure 1
2. Ground the input
3. Load the output with 50 Ω to ground

Power Supplies

Refer to the product data sheet for the recommended supply voltages.

Component Values

- R_f , R_g - Use the product data sheet to select values
- R_{in} , R_{out} - 50 Ω (Refer to **Basic Operation** section for details)
- R_t - Optional resistor for inverting gain configurations (Refer **Inverting Gain Operation** section for details)
- C3, C4 - 6.8 μ F tantalum capacitors
- C1, C2 - 0.1 μ F ceramic capacitors

Customer Design Applications Support

National Semiconductor is committed to design excellence. For sales, literature and technical support, call the National Semiconductor Customer Response Group at **1-800-272-9959** or fax **1-800-737-7018**.

Life Support Policy

National's products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of National Semiconductor Corporation. As used herein:

1. Life support devices or systems are devices or systems which, a) are intended for surgical implant into the body, or b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
