About This Manual.....	67
Notational Conventions.....	67
Glossary.....	67
Related Documentation From Texas Instruments.....	67
Support Resources.....	67
Trademarks.....	68
<b>1 C2000™ Microcontrollers Software Support</b> .....	69
1.1 Introduction.....	70
1.2 C2000Ware Structure.....	70
1.3 Documentation.....	70
1.4 Devices.....	70
1.5 Libraries.....	70
1.6 Code Composer Studio™ Integrated Development Environment (IDE).....	70
1.7 SysConfig and PinMUX Tool.....	71
<b>2 C28x Processor</b> .....	73
2.1 Introduction.....	74
2.2 C28X Related Collateral.....	74
2.3 Features.....	74
2.4 Floating-Point Unit.....	74
2.5 Trigonometric Math Unit (TMU).....	75
<b>3 System Control and Interrupt</b> .....	77
3.1 Introduction.....	78
3.2 System Control Functional Description.....	78
3.2.1 Device Identification.....	78
3.2.2 Device Configuration Registers.....	78
3.3 Resets.....	79
3.3.1 Reset Sources.....	79
3.3.2 External Reset ( $\overline{XRS}$ ).....	79
3.3.3 Power-On Reset (POR).....	79
3.3.4 Debugger Reset ( $\overline{SYSRS}$ ).....	80
3.3.5 Watchdog Reset ( $\overline{WDRS}$ ).....	80
3.3.6 NMI Watchdog Reset (NMIWDRS).....	80
3.3.7 DCSM Safe Code Copy Reset ( $\overline{SCCRESET}$ ).....	80
3.3.8 Hibernate Reset ( $\overline{HIBRESET}$ ).....	80
3.3.9 Hardware BIST Reset (HWBISTR $\overline{S}$ ).....	80
3.3.10 Test Reset ( $\overline{TRST}$ ).....	81
3.4 Peripheral Interrupts.....	81
3.4.1 Interrupt Concepts.....	81
3.4.2 Interrupt Architecture.....	81
3.4.3 Interrupt Entry Sequence.....	82
3.4.4 Configuring and Using Interrupts.....	83
3.4.5 PIE Channel Mapping.....	85
3.4.6 Vector Tables.....	87
3.5 Exceptions and Non-Maskable Interrupts.....	92
3.5.1 Configuring and Using NMIs.....	92
3.5.2 Emulation Considerations.....	93
3.5.3 NMI Sources.....	93
3.5.4 Illegal Instruction Trap (ITRAP).....	93

3.6 Safety Features.....	93
3.6.1 Write Protection on Registers.....	94
3.6.2 Missing Clock Detection Logic.....	94
3.6.3 PLLSLIP Detection.....	95
3.6.4 CPU Vector Address Validity Check.....	96
3.6.5 NMIWDs.....	96
3.6.6 ECC and Parity Enabled RAMs, Shared RAMs Protection.....	96
3.6.7 ECC Enabled Flash Memory.....	96
3.6.8 ERRORSTS Pin.....	97
3.7 Clocking.....	97
3.7.1 Clock Sources.....	99
3.7.2 Derived Clocks.....	100
3.7.3 Device Clock Domains.....	101
3.7.4 XCLKOUT.....	102
3.7.5 Clock Connectivity.....	103
3.7.6 Clock Source and PLL Setup.....	104
3.7.7 Clock (OSCCLK) Failure Detection.....	107
3.8 32-Bit CPU Timers 0/1/2.....	109
3.9 Watchdog Timers.....	110
3.9.1 Servicing the Watchdog Timer.....	111
3.9.2 Minimum Window Check.....	111
3.9.3 Watchdog Reset or Watchdog Interrupt Mode.....	112
3.9.4 Watchdog Operation in Low Power Modes.....	112
3.9.5 Emulation Considerations.....	112
3.10 Low-Power Modes.....	113
3.10.1 IDLE.....	113
3.10.2 STANDBY.....	113
3.10.3 HALT.....	114
3.10.4 Hibernate (HIB).....	116
3.11 Memory Controller Module.....	117
3.11.1 Functional Description.....	117
3.12 Flash and OTP Memory.....	124
3.12.1 Features.....	124
3.12.2 Flash Tools.....	124
3.12.3 Default Flash Configuration.....	125
3.12.4 Flash Bank, One-Time Programmable (OTP) Memory, and Flash Pump.....	125
3.12.5 Flash Module Controller (FMC).....	126
3.12.6 Flash and OTP Memory Power-Down Modes and Wakeup.....	127
3.12.7 Flash and OTP Memory Performance.....	128
3.12.8 Flash Read Interface.....	128
3.12.9 Erase/Program Flash.....	130
3.12.10 Error Correction Code (ECC) Protection.....	131
3.12.11 Reserved Locations Within Flash and OTP Memory.....	135
3.12.12 Procedure to Change the Flash Control Registers.....	135
3.12.13 Simple Procedure to Modify an Application from RAM Configuration to Flash Configuration.....	136
3.13 Dual Code Security Module (DCSM).....	137
3.13.1 Functional Description.....	137
3.13.2 CSM Impact on Other On-Chip Resources.....	144
3.13.3 Incorporating Code Security in User Applications.....	145
3.14 JTAG.....	150
3.15 System Control Register Configuration Restrictions.....	150
3.16 Software.....	151
3.16.1 SYSCTL Examples.....	151
3.16.2 TIMER Examples.....	151
3.16.3 MEMCFG Examples.....	152
3.16.4 INTERRUPT Examples.....	152
3.16.5 LPM Examples.....	154
3.16.6 WATCHDOG Examples.....	155
3.17 System Control Registers.....	156
3.17.1 System Control Base Addresses.....	156
3.17.2 CPUTIMER_REGS Registers.....	157

3.17.3 PIE_CTRL_REGS Registers.....	164
3.17.4 WD_REGS Registers.....	216
3.17.5 NMI_INTRUPT_REGS Registers.....	222
3.17.6 XINT_REGS Registers.....	233
3.17.7 SYNC_SOC_REGS Registers.....	242
3.17.8 DMA_CLA_SRC_SEL_REGS Registers.....	249
3.17.9 DEV_CFG_REGS Registers.....	256
3.17.10 CLK_CFG_REGS Registers.....	301
3.17.11 CPU_SYS_REGS Registers.....	323
3.17.12 ROM_PREFETCH_REGS Registers.....	362
3.17.13 DCSM_Z1_REGS Registers.....	364
3.17.14 DCSM_Z2_REGS Registers.....	384
3.17.15 DCSM_COMMON_REGS Registers.....	404
3.17.16 MEM_CFG_REGS Registers.....	411
3.17.17 ACCESS_PROTECTION_REGS Registers.....	456
3.17.18 MEMORY_ERROR_REGS Registers.....	479
3.17.19 ROM_WAIT_STATE_REGS Registers.....	496
3.17.20 FLASH_CTRL_REGS Registers.....	498
3.17.21 FLASH_ECC_REGS Registers.....	507
3.17.22 UID_REGS Registers.....	530
3.17.23 DCSM_Z1_OTP Registers.....	539
3.17.24 DCSM_Z2_OTP Registers.....	546
3.17.25 Register to Driverlib Function Mapping.....	553
<b>4 ROM Code and Peripheral Booting.....</b>	<b>571</b>
4.1 Introduction.....	572
4.2 Boot ROM Registers.....	572
4.3 Device Boot Sequence.....	572
4.4 Device Boot Modes.....	573
4.5 Configuring Boot Mode Pins.....	574
4.6 Configuring Get Boot Options.....	575
4.7 Configuring Emulation Boot Options.....	576
4.8 Device Boot Flow Diagrams.....	577
4.8.1 Emulation Boot Flow Diagrams.....	578
4.8.2 Standalone and Hibernate Boot Flow Diagrams.....	579
4.9 Device Reset and Exception Handling.....	580
4.9.1 Reset Causes and Handling.....	580
4.9.2 Exceptions and Interrupts Handling.....	581
4.10 Boot ROM Description.....	582
4.10.1 Entry Points.....	582
4.10.2 Wait Points.....	582
4.10.3 Memory Maps.....	582
4.10.4 Boot Modes.....	585
4.10.5 Boot Data Stream Structure.....	600
4.10.6 GPIO Assignments.....	602
4.10.7 Secure ROM Function APIs.....	604
4.10.8 Clock Initializations.....	605
4.10.9 Wait State Configuration.....	605
4.10.10 Boot Status information.....	606
4.10.11 ROM Version.....	606
<b>5 Direct Memory Access (DMA).....</b>	<b>607</b>
5.1 Introduction.....	608
5.1.1 Features.....	608
5.1.2 Block Diagram.....	609
5.2 Architecture.....	610
5.2.1 Common Peripheral Architecture.....	610
5.2.2 Peripheral Interrupt Event Trigger Sources.....	610
5.2.3 DMA Bus.....	615
5.3 Address Pointer and Transfer Control.....	615
5.4 Pipeline Timing and Throughput.....	621
5.5 CPU and CLA Arbitration.....	622
5.6 Channel Priority.....	623

5.6.1 Round-Robin Mode.....	623
5.6.2 Channel 1 High-Priority Mode.....	624
5.7 Overrun Detection Feature.....	624
5.8 Software.....	625
5.8.1 DMA Examples.....	625
5.9 DMA Registers.....	626
5.9.1 DMA Base Addresses.....	626
5.9.2 DMA_REGS Registers.....	627
5.9.3 DMA_CH_REGS Registers.....	632
5.9.4 DMA Registers to Driverlib Functions.....	658
<b>6 Control Law Accelerator (CLA).....</b>	<b>661</b>
6.1 Introduction.....	662
6.1.1 Features.....	662
6.1.2 CLA Related Collateral.....	662
6.1.3 Block Diagram.....	663
6.2 CLA Interface.....	664
6.2.1 CLA Memory.....	664
6.2.2 CLA Memory Bus.....	665
6.2.3 Shared Peripherals and EALLOW Protection.....	666
6.2.4 CLA Tasks and Interrupt Vectors.....	666
6.2.5 CLA Software Interrupt to CPU.....	669
6.3 CLA and CPU Arbitration.....	670
6.3.1 CLA Message RAM.....	670
6.3.2 CLA Program Memory.....	671
6.3.3 CLA Data Memory.....	672
6.3.4 Peripheral Registers (ePWM, HRPWM, Comparator).....	672
6.4 CLA Configuration and Debug.....	673
6.4.1 Building a CLA Application.....	673
6.4.2 Typical CLA Initialization Sequence.....	673
6.4.3 Debugging CLA Code.....	674
6.4.4 CLA Illegal Opcode Behavior.....	676
6.4.5 Resetting the CLA.....	677
6.5 Pipeline.....	677
6.5.1 Pipeline Overview.....	677
6.5.2 CLA Pipeline Alignment.....	678
6.5.3 Parallel Instructions.....	682
6.5.4 CLA Task Execution Latency.....	682
6.6 Software.....	683
6.6.1 CLA Examples.....	683
6.7 Instruction Set.....	684
6.7.1 Instruction Descriptions.....	684
6.7.2 Addressing Modes and Encoding.....	685
6.7.3 Instructions.....	688
6.8 CLA Registers.....	814
6.8.1 CLA Base Addresses.....	815
6.8.2 CLA_REGS Registers.....	816
6.8.3 CLA_SOFTINT_REGS Registers.....	855
6.8.4 CLA Registers to Driverlib Functions.....	859
<b>7 General-Purpose Input/Output (GPIO).....</b>	<b>861</b>
7.1 Introduction.....	862
7.1.1 GPIO Related Collateral.....	863
7.2 Configuration Overview.....	864
7.3 Digital General-Purpose I/O Control.....	865
7.4 Input Qualification.....	866
7.4.1 No Synchronization (Asynchronous Input).....	866
7.4.2 Synchronization to SYSCLKOUT Only.....	866
7.4.3 Qualification Using a Sampling Window.....	867
7.5 USB Signals.....	870
7.6 SPI Signals.....	870
7.7 GPIO and Peripheral Muxing.....	871
7.7.1 GPIO Muxing.....	871

7.7.2 Peripheral Muxing.....	877
7.8 Internal Pullup Configuration Requirements.....	878
7.9 Software.....	879
7.9.1 GPIO Examples.....	879
7.9.2 LED Examples.....	879
7.10 GPIO Registers.....	880
7.10.1 GPIO Base Addresses.....	880
7.10.2 GPIO_CTRL_REGS Registers.....	881
7.10.3 GPIO_DATA_REGS Registers.....	1047
7.10.4 GPIO Registers to Driverlib Functions.....	1096
<b>8 Crossbar (X-BAR).....</b>	<b>1103</b>
8.1 Input X-BAR.....	1104
8.2 ePWM, CLB, and GPIO Output X-BAR.....	1107
8.2.1 ePWM X-BAR.....	1107
8.2.2 CLB X-BAR.....	1109
8.2.3 GPIO Output X-BAR.....	1112
8.2.4 X-BAR Flags.....	1114
8.3 XBAR Registers.....	1115
8.3.1 XBAR Base Addresses.....	1115
8.3.2 INPUT_XBAR_REGS Registers.....	1116
8.3.3 XBAR_REGS Registers.....	1133
8.3.4 EPWM_XBAR_REGS Registers.....	1147
8.3.5 CLB_XBAR_REGS Registers.....	1240
8.3.6 OUTPUT_XBAR_REGS Registers.....	1333
8.3.7 Register to Driverlib Function Mapping.....	1434
<b>9 Analog Subsystem.....</b>	<b>1441</b>
9.1 Introduction.....	1442
9.1.1 Features.....	1442
9.1.2 Block Diagram.....	1442
9.2 Optimizing Power-Up Time.....	1445
9.3 Analog Subsystem Registers.....	1445
9.3.1 Analog Subsystem Base Addresses.....	1445
9.3.2 ANALOG_SUBSYS_REGS Registers.....	1446
<b>10 Analog-to-Digital Converter (ADC).....</b>	<b>1455</b>
10.1 Introduction.....	1456
10.1.1 ADC Related Collateral.....	1456
10.1.2 Features.....	1457
10.1.3 Block Diagram.....	1458
10.2 ADC Configurability.....	1459
10.2.1 Clock Configuration.....	1459
10.2.2 Resolution.....	1459
10.2.3 Voltage Reference.....	1460
10.2.4 Signal Mode.....	1460
10.2.5 Expected Conversion Results.....	1460
10.2.6 Interpreting Conversion Results.....	1460
10.3 SOC Principle of Operation.....	1461
10.3.1 SOC Configuration.....	1462
10.3.2 Trigger Operation.....	1462
10.3.3 ADC Acquisition (Sample and Hold) Window.....	1462
10.3.4 ADC Input Models.....	1463
10.3.5 Channel Selection.....	1464
10.4 SOC Configuration Examples.....	1465
10.4.1 Single Conversion from ePWM Trigger.....	1465
10.4.2 Oversampled Conversion from ePWM Trigger.....	1465
10.4.3 Multiple Conversions from CPU Timer Trigger.....	1466
10.4.4 Software Triggering of SOCs.....	1467
10.5 ADC Conversion Priority.....	1467
10.6 Burst Mode.....	1470
10.6.1 Burst Mode Example.....	1470
10.6.2 Burst Mode Priority Example.....	1471
10.7 EOC and Interrupt Operation.....	1472

10.7.1 Interrupt Overflow.....	1473
10.7.2 Continue to Interrupt Mode.....	1473
10.7.3 Early Interrupt Configuration Mode.....	1473
10.8 Post-Processing Blocks.....	1474
10.8.1 PPB Offset Correction.....	1475
10.8.2 PPB Error Calculation.....	1475
10.8.3 PPB Limit Detection and Zero-Crossing Detection.....	1475
10.8.4 PPB Sample Delay Capture.....	1477
10.9 Opens/Shorts Detection Circuit (OSDETECT).....	1478
10.9.1 Implementation.....	1479
10.9.2 Detecting an Open Input Pin.....	1479
10.9.3 Detecting a Shorted Input Pin.....	1479
10.10 Power-Up Sequence.....	1480
10.11 ADC Calibration.....	1480
10.11.1 ADC Zero Offset Calibration.....	1481
10.12 ADC Timings.....	1482
10.12.1 ADC Timing Diagrams.....	1482
10.13 Additional Information.....	1486
10.13.1 Ensuring Synchronous Operation.....	1486
10.13.2 Choosing an Acquisition Window Duration.....	1489
10.13.3 Achieving Simultaneous Sampling.....	1491
10.13.4 Result Register Mapping.....	1491
10.13.5 Internal Temperature Sensor.....	1491
10.13.6 Designing an External Reference Circuit.....	1492
10.14 Software.....	1494
10.14.1 ADC Examples.....	1494
10.15 ADC Registers.....	1498
10.15.1 ADC Base Addresses.....	1498
10.15.2 ADC_RESULT_REGS Registers.....	1499
10.15.3 ADC_REGS Registers.....	1520
10.15.4 ADC Registers to Driverlib Functions.....	1636
<b>11 Buffered Digital-to-Analog Converter (DAC).....</b>	<b>1641</b>
11.1 Introduction.....	1642
11.1.1 DAC Related Collateral.....	1642
11.1.2 Features.....	1642
11.1.3 Block Diagram.....	1642
11.2 Using the DAC.....	1643
11.2.1 Initialization Sequence.....	1643
11.2.2 DAC Offset Adjustment.....	1644
11.2.3 EPWMSYNCPER Signal.....	1644
11.3 Lock Registers.....	1644
11.4 Software.....	1645
11.4.1 DAC Examples.....	1645
11.5 DAC Registers.....	1645
11.5.1 DAC Base Addresses.....	1645
11.5.2 DAC_REGS Registers.....	1646
11.5.3 DAC Registers to Driverlib Functions.....	1653
<b>12 Comparator Subsystem (CMPSS).....</b>	<b>1655</b>
12.1 Introduction.....	1656
12.1.1 CMPSS Related Collateral.....	1656
12.1.2 Features.....	1656
12.1.3 Block Diagram.....	1657
12.2 Comparator.....	1657
12.3 Reference DAC.....	1658
12.4 Ramp Generator.....	1659
12.4.1 Ramp Generator Overview.....	1659
12.4.2 Ramp Generator Behavior.....	1660
12.4.3 Ramp Generator Behavior at Corner Cases.....	1661
12.5 Digital Filter.....	1662
12.5.1 Filter Initialization Sequence.....	1663
12.6 Using the CMPSS.....	1663

12.6.1 LATCHCLR and EPWMSYNCPER Signals .....	1663
12.6.2 Synchronizer, Digital Filter, and Latch Delays.....	1663
12.6.3 Calibrating the CMPSS .....	1664
12.6.4 Enabling and Disabling the CMPSS Clock.....	1664
12.7 Software.....	1665
12.7.1 CMPSS Examples.....	1665
12.8 CMPSS Registers.....	1666
12.8.1 CMPSS Base Addresses.....	1666
12.8.2 CMPSS_REGS Registers.....	1667
12.8.3 CMPSS Registers to Driverlib Functions.....	1690
<b>13 Sigma Delta Filter Module (SDFM).....</b>	<b>1693</b>
13.1 Introduction.....	1694
13.1.1 SDFM Related Collateral.....	1694
13.1.2 Features.....	1695
13.1.3 Block Diagram.....	1696
13.2 Configuring Device Pins.....	1698
13.3 Input Control Unit.....	1699
13.4 Sinc Filter.....	1700
13.4.1 Data Rate and Latency of the Sinc Filter.....	1702
13.5 Data (Primary) Filter Unit.....	1703
13.5.1 32-bit or 16-bit Data Filter Output Representation.....	1704
13.5.2 SDSYNC Event.....	1705
13.6 Comparator (Secondary) Filter Unit.....	1706
13.6.1 Higher Threshold (HLT) Comparator .....	1707
13.6.2 Lower Threshold (LLT) Comparator .....	1707
13.7 Theoretical SDFM Filter Output.....	1708
13.8 Interrupt Unit.....	1710
13.8.1 SDFM (SDINT) Interrupt Sources .....	1710
13.9 Register Descriptions.....	1712
13.10 Software.....	1714
13.10.1 SDFM Examples.....	1714
13.11 SDFM Registers.....	1714
13.11.1 SDFM Base Addresses.....	1714
13.11.2 SDFM_REGS Registers.....	1715
13.11.3 SDFM Registers to Driverlib Functions.....	1751
<b>14 Enhanced Pulse Width Modulator (ePWM).....</b>	<b>1753</b>
14.1 Introduction.....	1754
14.1.1 EPWM Related Collateral.....	1755
14.1.2 Submodule Overview.....	1756
14.2 Configuring Device Pins.....	1761
14.3 ePWM Modules Overview.....	1761
14.4 Time-Base (TB) Submodule.....	1763
14.4.1 Purpose of the Time-Base Submodule.....	1763
14.4.2 Controlling and Monitoring the Time-Base Submodule.....	1764
14.4.3 Calculating PWM Period and Frequency.....	1766
14.4.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules.....	1769
14.4.5 Simultaneous Writes to TBPRD and CMPx Registers Between ePWM Modules.....	1769
14.4.6 Time-Base Counter Modes and Timing Waveforms.....	1770
14.4.7 Global Load.....	1774
14.5 Counter-Compare (CC) Submodule.....	1776
14.5.1 Purpose of the Counter-Compare Submodule.....	1776
14.5.2 Controlling and Monitoring the Counter-Compare Submodule.....	1777
14.5.3 Operational Highlights for the Counter-Compare Submodule.....	1778
14.5.4 Count Mode Timing Waveforms.....	1779
14.6 Action-Qualifier (AQ) Submodule.....	1782
14.6.1 Purpose of the Action-Qualifier Submodule.....	1782
14.6.2 Action-Qualifier Submodule Control and Status Register Definitions.....	1783
14.6.3 Action-Qualifier Event Priority.....	1785
14.6.4 AQCTLA and AQCTLB Shadow Mode Operations.....	1786
14.6.5 Configuration Requirements for Common Waveforms.....	1788
14.7 Dead-Band Generator (DB) Submodule.....	1795

14.7.1 Purpose of the Dead-Band Submodule.....	1795
14.7.2 Dead-band Submodule Additional Operating Modes.....	1796
14.7.3 Operational Highlights for the Dead-Band Submodule.....	1798
14.8 PWM Chopper (PC) Submodule.....	1802
14.8.1 Purpose of the PWM Chopper Submodule.....	1802
14.8.2 Operational Highlights for the PWM Chopper Submodule.....	1802
14.8.3 Waveforms.....	1803
14.9 Trip-Zone (TZ) Submodule.....	1806
14.9.1 Purpose of the Trip-Zone Submodule.....	1806
14.9.2 Operational Highlights for the Trip-Zone Submodule.....	1807
14.9.3 Generating Trip Event Interrupts.....	1809
14.10 Event-Trigger (ET) Submodule.....	1812
14.10.1 Operational Overview of the ePWM Event-Trigger Submodule.....	1813
14.11 Digital Compare (DC) Submodule.....	1817
14.11.1 Purpose of the Digital Compare Submodule.....	1819
14.11.2 Enhanced Trip Action Using CMPSS.....	1819
14.11.3 Using CMPSS to Trip the ePWM on a Cycle-by-Cycle Basis.....	1819
14.11.4 Operation Highlights of the Digital Compare Submodule.....	1820
14.12 ePWM Crossbar (X-BAR).....	1827
14.13 Applications to Power Topologies.....	1828
14.13.1 Overview of Multiple Modules.....	1828
14.13.2 Key Configuration Capabilities.....	1829
14.13.3 Controlling Multiple Buck Converters With Independent Frequencies.....	1830
14.13.4 Controlling Multiple Buck Converters With Same Frequencies.....	1832
14.13.5 Controlling Multiple Half H-Bridge (HHB) Converters.....	1834
14.13.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM).....	1836
14.13.7 Practical Applications Using Phase Control Between PWM Modules.....	1838
14.13.8 Controlling a 3-Phase Interleaved DC/DC Converter.....	1839
14.13.9 Controlling Zero Voltage Switched Full Bridge (ZVSFB) Converter.....	1842
14.13.10 Controlling a Peak Current Mode Controlled Buck Module.....	1844

19.7.3 I2C Registers to Driverlib Functions.....	2245
<b>20 Multichannel Buffered Serial Port (McBSP).....</b>	<b>2247</b>
20.1 Introduction.....	2248
20.1.1 MCBSP Related Collateral.....	2248
20.1.2 Features of the McBSPs.....	2248
20.1.3 McBSP Pins/Signals.....	2249
20.2 Configuring Device Pins.....	2249
20.3 McBSP Operation.....	2250
20.3.1 Data Transfer Process of McBSPs.....	2251
20.3.2 Companding (Compressing and Expanding) Data.....	2251
20.3.3 Clocking and Framing Data.....	2253
20.3.4 Frame Phases.....	2255
20.3.5 McBSP Reception.....	2258
20.3.6 McBSP Transmission.....	2259
20.3.7 Interrupts and DMA Events Generated by a McBSP.....	2260
20.4 McBSP Sample Rate Generator.....	2260
20.4.1 Block Diagram.....	2261
20.4.2 Frame Synchronization Generation in the Sample Rate Generator.....	2264
20.4.3 Synchronizing Sample Rate Generator Outputs to an External Clock.....	2264
20.4.4 Reset and Initialization Procedure for the Sample Rate Generator.....	2266
20.5 McBSP Exception/Error Conditions.....	2267
20.5.1 Types of Errors.....	2267
20.5.2 Overrun in the Receiver.....	2268
20.5.3 Unexpected Receive Frame-Synchronization Pulse.....	2269
20.5.4 Overwrite in the Transmitter.....	2271
20.5.5 Underflow in the Transmitter.....	2272
20.5.6 Unexpected Transmit Frame-Synchronization Pulse.....	2273
20.6 Multichannel Selection Modes.....	2276
20.6.1 Channels, Blocks, and Partitions.....	2276
20.6.2 Multichannel Selection.....	2277
20.6.3 Configuring a Frame for Multichannel Selection.....	2277
20.6.4 Using Two Partitions.....	2277
20.6.5 Using Eight Partitions.....	2279
20.6.6 Receive Multichannel Selection Mode.....	2280
20.6.7 Transmit Multichannel Selection Modes.....	2281
20.6.8 Using Interrupts Between Block Transfers.....	2282
20.7 SPI Operation Using the Clock Stop Mode.....	2284
20.7.1 SPI Protocol.....	2284
20.7.2 Clock Stop Mode.....	2284
20.7.3 Enable and Configure the Clock Stop Mode.....	2285
20.7.4 Clock Stop Mode Timing Diagrams.....	2286
20.7.5 Procedure for Configuring a McBSP for SPI Operation.....	2288
20.7.6 McBSP as the SPI Master.....	2288
20.7.7 McBSP as an SPI Slave.....	2290
20.8 Receiver Configuration.....	2291
20.8.1 Programming the McBSP Registers for the Desired Receiver Operation.....	2291
20.8.2 Resetting and Enabling the Receiver.....	2292
20.8.3 Set the Receiver Pins to Operate as McBSP Pins.....	2293
20.8.4 Digital Loopback Mode.....	2293

20.8.5 Clock Stop Mode.....	2293
20.8.6 Receive Multichannel Selection Mode.....	2294
20.8.7 Receive Frame Phases.....	2294
20.8.8 Receive Word Lengths.....	2295
20.8.9 Receive Frame Length.....	2296
20.8.10 Receive Frame-Synchronization Ignore Function.....	2297
20.8.11 Receive Companding Mode.....	2298
20.8.12 Receive Data Delay.....	2300
20.8.13 Receive Sign-Extension and Justification Mode.....	2302
20.8.14 Receive Interrupt Mode.....	2303
20.8.15 Receive Frame-Synchronization Mode.....	2303
20.8.16 Receive Frame-Synchronization Polarity.....	2305
20.8.17 Receive Clock Mode.....	2308
20.8.18 Receive Clock Polarity.....	2309
20.8.19 SRG Clock Divide-Down Value.....	2311
20.8.20 SRG Clock Synchronization Mode.....	2311
20.8.21 SRG Clock Mode (Choose an Input Clock).....	2312
20.8.22 SRG Input Clock Polarity.....	2312
20.9 Transmitter Configuration.....	2313
20.9.1 Programming the McBSP Registers for the Desired Transmitter Operation.....	2313
20.9.2 Resetting and Enabling the Transmitter.....	2314
20.9.3 Set the Transmitter Pins to Operate as McBSP Pins.....	2314
20.9.4 Digital Loopback Mode.....	2315
20.9.5 Clock Stop Mode.....	2315
20.9.6 Transmit Multichannel Selection Mode.....	2316
20.9.7 XCEs Used in the Transmit Multichannel Selection Mode.....	2317
20.9.8 Transmit Frame Phases.....	2319
20.9.9 Transmit Word Lengths.....	2319
20.9.10 Transmit Frame Length.....	2320
20.9.11 Enable/Disable the Transmit Frame-Synchronization Ignore Function.....	2321
20.9.12 Transmit Companding Mode.....	2322
20.9.13 Transmit Data Delay.....	2323
20.9.14 Transmit DXENA Mode.....	2325
20.9.15 Transmit Interrupt Mode.....	2325
20.9.16 Transmit Frame-Synchronization Mode.....	2326
20.9.17 Transmit Frame-Synchronization Polarity.....	2327
20.9.18 SRG Frame-Synchronization Period and Pulse Width.....	2328
20.9.19 Transmit Clock Mode.....	2329
20.9.20 Transmit Clock Polarity.....	2329
20.10 Emulation and Reset Considerations.....	2331
20.10.1 McBSP Emulation Mode.....	2331
20.10.2 Resetting and Initializing McBSPs.....	2331
20.11 Data Packing Examples.....	2334
20.11.1 Data Packing Using Frame Length and Word Length.....	2334
20.11.2 Data Packing Using Word Length and the Frame-Synchronization Ignore Function.....	2336
20.12 Interrupt Generation.....	2337
20.12.1 McBSP Receive Interrupt Generation.....	2337
20.12.2 McBSP Transmit Interrupt Generation.....	2338

## About This Manual

This Technical Reference Manual (TRM) details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

The TRM should not be considered a substitute for the data sheet, rather a companion guide that should be used alongside the device-specific data sheet to understand the details to program the device. The primary purpose of the TRM is to abstract the programming details of the device from the data sheet. This allows the data sheet to outline the high-level features of the device without unnecessary information about register descriptions or programming models.

---

### Note

Texas Instruments is transitioning to use more inclusive terminology. Some language may be different than what you expect to see for certain technology areas.

---

## Notational Conventions

This document uses the following conventions.

- Hexadecimal numbers can be shown with the suffix h or the prefix 0x. For example, the following number is 40 hexadecimal (decimal 64): 40h or 0x40.
- Registers in this document are shown in figures and described in tables.
  - Each register figure shows a rectangle divided into fields that represent the fields of the register. Each field is labeled with its bit name, its beginning and ending bit numbers above, and its read/write properties with default reset value below. A legend explains the notation used for the properties.
  - Reserved bits in a register figure can have one of multiple meanings:
    - Not implemented on the device
    - Reserved for future device expansion
    - Reserved for TI testing
    - Reserved configurations of the device that are not supported
  - Writing nondefault values to the Reserved bits could cause unexpected behavior and should be avoided.

## Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## Related Documentation From Texas Instruments

For a complete listing of related documentation and development-support tools for these devices, visit the Texas Instruments website at <http://www.ti.com>. Additionally, the [TMS320C28x DSP CPU and Instruction Set Reference Guide](#) and the [TMS320C28x Floating Point Unit and Instruction Set Reference Guide](#) must be used in conjunction with this TRM.

## Support Resources

Chapter 1

# C2000™ Microcontrollers Software Support

---

This chapter discusses the C2000Ware for the C2000™ microcontrollers. The C2000Ware can be downloaded from: [www.ti.com/tool/C2000WARE](http://www.ti.com/tool/C2000WARE)

<b>1.1 Introduction</b> .....	<b>70</b>
<b>1.2 C2000Ware Structure</b> .....	<b>70</b>
<b>1.3 Documentation</b> .....	<b>70</b>
<b>1.4 Devices</b> .....	<b>70</b>
<b>1.5 Libraries</b> .....	<b>70</b>
<b>1.6 Code Composer Studio™ Integrated Development Environment (IDE)</b> .....	<b>70</b>
<b>1.7 SysConfig and PinMUX Tool</b> .....	<b>71</b>

## 1.1 Introduction

C2000Ware for the C2000™ microcontrollers is a cohesive set of development software and documentation designed to minimize software development time. From device-specific drivers and libraries to device peripheral examples, C2000Ware provides a solid foundation to begin development and evaluation of your product.

C2000Ware can be downloaded from: [www.ti.com/tool/C2000WARE](http://www.ti.com/tool/C2000WARE)

## 1.2 C2000Ware Structure

The C2000Ware software package is organized into the following directory structure as shown in [Table 1-1](#).

**Table 1-1. C2000Ware Root Directories**

Directory Name	Description
boards	Contains the hardware design schematics, BOM, Gerber files, and documentation for C2000 controlCARDS.
device_support	Contains all device-specific support files, bit field headers and device development user's guides.
docs	Contains the C2000Ware package user's guides and the HTML index page of all package documentation.
driverlib	Contains the device-specific driver library and driver-based peripheral examples.
libraries	Contains the device-specific and core libraries.

## 1.3 Documentation

Within C2000Ware, there is an extensive amount of development documentation ranging from board design documentation, to library user's guides, to driver API documentation. The "boards" directory contains all the hardware design, BOM, Gerber files, and more for controlCARDS. To assist with locating the necessary documentation, an HTML page is provided that contains a full list of all the documents in the C2000Ware package. Locate this page in the "docs" directory.

## 1.4 Devices

C2000Ware contains the necessary software and documentation to jumpstart development for C2000™ microcontrollers. Each device includes device-specific common source files, peripheral example projects, bit field headers, and if available, a device peripheral driver library. Additionally, documentation is provided for each device on how to set up a CCS project, as well as give an overview of all the included example projects and assist with troubleshooting. For devices with a driver library, documentation is also included that details all the peripheral APIs available.

To learn more about C2000™ microcontrollers, visit: [www.ti.com/c2000](http://www.ti.com/c2000).

## 1.5 Libraries

The libraries included in C2000Ware range from fixed-point and floating-point math libraries, to specialized DSP libraries, as well as calibration libraries. Each library includes documentation and examples, where applicable. Additionally, the Flash API files and boot ROM source code are located in the "libraries" directory.

## 1.6 Code Composer Studio™ Integrated Development Environment (IDE)

Code Composer Studio™ is an integrated development environment (IDE) that supports TI's microcontroller and embedded processors portfolio. The Code Composer Studio™ IDE comprises a suite of tools used to develop and debug embedded applications. The latest version of Code Composer Studio™ IDE can be obtained at: [www.ti.com/ccstudio](http://www.ti.com/ccstudio)

All projects and examples in C2000Ware are built for and tested with the Code Composer Studio™ IDE. Although the Code Composer Studio™ IDE is not included with the C2000Ware installer, Code Composer Studio™ IDE is easily obtainable in a variety of versions.

## 1.7 SysConfig and PinMUX Tool

To help simplify configuration challenges and accelerate software development, Texas Instruments™ created SysConfig, an intuitive and comprehensive collection of graphical utilities for configuring pins, peripherals, subsystems, and other components. SysConfig helps you manage, expose, and resolve conflicts visually so that you have more time to create differentiated applications.

The tool's output includes C header and code files that can be used with C2000Ware examples or used to configure custom software.

The SysConfig tool automatically selects the pinmux settings that satisfy the entered requirements. The SysConfig tool is delivered integrated in the Code Composer Studio™ IDE, in the C2000Ware GPIO example, as a standalone installer, or can be used by way of the cloud tools portal at: [dev.ti.com](https://dev.ti.com)

## 2.1 Introduction

The C28x CPU is a 32-bit fixed-point processor. This device draws from the best features of digital signal processing, reduced instruction set computing (RISC), microcontroller architectures, firmware, and tool sets.

For more information on CPU architecture and instruction set, see the [TMS320C28x CPU and Instruction Set Reference Guide](#).

## 2.3 Features

The CPU features include a modified Harvard architecture and circular addressing. The RISC features are single-cycle instruction execution, register-to-register operations, and modified Harvard architecture. The microcontroller features include ease of use through an intuitive instruction set, byte packing and unpacking, and bit manipulation. The modified Harvard architecture of the CPU enables instruction and data fetches to be performed in parallel. The CPU can read instructions and data while it writes data simultaneously to maintain the single-cycle instruction operation across the pipeline.

## 2.4 Floating-Point Unit

The C28x plus floating-point (C28x+FPU) processor extends the capabilities of the C28x fixed-point CPU by adding registers and instructions to support IEEE single-precision floating point operations.

Devices with the C28x+FPU include the standard C28x register set plus an additional set of floating-point unit registers. The additional floating-point unit registers are the following:

- Eight floating-point result registers, RnH (where n = 0–7)
- Floating-point Status Register (STF)
- Repeat Block Register (RB)

All of the floating-point registers, except the repeat block register, are shadowed. This shadowing can be used in high-priority interrupts for fast context save and restore of the floating-point registers.

For more information, see the [TMS320C28x Extended Instruction Sets Technical Reference Manual](#).

## 2.5 Trigonometric Math Unit (TMU)

The trigonometric math unit (TMU) extends the capabilities of a C28x+FPU by adding instructions and leveraging existing FPU instructions to speed up the execution of common trigonometric and arithmetic operations listed in [Table 2-1](#).

**Table 2-1. TMU Supported Instructions**

Instructions	C Equivalent Operation	Pipeline Cycles
MPY2PIF32 RaH,RbH	$a = b * 2\pi$	2/3
DIV2PIF32 RaH,RbH	$a = b / 2\pi$	2/3
DIVF32 RaH,RbH,RcH	$a = b/c$	5
SQRTF32 RaH,RbH	$a = \text{sqrt}(b)$	5
SINPUF32 RaH,RbH	$a = \sin(b*2\pi)$	4
COSPUF32 RaH,RbH	$a = \cos(b*2\pi)$	4
ATANPUF32 RaH,RbH	$a = \text{atan}(b)/2\pi$	4
QUADF32 RaH,RbH,RcH,RdH	Operation to assist in calculating ATANPU2	5

No changes have been made to existing instructions, pipeline or memory bus architecture. All TMU instructions use the existing FPU register set (R0H to R7H) to carry out their operations.

For more information, see the [TMS320C28x Extended Instruction Sets Technical Reference Manual](#).

This page intentionally left blank.

## Chapter 3 System Control and Interrupt

This chapter explains system control and interrupts found on the MCU. The system control module configures and manages the overall operation of the device and provides information about the device status. Configurable features in system control include reset control, NMI operation, power control, clock control, and low-power modes.

<b>3.16 Software</b> .....	<b>151</b>
<b>3.17 System Control Registers</b> .....	<b>156</b>

### 3.1 Introduction

This chapter explains the register space of the device system control module that is divided into three categories:

1. System Control Device Configuration Registers (DEV\_CFG\_REGS). The base address of these registers begins at 0x5D000.
2. System Control Clock Configuration Registers (CLK\_CFG\_REGS). The base address of these registers begins at 0x5D200.
3. System control CPU Subsystem Registers (CPU\_SYS\_REGS). The base address of these registers begins at 0x5D300.

### 3.2 System Control Functional Description

The system control module provides the following capabilities:

- Device identification and configuration registers
- Reset control
- Exceptions and Interrupt control
- Safety and error handling features of the device
- Power control
- Clock control
- Low Power modes
- Security module

#### 3.2.1 Device Identification

Device identification registers provide information on device class, device family, revision, part number, pin count, operating temperature range, package type, and device qualification status.

All of the device information is part of the DEV\_CFG\_REGS space and is accessible only by the software running on the CPU1 subsystem.

The control subsystem device identification registers are: PARTIDL, PARTIDH, and REVID.

A 256-bit Unique ID (UID) is available in UID\_REGS. The 256 bits are separated into these registers:

- UID\_PSRAND0-5: 192 bits of pseudo-random data
- UID\_UNIQUE: 32-bit unique data, the value in this register is unique across all devices with the same PARTIDH
- UID\_CHECKSUM: 32-bit Fletcher checksum of UID\_PSRAND0-5 and UID\_UNIQUE
- CPU ID: 16-bit location in OTP memory. The value at this location provides the information about the CPU. Refer to the device data sheet for more detail.

#### 3.2.2 Device Configuration Registers

Several registers provide users with configuration information for debug and identification purposes on this MCU. This information includes the features of the peripheral and how much RAM and FLASH memory is available on this part.

These registers are part of DEV\_CFG\_REGS space .

- DC0 – DC20: Device Configuration or Capabilities registers.  
If a particular bit in these registers is set to '1' then the associated/feature or module is available in the device.
- PERCNF: Peripheral configuration register.  
This register configures ADC capabilities, and enables or disables the USB internal PHY.
- CPUID: CPU identification register

### 3.3 Resets

This section explains the types and effects of the different resets on this device.

#### 3.3.1 Reset Sources

Table 3-1 summarizes the various reset signals and their effect on the device.

**Table 3-1. Reset Signals**

Reset Source	CPU Core Reset (C28x, TMU, FPU)	Peripherals Reset	JTAG / Debug Logic Reset	IOs	XRS Output
POR	Yes	Yes	Yes	Hi-Z	Yes
$\overline{\text{XRS}}$ Pin	Yes	Yes	No	Hi-Z	-
$\overline{\text{WDRS}}$	Yes	Yes	No	Hi-Z	Yes
$\overline{\text{NMIWDRS}}$	Yes	Yes	No	Hi-Z	Yes
$\overline{\text{SYSRS}}$ (Debugger Reset)	Yes	Yes	No	Hi-Z	No
$\overline{\text{SCCRESET}}$	Yes	Yes	No	Hi-Z	No
$\overline{\text{HIBRESET}}$	Yes	Yes	Yes	Isolated	No
$\overline{\text{HWBISTRs}}$	Yes	No	No	-	No
$\overline{\text{TRST}}$	No	No	Yes	-	No

The resets can be divided into a few groups:

- Chip-level resets ( $\overline{\text{XRS}}$ , POR,  $\overline{\text{WDRS}}$ , and  $\overline{\text{NMIWDRS}}$ ), which reset all or almost all of the device.
- System resets ( $\overline{\text{SYSRS}}$  and  $\overline{\text{SCCRESET}}$ ), which reset a large subset of the device but maintain some system-level configuration.
- Special resets ( $\overline{\text{HIBRESET}}$ ,  $\overline{\text{HWBISTRs}}$ , and  $\overline{\text{TRST}}$ ), which enable specific device functions.

After a reset, the reset cause register (RESC) is updated with the reset cause. The bits in this register maintain their state across multiple resets. The bits can only be cleared by a power-on reset (POR) or by writing ones to the register.

Many peripheral modules have individual resets accessible through the system control registers. For information about a module's reset state, refer to the appropriate chapter for that module.

#### Note

After a POR, XRS, WDRS, NMIWDRS, or HIBRESET, the boot ROM clears all of the system and message RAMs.

#### 3.3.2 External Reset ( $\overline{\text{XRS}}$ )

The external reset ( $\overline{\text{XRS}}$ ) is the main chip-level reset for the device and resets the CPU, all peripherals and I/O pin configurations, and most of the system control registers. There is a dedicated open-drain pin for  $\overline{\text{XRS}}$ . This pin can be used to drive reset pins for other ICs in the application, and can be driven by an external source. The  $\overline{\text{XRS}}$  is driven internally during watchdog, NMI, and power-on resets. In hibernate mode, toggling  $\overline{\text{XRS}}$  produces a  $\overline{\text{HIBRESET}}$ .

The XRSn bit in the RESC register is set whenever  $\overline{\text{XRS}}$  is driven low for any reason. This bit is then cleared by the boot ROM.

#### 3.3.3 Power-On Reset (POR)

The power-on reset (POR) circuit creates a clean reset throughout the device during power-up, suppressing glitches on the GPIOs. The  $\overline{\text{XRS}}$  pin is held low for the duration of the POR. In most applications,  $\overline{\text{XRS}}$  is held low long enough to reset other system ICs, but some applications can require a longer pulse. In these cases,  $\overline{\text{XRS}}$  can be driven low externally to provide the correct reset duration. A POR resets everything that  $\overline{\text{XRS}}$  does, along with a few other registers – the reset cause register (RESC), the NMI shadow flag

register (NMISHDFLG), the X1 clock counter register (X1CNT), and the hibernate configuration registers (HIBBOOTMODE, IORESTOREADDR, and LPMC.M0M1MODE).

After a POR, the POR and XRSn bits in RESC are set. These bits are then cleared by the boot ROM.

### 3.3.4 Debugger Reset ( $\overline{\text{SYSRS}}$ )

During development, it is sometimes necessary to reset the CPU and its peripherals without disconnecting the debugger or disrupting the system-level configuration. To facilitate this, the CPU has a subsystem reset, which can be triggered by a debugger using Code Composer Studio™ IDE. This reset ( $\overline{\text{SYSRS}}$ ) resets the CPU, the peripherals, many system control registers (including the clock gating and LPM configuration), and all I/O pin configurations.

The  $\overline{\text{SYSRS}}$  does not reset the ICEPick debug module, the device capability registers, the clock source and PLL configurations, the missing clock detection state, the PIE vector fetch error handler address, the NMI flags, the analog trims, or anything reset only by a POR (see [Section 3.3.3](#)).

### 3.3.5 Watchdog Reset ( $\overline{\text{WDRS}}$ )

The device has a watchdog timer that can optionally trigger a reset that lasts for 512 INTOSC1 cycles. This watchdog reset ( $\overline{\text{WDRS}}$ ) produces an  $\overline{\text{XRS}}$ .

After a watchdog reset, the WDRSn bit in RESC is set.

### 3.3.6 NMI Watchdog Reset ( $\overline{\text{NMIWDRS}}$ )

The device has a non-maskable interrupt (NMI) module that detects hardware errors in the system. The NMI module has a watchdog timer that triggers a reset, if the CPU does not respond to an error within a user-specified amount of time. This NMI watchdog reset ( $\overline{\text{NMIWDRS}}$ ) produces an  $\overline{\text{XRS}}$ .

After an NMI watchdog reset, the NMIWDRSn bit in RESC is set.

### 3.3.7 DCSM Safe Code Copy Reset ( $\overline{\text{SCCRESET}}$ )

The device has a dual-zone code security module (DCSM) that blocks read access to certain areas of the Flash memory. To facilitate CRC checks and copying of CLA code, TI provides ROM functions to securely access those memory areas. To prevent security breaches, interrupts must be disabled before calling these functions. If a vector fetch occurs in a safe copy or CRC function, the DCSM triggers a reset. The security reset ( $\overline{\text{SCCRESET}}$ ) is similar to a  $\overline{\text{SYSRS}}$ . However, the security reset also resets the debug logic to deny access to a potential attacker.

After a security reset, the SCCRESETn bit in RESC is set.

### 3.3.8 Hibernate Reset ( $\overline{\text{HIBRESET}}$ )

Hibernate is a chip-level low-power mode that gates power to large portions of the device. Waking up from hibernate involves a special reset ( $\overline{\text{HIBRESET}}$ ). This reset is similar to a POR except that the I/O pins remain isolated and the  $\overline{\text{XRS}}$  pin is not toggled. (An external  $\overline{\text{XRS}}$  toggle during hibernate triggers a  $\overline{\text{HIBRESET}}$ ). I/O isolation is disabled in software as part of a special boot ROM flow. For more information on hibernate, refer to [Section 3.10](#).

After a hibernate reset, the HIBRESETn bit in RESC is set. This bit is then cleared by the boot ROM.

### 3.3.9 Hardware BIST Reset ( $\overline{\text{HWBISTR}}$ )

The Hardware Built-In Self-Test (HWBIST) module tests the functionality of the CPU. At the end of the test, it resets the CPU to return it to a working state. This reset ( $\overline{\text{HWBISTR}}$ ) only affects the CPU itself. The peripherals and system control remain as previously configured. The CPU state is restored in software as part of a special boot ROM flow. For more information on the HWBIST flow, contact your local TI representative.

After a HWBIST reset, the HWBISTRn bit in RESC is set. This bit is then cleared by the boot ROM.

### 3.3.10 Test Reset ( $\overline{\text{TRST}}$ )

The ICEPick debug module and associated JTAG logic has a reset ( $\overline{\text{TRST}}$ ) that is controlled by a dedicated pin. This reset is normally active unless the user connects a debugger to the device. For more information on the debug module, see the TI Processors Wiki page on ICEPick: <http://processors.wiki.ti.com/index.php/ICEPICK>.

The  $\overline{\text{TRST}}$  does not have a normal RESC bit, but the TRSTn\_pin\_status bit indicates the state of the pin.

## 3.4 Peripheral Interrupts

This section explains the peripheral interrupt handling on the device. Non-maskable interrupts are covered in Section 3.5. Software interrupts and emulation interrupts are not covered in this document. For information on those, see the *TMS320C28x CPU and Instruction Set Reference Guide*.

### 3.4.1 Interrupt Concepts

An interrupt is a signal that causes the CPU to pause its current execution and branch to a different piece of code known as an interrupt service routine (ISR). This is a useful mechanism for handling peripheral events, and involves less CPU overhead or program complexity than register polling. However, because interrupts are asynchronous to the program flow, care must be taken to avoid conflicts over resources that are accessed both in interrupts and in the main program code.

Interrupts propagate to the CPU through a series of flag and enable registers. The flag registers store the interrupt until it is processed. The enable registers block the propagation of the interrupt. When an interrupt signal reaches the CPU, the CPU fetches the appropriate ISR address from a list called the vector table.

### 3.4.2 Interrupt Architecture

The C28x CPU has 14 peripheral interrupt lines. Two of them (INT13 and INT14) are connected directly to CPU timers 1 and 2, respectively. The remaining 12 are connected to peripheral interrupt signals through the enhanced Peripheral Interrupt Expansion module (ePIE, or PIE as a shortened version). The PIE multiplexes up to 16 peripheral interrupts into each CPU interrupt line and also expands the vector table to allow each interrupt to have an ISR. This allows the CPU to support a large number of peripherals.

An interrupt path is divided into three stages – the peripheral, the PIE, and the CPU. Each stage has enable and flag registers. This system allows the CPU to handle one interrupt while others are pending, implement and prioritize nested interrupts in software, and disable interrupts during certain critical tasks.

Figure 3-1 shows the interrupt architecture for this device.

Figure 3-1. Device Interrupt Architecture

### 3.4.2.1 Peripheral Stage

Each peripheral has a unique interrupt configuration, which is described in that peripheral's chapter. Some peripherals allow multiple events to trigger the same interrupt signal. For example, a communications peripheral can use the same interrupt to indicate that data has been received or that there has been a transmission error. The cause of the interrupt can be determined by reading the peripheral's status register. Often, the bits in the status register must be cleared manually before another interrupt is generated.

### 3.4.2.2 PIE Stage

The PIE provides individual flag and enable register bits for each of the peripheral interrupt signals, which are sometimes called PIE channels. These channels are grouped according to their associated CPU interrupt. Each PIE group has one 16-bit enable register (PIEIERx), one 16-bit flag register (PIEIFRx), and one bit in the PIE acknowledge register (PIEACK). The PIEACK register bit acts as a common interrupt mask for the entire PIE group.

When the CPU receives an interrupt, it fetches the address of the ISR from the PIE. The PIE returns the vector for the lowest-numbered channel in the group that is both flagged and enabled. This gives lower-numbered interrupts a higher priority when multiple interrupts are pending.

If no interrupt is both flagged and enabled, the PIE returns the vector for channel 1. This condition does not happen unless software changes the state of the PIE while an interrupt is propagating. [Section 3.4.4](#) contains procedures for safely modifying the PIE configuration once interrupts have been enabled.

### 3.4.2.3 CPU Stage

Like the PIE, the CPU provides flag and enable register bits for each of its interrupts. There is one enable register (IER) and one flag register (IFR), both of which are internal CPU registers. There is also a global interrupt mask, which is controlled by the INTM bit in the ST1 register. This mask can be set and cleared using the CPU's SETC instruction. In C code, controlSUITE's DINT and EINT macros can be used for this purpose.

Writes to IER and INTM are atomic operations. In particular, if INTM is cleared, the next instruction in the pipeline runs with interrupts disabled. No software delays are needed.

### 3.4.3 Interrupt Entry Sequence

Figure 3-2 shows how peripheral interrupts propagate to the CPU.

**Figure 3-2. Interrupt Propagation Path**

When a peripheral generates an interrupt (on PIE group x, channel y), the following sequence of events is triggered:

1. The interrupt is latched in PIEIFRx.y.
2. If PIEIERx.y is set, the interrupt propagates.
3. If PIEACK.x is clear, the interrupt propagates and PIEACK.x is set.
4. The interrupt is latched in IFR.x.
5. If IER.x is set, the interrupt propagates.
6. If INTM is clear, the CPU receives the interrupt.
7. Any instructions in the D2 or later stage of the pipeline are run to completion. Instructions in earlier stages are flushed.
8. The CPU saves the context on the stack.
9. IFR.x and IER.x are cleared. INTM is set. EALLOW is cleared.
10. The CPU fetches the ISR vector from the PIE. PIEIFRx.y is cleared.
11. The CPU branches to the ISR.

The interrupt latency is the time between PIEIFRx.y latching the interrupt and the first ISR instruction entering the execution stage of the CPU pipeline. The minimum interrupt latency is 14 SYSCLK cycles. Wait states on the ISR or stack memories add to the latency. External interrupts add a minimum of two SYSCLK cycles for GPIO synchronization plus extra time for input qualification (if used). Loops created using the RPT instruction cannot be interrupted.

### 3.4.4 Configuring and Using Interrupts

At power-up, no interrupts are enabled by default. The PIEIER and IER registers are cleared and INTM is set. The application code is responsible for configuring and enabling all peripheral interrupts.

#### 3.4.4.1 Enabling Interrupts

To enable a peripheral interrupt, perform the following steps:

1. Disable interrupts globally (DINT or SETC INTM).
2. Enable the PIE by setting the ENPIE bit of the PIECTRL register.
3. Write the ISR vector for each interrupt to the appropriate location in the PIE vector table, which can be found in [Table 3-2](#).
4. Set the appropriate PIEIERx bit for each interrupt. The PIE group and channel assignments can be found in [Table 3-2](#).
5. Set the CPU IER bit for any PIE group containing enabled interrupts.
6. Enable the interrupt in the peripheral.
7. Enable interrupts globally (EINT or CLRC INTM).

Step 4 does not apply to the Timer1 and Timer2 interrupts, which connect directly to the CPU.

#### 3.4.4.2 Handling Interrupts

ISRs are similar to normal functions, but must do the following:

1. Save and restore the state of certain CPU registers (if used).
2. Clear the PIEACK bit for the interrupt group.
3. Return using the IRET instruction.

Requirements 1 and 3 are handled automatically by the TMS320C28x C compiler if the function is defined using the `__interrupt` keyword. For information on this keyword, see the Keywords section of the [TMS320C28x Optimizing C/C++ Compiler v6.2.4 User's Guide](#). For information on writing assembly code to handle interrupts, see the Standard Operation for Maskable Interrupts section of the [TMS320C28x CPU and Instruction Set Reference Guide](#).

The PIEACK bit for the interrupt group must be cleared manually in user code. This is normally done at the end of the ISR. If the PIEACK bit is not cleared, the CPU does not receive any further interrupts from that group. This does not apply to the Timer1 and Timer2 interrupts, which do not go through the PIE.

### 3.4.4.3 Disabling Interrupts

To disable all interrupts, set the CPU's global interrupt mask using a DINT or SETC INTM. It is not necessary to add NOPs after setting INTM or modifying IER – the next instruction executes with interrupts disabled.

Individual interrupts can be disabled using the PIEIERx registers, but care must be taken to avoid race conditions. If an interrupt signal is already propagating when the PIEIER write completes, it may reach the CPU and trigger a spurious interrupt condition. To avoid this, use the following procedure:

1. Disable interrupts globally (DINT or SETC INTM).
2. Clear the PIEIER bit for the interrupt.
3. Wait 5 cycles to make sure that any propagating interrupt has reached the CPU IFR register.
4. Clear the CPU IFR bit for the interrupt's PIE group.
5. Clear the PIEACK bit for the interrupt's PIE group.
6. Enable interrupts globally (EINT or CLRC INTM).

Interrupt groups can be disabled using the CPU IER register. This cannot cause a race condition, so no special procedure is needed.

PIEIFR bits must never be cleared in software since the read/modify/write operation may cause incoming interrupts to be lost. The only safe way to clear a PIEIFR bit is to have the CPU take the interrupt. The following procedure can be used to bypass the normal ISR:

1. Disable interrupts globally (DINT or SETC INTM).
2. Modify the PIE vector table to map the PIEIFR bit interrupt vector to an empty ISR. This ISR only contains a return from interrupt instruction (IRET).
3. Disable the interrupt in the peripheral registers.
4. Enable interrupts globally (EINT or CLRC INTM).
5. Wait for the pending interrupt to be serviced by the empty ISR.
6. Disable interrupts globally.
7. Modify the PIE vector table to map the interrupt vector back to the original ISR.
8. Clear the PIEACK bit for the interrupt's PIE group.
9. Enable interrupts globally.

### 3.4.4.4 Nesting Interrupts

By default, interrupts do not nest. It is possible to nest and prioritize interrupts via software control of the IER and PIEIERx registers. Documentation and example code can be found in controlSUITE and on the TI Processors wiki:

[http://processors.wiki.ti.com/index.php/Interrupt\\_Nesting\\_on\\_C28x](http://processors.wiki.ti.com/index.php/Interrupt_Nesting_on_C28x)

### 3.4.5 PIE Channel Mapping

Table 3-2 shows the PIE group and channel assignments for each peripheral interrupt. Each row is a group, and each column is a channel within that group. When multiple interrupts are pending, the lowest-numbered channel is the lowest-numbered group is serviced first. Thus, the interrupts at the top of the table have the highest priority, and the interrupts at the bottom have the lowest priority.

**Note**

Cells marked "-" are Reserved

**Table 3-2. PIE Channel Mapping**

### 3.4.5.1 PIE Interrupt Priority

#### 3.4.5.1.1 Channel Priority

For every PIE group, the low number channels in the group have the highest priority. For instance in PIE group 1, channel 1.1 has priority over channel 1.3. If those two enabled interrupts occurred simultaneously, channel 1.1 is serviced first with channel 1.3 left pending. Once the ISR for channel 1.1 completes and provided there are no other enabled and pending interrupts for PIE group 1, channel 1.3 is serviced. However, for the CPU to service any more interrupts from a PIE group, PIEACK for the group must be cleared. For this specific example, in order for channel 1.3 to be serviced, channel 1.1's ISR has to clear PIEACK for group 1.

The following example describes an alternative scenario: channel 1.1 is currently being serviced by the CPU, channel 1.3 is pending and before channel 1.1's ISR completes, channel 1.2 which is enabled also comes in. Since channel 1.2 has a higher priority than channel 1.3, the CPU services channel 1.2 and channel 1.3 is still remains pending. Using the steps from the Interrupt Entry Sequence ([Section 3.4.3](#)), channel 1.2 interrupt can happen as late as step 10 (The CPU fetches the ISR vector from the PIE. PIEIFRx.y is cleared) and channel 1.2 is still serviced ahead of channel 1.3.

#### 3.4.5.1.2 Group Priority

Generally, the lowest channel in the lowest PIE group has the highest priority. An example of this is channels 1.1 and 2.1. Those two channels have the highest priority in their respective groups. If the interrupts for those two enabled channels happened simultaneously and provided there are no other enabled and pending interrupts, channel 1.1 is serviced first by the CPU with channel 2.1 left pending.

However, there are cases where channel priority supersedes group priority. This special case happens depending on which step the CPU is currently at in the Interrupt Entry Sequence ([Section 3.4.3](#)).

The following describes an example of this special case.

The CPU is about to service channel 2.3 and is currently going through the steps in the Interrupt Entry Sequence ([Section 3.4.3](#)).

1. As the CPU reaches step 10 (The CPU fetches the ISR vector from the PIE. PIEIFRx.y is cleared), two enabled interrupts: channel 1.1 and channel 2.1 come in.
2. Due to channel priority, channel 2.1 is serviced ahead of channel 2.3. However, group priority dictates that channel 1.1 be serviced ahead of channels 2.1 and 2.3.
3. Channel priority supersedes here and channel 2.1 is serviced ahead of 1.1 and 2.3.
4. After channel 2.1 completes, channel 1.1 is serviced followed by channel 2.3.

Group priority is only guaranteed if no interrupts are currently being serviced, that is, the Interrupt Entry Sequence ([Section 3.4.3](#)) is not executing.

### 3.4.6 Vector Tables

Table 3-3 shows the CPU interrupt vector table. The vectors for INT1 – INT12 are not used in this device. The reset vector is fetched from the boot ROM instead of from this table.

Table 3-4 shows the PIE vector table.

**Table 3-3. CPU Interrupt Vectors**

Name	Vector ID	Address	Size (x16)	Description	Core priority	ePIE group Priority
Reset	0	0x0000 0D00	2	Reset is always fetched from location 0x003F_FFC0 in Boot ROM	1 (Highest)	-
INT1	1	0x0000 0D02	2	Not used. See PIE Group 1	5	-

### 3.5 Exceptions and Non-Maskable Interrupts

This section describes system-level error conditions that can trigger a non-maskable interrupt (NMI). The interrupt allows the application to respond to the error.

#### 3.5.1 Configuring and Using NMIs

An incoming NMI sets a status bit in the NMIFLG register and starts the NMI watchdog counter. This counter is clocked by the SYSCLK, and if it reaches the value in the NMIWDRPD register, it triggers an NMI watchdog reset (NMIWDRS). To prevent this, the NMI handler must clear the flag bit using the NMIFLGCLR register. Once all flag bits are clear, the NMIINT bit in the NMIFLG register may also be cleared to allow future NMIs to be taken.

The NMI module is enabled by the boot ROM during the startup process. To respond to NMIs, an NMI handler vector must be written to the PIE vector table.

### 3.5.2 Emulation Considerations

The NMI watchdog counter behaves as follows under debug conditions:

CPU Suspended	When the CPU is suspended, the NMI watchdog counter is suspended.
Run-Free Mode	When the CPU is placed in run-free mode, the NMI watchdog counter resumes operation as normal.
Real-Time Single-Step Mode	When the CPU is in real-time single-step mode, the NMI watchdog counter is suspended. The counter remains suspended even within real-time interrupts.
Real-Time Run-Free Mode	When the CPU is in real-time run-free mode, the NMI watchdog counter operates as normal.

### 3.5.3 NMI Sources

There are several types of hardware errors that can trigger an NMI. Additional information about the error is usually available from the module that detects it.

#### 3.5.3.1 Missing Clock Detection

The missing clock detection logic monitors OSCCLK for failure. If the OSCCLK source stops, the PLL is bypassed, OSCCLK is connected to INTOSC1, and an NMI is fired to the CPU. For more information on missing clock detection, see [Section 3.6.2](#).

#### 3.5.3.2 RAM Uncorrectable ECC Error

A single-bit parity error, double-bit ECC data error, or single-bit ECC address error in a RAM read triggers an NMI. This applies to CPU, CLA, and DMA reads. Single-bit ECC data errors do not trigger an NMI, but can optionally trigger a normal peripheral interrupt. For more information on RAM error detection, see [Section 3.11.1.7](#).

#### 3.5.3.3 Flash Uncorrectable ECC Error

A double-bit ECC data error or single-bit ECC address error in a Flash read triggers an NMI. Single-bit ECC data errors do not trigger an NMI, but can optionally trigger a normal peripheral interrupt. For more information on Flash error detection, see [Section 3.12.10](#).

### 3.5.4 Illegal Instruction Trap (ITRAP)

If the CPU tries to execute an illegal instruction, the CPU generates a special interrupt called an illegal instruction trap (ITRAP). This interrupt is non-maskable and has a vector in the PIE vector table. For more information about ITRAPs, see the Illegal-Instruction Trap in the [TMS320C28x DSP CPU and Instruction Set Reference Guide](#).

---

#### Note

A RAM fetch access violation triggers an ITRAP in addition to the normal peripheral interrupt for RAM access violations. The CPU handles the ITRAP first.

---

## 3.6 Safety Features

This section gives details on features that monitor device operation during run-time to detect any error in operation.

### 3.6.1 Write Protection on Registers

#### 3.6.1.1 LOCK Protection on System Configuration Registers

Several system configuration registers are protected from spurious CPU writes by “LOCK” registers. Once these associated LOCK register bits are set the respective locked registers can no longer be modified by software. See specific register descriptions for details.

#### 3.6.1.2 EALLOW Protection

Several control registers are protected from spurious CPU writes by the EALLOW protection mechanism. The EALLOW bit in status register 1 (ST1) indicates the state of protection as shown in [Table 3-5](#).

**Table 3-5. Access to EALLOW-Protected Registers**

EALLOW Bit	CPU Writes	CPU Reads	JTAG Writes	JTAG Reads
0	Ignored	Allowed	Allowed <sup>(1)</sup>	Allowed
1	Allowed	Allowed	Allowed	Allowed

(1) The EALLOW bit is overridden via the JTAG port, allowing full access of protected registers during debug from the Code Composer Studio™ IDE interface.

At reset, the EALLOW bit is cleared, enabling EALLOW protection. While protected, all writes to protected registers by the CPU are ignored and only CPU reads, JTAG reads, and JTAG writes are allowed. If this bit is set, by executing the EALLOW instruction, the CPU is allowed to write freely to protected registers. After modifying registers, the registers can once again be protected by executing the EDIS instruction to clear the EALLOW bit.

### 3.6.2 Missing Clock Detection Logic

The missing clock detect (MCD) logic detects OSCCLK failure, using INTOSC1 as the reference clock source. This circuit only detects complete loss of OSCCLK and doesn't do any detection of frequency drift on the OSCCLK.

This circuit monitors the OSCLK (primary clock) using the 10 MHz clock provided by the INTOSC1 (secondary clock) as a backup clock. This circuit functions as following.

1. The primary clock (OSCCLK) clock keeps ticking a 7-bit counter (named as MCDPCNT). This counter is asynchronously reset with  $\overline{XRS}$ .
2. The secondary clock (INTOSC1) clock keeps ticking a 13-bit counter (named as MCDSCNT). This counter is asynchronously reset with  $\overline{XRS}$ .
3. Each time MCDPCNT overflows, the MCDSCNT counter is reset. Thus, if OSCCLK is present or is not slower than INTOSC1 by a factor of 64, MCDSCNT never overflows.
4. If OSCCLK stops for some reason or is slower than INTOSC1 by at least a factor of 64, the MCDSCNT overflows and a missing clock condition is detected on OSCCLK.
5. The above check is continuously active, unless the MCD is disabled using MCDPCR register (by making the MCLKOFF bit 1)
6. If the circuit ever detects a missing OSCCLK, the following occurs:
  - The MCLKSTS flag is set.
  - The MCDSCNT counter is frozen to prevent further missing clock detection.
  - The CLOCKFAIL signal goes high, which generates TRIP events to PWM modules and fires NMIs to CPU1.NMIWD .
  - PLL is forcefully bypassed and OSCCLK is switched to INTOSC1 (after the PLLSYSCLK divider). PLLMULT is zeroed out automatically in this case.
  - While the MCLKSTS bit is set, the OSCCLKSRCSEL bits have no effect and OSCCLK is forcefully connected to INTOSC1.
  - PLLRAWCLK going to the system is switched to INTOSC1 automatically.
7. If the MCLKCLR bit is written (W = 1 bit), MCLKSTS bit are cleared and OSCCLK source is decided by the OSCCLKSRCSEL bits. Writing to MCLKCLR also clears the MCDPCNT and MCDSCNT counters to allow the circuit re-evaluate missing clock detection. To lock the PLL after a missing clock detection, switch the clock source to INTOSC1 (using OSCCLKSRCSEL register), do a MCLKCLR, and re-lock the PLL.

8. The MCD is enabled at power up. There is no support for a missing clock detection, if INTOSC2 is failed from the device power-up.

Figure 3-3 shows the missing clock logic functional flow.

Figure 3-3. Missing Clock Detection Logic

**Note**

On a complete clock failure when OSCCLK is dead, it can take a maximum time of 8192 INTOSC1 cycles (that is, 0.8192 ms) before the CLOCKFAIL signal goes high, after which:

- NMI is generated
- OSCCLK is switched to INTOSC1
- PWM trip happens

**3.6.3 PLLSLIP Detection**

The PLL SLIP detection on this device can detect if the PLL reference clock goes too high or too slow while PLL is locked. An interrupt to both the CPUs is triggered as shown in the ePIE table in Section 3.4. Apart from the interrupt to both the CPUs, the PLLSTS.SLIP bit is set for user software to check the error.

The SLIP detection is available on both SYSPLL and AUXPLL.

### 3.6.4 CPU Vector Address Validity Check

The ePIE vector table is duplicated into two parts:

- Main ePIE Vector Table mapped from 0xD00 to 0xEFF in the C28x memory space
- Redundant ePIE Vector Table mapped from 0x1000D00 to 0x1000EFF in the C28x memory space

Following is the behavior of accesses to the ePIE memories:

- Data Writes to Main Vector Table: Writes to both memories
- Data Writes to Redundant Vector Table: Writes only to the Redundant Vector Table
- Vector Fetch: Data from both the vector tables are compared
- Data Read: Can read the Main and Redundant vector table separately

On every vector fetch from the ePIE, a hardware comparison (no cycle penalty is incurred to do the comparison) of both the vector table outputs is performed and if there is a mismatch between the two vector table outputs, the following occurs:

1. If the PIEVERRADDR register (default value 0x3F FFFF) is not initialized, the default error handler at address 0x3FFFBE gets executed. But, when the PIEVERRADDR register is initialized to the address of the user-defined routine, the user-defined routine is executed instead of the default error handler.
2. Hardware also generates EPWM Trip signals that trips the PWM outputs using TRIPIN15.

If there is no mismatch, the correct vector is jammed onto the C28x program control.

### 3.6.5 NMIWDs

CPU1 has a user-programmable NMIWD period register in which users can set a limit on how much time they want to allocate for the device to acknowledge the NMI. If the NMI is not acknowledged, the NMI causes a device reset.

### 3.6.6 ECC and Parity Enabled RAMs, Shared RAMs Protection

The CPU subsystem has different RAM blocks. Few RAM blocks are ECC-enabled and others are parity-enabled. All single-bit errors in ECC RAM are auto-corrected and an error counter is incremented every time a single bit error is detected. If the error counter reaches a predefined user configured limit, an interrupt is generated to the corresponding CPU. A typical threshold setting to avoid triggering on transient errors which are corrected, but identify persistent faults is 10. Refer to [Section 3.11](#) for more details on RAM errors.

All uncorrectable double-bit errors end up triggering an NMI to corresponding CPUs.

### 3.6.7 ECC Enabled Flash Memory

When ECC is programmed and enabled, Flash single-bit errors are corrected automatically by ECC logic before giving data to CPU1, but the errors are not corrected in Flash memory. Flash memory still contains wrong data until another erase/program operation happens to correct the Flash contents. Irrespective of whether the error interrupt is enabled or disabled, single-bit errors are always corrected before giving data to CPU1. When the interrupt is disabled, users can check the single-bit error counter register for any single-bit error occurrences. The error counter stops incrementing once the value is equal to the threshold+1. It is always suggested to set the threshold register to a non-zero value so that the error counter can increment. It is up to the user to decide the threshold value at which to reprogram the Flash with the correct data. A typical threshold setting to avoid triggering on transient errors that are corrected, but identify persistent faults is 10. When ECC is programmed and enabled, Flash uncorrectable errors end up triggering an NMI to CPU1. Please refer to [Section 3.11](#) for more details on Flash error correction and error catching mechanisms.

### 3.6.8 ERRORSTS Pin

The ERRORSTS pin is an ‘always output’ pin and remains low until an error is detected inside the chip. On an error, the ERRORSTS pin goes high until the corresponding internal error status flag for that error source is cleared. [Figure 3-4](#) shows the functionality of the ERRORSTS pin.

The ERRORSTS pin is tri-stated until the chip power rails ramp up to the lower operational limit. As the ERRORSTS pin is an active-high pin, users who care about the state of this pin during power-up must connect an external pull-down on this pin.

Figure 3-4. ERRORSTS Pin Diagram

### 3.7 Clocking

This section explains the clock sources and clock domains on this device, and how to configure them for application use. [Figure 3-5](#) provides an overview of the device clocking system.

---

**Note**

The default/2 divider for ePWMs and EMIFs is not shown in [Figure 3-5](#).

---

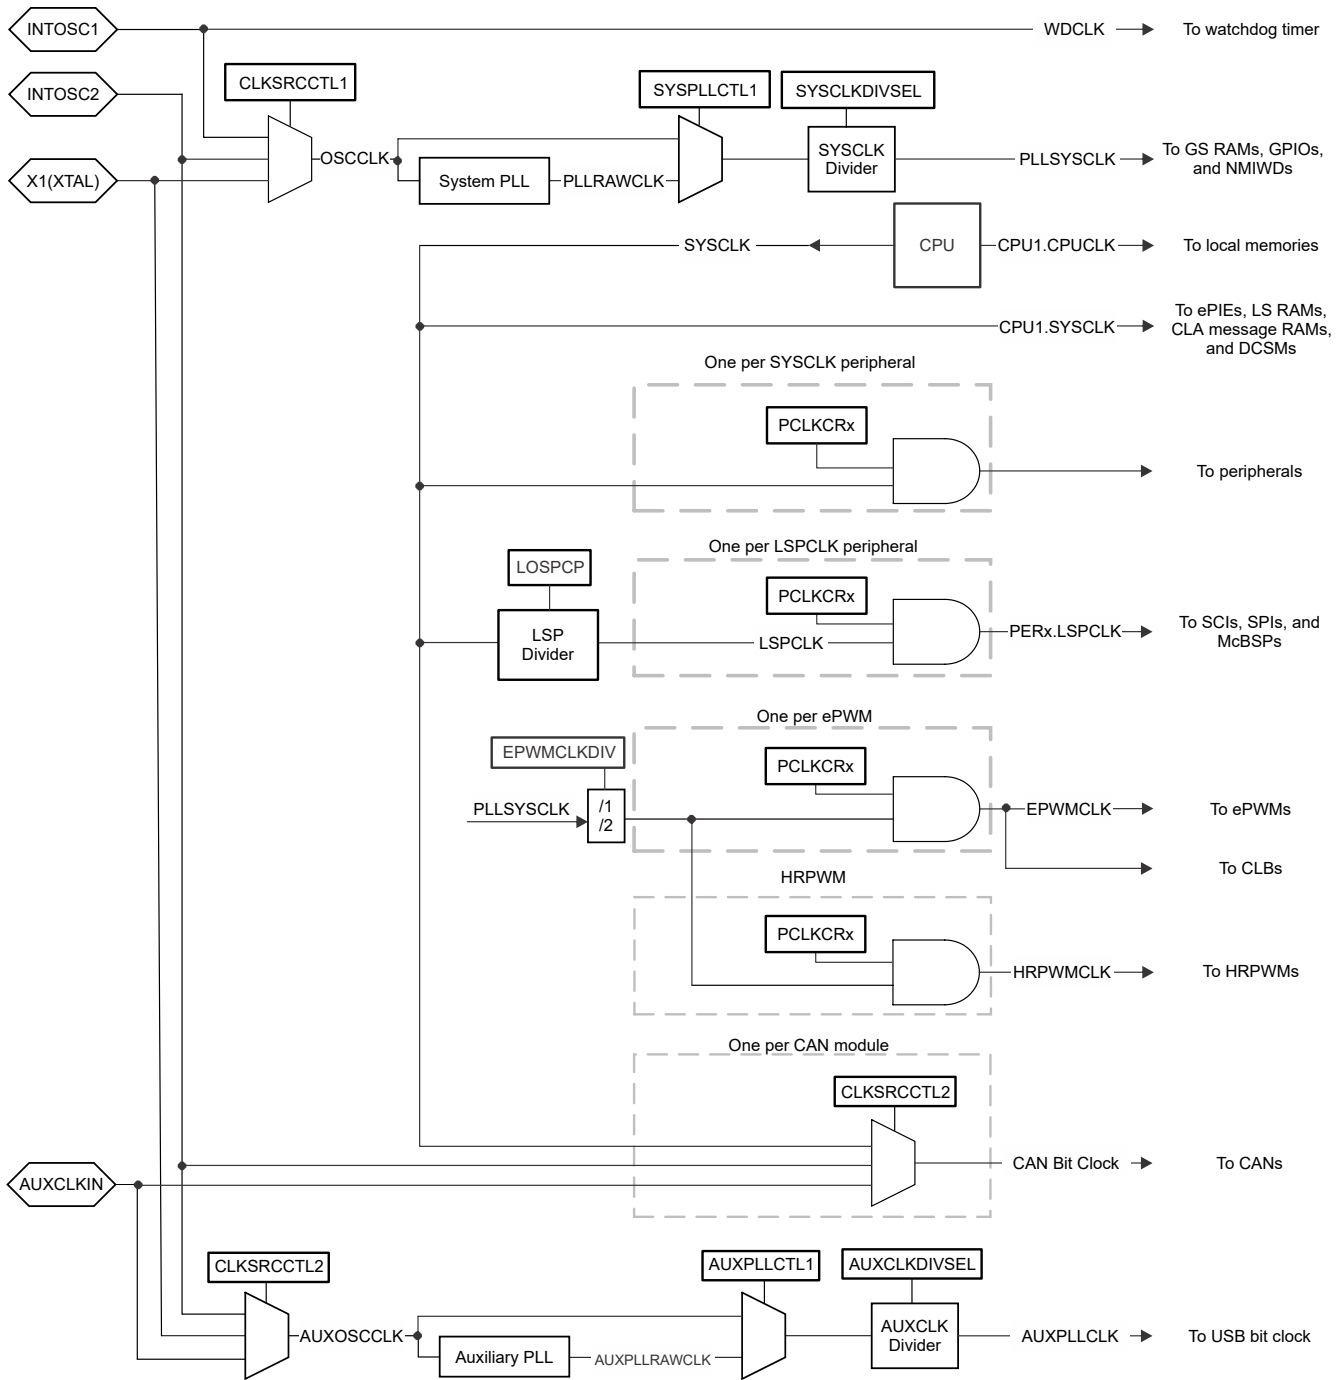

Figure 3-5. Clocking System

### 3.7.1 Clock Sources

All of the clocks in the device are derived from one of four clock sources.

#### 3.7.1.1 Primary Internal Oscillator (INTOSC2)

At power-up, the device is clocked from an on-chip 10 MHz oscillator (INTOSC2). INTOSC2 is the primary internal clock source, and is the default system clock at reset. It is used to run the boot ROM and can be used as the system clock source for the application. Note that INTOSC2's frequency tolerance is too loose to meet the timing requirements for CAN and USB, so an external clock must be used to support those features.

#### 3.7.1.2 Backup Internal Oscillator (INTOSC1)

The device also includes a redundant on-chip 10 MHz oscillator (INTOSC1). INTOSC1 is a backup clock source that normally only clocks the watchdog timers and missing clock detection circuit (MCD). If MCD is enabled and a missing system clock is detected, the system PLL is bypassed and all system clocks are connected to INTOSC1 automatically. INTOSC1 may also be manually selected as the system and auxiliary clock source for debug purposes.

#### 3.7.1.3 External Oscillator (XTAL)

The dedicated X1 and X2 pins support an external clock source (XTAL), which can be used as the main system and auxiliary clock source. Frequency limits and timing requirements can be found in the device data sheet. Three types of external clock sources are supported:

- A single-ended 3.3V external clock. The clock signal must be connected to X1 while X2 is left unconnected, as shown in [Figure 3-6](#).

**Figure 3-6. Single-ended 3.3V External Clock**

- An external crystal. The crystal must be connected across X1 and X2 with the load capacitors connected to VSSOSC as shown in [Figure 3-7](#).

**Figure 3-7. External Crystal**

- An external resonator. The resonator must be connected across X1 and X2 with the ground connected to VSSOSC as shown in [Figure 3-8](#).

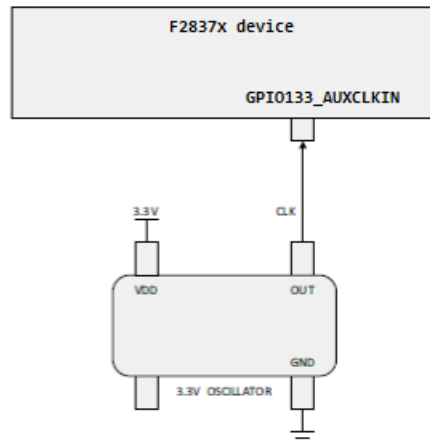

**Figure 3-8. External Resonator**

#### Note

All 3 external clocking modes require the XTALOFF bit in CLKSRCCTL1 register to be set to 0. This enables the path and circuitry required for the clock to propagate to the device.

#### 3.7.1.4 Auxiliary Clock Input (AUXCLKIN)

An additional external clock source is supported on GPIO133 (AUXCLKIN). This must be a single-ended 3.3V external clock and can be used as the source for the USB and CAN bit clocks. Frequency limits and timing requirements can be found in the device data sheet. The external clock must be connected directly to the GPIO133 pin, as shown in [Figure 3-9](#).

**Figure 3-9. AUXCLKIN**

### 3.7.2 Derived Clocks

The clock sources discussed in the previous section can be multiplied (via PLL) and divided down to produce the desired clock frequencies for the application. This process produces a set of derived clocks, which are described in this section.

#### 3.7.2.1 Oscillator Clock (OSCCLK)

One of INTOSC2, XTAL, or INTOSC1 must be chosen to be the master reference clock (OSCCLK) for the CPU and most of the peripherals. OSCCLK may be used directly or fed through the system PLL to reach a higher frequency. At reset, OSCCLK is the default system clock, and is connected to INTOSC2.

### 3.7.2.2 System PLL Output Clock (PLLRAWCLK)

The system PLL allows the device to run at its maximum rated operating frequency, and in most applications generates the main system clock. This PLL uses OSCCLK as a reference, and features a fractional multiplier and slip detection. For configuration instructions, see [Section 3.7.6](#).

### 3.7.2.3 Auxiliary Oscillator Clock (AUXOSCCLK)

One of INTOSC2, XTAL, or AUXCLKIN may be chosen to be the auxiliary reference clock (AUXOSCCLK) for the USB module. (This selection does not affect the CAN bit clock, which uses AUXCLKIN directly). AUXOSCCLK may be used directly or fed through the auxiliary PLL to reach a higher frequency. At reset, AUXOSCCLK is connected to INTOSC2, but only an external oscillator can meet the USB timing requirements.

### 3.7.2.4 Auxiliary PLL Output Clock (AUXPLLRAWCLK)

The auxiliary PLL is used to generate a 60 MHz clock for the USB module. This PLL uses AUXOSCCLK as a reference, and features a fractional multiplier and slip detection. For configuration instructions, see [Section 3.7.6](#).

## 3.7.3 Device Clock Domains

The device clock domains feed the clock inputs of the various modules in the device. They are connected to the derived clocks, either directly or through an additional divider.

### 3.7.3.1 System Clock (PLLSYSCLK)

The system control registers, GS RAMs, GPIO qualification, and NMI watchdog timer have their own clock domain (PLLSYSCLK). Despite the name, PLLSYSCLK may be connected to the system PLL (PLLRAWCLK) or to OSCCLK. The chosen clock source is run through a frequency divider, which is configured via the SYSCLKDIVSEL register. PLLSYSCLK is gated in HALT mode.

### 3.7.3.2 CPU Clock (CPUCLK)

The CPU has a clock (CPUCLK) that is used to clock the CPU, the coprocessors, the private RAMs (M0, M1, D0, and D1), and the boot ROM and Flash wrapper. This clock is identical to PLLSYSCLK, but is gated when the CPU enters IDLE, STANDBY, or HALT mode.

### 3.7.3.3 CPU Subsystem Clock (SYSCLK and PERx.SYSCLK)

The CPU provides a clock (SYSCLK) to the CLA, DMA, and most peripherals. This clock is identical to PLLSYSCLK, but is gated when the CPU enters STANDBY or HALT mode.

Each peripheral clock has its own independent clock gating that is controlled by the PCLKCRx registers. By default, the ePWM, EMIF1, and EMIF2 clocks each have an additional /2 divider, which is required to support CPU frequencies over 100 MHz. At slower CPU frequencies, these dividers can be disabled using the PERCLKDIVSEL register.

### 3.7.3.4 Low-Speed Peripheral Clock (LSPCLK and PERx.LSPCLK)

The SCI, SPI, and McBSP modules can communicate at bit rates that are much slower than the CPU frequency. These modules are connected to a shared clock divider, which generates a low-speed peripheral clock (LSPCLK) derived from SYSCLK. LSPCLK uses a /4 divider by default, but the ratio can be changed via the LOSPCP register. Each SCI, SPI, and McBSP module's clock (PERx.LSPCLK) can be gated independently via the PCLKCRx registers.

### 3.7.3.5 USB Auxiliary Clock (AUXPLLCLK)

The USB module requires a fixed 60-MHz clock for bit sampling. Since the main system clock is usually not a multiple of 60 MHz, the correct frequency cannot be achieved with a simple divider. Instead, the USB clock is provided through an auxiliary clock path (AUXPLLCLK), which can use an independent clock source and PLL to generate the correct frequency.

USB clock tolerances are very tight. As stated in section 7.1.11 of the USB 2.0 specification, low-speed devices (1.50 Mb/s) have a tolerance of  $\pm 1.5\%$ , while high-speed devices (12.000 Mb/s) have a tolerance of  $\pm 0.25\%$ . Typically these tolerances are achieved by using an external crystal or resonator as the source for AUXOSCCLK.

### 3.7.3.6 CAN Bit Clock

The required frequency tolerance for the CAN bit clock depends on the bit timing setup and network configuration, and can be as tight as 0.1%. Since the main system clock (in the form of PERx.SYSCLK) may not be precise enough, the bit clock can also be connected to XTAL or AUXCLKIN via the CLKSRCCTL2 register. There is an independent selection for each CAN module.

### 3.7.3.7 CPU Timer2 Clock (TIMER2CLK)

CPU timers 0 and 1 are connected to PERx.SYSCLK. Timer 2 is connected to PERx.SYSCLK by default, but may also be connected to INTOSC1, INTOSC2, XTAL, or AUXPLLCLK via the TMR2CLKCTL register. This register also provides a separate prescale divider for timer 2. If a source other than SYSCLK is used, the SYSCLK frequency must be at least twice the source frequency to ensure correct sampling.

The main reason to use a non-SYSCLK source would be for internal frequency measurement. In most applications, timer 2 runs off of the SYSCLK.

### 3.7.4 XCLKOUT

It is sometimes necessary to observe a clock directly for debug and testing purposes. The external clock output (XCLKOUT) feature supports this by connecting a clock to an external pin, GPIO73. The available clock sources are PLLSYSCLK, PLLRAWCLK, SYSCLK, AUXPLLRAWCLK, INTOSC1, and INTOSC2.

To use XCLKOUT, first select the clock source via the CLKSRCCTL3 register. Next, select the desired output divider via the XCLKOUTDIVSEL register. Finally, connect GPIO73 to mux channel 3 using the GPIO configuration registers.

### 3.7.5 Clock Connectivity

The following tables provide details on the clock connections of every module present in the device.

**Table 3-6. Clock Connections Sorted by Clock Domain**

Clock Domain	Module Name
CPUCLK	CPU FPU TMU Flash M0 - M1 RAMs D0 - D1 RAMs BootROM
SYSCLK	ePIE LS0 - LS5 RAMs CLA1 Message RAMs DCSM

Watchdog Timer	WDCLK (INTOSC1)

### 3.7.6 Clock Source and PLL Setup

The needs of the application are what ultimately determine the clock configuration. Specific concerns such as application performance, power consumption, total system cost, and EMC are beyond the scope of this document. The concerns must provide answers to the following questions:

1. What is the desired CPU frequency?
2. Is CAN required?
3. Is USB required?
4. What types of external oscillators or clock sources are available?

If CAN or USB is required, an external clock source with a precise frequency must be used as a reference clock. Otherwise, it can be possible to use only INTOSC2 and avoid the need for more external components.

### 3.7.6.1 Choosing PLL Settings

There are two settings to configure for each PLL – a multiplier and a divider. They obey the formulas:

$$f_{\text{PLLSYSCLK}} = f_{\text{OSCCLK}} * (\text{SYSPLLMULT.IMULT} + \text{SYSPLLMULT.FMULT}) / \text{SYSCLKDIVSEL.PLLSYSCLKDIV}$$

$$f_{\text{AUXPLLCLK}} = f_{\text{AUXOSCCLK}} * (\text{AUXPLLMULT.IMULT} + \text{AUXPLLMULT.FMULT}) / \text{AUXCLKDIVSEL.AUXPLLDIV}$$

where  $f_{\text{OSCCLK}}$  is the system oscillator clock frequency,  $f_{\text{AUXOSCCLK}}$  is the auxiliary oscillator clock frequency, IMULT and FMULT are the integral and fractional parts of the multipliers, PLLSYSCLKDIV is the system clock divider, and AUXPLLDIV is the auxiliary clock divider. For the permissible values of the multipliers and dividers, see the documentation for their respective registers.

Many combinations of multiplier and divider can produce the same output frequency. However, the product of the reference clock frequency and the multiplier (known as the VCO frequency) must be in the range specified in the data sheet.

---

#### Note

The system clock frequency (PLLSYSCLK) may not exceed the limit specified in the datasheet. This limit does not allow for oscillator tolerance.

---

### 3.7.6.2 System Clock Setup

Once the application requirements are understood, a specific clock configuration can be determined. The default configuration is for INTOSC2 to be used as the system clock (PLLSYSCLK) with a divider of 1. The following procedure must be used to set up the desired application configuration:

1. Select the reference clock source (OSCCLK) by writing to CLKSRCCTL1.OSCCLKSRCSEL.
2. Set up the system PLL: (see the InitSysPll() function in your devices controlSUITE installation for an example):
  - a. Bypass the PLL by clearing SYSPLLCTL1[PLLCLKEN].
  - b. Set the system clock divider to /1 to make sure of the fastest PLL configuration by clearing SYSCLKDIVSEL[PLLSYSCLKDIV].
  - c. Set the integral and fractional multipliers by simultaneously writing them both to SYSPLLMULT. This automatically enables the PLL. Be sure that the product of OSCCLK and the multiplier is in the range specified in the data sheet.
  - d. Lock the PLL five times (see your device errata for details). This number can be increased depending on application requirements. A higher number of lock attempts helps to make sure of a successful PLL start.
  - e. Set the system clock divider one setting higher than the final desired value. For example `ClkCfgRegs.SYSCLKDIVSEL.bit.PLLSYSCLKDIV = divsel + 1`. This limits the current increase when switching to the PLL.
  - f. Set up the watchdog to reset the device. Note that the SCRS[WDOVERRIDE] bit must not be cleared prior to locking the PLL.
  - g. Set the SYSDBGCTL[BIT\_0] bit. This bit is only reset by a POR reset. If the watchdog has to reset the device due to an issue with switching to the PLL, this bit can be checked in the reset handler to determine the reset was caused by a PLL error.
  - h. Switch to the PLL as the system clock by setting SYSPLLCTL1[PLLCLKEN].
  - i. Clear the SYSDBGCTL[BIT\_0] bit.
  - j. Change the divider to the appropriate value.
  - k. Reconfigure the watchdog as needed for the application.

### 3.7.6.3 USB Auxiliary Clock Setup

See the InitAuxPll() function in your device's controlSUITE installation for an example.

If USB functionality is needed, the auxiliary clock (AUXPLLCLK) must be configured to produce 60 MHz. The procedure is similar to the system clock setup:

1. Select the reference clock source (AUXOSCCLK) by writing to CLKSRCCTL2.AUXOSCCLKSRCSEL.
2. Wait two AUXOSCCLK cycles.
3. Set up the auxiliary PLL. If the PLL is not needed, bypass the PLL and power the PLL down by writing a 0 to AUXPLLCTL1.PLEN. To use the PLL:
  - a. Set the desired auxiliary clock divider by writing to AUXCLKDIVSEL.AUXPLLDIV.
  - b. ) Configure CPU Timer 2 to be clocked from AUXPLL. Keep the counter frozen.
  - c. ) Power down the AUXPLL by clearing AUXPLLCTL1[PLEN].
  - d. Set the integral and fractional multipliers simultaneously. This automatically enables the PLL. Be sure that the product of AUXOSCCLK and the multiplier is in the range specified in the data sheet.
  - e. Wait for the PLL to lock by polling the AUXPLLSTS.LOCKS bit. This takes 16  $\mu$ s plus 1024 AUXOSCCLK cycles.
  - f. Connect the auxiliary PLL output clock (AUXPLLRAWCLK) to AUXPLLCLK by writing a 1 to AUXPLLCTL1.PLLCLKEN.
  - g. Start CPU Timer 2. In a large for() loop, continue polling the TCR[TIF] overflow flag. If the flag is set, the AUXPLL started correctly. If not set, repeat steps (c) through (g). The auxiliary clock configuration can be changed at run time. Changing the AUXOSCCLK source automatically bypasses the PLL and sets the multiplier to zero. Changing the multiplier from one non-zero value to another temporarily bypasses the PLL until the PLL re-locks.

The auxiliary clock configuration can be changed at run time. Changing the AUXOSCCLK source automatically bypasses the PLL and sets the multiplier to zero. Changing the multiplier from one non-zero value to another temporarily bypasses the PLL until the PLL re-locks.

---

#### Note

If the AUXOSCCLK source is changed on the same AUXOSCCLK cycle as the multiplier, the PLL is disabled but the AUXPLLMULT register shows the written value. This can happen when the system PLL is enabled before configuring the auxiliary PLL (CPUCLK >> AUXOSCCLK). To avoid this issue, wait 2 AUXOSCCLK cycles between changing the clock source and writing to AUXPLLMULT.

---

### 3.7.6.4 Clock Configuration Examples

**Example 1:** Using a crystal (15 MHz) as a reference, generates a CPU frequency of 100 MHz and a USB clock of 60 MHz:

```

CLKSRCCTL1.OSCCLKSRCSEL = 0x1
SYSPLLMULT.IMULT = 26 (0x1A)
SYSPLLMULT.FMULT = .50 (0x2)
SYSCLKDIVSEL.PLLSYSCLKDIV = 4 (0x2)
SYSPLLCTL1.PLLCLKEN = 1

PERCLKDIVSEL.EPWMCLKDIV = 1 (0x0)
PERCLKDIVSEL.EMIF1CLKDIV = 1 (0x0)
PERCLKDIVSEL.EMIF2CLKDIV = 1 (0x0)

CLKSRCCTL2.AUXOSCCLKSRCSEL = 0x1
AUXPLLMULT.IMULT = 8 (0x08)
AUXPLLMULT.FMULT = .00 (0x0)
AUXCLKDIVSEL.AUXPLLDIV = 2 (0x1)
AUXPLLCTL1.PLLCLKEN = 1

```

This gives a PLLRAWCLK of 397.5 MHz and an AUXPLLRWCLK of 120 MHz, both of which are in the acceptable range. The CPU frequency is 99.375 MHz. Crystals have tight frequency tolerances, which can keep the system clock from exceeding 100 MHz. The USB frequency is exactly 60 MHz. Since the CPU frequency is less than 100 MHz, the ePWM and EMIF clock dividers can be set to /1.

### 3.7.7 Clock (OSCCLK) Failure Detection

To achieve safety diagnostic, Missing Clock Detection (MCD) can be used. [Table 3-8](#) lists the details.

**Table 3-8. Clock Source (OSCCLK) Failure Detection**

Clock Failure Detection Circuitry	Clocks Detected	Time for Detection (in Cycles)	Limitations
Missing Clock Detection (MCD)	INTOSC2, XTAL/X1	8192 INTOSC1 cycles	Cannot detect INTOSC1 clock failure.

#### 3.7.7.1 Missing Clock Detection Logic

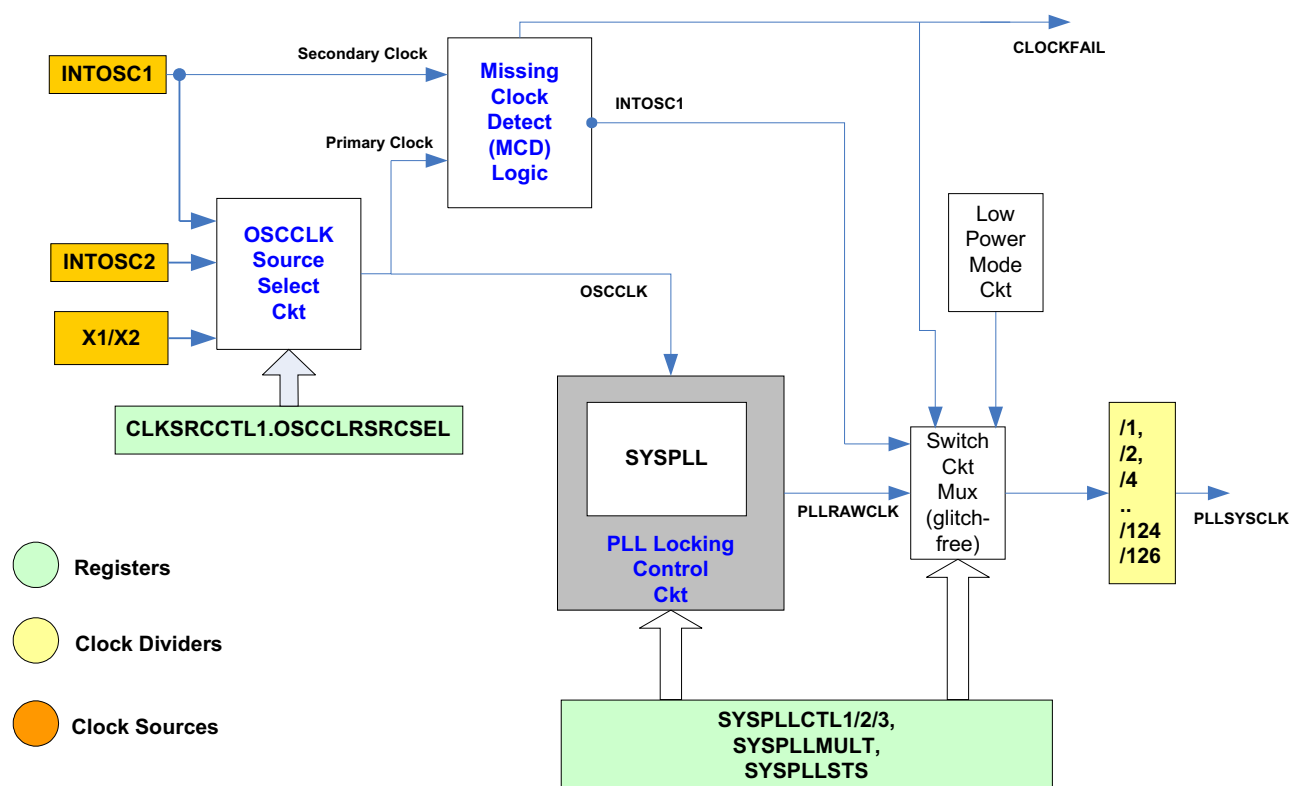

The missing clock detect (MCD) logic detects OSCCLK failure, using INTOSC1 as the reference clock source. This circuit only detects complete loss of OSCCLK and doesn't do any detection of frequency drift on the OSCCLK.

This circuit monitors the OSCLK (primary clock) using the 10 MHz clock provided by the INTOSC1 (secondary clock) as a backup clock. This circuit functions as following.

1. The primary clock (OSCCLK) clock keeps ticking a 7-bit counter (named as MCDPCNT). This counter is asynchronously reset with XRS.
2. The secondary clock (INTOSC1) clock keeps ticking a 13-bit counter (named as MCDSCNT). This counter is asynchronously reset with XRS.
3. Each time MCDPCNT overflows, the MCDSCNT counter is reset. Thus, if OSCCLK is present or is not slower than INTOSC1 by a factor of 64, MCDSCNT never overflows.
4. If OSCCLK stops for some reason or is slower than INTOSC1 by at least a factor of 64, the MCDSCNT overflows and a missing clock condition is detected on OSCCLK.
5. The above check is continuously active, unless the MCD is disabled using MCDCCR register (by making the MCLKOFF bit 1)

6. If the circuit ever detects a missing OSCCLK, the following occurs:
  - The MCLKSTS flag is set.
  - The MCDSCNT counter is frozen to prevent further missing clock detection.
  - The CLOCKFAIL signal goes high, which generates TRIP events to PWM modules and fires NMIs to CPU1.NMIWD .
  - PLL is forcefully bypassed and OSCCLK is switched to INTOSC1 (after the PLLSYSCLK divider). PLLMULT is zeroed out automatically in this case.
  - While the MCLKSTS bit is set, the OSCCLKSRCSEL bits have no effect and OSCCLK is forcefully connected to INTOSC1.
  - PLLRAWCLK going to the system is switched to INTOSC1 automatically.
7. If the MCLKCLR bit is written (W = 1 bit), MCLKSTS bit are cleared and OSCCLK source is decided by the OSCCLKSRCSEL bits. Writing to MCLKCLR also clears the MCDPCNT and MCDSCNT counters to allow the circuit re-evaluate missing clock detection. To lock the PLL after a missing clock detection, switch the clock source to INTOSC1 (using OSCCLKSRCSEL register), do a MCLKCLR, and re-lock the PLL.
8. The MCD is enabled at power up. There is no support for a missing clock detection, if INTOSC2 is failed from the device power-up.

Figure 3-10 shows the missing clock logic functional flow.

**Figure 3-10. Missing Clock Detection Logic**

#### Note

On a complete clock failure when OSCCLK is dead, it can take a maximum time of 8192 INTOSC1 cycles (that is, 0.8192 ms) before the CLOCKFAIL signal goes high, after which:

- NMI is generated
- OSCCLK is switched to INTOSC1
- PWM trip happens

### 3.8 32-Bit CPU Timers 0/1/2

This section describes the three 32-bit CPU-Timers (TIMER0/1/2) shown in Figure 3-11.

CPU-Timer0 and CPU-Timer1 can be used in user applications. CPU-Timer2 is reserved for real-time operating system uses (for example, TI-RTOS). If the application is not using an operating system that utilizes this timer, then CPU-Timer2 can be used in the application. CPU-Timer0 and CPU-Timer1 run off of SYSCLK. CPU-Timer2 normally runs off of SYSCLK, but can also use INTOSC1, INTOSC2, XTAL, and AUXPLLCLK. The CPU-Timer interrupt signals (TINT0, TINT1, TINT2) are connected as shown in Figure 3-12.

**Note**

If a source other than SYSCLK is used for CPU-Timer2, the SYSCLK frequency must be at least twice the source frequency to make sure of correct sampling.

The CPU-Timer2 pre-scaler is implemented as a post-scale of the results

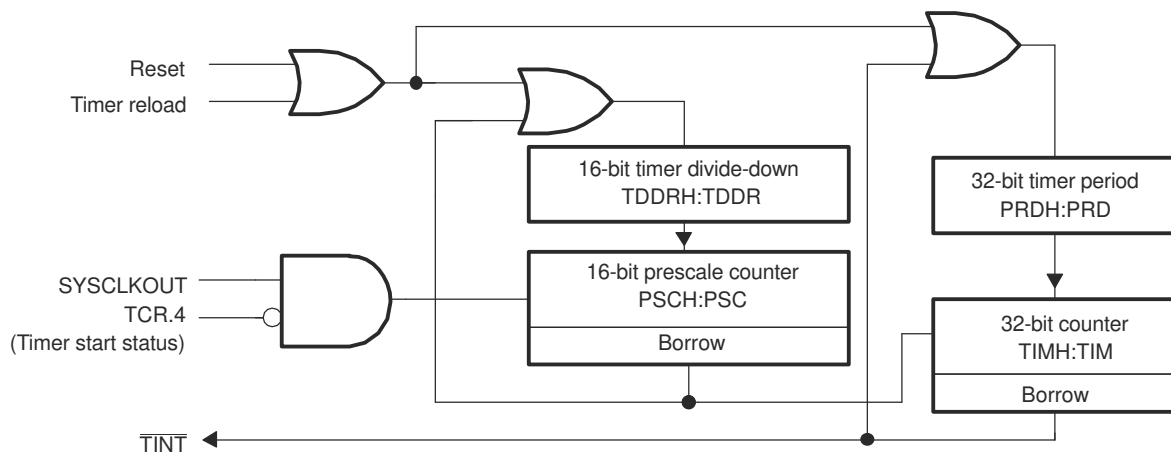

Figure 3-11. CPU-Timers

- A. The timer registers are connected to the memory bus of the C28x processor.
- B. The CPU Timers are synchronized to SYSCLKOUT.

Figure 3-12. CPU-Timer Interrupts Signals and Output Signal

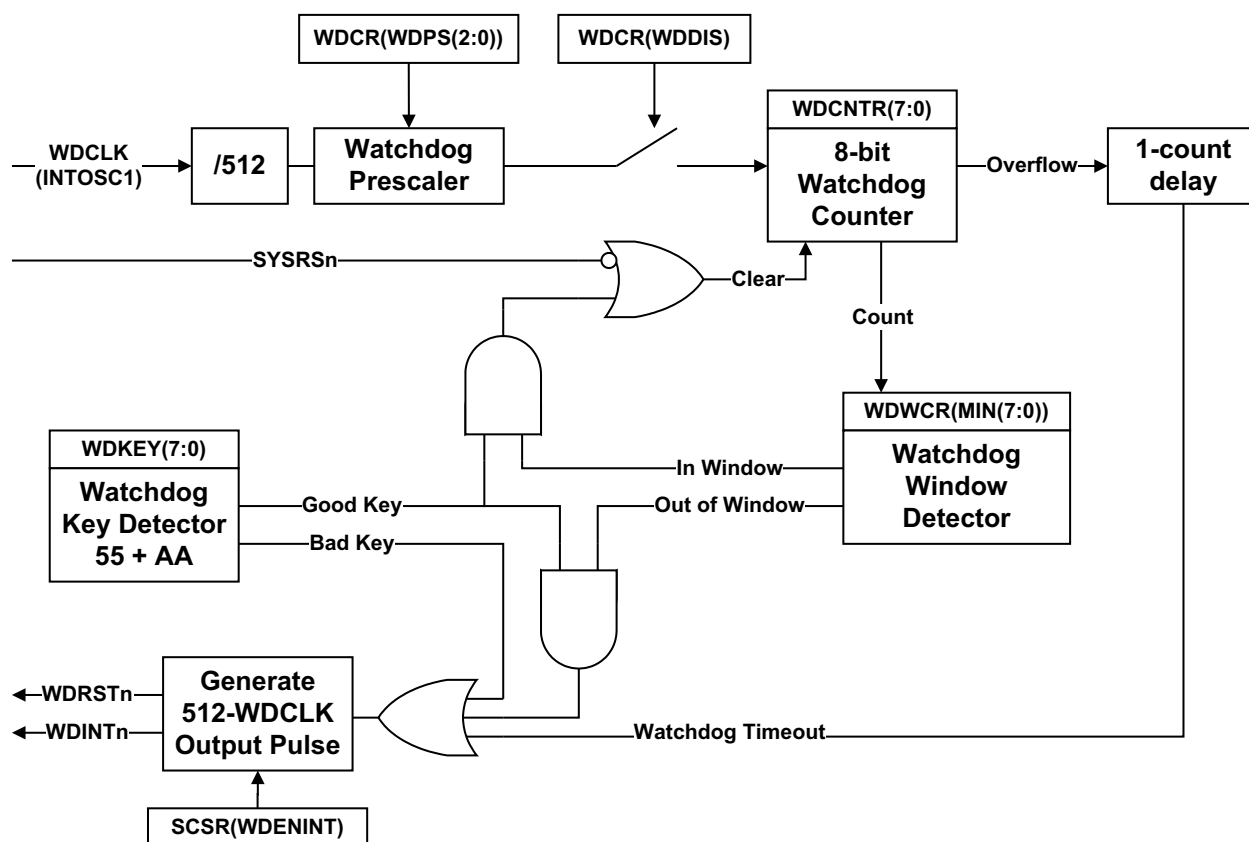

The general operation of the CPU-Timer is as follows:

- The 32-bit counter register, TIMH:TIM, is loaded with the value in the period register PRDH:PRD
- The counter decrements once every  $(TPR[TDDRH:TDDR]+1)$  SYSCLKOUT cycles, where TDDRH:TDDR is the timer divider.
- When the counter reaches 0, a timer interrupt output signal generates an interrupt pulse.

The registers listed in [Section 3.17](#) are used to configure the timers.

### 3.9 Watchdog Timers

The watchdog module generates an output pulse 512 watchdog clocks (WDCLKs) wide whenever the 8-bit watchdog up counter has reached the maximum value. The watchdog clock source is INTOSC1. Software must periodically write a 0x55 + 0xAA sequence into the watchdog key register to reset the watchdog counter. The counter can also be disabled. [Figure 3-13](#) shows the various functional blocks within the watchdog module.

**Figure 3-13. CPU Watchdog Timer Module**

### 3.9.1 Servicing the Watchdog Timer

The watchdog counter (WDCNTR) is reset when the proper sequence is written to the WDKEY register before the 8-bit watchdog counter overflows. The WDCNTR is reset-enabled when a value of 0x55 is written to the WDKEY. When the next value written to the WDKEY register is 0xAA, then the WDCNTR is reset. Any value written to the WDKEY other than 0x55 or 0xAA causes no action. Any sequence of 0x55 and 0xAA values can be written to the WDKEY without causing a system reset; only a write of 0x55 followed by a write of 0xAA to the WDKEY resets the WDCNTR.

**Table 3-9. Example Watchdog Key Sequences**

Step	Value Written to WDKEY	Result
1	0xAA	No action
2	0xAA	No action
3	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
4	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
5	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
6	0xAA	WDCNTR is reset.
7	0xAA	No action
8	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
9	0xAA	WDCNTR is reset.
10	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
11	0x32	Improper value written to WDKEY. No action, WDCNTR no longer enabled to be reset by next 0xAA.
12	0xAA	No action due to previous invalid value.
13	0x55	WDCNTR is enabled to be reset if next value is 0xAA.
14	0xAA	WDCNTR is reset.

Step 3 in [Table 3-9](#) is the first action that enables the WDCNTR to be reset. The WDCNTR is not actually reset until step 6. Step 8 again re-enables the WDCNTR to be reset and step 9 resets the WDCNTR. Step 10 again re-enables the WDCNTR to be reset. Writing the wrong key value to the WDKEY in step 11 causes no action, however the WDCNTR is no longer enabled to be reset and the 0xAA in step 12 now has no effect.

If the watchdog is configured to reset the device, then a WDCR overflow or writing the incorrect value to the WDCR[WDCHK] bits resets the device and set the watchdog flag (WDRSn) in the reset cause register (RESC). After a reset, the program can read the state of this flag to determine whether the reset was caused by the watchdog. After doing this, the program must clear WDRSn to allow subsequent watchdog resets to be detected. Watchdog resets are not prevented when the flag is set.

### 3.9.2 Minimum Window Check

To complement the timeout mechanism, the watchdog also contains an optional "windowing" feature that requires a minimum delay between counter resets. This can help protect against error conditions that bypass large parts of the normal program flow but still include watchdog handling.

To set the window minimum, write the desired minimum watchdog count to the WDWCR register. This value takes effect after the next WDKEY sequence. From then on, any attempt to service the watchdog when WDCNTR is less than WDWCR triggers a watchdog interrupt or reset. When WDCNTR is greater than or equal to WDWCR, the watchdog can be serviced normally.

At reset, the window minimum is zero, which disables the windowing feature.

### 3.9.3 Watchdog Reset or Watchdog Interrupt Mode

The watchdog can be configured in the SCSR register to either reset the device ( $\overline{\text{WDRST}}$ ) or assert an interrupt ( $\overline{\text{WDINT}}$ ) if the watchdog counter reaches the maximum value. The behavior of each condition is described below:

- **Reset mode:**

If the watchdog is configured to reset the device, then the  $\overline{\text{WDRST}}$  signal pulls the device reset ( $\overline{\text{XRS}}$ ) pin low for 512 OSCCLK cycles when the watchdog counter reaches the maximum value.

**Note:** After a watchdog reset, the boot ROM clears all of the system and message RAMs.

- **Interrupt mode:**

When the watchdog counter expires, the watchdog asserts an interrupt by driving the  $\overline{\text{WDINT}}$  signal low for 512 OSCCLK cycles. The falling edge of  $\overline{\text{WDINT}}$  triggers a WAKEINT interrupt in the PIE, if the interrupt is enabled. Because the PIE is edge-triggered, re-enabling the WAKEINT while  $\overline{\text{WDINT}}$  is active does not produce a duplicate interrupt.

To avoid unexpected behavior, software must not change the configuration of the watchdog while  $\overline{\text{WDINT}}$  is active. For example, changing from interrupt mode to reset mode while  $\overline{\text{WDINT}}$  is active, immediately resets the device. Disabling the watchdog while  $\overline{\text{WDINT}}$  is active, causes a duplicate interrupt if the watchdog is later re-enabled. If a debug reset is issued while  $\overline{\text{WDINT}}$  is active, the reset cause register (RESC) shows a watchdog reset. The WDINTS bit in the SCSR register can be read to determine the current state of  $\overline{\text{WDINT}}$ .

### 3.9.4 Watchdog Operation in Low Power Modes

In IDLE mode, the watchdog interrupt ( $\overline{\text{WDINT}}$ ) signal can generate an interrupt to the CPU to take the CPU out of IDLE mode. As with any other peripheral, the watchdog interrupt triggers a WAKEINT interrupt in the PIE during IDLE mode. User software must determine which peripheral caused the interrupt.

In STANDBY mode, all of the clocks to the peripherals are turned off within the CPU subsystem. The only peripheral that remains functional is the watchdog since the watchdog module runs off the oscillator clock (OSCCLK). The  $\overline{\text{WDINT}}$  signal is fed to the Low Power Modes (LPM) block so that it can be used to wake the CPU from STANDBY low power mode. This feature is enabled by setting LPMCR.WDINTE = 1. See [Section 3.10](#) for details.

**Note:** If the watchdog interrupt is used to wake-up from an IDLE or STANDBY low power mode condition, software must make sure that the  $\overline{\text{WDINT}}$  signal goes back high before attempting to reenter the IDLE or STANDBY mode. The  $\overline{\text{WDINT}}$  signal is held low for 512 OSCCLK cycles when the watchdog interrupt is generated. The current state of  $\overline{\text{WDINT}}$  can be determined by reading the watchdog interrupt status bit (WDINTS) bit in the SCSR register. WDINTS follows the state of  $\overline{\text{WDINT}}$  by two SYSCLKOUT cycles.

In HALT mode, the internal oscillators and CPU1 watchdog are kept active if the user sets CLKSRCCTL1.WDHALTI = 1. A watchdog reset can wake the system from HALT mode, but a watchdog interrupt cannot.

### 3.9.5 Emulation Considerations

The watchdog module behaves as follows under various debug conditions:

CPU Suspended:	When the CPU is suspended, the watchdog clock (WDCLK) is suspended
Run-Free Mode:	When the CPU is placed in run-free mode, then the watchdog module resumes operation as normal.
Real-Time Single-Step Mode:	When the CPU is in real-time single-step mode, the watchdog clock (WDCLK) is suspended. The watchdog remains suspended even within real-time interrupts.
Real-Time Run-Free Mode:	When the CPU is in real-time run-free mode, the watchdog operates as normal.

### 3.10 Low-Power Modes

This device has three clock-gating, low-power modes, and a special power-gating mode. All low-power modes are entered by setting the LPMCR register and executing the IDLE instruction. More information about the IDLE instruction can be found in the [TMS320C28x CPU and Instruction Set Reference Guide](#).

Low-power modes must not be entered into while a Flash program or erase is ongoing.

The application can verify the following before entering STANDBY or HALT mode:

1. Check the value of the GPIODAT register of the pin selected for STANDBY or HALT wake-up (GPIOLPMSEL0/1) prior to entering the low-power mode to make sure that the wake event has not already been asserted.
2. The LPMCR.QUALSTDBY register must be set to a value greater than the ratio of INTOSC1/PLLSYSCLK to make sure of proper wake up. This is applicable to STANDBY only.

#### 3.10.1 IDLE

IDLE is a standard feature of the C28x CPU. In this mode, the CPU clock is gated while all peripheral clocks are left running. IDLE can thus be used to conserve power while a CPU is waiting for peripheral events.

Any enabled interrupt wakes up the CPU from IDLE mode.

To enter IDLE mode, set LPMCR.LPM to 0x0 and execute the IDLE instruction.

#### 3.10.2 STANDBY

STANDBY is a more aggressive low-power mode that gates both the CPU clock and any peripheral clocks derived from the CPU's SYSCLK. The watchdog however, is left active. STANDBY is best for an application where the wake-up signal is from an external system rather than a peripheral input.

An NMI (or optionally) a watchdog interrupt or a configured GPIO can wake the CPU from STANDBY mode. Each GPIO from GPIO0-63 can be configured to wake the CPU when the GPIOs are driven active low. Upon wakeup, the CPU receives the WAKEINT interrupt if configured.

##### To enter STANDBY mode:

1. Set LPMCR.LPM to 0x1.
2. Enable the WAKEINT interrupt in the PIE.
3. For watchdog interrupt wakeup, set LPMCR.WDINTE to 1 and configure the watchdog to generate interrupts.
4. For GPIO wakeup, set GPIOLPMSEL0 and GPIOLPMSEL1 to connect the chosen GPIOs to the LPM module, and set LPMCR.QUALSTDBY to select the number of OSCCLK cycles for input qualification.
5. Execute the IDLE instruction to enter STANDBY.

##### To wake up from Standby mode:

1. Configure the desired GPIO to trigger the wakeup.
2. Drive the selected GPIO signal low; the signal must remain low for the number of OSCCLK cycles specified in the QUALSTDBY bits in the LPMCR register. If the signal is sampled high during this period, the count restarts.

At the end of the qualification period, the PLL enables the CLKIN to the CPU and the WAKEINT interrupt is latched in the PIE block. The WAKEINT interrupt can also be triggered by a watchdog interrupt.

The CPU is now out of STANDBY mode and can resume normal execution.

### 3.10.3 HALT

HALT is a global low-power mode that gates almost all system clocks and allows for power-down of oscillators and analog blocks. HALT can be used for additional power savings over putting the CPU in STANDBY, although the options for wakeup are more limited.

Similar to STANDBY, any of GPIO0-63 can be configured to wake up the system from HALT. No other wakeup option is available. However, CPU1's watchdog can still be clocked, and can be configured to produce a watchdog reset if a timeout mechanism is needed. On wakeup, the CPU receives a WAKEINT interrupt.

#### To enter HALT mode:

1. Disable all interrupts with the exception of the WAKEINT interrupt on both CPUs. The other interrupts can be reenabled after the device is brought out of HALT mode.
2. Set LPMCR.LPM to 0x2. Set GPIOLPMSEL0 and GPIOLPMSEL1 to connect the chosen GPIOs to the LPM module.
3. Set CLKSRCCTL1.WDHALTI to 1 to keep the CPU1 watchdog active and INTOSC1 and INTOSC2 powered up in HALT.
4. Set CLKSRCCTL1.WDHALTI to 0 to disable the CPU1 watchdog and power down INTOSC1 and INTOSC2 in HALT.
5. Execute the IDLE instruction on CPU1 to enter HALT.

If an interrupt or NMI is received while the IDLE instruction is in the pipeline, the system begins executing the WAKEINT ISR. After HALT wakeup, ISR execution resumes where the execution left off.

---

#### Note

Before entering HALT mode, if the system PLL is locked (SYSPLL.LOCKS = 1), the system PLL must also be connected to the system clock (PLLCTL1.PLLCLKEN = 1). Otherwise, the device never wakes up.

---

#### To wake up from HALT mode:

1. Drive the selected GPIO low for a minimum 5  $\mu$ s. This activates the CPU1.WAKEINT PIE interrupt.
2. Drive the wake-up GPIO high again to initiate the powering up of the SYSPLL and AUXPLL
3. Wait 16  $\mu$ s plus 1024 OSCCLK cycles to allow the PLLs to lock and the WAKEINT ISR to be latched.
4. Execute the WAKEINT ISR.

The device is now out of HALT mode and can resume normal execution.

**Table 3-10. LPM Entry and Exit Criteria**

<b>LPM Mode</b>	<b>Entry Sequence</b>	<b>Exit Criteria</b>
CPU1 IDLE	<ol style="list-style-type: none"> <li>1. CPU1 configures CPU1.LPMCR.LPM to 00b</li> <li>2. CPU1 Executes IDLE instruction</li> </ol>	<ol style="list-style-type: none"> <li>1. POR/BOR</li> <li>2. IORSn</li> <li>3. Any enabled CPU1 interrupt</li> <li>4. CPU1 NMI</li> </ol>
CPU1 STANDBY	<ol style="list-style-type: none"> <li>1. CPU1 configures CPU1.LPMCR.LPM bits to 01b</li> <li>2. CPU1 programs CPU1.LPMCR.QUAL bits to configure appropriate OSCCLK qualification for GPIO wakeup pin</li> <li>3. ### 3.10.4 Hibernate (HIB)

Hibernate (HIB) is a global low-power mode that gates the supply voltages to most of the system. HIB is essentially a controlled power-down with remote wakeup capability, and can be used to save power during long periods of inactivity. Because gating the supply voltage corrupts the state of the logic, a reset is required to exit HIB. To prevent external systems from being affected by the reset, HIB provides isolation of the I/O pin states as well as low-power data retention via the M0 and M1 memories.

Unlike the clock-gating modes, HIB does not have a true wakeup. Instead, GPIO41 becomes  $\overline{\text{HIBWAKE}}$ , an asynchronous reset signal. When the boot ROM detects a HIB wakeup, the boot ROM avoids clearing M0 and M1 and calls a user-specified I/O restore function. To prevent glitches on internal and external signals,  $\overline{\text{XRS}}$  also generates a  $\overline{\text{HIBWAKE}}$  signal during HIB. The I/O restore function must set up the GPIO control registers to match their pre-HIB state, then write a 1 to LPMCR.IOISODIS to deactivate I/O isolation. If the restore function does not disable isolation, the boot ROM disables isolation.

#### To enter HIB mode:

1. Save any necessary state to the M0 and M1 memories .
2. Put all I/Os in the desired state for isolation and deactivate any analog modules in use.
3. Write the address of the I/O restore function for the CPU to the IORESTOREADDR register.
4. Bypass the PLL by setting PLLCLKEN to 0.
5. Set CPU1's LPMCR.LPM to 0x3 and execute the IDLE instruction.

Any debugger connection is lost on HIB entry since the JTAG logic is powered down.

Due to the loss of system state on HIB entry, it is possible for error information to be lost if an NMI is triggered while the IDLE instruction is in the pipeline. The ERRORSTS pin is set and remains set until I/O isolation is disabled, but there is no way to determine what caused the error.

#### To wake the device from HIB mode:

1. Assert the dedicated  $\overline{\text{GPIOHIBWAKE}}$  pin (GPIO41) low to enable the power-up of the device clock sources.
2. Assert  $\overline{\text{GPIOHIBWAKE}}$  pin high again. This triggers the power-up of the rest of the device.
3. Boot ROM code executes on HIB wake-up. Boot ROM reads CPU1.RESC.HIBRESTn bit to determine this is a wakeup from HIB.
4. Boot ROM calls the I/O context restore routine. This I/O restore function must reconfigure the I/O configuration and do any other necessary application setup.

Since waking up from HIB mode is a type of reset, the device enters the main function. The device is now out of HIB mode and can normal execution.

---

#### Note

The bootROM uses locations 0x02-0x122 on CPU1 M0 RAM . To prevent losing any data during HIB wake-up, avoid saving any critical data to these locations.

The application must bypass the PLL before executing the IDLE instruction to enter HIB. If the PLL is not bypassed when entering HIB, there is a brief current spike on the Vdd supply that can cause the device to reset.

---

### 3.11 Memory Controller Module

#### Note

All RAMs on these devices are SRAMs.

For these devices, the RAMs have different characteristics. Some are:

- dedicated to the CPU (M0, M1, and Dx RAMs),
- shared between the CPU and CLA (LSx RAM),
- shared between the CPU and DMA (GSx RAM), and
- used to send and receive messages between processors (MSGRAM).

All these RAMs are highly configurable to achieve control for write access and fetch access from different masters. All dedicated RAMs are enabled with the ECC feature (both data and address) and shared RAMs, are enabled with the PARITY (both data and address) feature. Some of the dedicated memories are secure memory as well. Refer to [Section 3.13](#) for more details. Each RAM has its own controller that takes care of the access protection/security related checks and ECC/Parity features for that RAM. [Figure 3-14](#) shows the configuration of these RAMs.

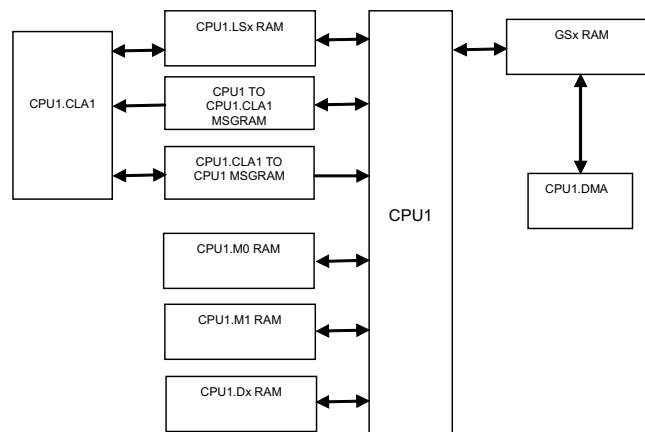

Figure 3-14. Memory Architecture

#### 3.11.1 Functional Description

This section further defines and discusses the dedicated RAMs, shared RAMs, and MSG RAMs on this device.

##### 3.11.1.1 Dedicated RAM (Dx RAM)

This device has four dedicated RAM blocks: M0, M1, D0, and D1. M0/M1 memories are small blocks of memory which are tightly coupled with the CPU. Only the CPU has access to these memories. No other masters (including DMA) have any access to these memories.

All dedicated RAMs have the ECC feature. All dedicated memories (except for M0/M1) are secure memory and also have the access protection (CPU write protection/CPU fetch protection) feature. Each type of access protection for each RAM block can be enabled/disabled by configuring the specific bit in the access protection register (DxACCPROT).

##### 3.11.1.2 Local Shared RAM (LSx RAM)

RAM blocks that are accessible to the CPU and CLA only, are called local shared RAMs (LSx RAMs). All such memories are secure memory and have the parity feature. By default, these memories are dedicated to the CPU only, and the user can choose to share these memories with the CLA by appropriately configuring the MSEL\_LSx bit field in the LSxMSEL register. Further, when these memories are shared between the CPU and CLA, the user can choose to use these memories as CLA program memory by configuring the CLAPGM\_LSx bit

field in the LSxCLAPGM registers. CPU access to all memory blocks, which are programmed as CLA program memory, are blocked.

All these RAMs have the access protection (CPU write/CPU fetch) feature. Each type of access protection for each RAM block can be enabled or disabled by configuring the specific bit in the local shared RAM access protection registers. [Table 3-11](#) shows the LSx RAM features.

**Table 3-11. Local Shared RAM**

MSEL_LSx	CLAPGM_LSx	CPUx Allowed Access	CPUx.CLA1 Allowed Access	Comment
00	X	All	-	LSx memory is configured as CPU dedicated RAM
01	0	All	Data Read Data Write	LSx memory is shared between CPU and CLA1
01	1	Emulation Read Emulation Write	Fetch Only	LSx memory is CLA1 program memory

### 3.11.1.3 Global Shared RAM (GSx RAM)

RAM blocks that are accessible from the CPU and DMA are called global shared RAMs (GSx RAMs).

[Table 3-12](#) shows the features of the GSx RAM.

**Table 3-12. Global Shared RAM**

CPU1	CPU1	CPU1	CPU1.DMA	CPU1.DMA
Fetch	Read	Write	Read	Write
Yes	Yes	Yes	Yes	Yes

Like other shared RAM, these RAMs also have a different levels of access protection which can be enabled or disabled by configuring specific bits in the GSxACCPROT registers.

Master select and access protection configuration for each GSx RAM block can be individually locked by the user to prevent further update to these bit fields. The user can also choose to permanently lock the configuration to individual bit fields by setting the specific bit fields in the GSxCOMMIT register (refer to the register description for more details). Once configuration is committed for a particular GSx RAM block, the configuration cannot be changed further until CPU1. SYSRS is issued.

### 3.11.1.4 Message RAM (CLA MSGRAM)

These RAM blocks are be used to share data between the CPU and CLA. The CLA has read and write access to the "CLA to CPU MSGRAM." The CPU has read and write access to the "CPU to CLA MSGRAM." The CPU and CLA both have read access to both MSGRAMs.

This RAM has parity.

### 3.11.1.5 Access Arbitration

For a shared RAM, multiple accesses can happen at a given time. The maximum number of accesses to any shared RAM at any given time depends on the type of shared RAM. On this device, a combination of a fixed and round robin scheme is followed to arbitrate multiple access at any given time.

The following is the order of fixed priority for CPU accesses:

1. Data Write/Program Write
2. Data Read
3. Program Read/Program Fetch

The following is the order of fixed priority for CLA accesses:

1. Data Write
2. Data Read/Program Fetch

Figure 3-15 represents the arbitration scheme on global shared memories:

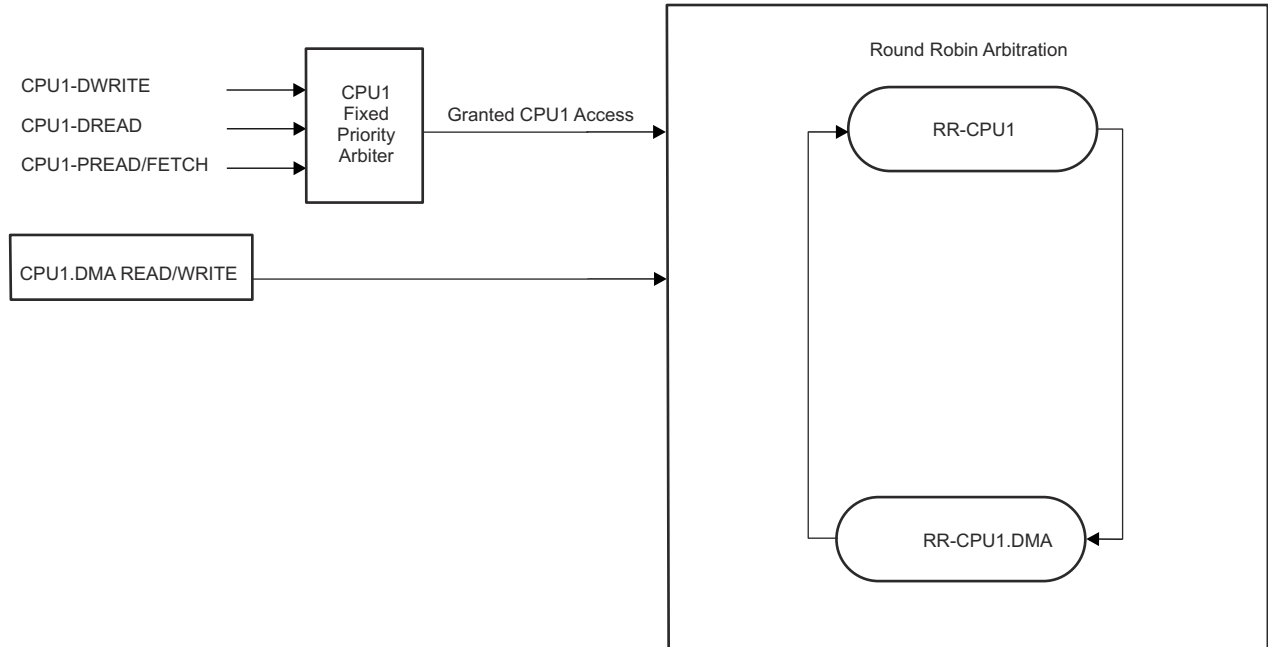

Figure 3-15. Arbitration Scheme on Global Shared Memories

Figure 3-16 represents the arbitration scheme on local shared memories.

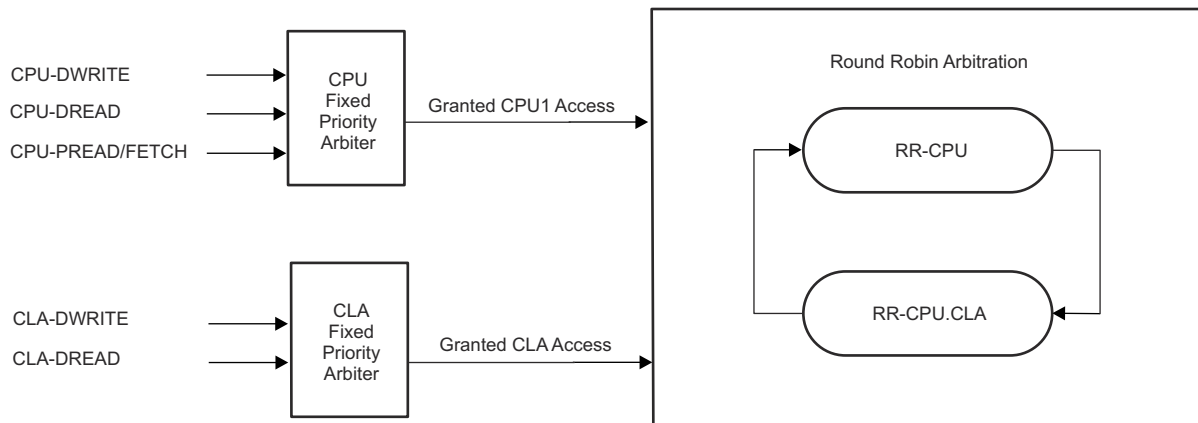

Figure 3-16. Arbitration Scheme on Local Shared Memories

### 3.11.1.6 Access Protection

All RAM blocks except for M0/M1 have different levels of protection. This feature allows the user to enable or disable specific access to individual RAM blocks from individual masters. There is no protection for read accesses, hence reads are always allowed from all the masters which have access to that RAM block.

The following sections describe the different kinds of protection available for RAM blocks on this device.

**Note:** For debug accesses, all the protections are disabled.

#### 3.11.1.6.1 CPU Fetch Protection

Fetch accesses from the CPU can be protected by setting the FETCHPROTx bit of the specific register to '1.' If fetch access is done by the CPU to a memory where CPU fetch protection is enabled, a fetch protection violation occurs.

If a fetch protection violation occurs, it results in an ITRAP for CPU. A flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, get latched into the appropriate CPU fetch access violation address register.

#### 3.11.1.6.2 CPU Write Protection

Write accesses from the CPU can be protected by setting the CPUWRPROTx bit of the specific register to 1. If write access is done by a CPU to memory where the write is protected, a write protection violation occurs.

If a write protection violation occurs, write gets ignored, a flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, gets latched into the appropriate CPU write access violation address register. Also, an access violation interrupt is generated if enabled in the interrupt enable register.

#### 3.11.1.6.3 CPU Read Protection

For local shared RAM, if memory is shared between the CPU and the CLA, the CPU only has access if the memory is configured as data RAM for the CLA. If the memory is programmed as program RAM, all the access from the CPU, including a read, is blocked and the violation is considered as a non-master access violation.

If a read protection violation occurs, a flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, gets latched into the appropriate CPU read access violation address register. Also, an access violation interrupt is generated, if enabled in the interrupt enable register.

#### 3.11.1.6.4 CLA Fetch Protection

If local shared RAM is configured as dedicated RAM for the CPU, or if it is configured as data RAM for the CLA, any fetch access from the CLA to that particular LSx RAM results in a CLA fetch protection violation, which is a non-master access violation.

If a CLA fetch protection violation occurs, it results in a MSTOP, a flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, gets latched into the appropriate CLA fetch access violation address register. Also, an access violation interrupt is generated to the master CPU if enabled in the interrupt enable register.

#### 3.11.1.6.5 CLA Write Protection

If local shared RAM is configured as dedicated RAM for the CPU, or if it is configured as program RAM for the CLA, any data write access from the CLA to that particular LSx RAM results in a CLA write protection violation, which is a non-master access violation.

If a CLA write protection violation occurs, write gets ignored, a flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, gets latched into the appropriate CLA write access violation address register. Also, an access violation interrupt is generated to the master CPU if enabled in the interrupt enable register.

#### 3.11.1.6.6 CLA Read Protection

If local shared RAM is configured as dedicated RAM for the CPU, or if it is configured as program RAM for the CLA, any data read access from the CLA to that particular LSx RAM results in a CLA read protection violation, which is a non-master access violation.

If a CLA read protection violation occurs, a flag gets set into the appropriate access violation flag register, and the memory address for which the access violation occurred, gets latched into the appropriate CLA read access violation address register. Also, an access violation interrupt is generated to the master CPU if enabled in the interrupt enable register.

### 3.11.1.6.7 DMA Write Protection

Write accesses from the DMA can be protected by setting the DMAWRPROTx bit of a specific register to 1. If write access is done by the DMA to protected memory, a write protection violation occurs.

If a write access is made to GSx memory by a non-master DMA, the write access is called a non-master write protection violation. If a write access is made to a dedicated or shared memory by a master DMA, and DMAWRPROTx is set to 1 for that memory, the write access is called a master DMA write protection violation.

A flag gets set in the DMA access violation flag register, and the memory address where the violation happened gets latched in the DMA fetch access violation address register. These are dedicated registers for each subsystem.

- Note 1:** All access protections are ignored during debug accesses. Write access to a protected memory goes through when the write is done using the debugger, irrespective of the write protection configuration for that memory.
- Note 2:** Access protection is not implemented for M0 and M1 memories.
- Note 3:** In the case of local shared RAM, if memory is shared between the CPU and the CLA, the CPU only has access if the memory is configured as data RAM for the CLA. If the memory is programmed as program RAM, all the access from the CPU (including read) and data access from the CLA is blocked, and the violation is considered as a non-master access violation. If the memory is configured as dedicated to the CPU, all access from the CLA is blocked and the violation is considered a non-master access violation.

### 3.11.1.7 Memory Error Detection, Correction and Error Handling

These devices have memory error detection and correction features to satisfy safety standards requirements. These requirements warrant the addition of detection mechanisms for finite dangerous failures.

In this device, all dedicated RAMs support error correction code (ECC) protection and the shared RAMs have parity protection. The ECC scheme used is Single Error Correction Double Error Detection (SECCDED). The parity scheme used is even parity. ECC/Parity covers the data bits stored in memory as well as address.

ECC/Parity calculation is done inside the memory controller module and then calculated. ECC/Parity is written into the memory along with the data. ECC/Parity is computed for 16-bit data; hence, for each 32-bit data, there are three 7-bit ECC codes (or 3-bit parity), two of which are for data and a third one for the address.

#### 3.11.1.7.1 Error Detection and Correction

Error detection is done while reading the data from memory. The error detection is performed for data as well as address. For parity memory, only a single-bit error gets detected, whereas in case of ECC memory, along with a single-bit error, a double-bit error also gets detected. These errors are called correctable error and uncorrectable errors. The following are characteristics of these errors:

- Parity errors are always uncorrectable errors
- Single-bit ECC errors are correctable errors
- Double-bit ECC errors are uncorrectable errors
- Address ECC errors are also uncorrectable errors

Correctable errors get corrected by the memory controller module and then correct data is given back as read data to the master. It is also written back into the memory to prevent double-bit error due to another single-bit error at the same memory address.

---

### Note

ECC/Parity for address is calculated for address offset only (based on RAM block size) of corresponding 32-bit aligned address. For example, in case of LSx RAM that are 4-KB RAM block, only 11 LSBs of 32-bit aligned address are used. So if address is 0x8F8F, address ECC (or Parity) is calculated for address 0x78E (11-bit offset of 32-bit aligned address). Similarly for 8-KB RAM block, 12-bit address offset is used.

---

#### 3.11.1.7.2 Error Handling

For each correctable error, the count in the correctable error count register increments by one. When the value in this count register becomes equal to the value configured into the correctable error threshold register, an interrupt is generated to the respective CPU, that is, if the interrupt is enabled in the correctable interrupt enable register. The user needs to configure the correctable error threshold register based on the system requirements. Also, the address for which the error occurred, gets latched into the master-specific status register and a flag gets set. Each of these registers are dedicated for each CPU subsystem.

If there are uncorrectable errors, an NMI gets generated for the respective CPU. In this case, the address for which the error occurred, also gets latched into the master-specific address status register, and a flag gets set.

[Table 3-13](#) summarizes different error situations that can arise. These need to be handled appropriately in the software, using the status and interrupt indications provided.

**Table 3-13. Error Handling in Different Scenarios**

Access Type	Error Found In	Error Type	Status Indication	Error Notification
Reads	Data read from memory	Uncorrectable Error (Single-bit error for Parity RAMs OR Double bit Error for ECC RAMs)	Yes -CPU1/CPU1.DMA/CPU1.CLA1 CPU/DMA/CLA Read Error Address Register Data returned to CPU1/ CPU1.DMA/CPU1.CLA1 is incorrect	NMI for CPU1 access NMI for CPU1.DMA access NMI to CPU for CPU1.CLA1 access
Reads	Data read from memory	Single-bit error for ECC RAMs	Yes - CPU1/CPU1.DMA CPU/DMA Read Error Address Register Increment single error counter	Interrupt when error counter reaches the user programmable threshold for single errors
Reads	Address	Address error	Yes - CPU1/CPU1.DMA/CPU1.CLA1 CPU/DMA/CLA Read Address Error Register Data returned to CPU1/ CPU1.DMA/CPU1.CLA1 is incorrect	NMI to CPU for CPU1 access NMI to CPU for CPU1.DMA access NMI to CPU for CPU1.CLA1 access

---

### Note

In the case of an uncorrectable error during fetch on the CPU, there is the possibility of getting an ITRAP before an NMI exception, since garbage instructions enter into the CPU pipeline before the NMI gets generated.

During debug accesses, correctable as well as uncorrectable errors are masked.

---

### 3.11.1.8 Application Test Hooks for Error Detection and Correction

Since error detection and correction logic is part of safety critical logic, safety applications need to make sure that the logic is always working fine (during run time also). To enable this, a test mode is provided, in which a user can modify the data bits (without modifying the ECC/Parity bits) or ECC/Parity bits directly. Using this feature, an ECC/Parity error can be injected into data.

---

#### Note

The memory map for ECC/Parity bits and data bits are the same. The user must choose a different test mode to access ECC/Parity bits.

---

Table 3-14 shows the bit mapping for the ECC bits when the bits are read in RAMTEST mode using their respective addresses. Table 3-15 shows the bit mapping for the Parity bits when the bits are read in RAMTEST mode using their respective addresses.

**Table 3-14. Mapping of ECC Bits in Read Data from ECC/Parity Address Map**

Data Bits Location in Read Data	Content (ECC Memory)
6:0	ECC Code for lower 16 bits of data
7	Not Used
14:8	ECC Code for upper 16 bits of data
15	Not Used
22:16	ECC Code for address
31:23	Not Used

**Table 3-15. Mapping of Parity Bits in Read Data from ECC/Parity Address Map**

Data Bits Location in Read Data	Content (Parity Memory)
0	Parity for lower 16 bits of data
7:1	Not Used
8	Parity for upper 16 bits of data
15:9	Not Used
16	Parity for address
31:17	Not Used

### 3.11.1.9 RAM Initialization

To make sure that read/fetch from uninitialized RAM locations do not cause ECC or parity errors, the RAM\_INIT feature is provided for each memory block. Using this feature, any RAM block can be initialized with 0x0 data and respective ECC/Parity bits accordingly. This can be initiated by setting the INIT bit to 1 for the specific RAM block in INIT registers. To check the status of RAM initialization, the software must poll for the INITDONE bit for that RAM block in the INITDONE register to be set. Unless this bit gets set, no access must be made to that RAM memory block.

---

#### Note

None of the masters must access the memory while initialization is taking place. If memory is accessed before RAMINITDONE is set, the memory read/write as well as initialization does not happen correctly.

---

## 3.12 Flash and OTP Memory

Flash is an electrically erasable/programmable nonvolatile memory that can be programmed and erased many times to ease code development. Flash memory can be used primarily as a program memory for the core, and secondarily as static data memory.

This section describes the proper sequence to configure the wait states and operating mode of Flash. This section also includes information on Flash and OTP memory power modes, how to improve Flash performance by enabling the Flash prefetch/cache mode, and the SECEDED safety feature.

### 3.12.1 Features

Features of Flash memory include:

- A Flash bank (refer to the device data sheet for the size of the Flash bank)
- 128 bits (bank width) can be programmed at a time along with ECC
- Flash module controller (FMC)
- Multiple sectors providing the option of leaving some sectors programmed and only erasing specific sectors
- User-programmable OTP memory locations (in USER OTP) for configuring security, OTP boot-mode and boot-mode select pins (if the user is unable to use the factory-default boot-mode select pins)
- Flash pump
- Enhanced performance using the code-prefetch mechanism and data cache in FMC
- Configurable wait states to give the best performance for a given execution speed
- Safety Features
  - SECEDED-single error correction and double error detection is supported in the FMC
  - Address bits are included in ECC
  - Test mode to check the health of ECC logic
- Supports low-power modes for Flash bank and pump for power savings
- Built-in power mode control logic
- Integrated Flash program/erase state machine (FSM) in the FMC
  - Fast erase and program times (refer to the device data sheet for details)
- Code Security Module (CSM) to prevent access to the Flash by unauthorized persons (refer to [Section 3.13](#) for details)

### 3.12.2 Flash Tools

Texas Instruments provides the following tools for Flash:

- Code Composer Studio (CCS) IDE - the development environment with integrated Flash plugin
- F021 Flash API Library - a set of software peripheral functions to erase/program Flash
- UniFlash - standalone tool to erase/program/verify the Flash content through JTAG. No CCS IDE is required.
- CCS On-Chip Flash Plugin and UniFlash tools developed for these devices support AutoEccGeneration (see [TMS320F2837xD Flash API Version 1.54 Reference Guide](#)). But the tools do not support the program of ECC generated by the linker -ecc options.

Users must check and install available updates for CCS On-Chip Flash Plugin and UniFlash tools.

### 3.12.3 Default Flash Configuration

The following are Flash module configuration settings at power-up:

- The Flash bank is in sleep power mode
- Pump is in sleep mode
- ECC is enabled
- Wait-states are set to the maximum (0xF)
- Code-prefetch mechanism and data cache are disabled in the FMC

During the boot process, the boot ROM performs a dummy read of the Code Security Module (CSM) password locations in the OTP memory. This read is performed to unlock a new (or erased) device that has no password stored in the device, so that Flash programming or loading of code into CSM-protected SARAM can be performed. On devices with a password, this read has no effect and the device remains locked. One effect of this read is that the Flash transitions from the sleep (reset) state to the active state.

User application software must initialize wait-states using the FRDCNTL register, and configure cache/prefetch features using the RD\_INTF\_CTRL register, to achieve optimum system performance. Software that configures Flash settings like wait-states, cache/prefetch features, and so on, must be executed only from RAM memory, **not** from Flash memory.

---

#### Note

Before initializing wait-states, turn off the pre-fetch and data caching in the FRD\_INTF\_CTRL register.

---

### 3.12.4 Flash Bank, One-Time Programmable (OTP) Memory, and Flash Pump

There is one Flash bank. Also, there is a one-time programmable (OTP) memory called USER OTP, which the user can program only once and cannot erase. Flash and OTP memory are uniformly mapped in both program and data memory space.

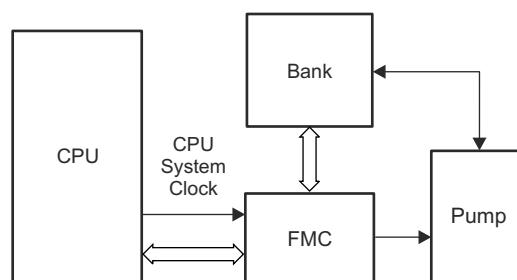

There is also a TI-OTP that contains manufacturing information like settings used by the Flash state machine for erase and program operations, and so on. Users can read TI-OTP but the TI-OTP cannot be programmed or erased. For memory-map and size information of the bank, TI-OTP, USER OTP, and corresponding ECC locations, refer to the device data sheet.

The Bank and OTP share a common Flash pump.

[Figure 3-21](#) depicts the user-programmable OTP memory locations in USER-OTP. For more information on the functionality of these fields, refer to [Section 3.13](#) and [Chapter 4](#).

### 3.12.5 Flash Module Controller (FMC)

The CPU interfaces with the FMC, which in turn interfaces with the Bank and the shared pump to perform erase or program operations as well as to read data and execute code from the bank.

**Figure 3-17. FMC Interface with Core, Bank, and Pump**

Control signals to the Flash pump are controlled by the FMC.

There is a state machine in the FMC that generates the erase and program sequences in hardware. This simplifies the Flash API software that configures control registers in the FMC to perform Flash erase and program operations (see [TMS320F2837xD Flash API Version 1.54 Reference Guide](#), for details on Flash API).

### 3.12.6 Flash and OTP Memory Power-Down Modes and Wakeup

The Flash bank and pump consume a significant amount of power when active. The Flash module provides a mechanism to power-down the Flash bank and pump. Special timers automatically sequence the power-up of the Bank. The charge pump module has an independent power-up timer as well.

The Flash bank and OTP memory operate in three power modes: Sleep (lowest power), Standby, and Active (highest power)

- **Sleep State:** This is the state after a device reset. In this state, a CPU data read or opcode fetch automatically initiates a change in power mode to the standby state and then to the active state. During this transition time to the active state, the CPU is automatically stalled.
- **Standby State:** This state uses more power than the sleep state, but takes a shorter time to transition to the active or read state. In this state, a CPU data read or opcode fetch automatically initiates a change in power mode to the active state. During this transition time to the active state, the CPU is automatically stalled. Once the Flash/OTP memory has reached the active state, the CPU access completes as normal.
- **Active or Read State:** In this state, the bank and pump are in active power mode state (highest power).

The charge pump operates in two power modes:

- Sleep (lowest power)
- Active (highest power)

Any access to Flash bank/OTP memory causes the charge pump to go into active mode, if the charge pump is in sleep mode. An erase or program command causes the charge pump and bank to become active. If the bank is in active or in standby mode, the charge pump is in active mode, independent of the pump power mode control configuration (PMPPWR bit-field in the FPAC1 register). The application software can also check the current power mode of the Flash bank and charge pump by reading the FBPRDY register. See the register descriptions, [Section 3.17](#), for detailed information.

While the pump is in sleep state, a charge pump sleep down counter holds a user configurable value (PSLEEP bit field in the FPAC1 register) and when the charge pump exits sleep power mode, the down counter delays from 0 to PSLEEP prescaled SYSCLK clock cycles (prescaled clock is SYSCLK/2) before putting the charge pump into active power mode. Note that the configured PSLEEP value must yield at least a delay of 20  $\mu$ s for the pump to go to active mode. Refer to the register descriptions, [Section 3.17](#), for detailed information.

Before configuring Flash bank and pump power modes to sleep, make sure that the VREADST (refer to the FBAC register) value is 0xF (which is the reset value) to make sure the requisite delay is needed for the Flash pump/bank to come out of low-power mode later.

Following are the number of cycles for the Bank and pump to wake up from low-power modes:

- Pump sleep to active = PSLEEP \* (SYSCLK/2) cycles
- Bank sleep to standby = 425 Flash clock cycles
- Bank standby to active = 90 Flash clock cycles

Where in Flash clock = SYSCLK/(RWAIT+1)

### 3.12.7 Flash and OTP Memory Performance

Once the Flash bank and pump are in the active power state, a read or fetch access can be classified as a Flash access (access to an address location in Flash) or an OTP memory access (access to an address location in OTP memory). Once the CPU throws an access to a Flash memory address, data is returned after  $RWAIT+1$  number of SYSCLK cycles. For a USER-OTP access, data is returned after 11 SYSCLK cycles.

RWAIT defines the number of random access wait-states and is configurable using the RWAIT bit-field in the FRDCNTL register. At reset, the RWAIT bit-field defaults to a worst-case wait-state count (15), and therefore needs to be initialized for the appropriate number of wait states to improve performance, based on the CPU clock rate and the access time of the Flash. The Flash supports 0-wait accesses when the RWAIT bits are set to zero. This assumes that the CPU speed is low enough to accommodate the access time.

For a given system clock frequency, RWAIT has to be configured using the formula:

$$RWAIT = \text{ceiling}[(SYSCLK/FCLK)-1]$$

where SYSCLK is the system operating frequency

FCLK is Flash clock frequency. FCLK must be  $\leq FCLK_{\text{max}}$ , allowed maximum Flash clock frequency at  $RWAIT=0$ .

If RWAIT results in a fractional value when calculated using the above formula, RWAIT has to be rounded up to the nearest integer.

### 3.12.8 Flash Read Interface

This section provides details about the data read modes to access Flash bank/OTP memory and the configuration registers which control the read interface. In addition to a standard read mode, the FMC has a built-in prefetch and cache mechanism to allow increased clock speeds and CPU throughput wherever applicable.

#### 3.12.8.1 FMC Flash Read Interface

##### 3.12.8.1.1 Standard Read Mode

Standard read mode is defined as the read mode in effect when code prefetch-mechanism and data cache are disabled. Standard read mode is also the default read mode after reset. During this mode, each read access to Flash is decoded by the Flash wrapper to fetch the data from the addressed location and the data is returned after the  $RWAIT+1$  number of cycles.

Prefetch buffers associated with prefetch mechanism and data cache are bypassed in standard read mode; therefore, every access to the Flash/OTP memory is used by the CPU immediately, and every access creates a unique Flash bank access.

Standard read mode is the recommended mode for lower system-frequency operation in which RWAIT can be set to zero to provide single-cycle access operation. The FMC can operate at higher frequencies using standard read mode at the expense of adding wait states. At higher system frequencies, it is recommended to enable cache and prefetch mechanisms to improve performance. Refer to the device specific data sheet to determine the maximum Flash frequency allowed in standard read mode (that is, maximum Flash clock frequency with  $RWAIT=0$ ,  $FCLK_{\text{MAX}}$ ).

##### 3.12.8.1.2 Prefetch Mode

Flash memory is typically used to store application code. During code execution, instructions are fetched from sequential memory addresses, except when a discontinuity occurs. Usually the portion of the code that resides in sequential addresses makes up the majority of the application code and is referred to as linear code. To improve the performance of linear code execution, a Flash prefetch-mechanism has been implemented in the FMC. [Figure 3-18](#) illustrates how this mode functions.

**Figure 3-18. Flash Prefetch Mode**

This prefetch mechanism does a look-ahead prefetch on linear address increments starting from the address of the last instruction fetch. The Flash prefetch mechanism is disabled by default. Setting the PREFETCH\_EN bit in the FRD\_INTF\_CTRL register enables this prefetch mode.

An instruction fetch from the Flash or OTP memory reads out 128 bits per access. The starting address of the access from Flash is automatically aligned to a 128-bit boundary, such that the instruction location is within the 128 bits to be fetched. With the Flash prefetch mode enabled, the 128 bits read from the instruction fetch are stored in a 128-bit wide by 2-level deep instruction prefetch buffer. The contents of this prefetch buffer are then sent to the CPU for processing as required.

Up to four 32-bit or eight 16-bit instructions can reside within a single 128-bit access. The majority of C28x instructions are 16 bits, so for every 128-bit instruction fetch from the Flash bank, it is likely that there are up to eight instructions in the prefetch buffer ready to process through the CPU. During the time it takes to process these instructions, the Flash prefetch mechanism automatically initiates another access to the Flash bank to prefetch the next 128 bits. In this manner, the Flash prefetch mechanism works in the background to keep the instruction prefetch buffers as full as possible. Using this technique, the overall efficiency of sequential code execution from Flash or OTP memory is improved significantly.

**Note**

If the prefetch mechanism is enabled, then the last two rows (16 16-bit words, 256 bits) of the bank that does not have a valid address beyond the boundary must not be used, because the prefetch logic that does a look-ahead prefetch tries to fetch from outside the bank and can result in an ECC error.

The Flash prefetch is aborted only on a PC discontinuity caused by executing an instruction such as a branch, BANZ, call, or loop. When this occurs, the prefetch mechanism is aborted and the contents of the prefetch buffer are flushed. There are two possible scenarios when this occurs:

1. If the destination address is within the Flash or OTP memory, the prefetch aborts and then resumes at the destination address.

2. If the destination address is outside of the Flash and OTP memory, the prefetch is aborted and begins again only when a branch is made back into the Flash or OTP memory. The Flash prefetch mechanism only applies to instruction fetches from program space. Data reads from data memory and from program memory do not utilize the prefetch buffer capability and thus bypass the prefetch buffer. For example, instructions such as MAC, DMAC, and PREAD read a data value from program memory. When this read happens, the prefetch buffer is bypassed but the buffer is not flushed. If an instruction prefetch is already in progress when a data read operation is initiated, then the data read is stalled until the prefetch completes.

Note that the prefetch mechanism gets bypassed when RWAIT is configured as zero.

#### 3.12.8.1.2.1 Data Cache

Along with the prefetch mechanism, a data cache of 128-bits wide is also implemented to improve data-space read performance. This data cache is not filled by the prefetch mechanism. When any kind of data-space read is made by the CPU from an address in the bank, and if the data corresponding to the requested address is not in the data cache, then 128 bits of data is read from the bank and loaded in the data cache. This data is eventually sent to the CPU for processing. The starting address of the access from Flash is automatically aligned to a 128-bit boundary such that the requested address location is within the 128 bits to be read from the bank. By default, this data cache is disabled and can be enabled by setting DATA\_CACHE\_EN bit in the FRD\_INTF\_CTRL register. Note that the data cache gets bypassed when RWAIT is configured as zero.

Some other points to keep in mind when working with Flash/ OTP memory:

- Reads of the USER OTP locations are hardwired for 10 wait states. The RWAIT bits have no effect on these locations.
- CPU writes to the Flash or OTP memory-map areas are ignored. The writes complete in a single cycle.
- If a security zone is in the locked state and the respective password lock bits are not all 1s, then,
  - Data reads to Zx-CSMPSWD return 0
  - Program space reads to Zx-CSMPSWD return 0
  - Program fetches to Zx-CSMPSWD return 0
- When the Code Security Module (CSM) is secured, reads to the Flash/OTP memory-map area from outside the secure zone take the same number of cycles as a normal access. However, the read operation returns a zero.
- The arbitration scheme in FMC prioritizes CPU accesses in the fixed priority order of data read (highest priority), program space read and program fetches/program prefetches (lowest priority).
- When FSM interface is active for erase/program operations, data in the prefetch buffers and data cache in FMC are flushed.
- When data cache is enabled, the debugger memory window open to Flash/OTP memory space invokes data caching. Hence, the debugger memory window must not be left open for Flash/OTP memory space when benchmarking the code for performance.

---

#### Note

Flash contents are verified for ECC correctness before the contents enter the prefetch buffer or data cache and not inside the prefetch buffer or data cache itself.

---

### 3.12.9 Erase/Program Flash

Flash memory can be programmed either by using the CCS Flash plugin or by using UniFlash. If these methods are not feasible in an application, the API can be used. The Flash memory must be programmed, erased, and verified only by using the F021 Flash API library. These functions are written, compiled and validated by Texas Instruments. The Flash module contains a Flash state machine (FSM) to perform program and erase operations. This section only provides a high level description for these operations, therefore, refer to the [TMS320F2837xD Flash API Version 1.54 Reference Guide](#) for more information. Note that Flash API execution is interruptible. However, there must not be any read/fetch access from the Flash bank on which an erase/program operation is in progress. Flash API must be executed from RAM.

A typical flow to program Flash is:

Erase → Program → Verify

Always refer to the device-specific support folder in the controlSUITE™ software for the latest Flash API library.

### 3.12.9.1 Erase

When the target Flash is erased, Flash reads as all 1s. This state is called 'blank.' The erase function must be executed before programming. The user must not skip erase on sectors that read as 'blank', because these sectors can require additional erasing due to marginally erased bits columns. The FSM provides an "Erase Sector" command to erase the target sector. The erase function erases the data and the ECC together. This command is implemented by the following Flash API function:

```
Fapi_issueAsyncCommandWithAddress();
```

The Flash API provides the following function to determine if the Flash bank is 'blank':

```
Fapi_doBlankCheck();
```

### 3.12.9.2 Program

The FSM provides a command to program the USER OTP and Flash. This command is also used to program ECC check bits.

This command is implemented by the following Flash API function:

```
Fapi_issueProgrammingCommand();
```

The Program function provides the options to program data without ECC, data along with user-provided ECC data, data along with ECC calculated by API software using ECC logic in the device, and to program ECC only.

### 3.12.9.3 Verify

After programming, the user must perform verify using API function `Fapi_doVerify()`. This function verifies the Flash contents against supplied data.

Application software typically perform a CRC check of the Flash memory contents during power-up and at regular intervals during runtime (as needed). Apart from this, ECC logic, when enabled (enabled by default), catches single-bit errors, double-bit errors, and address errors whenever the CPU reads/fetches from a Flash address.

### 3.12.10 Error Correction Code (ECC) Protection

FMC contains an embedded single error correction and double error detection (SECEDED) module. SECEDED, when enabled, provides the capability to screen out memory faults. SECEDED can detect and correct single-bit data errors and detect address errors/double-bit data errors. For every 64 bits of Flash/OTP memory data (aligned on a 64-bit memory boundary) that is programmed, eight ECC check bits have to be calculated and programmed in ECC memory space. Refer to the device data sheet for the Flash/OTP memory ECC memory-map. SECEDED works with a total of eight error correction code (ECC) check bits associated with each 64-bit wide data word and the corresponding 128-bit memory-aligned address. Users must program ECC check bits along with Flash data. TI recommends using the `AutoEccGeneration` option available in Plugin/API to program ECC. Users can use the F021 Flash API to calculate and program ECC data along with Flash data. Flash API uses hardware ECC logic in the device to generate the ECC data for the given Flash data. The Flash Plugin, the Flash programming tool integrated with Code Composer Studio IDE, uses Flash API to generate and program ECC data).

Figure 3-19 illustrates the ECC logic inputs and outputs.

**Figure 3-19. ECC Logic Inputs and Outputs**

During an instruction fetch or a data read operation, the 19 most-significant address bits (3 least-significant bits of address are not considered), together with the 64-bit data/8-bit ECC read-out of Flash banks/ECC memory-map area, pass through the SECDDED logic and the eight checkbits are produced in FMC. These eight calculated ECC check bits are then XORed with the stored check bits (user programmed check bits) associated with the address and the read data. The 8-bit output is decoded inside the SECDDED module to determine one of three conditions:

- No error occurred
- A correctable error (single bit data error) occurred
- A non-correctable error (double bit data error or address error) occurred

If the SECDDED logic finds a single-bit error in the address field, then the error is considered to be a non-correctable error.

#### Note

TI recommends programming ECC while programming Flash to avoid any error. Since ECC is calculated for an entire 64-bit data, a non 64-bit read such as a byte read or a half-word read still forces the entire 64-bit data to be read and calculated, but only the byte or half-word is actually used by the CPU.

This ECC (SECDDED) feature is enabled at reset. The ECC\_ENABLE register can be used to configure( enable/disable) the ECC feature. The ECC for the application code must be programmed. There are two SECDDED modules in the FMC. Out of the 128-bit data (aligned on a 128-bit memory boundary) read from the bank/OTP memory address, the lower 64-bits of data and corresponding 8 ECC bits (read from user programmable ECC memory area) are fed as inputs to one SECDDED module along with 128-bit aligned 19-bit address from where data has been read. The upper 64- bits of data and corresponding 8 ECC bits are fed as inputs to another SECDDED module in parallel, along with 128-bit aligned 19-bit address. Each of the SECDDED modules evaluate their inputs and determine if there is any single-bit data error or double-bit data error/address error.

ECC logic is bypassed when the 64 data bits and the associated ECC bits fetched from the bank are either all ones or zeros.

### 3.12.10.1 Single-Bit Data Error

This section provides information for both single-bit data errors and single-bit ECC check bit errors. If there is a single bit flip (0 to 1 or 1 to 0) in Flash data or in ECC data, then it is considered as a single-bit data error. The SECEDED module detects and corrects single-bit errors, if any, in the 64-bit Flash data or eight ECC check bits read from the Flash/ECC memory map before the read data is provided to the CPU.

When SECEDED finds and corrects single bit data errors, the following information is logged in the ECC registers if the ECC feature is enabled:

- Address where the error occurred – if the single-bit error occurs in the lower 64-bits of a 128-bit memory-aligned data, the lower 64-bit memory-aligned address is captured in the SINGLE\_ERR\_ADDR\_LOW register. If the single-bit error occurs in the upper 64-bits of a 128-bit memory-aligned data, the upper 64-bit memory-aligned address is captured in the SINGLE\_ERR\_ADDR\_HIGH register.
- Whether the error occurred in data bits or ECC bits – the ERR\_TYPE\_L and ERR\_TYPE\_H bit fields in the ERR\_POS register indicate whether the error occurred in data bits or ECC bits of the lower 64-bits, or the upper 64-bits respectively, of a 128-bit memory-aligned data.
- Bit position at which error occurred – the ERR\_POS\_L and ERR\_POS\_H bit fields in the ERR\_POS register indicate the bit position of the error in the lower 64-bits/lower 8-bit ECC, or the upper 64-bits/upper 8-bit ECC respectively, of a 128-bit memory-aligned data.
- Whether the corrected value is 0 (FAIL\_0\_L, FAIL\_0\_H flags in ERR\_STATUS register)
- Whether the corrected value is 1 (FAIL\_1\_L, FAIL\_1\_H flags in ERR\_STATUS register)
- A single bit error counter that increments on every single bit error occurrence (ERR\_CNT register) until a user-configurable threshold (see ERR\_THRESHOLD) is met
- A flag that gets set when one or more single-bit errors occurs after ERR\_CNT equals ERR\_THRESHOLD (SINGLE\_ERR\_INT\_FLG flag in the ERR\_INTFLG register)

When the ERR\_CNT value equals THRESHOLD+1 value and a single bit error occurs, the SINGLE\_ERR\_INT flag is set, and an interrupt (FLASH\_CORRECTABLE\_ERR on C28x PIE has to be enabled for interrupt, if needed) is fired. The SINGLE\_ERR interrupt is not fired again until the SINGLE\_ERR\_INTFLG is cleared. If the single error interrupt flag is not cleared using the corresponding error interrupt clear bit in the ERR\_INTCLR register, the error interrupt does not come again, as this is an edge-based interrupt.

When multiple single-bit errors get caught by ECC logic, Flash ECC registers hold the information related to the latest ECC error. When multiple single-bit errors get caught, both FAIL\_0\_L and FAIL\_1\_L (and/or FAIL\_0\_H and FAIL\_1\_H) might get set, indicating that single-bit fail0/fail1 occurred in different 64-bit aligned addresses.

Although ECC is calculated on 64-bit basis, a read of any address location within a 128-bit aligned Flash memory causes the single-bit error flag to get set when there is a single-bit error in both or in either one of the lower 64 and upper 64 bits (or corresponding ECC check bits) of that 128-bit data.

### 3.12.10.2 Uncorrectable Error

Uncorrectable errors include address errors and double-bit errors in data/ECC. When SECEDED finds uncorrectable errors, the following information is logged in ECC registers if the ECC feature is enabled:

- Address where the error occurred – if the uncorrectable error occurs in the lower 64-bits of a 128-bit memory-aligned data, the lower 64-bit memory-aligned address is captured in the UNC\_ERR\_ADDR\_LOW register. If the uncorrectable error occurs in the upper 64-bits of a 128-bit memory-aligned data, the upper 64-bit memory-aligned address is captured in the UNC\_ERR\_ADDR\_HIGH register.
- A flag is set indicating that an uncorrectable error occurred – the UNC\_ERR\_L and UNC\_ERR\_H flags in the ERR\_STATUS register indicate the uncorrectable error occurrence in the lower 64-bits/lower 8-bit ECC, or the upper 64-bits/upper 8-bit ECC, respectively, of a 128-bit memory-aligned data.
- A flag is set indicating that an uncorrectable error interrupt is fired (UNC\_ERR\_INTFLG in ERR\_INTFLG register)

When an uncorrectable error occurs, the `UNC_ERR_INTFLG` bit is set and an uncorrectable error interrupt is fired. This uncorrectable error interrupt generates an NMI, if enabled. If an uncorrectable error interrupt flag is not cleared using the corresponding error interrupt clear bit in the `ERR_INTCLR` register, an error interrupt does not come again, as this is an edge based interrupt.

Although ECC is calculated on 64-bit basis, a read of any address location within a 128-bit aligned Flash memory causes the uncorrectable error flag to get set when there is a uncorrectable error in both or in either one of the lower 64 and upper 64 bits (or corresponding ECC check bits) of that 128-bit data. NMI occurs on the CPU for a read of any address location within a 128-bit aligned Flash memory, when there is an uncorrectable error in both or in either one of the lower 64 and upper 64 bits (or corresponding ECC check bits) of that 128-bit data.

### 3.12.10.3 SECDED Logic Correctness Check

Since error detection and correction logic are part of safety-critical logic, safety applications need to make sure that the SECDED logic is always working properly. For these safety concerns, make sure the correctness of the SECDED logic, an ECC test mode is provided to test the correctness of ECC logic periodically. In this ECC test mode, data/ECC and address inputs to the ECC logic are controlled by the ECC test mode registers `FDATAH_TEST`, `FDATAL_TEST`, `FECC_TEST`, and `FADDR_TEST`, respectively. Using this test mode, users can introduce single-bit errors, double-bit errors, or address errors and check whether or not SECDED logic is catching those errors. Users can also check if SECDED logic is reporting any false errors when no errors are introduced.

This ECC test mode can be enabled by setting the `ECC_TEST_EN` bit in the `FECC_CTRL` register. When ECC test mode is enabled, the CPU cannot read the data from Flash and instead the CPU gets data from the ECC test mode registers (`FDATAH_TEST`/`FDATAL_TEST`). This is because ECC test mode registers (`FDATAH_TEST`, `FDATAL_TEST`, `FECC_TEST`) are multiplexed with data from the Flash. Hence, the CPU must not read/fetch from Flash when ECC test mode is enabled. For this reason, ECC test mode code must be executed from RAM and not from Flash.

Only one of the SECDED modules (out of the two SECDED modules that work on lower 64 bits and upper 64 bits of a read 128-bit data) at a time can be tested. The `ECC_SELECT` bit in the `FECC_CTRL` register can be configured by users to select one of the SECDED modules for test.

To test the ECC logic using ECC test mode, users can follow the steps below:

1. Obtain the ECC for a given Flash address (128-bit aligned) and 64-bit data by using the Auto ECC generation option provided in Flash API .
2. Develop an application to test ECC logic using the above data. In this application
  - Write the 128-bit aligned 19-bit Flash address in `FADDR_TEST`
  - Write 64-bit data in `FDATAH_TEST` (upper 32-bits) and `FDATAL_TEST` (lower 32-bits) registers
  - Write the corresponding 8-bit ECC in the `FECC_TEST` register
  - In any of the above three steps, users can insert errors (single-bit data error or double-bit data error or address error or single-bit ECC error or double-bit ECC error) to check whether or not ECC logic is able to catch the errors
  - Select the ECC logic block (lower 64-bits or upper 64-bits) which needs to be tested using the `ECC_SELECT` bit in the `FECC_CTRL` register
  - Enable ECC test mode using the `ECC_TEST_EN` bit in `FECC_CTRL` register
  - Write a value of 1 in the `DO_ECC_CALC` bit in `FECC_CTRL` register to enable ECC test logic for a single cycle to evaluate the address, data, ECC in `FADDR_TEST`, `FDATAx_TEST` and `FECC_TEST` registers for ECC errors

Once the above ECC test mode registers are written by the user:

- The `FECC_OUTH` register holds the data output bits 63:32 from the SECDED block under test
- The `FECC_OUTL` register holds the data output bits 31:0 from the SECDED block under test
- The `FECC_STATUS` register holds the status of single-bit error occurrence, uncorrectable error occurrence, and error position of single-bit error in data/check bits

### 3.12.10.4 Reading ECC Memory From a Higher Address Space

In these devices, ECC memory for Flash and OTP memory is allocated at a higher address space (address width more than 22 bits). C2000 Codegen tools (6.2 and onwards) are updated to include the below intrinsics to read ECC space.

For 16-bit read: unsigned int variable = \_\_addr32\_read\_uint16(unsigned long address);

For 32-bit read: unsigned long variable = \_\_addr32\_read\_uint32(unsigned long address);

### 3.12.11 Reserved Locations Within Flash and OTP Memory

When allocating code and data to Flash and OTP memory, keep the following reserved locations in mind:

- The entire OTP memory has reserved user-configurable locations for security and boot process. For more details on the functionality of these fields, refer to [Section 3.13](#) and [Chapter 4](#).
- Refer to [Chapter 4](#) for reserved locations in Flash for real-time operating system usage and a boot-to-Flash entry point. A boot-to-Flash entry point is reserved for an entry-into-Flash branch instruction. When the boot-to-Flash boot option is used, the boot ROM jumps to this address in Flash. If the user programs a branch instruction here, that then redirects code execution to the entry point of the application.

### 3.12.12 Procedure to Change the Flash Control Registers

During Flash configuration, no accesses to the Flash or OTP memory can be in progress. This includes instructions still in the CPU pipeline, data reads, and instruction prefetch operations. To be sure that no access takes place during the configuration change, follow this procedure for any code that modifies the Flash control registers.

1. Start executing application code from RAM/Flash/OTP memory.
2. Branch to or call the Flash configuration code (that writes to Flash control registers) in RAM. This is required to properly flush the CPU pipeline before the configuration change. The function that changes the Flash configuration cannot execute from the Flash or OTP memory. The function must reside in RAM.
3. Execute the Flash configuration code (must be located in RAM) that writes to Flash control registers like FRDCNTL, FRD\_INTF\_CTRL, and so on.
4. At the end of the Flash configuration code execution, wait eight cycles to let the write instructions propagate through the CPU pipeline. This must be done before the return-from-function call is made.
5. Return to the calling function that resides in RAM or Flash/OTP memory and continue execution.

### 3.12.13 Simple Procedure to Modify an Application from RAM Configuration to Flash Configuration

All of the C2000Ware example projects are provided with both RAM and Flash build configurations. To change the build configuration from RAM to Flash, import the project in to the CCS IDE and right click on the project and select 'Build Configurations' -> 'Set Active' -> 'Flash'. By selecting this, notice that:

1. `_FLASH` symbol is defined in the "Predefined symbols" section under Project Build settings. This is used to define and execute any Flash-build specific code.
2. Flash-based linker command file is chosen for the application instead of a RAM-based linker command file. Flash-based linker command files are provided in the C2000Ware for reference (for example: `XXX_FLASH_Ink_cpu1.cmd` at `C2000Ware_x_xx_xx_xx\device_support\XXX\common\cmd`). Flash-based linker command files have `codestart` mapped to a Flash entry point address.
3. All of the initialized sections are mapped to Flash memory in the Flash-based linker command file.
4. All of the functions that need to execute from RAM (for initialization or 0-wait performance purpose) are assigned to the `.TI.ramfunc` section in the code. For example, `Flash_initModule()` is assigned to `.TI.ramfunc` section.
5. `.TI.ramfunc` section is mapped to a Flash address for "Load" and a RAM address for "RUN" in the Flash-based linker command file.
6. All of the sections mapped to Flash are aligned on a 128-bit boundary using the `ALIGN()` directive in the Flash-based linker command file.
7. `memcpy()` function is called in the application to copy the `.TI.ramfunc` content from Flash to RAM. The `memcpy()` is called before executing any code that is assigned to `.TI.ramfunc` section.
8. For EABI type executable: All uninitialized sections mapped to RAM are defined as `NOINIT` sections (using the directive "type=NOINIT") in the linker cmd file.

### 3.13 Dual Code Security Module (DCSM)

The dual code security module (DCSM) is a security feature incorporated in this device. It prevents access and visibility to on-chip secure memories (and other secure resources) to unauthorized persons. It also prevents duplication and reverse engineering of proprietary code. The term “secure” implies access to on-chip secure memories and resources are blocked. The term “unsecure” implies access is allowed (the contents of the memory could be read by any means); for example, through a debugging tool such as the Code Composer Studio™ IDE.

The CPU subsystem's CSM has dual-zone security, zone1 and zone2.

#### 3.13.1 Functional Description

The security module restricts the CPU access to on-chip secure memory and resources without interrupting or stalling CPU execution. When a read occurs to a secure memory location, the read returns a zero value and CPU execution continues with the next instruction. This, in effect, blocks read and write access to secure memories through the JTAG port or external peripherals.

The code security mechanism offers protection for two zones, Zone 1 (Z1) and Zone 2 (Z2). The security mechanism for both the zones is identical. Each zone has a dedicated secure resource and allocated secure resource. The following are different secure resources available on this device:

- **OTP:** Each zone has a dedicated secure OTP (USER OTP). This contains the security configurations for the individual zone. If a zone is secure, the USER OTP content (including CSM passwords) can be read (execution not allowed) only if the zone is unlocked using the password match flow (PMF).
- **CLA:** The CLA is a secure resource that can be allocated to either zone by configuring the GRABRAM location in the USER OTP. CLA configuration can only be performed by code running from the zone to which it has been allocated. The CLA message RAMs also belong to the same zone.

**Table 3-16. CLA Access Filter**

CLA Ownership	RAM Block Ownership	Fetch Access	Read Access	Write Access
None	None	Yes	Yes	Yes
None	Z1 or Z2	No	No	No
Z1	Z1	Yes	Yes	Yes
Z1	Z2	No	No	No
Z1	None	No	Yes	Yes
Z2	Z1	No	No	No
Z2	Z2	Yes	Yes	Yes
Z2	None	No	Yes	Yes

- **RAM:** All Dx and LSx RAMs can be secure RAM on this device. These RAMs can be allocated to either zone by configuring the respective GRABRAM location in the USER OTP.
- **Flash Sectors:** Flash Sectors can be secure on this device. Each Flash sector can be allocated to either zone by configuring the respective GRABSECT location in the USER OTP.
- **Secure ROM:** This device also has secure ROM which is EXEONLY-protected. This ROM contains specific function for the user, provided by TI.

Table 3-17 shows the status of a RAM block based on the configuration in GRABRAM register.

**Table 3-17. RAM Status**

GRAM_RAMx Bits in Z1_GRABRAMR Register	GRAM_RAMx Bits in Z2_GRABRAMR Register	Ownership
00	XX	GRAM_RAMx is inaccessible
XX	00	GRAM_RAMx is inaccessible
Differential Value (01/10)	Differential Value (01/10)	GRAM_RAMx is inaccessible
Differential Value (01/10)	11	GRAM_RAMx belongs to Z1
11	Differential Value (01/10)	GRAM_RAMx belongs to Z2
11	11	GRAM_RAMx is Non-Secure

The security of each zone is maintained by a 128-bit (four 32-bit words) password (CSM password). The password for each zone is stored in a dedicated OTP memory location based on a zone-specific link pointer. A zone can be unsecured by executing the password match flow (PMF), described in [Section 3.13.3.3.2](#).

There are three types of accesses: data/program reads, JTAG access, and instruction fetches (calls, jumps, code executions, ISRs). Instruction fetches are never blocked. JTAG accesses are always blocked when a memory is secure. Data reads to a secure memory are always blocked unless the program is executing from a memory which belongs to the same zone. Data reads to unsecure memory are always allowed. [Table 3-18](#) shows the levels of security.

**Table 3-18. Security Levels**

PMF Executed With Correct Password?	Operating Mode of the Zone	Program Fetch Location	Security Description
No	Secure	Outside secure memory	Only instruction fetches by the CPU are allowed to secure memory. In other words, code can still be executed, but not read.
No	Secure	Inside secure memory	CPU has full access (except for EXEONLY memories where read is not allowed). JTAG port cannot read the secured memory contents.
Yes	Non-Secure	Anywhere	Full access for CPU and JTAG port to secure memory of that zone.

If the password locations of a zone have all 128 bits as ones, the zone is considered unsecure. Since new Flash devices have erased Flash (all ones), only a read of the password locations is required to bring any zone into unsecure mode. If the password locations of a zone have all 128 bits as zeros, the zone is secure, regardless of the contents of the CSMKEY registers. This means the zone cannot be unlocked using PMF, the password match flow described in [Section 3.13.3.3.2](#). Therefore, the user must never use all zeros as a password. A password of all zeros prevents debug of secure code or reprogramming the Flash.

CSMKEY registers are user-accessible registers that are used to unsecure the zones.

### 3.13.1.1 Emulation Code Security Logic (ECSL)

In addition to the CSM, the emulation code security logic (ECSL) has been implemented using a 64-bit password (part of existing CSM password) for each zone to prevent unauthorized users from stepping through secure code. A halt in secure code while the emulator is connected trips the ECSL and break the emulation connection. To allow emulation of secure code, while maintaining the CSM protection against secure memory reads, the user must write the correct 64-bit password into the CSMKEY (0/1) registers, which matches the password value stored in the USER OTP of that zone. This disables the ECSL for the specific zone.

When initially debugging a device with the password locations in OTP memory programmed (secured), the emulator takes some time to take control of the CPU. During this time, the CPU starts running and executes an

instruction that performs an access to a protected ECSL area and if the CPU is halted when the program counter (PC) is pointing to a secure location, the ECSL trips and causes the emulator connection to be broken.

A solution to this problem is:

- Use the Wait Boot Mode boot option. In this mode, the CPU is in a loop and hence does not jump to the user application code. Using this BOOTMODE, the user can connect to CCS and debug the code.

### 3.13.1.2 CPU Secure Logic

The CPU Secure Logic (CPUSL) on this device prevents a hacker from reading the CPU registers in a watch window while code is running in a secure zone. All accesses to CPU registers when the PC points to a secure location are blocked by this logic. The only exception to this is read access to the PC. It is highly recommended not to write into the CPU register in this case, because proper code execution may get affected. If the CSM is unlocked using the CSM password match flow, the CPUSL logic also gets disabled.

### 3.13.1.3 Execute-Only Protection

To achieve a higher level of security on secure Flash sectors and RAM blocks that store critical user code (instruction opcodes), the Execute-Only protection feature is provided. When the Execute-Only protection is turned on for any secure Flash sector or RAM block, data reads to that Flash sectors are disallowed from any code (even from secure code). Execute-only protection for a Flash sector and RAM block can be turned on by configuring the bit field associated for that particular sector/RAM block in the zone's (which has ownership of that sector/RAM block) EXEONLYSECT and EXEONLYRAM register, respectively.

### 3.13.1.4 Password Lock

The password locations for each zone can be locked by programming the zone's PSWDLOCK field with any value other than 1111 (0xF) at the PSWDLOCK location in OTP memory. Until the passwords of a zone are locked, password locations are not secure and can be read from the debugger as well as code running from non-secure memory. This feature can be used by the user to avoid accidental locking of the zone while programming the Flash sectors during the software development phase. On a new device, the value for password lock fields for all zones at the PSWDLOCK location in OTP memory is 1111, which means the password for all zones is unlocked.

---

#### Note

Password unlock only makes password locations non-secure. All other secure memories and other locations of Flash sectors, which contain a password, remains secure as per security settings. But since passwords are non-secure, anyone can read the password and make the zone non-secure by running through PMF.

---

### 3.13.1.5 JTAG Lock

The JTAG lock feature can be used to *permanently* disable any access to the device using the JTAG port. For example, access by the Code Composer Studio™ IDE debugger or Flash programming tools are blocked. This feature is enabled by programming the Z1OTP\_JTAGLOCK location in user OTP memory with any value other than 1111 (0xF). Values of CRCLOCK, JTAGLOCK, and PSWDLOCK locations in the OTP memory are copied in the Z1\_OTPSECLOCK register by the boot-ROM code.

#### CAUTION

If the JTAG lock feature is enabled, all future debug of the device through JTAG is disabled. This specifically impairs TI's ability to analyze devices returned to TI for failure analysis. If the JTAG lock feature is enabled, TI rejects any return analysis requests.

### 3.13.1.6 Link Pointer and Zone Select

For each of the two security zones a dedicated OTP memory block exists that holds the configuration related to zone's security. The following are the available programmed configurations:

- Zx-LINKPOINTER1
- Zx-LINKPOINTER2
- Zx-LINKPOINTER3
- Zx-PSWDLOCK
- Zx-CRCLOCK
- Zx-BOOTCTRL
- Zx-EXEONLYRAM
- Zx-EXEONLYSECT
- Zx-GRABRAM
- Zx-GRABSECT
- Zx-CSMPASSWORD

Since OTP memory cannot be erased, to provide flexibility of configuring some of the security settings like CSM passwords, allocation of RAM/Flash sectors and their attributes, multiple times by the user, the following configurations are placed in zone select regions of each zone's OTP Flash.

- Zx-EXEONLYRAM
- Zx-EXEONLYSECT
- Zx-GRABRAM
- Zx-GRABSECT
- Zx-CSMPASSWORD

The location of the zone select region in OTP memory is decided based on the value of three 29-bit link pointers (Zx-LINKPOINTERx) programmed in the OTP memory of each zone. All OTP memory locations except link pointer locations are protected with ECC. Since the link pointer locations are not protected with ECC, three link pointers are provided that need to be programmed with the same value. The final value of the link pointer is resolved in hardware when a dummy read is done to all the link pointers by comparing all the three values (bit-wise voting logic). Since in OTP memory, a 1 can be flipped by the user to 0 but a 0 cannot be flipped to a 1 (no erase operation for OTP memory), the most-significant bit position in the resolved link pointer that is 0 defines the valid base address for the zone select region. While generating the final link pointer value, if the bit patterns is not one of those listed in [Figure 3-20](#), the final link pointer value becomes All\_1 (0xFFFF\_FFFF) that selects the Zone-Select-Block1 (also known as the default zone select block).

Zx-LINKPOINTER	Addr Offset Of Zone-Select Block

0xa	Zx-CSMPSWD1
0xc	Zx-CSMPSWD2
0xe	Zx-CSMPSWD3

Figure 3-20. Storage of Zone-Select Bits in OTP Memory

**Note**

Address locations for other security settings (PSWDLCK/CRCLOCK) that are not part of Zone Select blocks can be programmed only once; therefore, the user must program the address locations toward the end of the development cycle.

Since linkpointer location in USER OTP does not have ECC, the user must always define a separate structure and section for linkpointers.

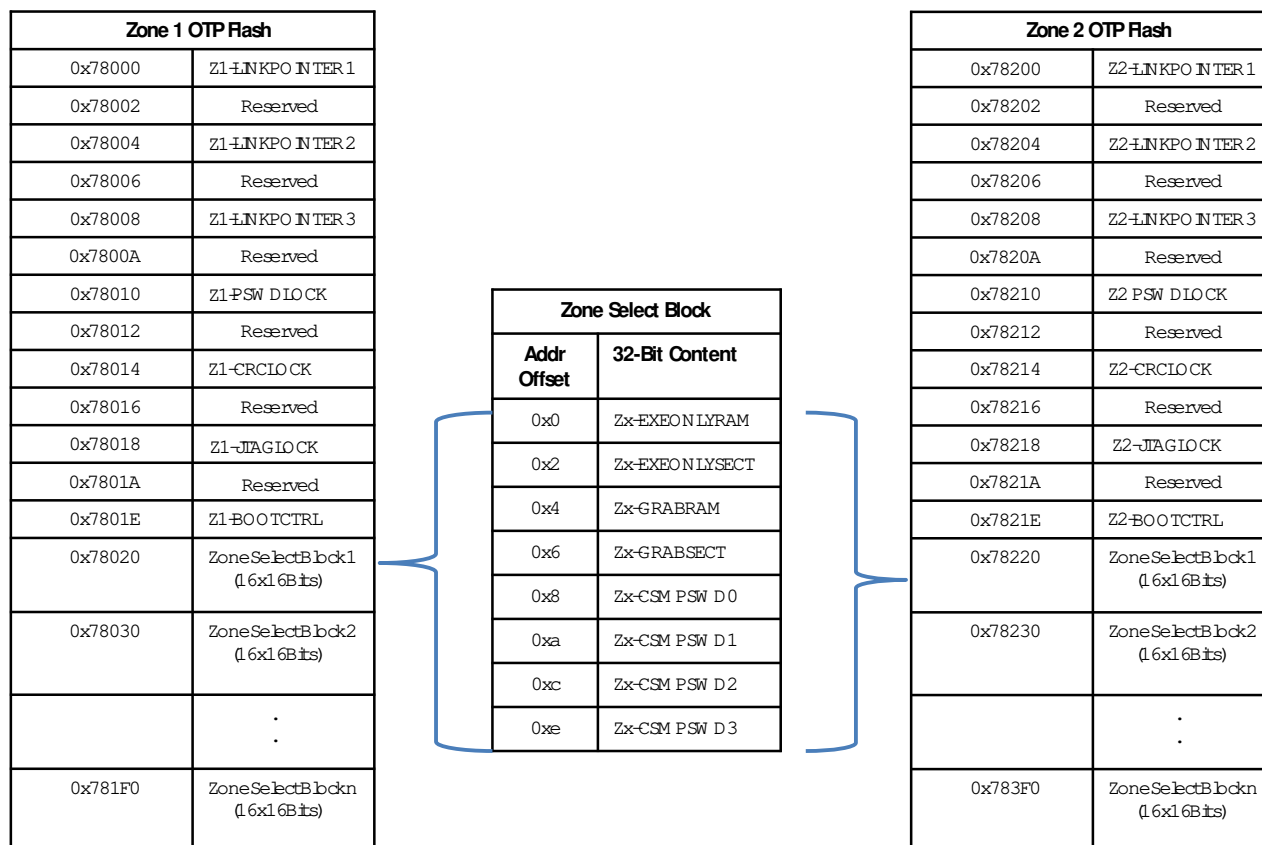

Figure 3-21. Location of Zone-Select Block Based on Link-Pointer

### 3.13.1.6.1 C Code Example to get Zone Select Block Addr for Zone1

```

unsigned long LinkPointer;
unsigned long *Zone1SelBlockPtr;
int Bitpos = 28;
int ZeroFound = 0;
// Read Z1-Linkpointer register of DCSM module.
LinkPointer = *(unsigned long *)0x5F000;
// Bits 31 30 and 29 as most-significant 0 are reserved LinkPointer options
LinkPointer = LinkPointer << 3;
while ((ZeroFound == 0) && (bitpos > -1))
{
    if ((LinkPointer & 0x80000000) == 0)
    {
        ZeroFound = 1;
        Zone1SelBlockPtr = (unsigned long *) (0x78000 + ((bitpos + 3)*16));
    } else
    {
        bitpos--;
        LinkPointer = LinkPointer << 1;
    }
}
if (ZeroFound == 0)
{
    //Default in case there is no zero found.
    Zone1SelBlockPtr = (unsigned long *)0x78020;
}
    
```

### 3.13.1.7 Flash and OTP Memory Erase/Program

On this device, OTP memory, as well as normal Flash, are secure resources. Each zone has a dedicated OTP memory, whereas normal Flash sectors can be allocated to any zone based on the value programmed in the GRABSECT location in OTP memory. Each zone has CSM passwords; read and write accesses are not allowed to resources owned by Z1 from code running from memory allocated to Z2 and conversely. Before programming any secure Flash sector, the user must either unlock the zone to which that particular sector belongs, using PMF or execute the Flash programming code from secure memory that belongs to the same zone. The same is the case for erasing any secure Flash sector. To program the security settings in OTP Flash, the user must unlock the CSM of the respective zone. Unless the zone is unlocked, security settings in OTP Flash cannot be updated. The OTP Flash content cannot be erased.

This device has only one Flash pump used for erase/program operation of normal Flash and OTP Flash. A semaphore mechanism is provided to avoid the conflict between Zone1 and Zone2. A zone needs to grab this semaphore to successfully complete the erase/program operation on the Flash sectors allocated to that zone. A semaphore can be grabbed by a zone by writing the appropriate value in the SEM field of the FLSEM register. For further details of this field, see the register description.

---

#### Note

If there is a loss of power or a reset of any nature during the Flash programming operation, there is high probability of some (or possibly all) of the 128 bits in the corresponding 128-bit aligned address getting corrupted. If this happens while programming the password locations in USER OTP, the passwords can get corrupted.

---

### 3.13.1.8 Safe Copy Code

In some applications, the user may want to copy the code from secure Flash to secure RAM for better performance. The user cannot do this for EXEONLY Flash sectors because EXEONLY secure memories cannot be read from anywhere. TI provides specific “Safe Copy Code” library functions for each zone to enable the user to copy content from EXEONLY secure Flash sectors to EXEONLY RAM blocks. These functions do the copy-code operation in a highly secure environment and allow a copy to be performed only when the following conditions are met:

- The secure RAM block and the secure Flash sector belong to the same zone.
- Both the secure RAM block and the secure Flash sector have EXEONLY protection enabled.

For further usage of these library functions, see the device-specific Boot ROM documentation.

### 3.13.1.9 SafeCRC

Since reads from EXEONLY memories are not allowed, the user cannot calculate the CRC for content in EXEONLY memories using the VCU-II. But in some safety-critical applications, the user may have to calculate the CRC on these memories as well. To enable this without compromising on security, TI provides specific “SafeCRC” library functions for each zone. These functions do the CRC calculation in highly secure environment and allow a CRC calculation to be performed only when the following conditions are met:

- The source address must be modulo the number of words (based on length\_id) for which the CRC needs to be calculated.
- The destination address must belong to the same zone as the source address.

For further usage of these library functions, see the device-specific Boot ROM documentation.

---

#### Note

The user must disable all the interrupts before calling the safe copy code and the safeCRC function. If there is a vector fetch during copy code operation, the CPU gets reset immediately.

---

**Disclaimer: Code Security Module Disclaimer** The Code Security Module (CSM) included on this device was designed to password protect the data stored in the associated memory and is warranted by Texas Instruments (TI), in accordance with its standard terms and conditions, to conform to TI's published specifications for the warranty period applicable for this device. TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

### 3.13.2 CSM Impact on Other On-Chip Resources

On this device, M0/M1 and GSx memories are not secure. To avoid any potential hacking when the device is in the default state (post reset), accesses (all types) to all memories (secure as well as non-secure, except BOOT-ROM and OTP memory) are disabled until proper security initialization is done. This means that after reset none of the memory resources except BOOT\_ROM and OTP memory is accessible to the user.

The following steps are required after reset (any type of reset) to initialize the security on each CPU subsystem.

- Dummy Read to address location of SECDC (0x703F0, TI-reserved register) in TI OTP memory
- Dummy Read to address location of Z1\_LINKPOINTER1 in Z1 OTP memory
- Dummy Read to address location of Z1\_LINKPOINTER2 in Z1 OTP memory
- Dummy Read to address location of Z1\_LINKPOINTER3 in Z1 OTP memory
- Dummy Read to address location of Z1\_PSWDLOCK in Z1 OTP memory
- Dummy Read to address location of Z1\_CRCLOCK in Z1 OTP memory
- Dummy Read to address location 0x78018 in Z1 OTP memory
- Dummy Read to address location of Z1\_BOOTCTRL in Z1 OTP memory
- Read to memory map register of Z1\_LINKPOINTER in DCSM module to calculate the address of zone select block for Z1
- Dummy read to address location of Z1\_EXEONLYRAM in Z1 OTP memory
- Dummy read to address location of Z1\_EXEONLYSECT in Z1 OTP memory
- Dummy read to address location of Z1\_GRABRAM in Z1 OTP memory
- Dummy read to address location of Z1\_GRABSECT in Z1 OTP memory
- Dummy Read to address location of Z2\_LINKPOINTER1 in Z2 OTP memory
- Dummy Read to address location of Z2\_LINKPOINTER2 in Z2 OTP memory
- Dummy Read to address location of Z2\_LINKPOINTER3 in Z2 OTP memory
- Dummy Read to address location of Z2\_PSWDLOCK in Z2 OTP memory
- Dummy Read to address location of Z2\_CRCLOCK in Z2 OTP memory
- Dummy Read to address location 0x78218 in Z2 OTP memory
- Dummy Read to address location of Z2\_BOOTCTRL in Z2 OTP memory
- Read to memory map register of Z2\_LINKPOINTER in DCSM module to calculate the address of zone select block for Z2
- Dummy read to address location of Z2\_EXEONLYRAM in Z2 OTP memory
- Dummy read to address location of Z2\_EXEONLYSECT in Z2 OTP memory
- Dummy read to address location of Z2\_GRABRAM in Z2 OTP memory
- Dummy read to address location of Z2\_GRABSECT in Z2 OTP memory

---

#### Note

Security Initialization is done by BOOTROM code on all the resets that assert SYSRSn (as part of device initialization). This is not part of the user application code.

---

### 3.13.3 Incorporating Code Security in User Applications

Code security is typically not required in the development phase of a project. However, security is needed once a robust code is developed for a zone. Before such a code is programmed in the Flash memory, a CSM password must be chosen to secure the zone. Once a CSM password is in place for a zone, the zone is secured (programming a password at the appropriate locations and either performing a device reset or setting the FORCESEC bit (Zx\_CR.15) is the action that secures the device). From that time on, access to debug the contents of secure memory by any means (using JTAG, code running off external/on-chip memory, and so forth) requires a valid password. A password is not needed to run the code out of secure memory (such as in a typical end-user usage); however, access to secure memory contents for debug purposes, requires a password.

#### 3.13.3.1 Environments That Require Security Unlocking

The following are the typical situations under which unsecuring can be required:

- Code development using debuggers (such as Code Composer Studio). This is the most common environment during the design phase of a product.
- Flash programming using TI's Flash utilities such as Code Composer Studio On-Chip Flash Programmer plug-in or the UniFlash tool. Flash programming is common during code development and testing. Once the user supplies the necessary password, the Flash utilities disable the security logic before attempting to program the Flash. The Flash utilities can disable the code security logic in new devices without any authorization, since new devices come with an erased Flash. However, reprogramming devices that already contain a custom password require the password to be supplied to the Flash utilities in order to unlock the device to enable programming. In custom programming solutions that use the Flash API supplied by TI, unlocking the CSM can be avoided by executing the Flash programming algorithms from secure memory.
- Custom environment defined by the application
  - In addition to the above, access to secure memory contents can be required in situations such as:
    - Using the on-chip bootloader to load code or data into secure SARAM or to erase and program the Flash.
    - Executing code from on-chip unsecure memory and requiring access to secure memory for the lookup table. This is not a suggested operating condition as supplying the password from external code could compromise code security.

The unsecuring sequence is identical in all the above situations. This sequence is referred to as the password match flow (PMF) for simplicity. [Figure 3-22](#) explains the sequence of operation that is required every time the user attempts to unsecure a particular zone. A code example is listed for clarity.

### 3.13.3.2 CSM Password Match Flow

Password match flow (PMF) is essentially a sequence of four dummy reads from password locations (PWL) followed by four writes (32-bit writes) to CSMKEY(0/1/2/3) registers. Figure 3-22 shows how PMF helps to initialize the security logic registers and disable security logic.

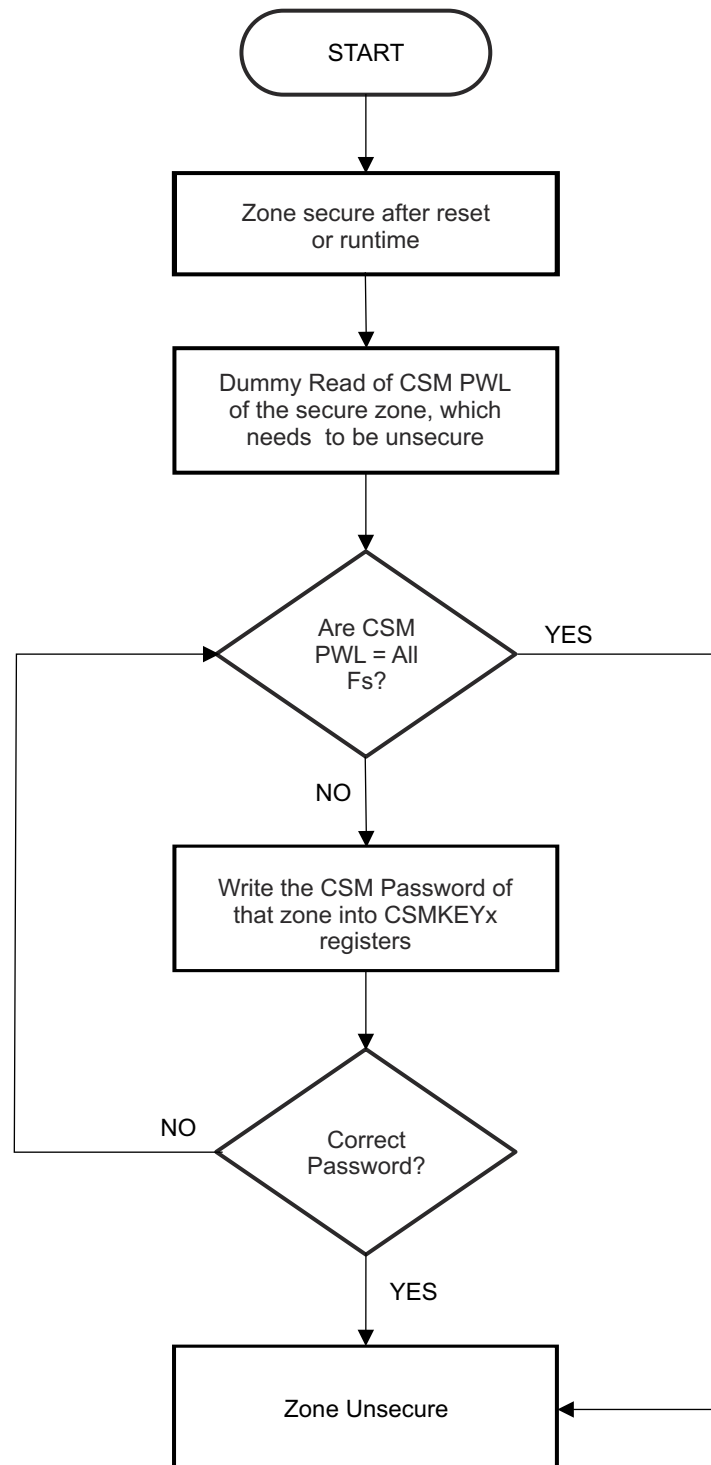

Figure 3-22. CSM Password Match Flow (PMF)

### 3.13.3.3 Unsecuring Considerations for Zones With and Without Code Security

Case 1 and Case 2 provide unsecuring considerations for zones with and without code security.

- **Case 1: Zone With Code Security**

A zone with code security must have a predetermined password stored in the password locations of that zone. The following are steps to unsecure any secure zone:

1. Perform a dummy read of the password locations of that zone.
2. Write the password into the CSMKEY registers.
3. If the password is correct, the zone becomes unsecure; otherwise, the zone stays secure.

- **Case 2: Zone Without Code Security**

A zone without code security must have 0x FFFF FFFF FFFF FFFF FFFF FFFF FFFF FFFF (128 bits of all ones) stored in the password locations. The following are steps to use this zone:

1. At reset, the CSM locks memory regions protected by the CSM.
2. Perform a dummy read of the password locations.
3. Since the password is all ones, this unlocks the zone and all the secure memories dedicated to that zone are fully accessible immediately after this operation is completed.

---

#### Note

Even if a zone is not protected with a password (all password locations all ones), the CSM locks at reset. Thus, a dummy read operation must still be performed on these zones prior to reading, writing, or programming secure memory if the code performing the access is executing from outside of the CSM protected memory region. The Boot ROM code does this dummy read for convenience.

---

#### 3.13.3.3.1 C Code Example to Unsecure C28x Zone1

```
volatile long int *CSM = (volatile long int *)0x5F010; //CSM register file
volatile long int *CSMPWL = (volatile long int *)0x78028; //CSM Password location (assuming default
Zone sel block)
volatile int tmp;

int I;
// Read the 128-bits of the CSM password locations (PWL)
//
for (I=0;I<4; I++) tmp = *CSMPWL++;
// If the password locations (CSMPWL) are all = ones (0xFFFF),
// then the zone will now be unsecure. If the password
// is not all ones (0xFFFF), then the code below is required
// to unsecure the CSM.
// Write the 128-bit password to the CSMKEY registers
// If this password matches that stored in the
// CSLPWL then the CSM will become unsecure. If it does not
// match, then the zone will remain secure.
// An example password of:
// 0x11112222333344445555666677778888 is used.
*CSM++ = 0x22221111; // Register Z1_CSMKEY0 at 0x5F010
*CSM++ = 0x44443333; // Register Z1_CSMKEY1 at 0x5F012
*CSM++ = 0x66665555; // Register Z1_CSMKEY2 at 0x5F014
*CSM++ = 0x88887777; // Register Z1_CSMKEY3 at 0x5F016
```

#### 3.13.3.3.2 C Code Example to Resecure C28x Zone1

```
volatile int *Z1_CR = 0x5F019; //CSMSCR register
//Set FORCESEC bit
*Z1_CR = 0x8000;
```

### 3.13.3.4 Environments That Require ECSL Unlocking

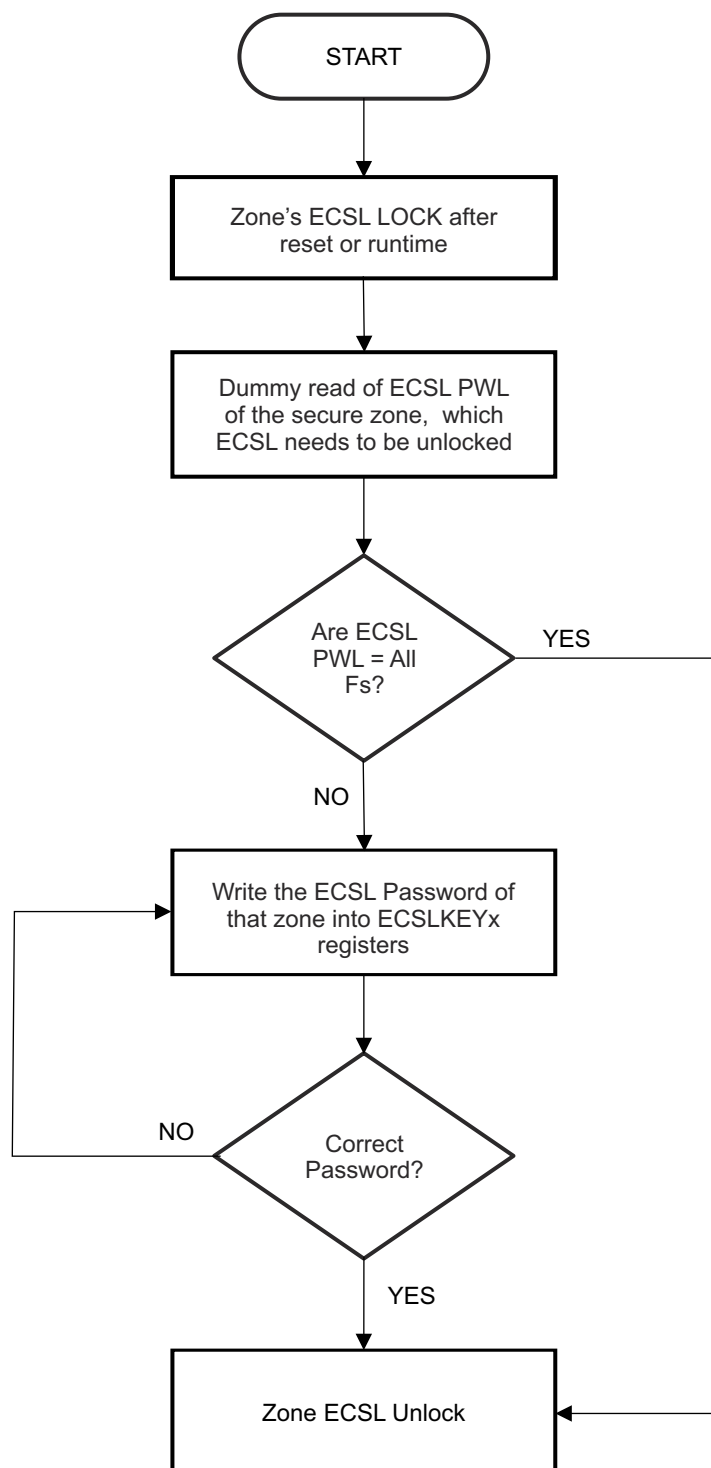

The following are the typical situations under which unsecuring can be required:

- The user develops some main IP, and then outsources peripheral functions to a subcontractor who must be able to run the user code during debug and may halt while main IP code is running. If ECSL is not unlocked,

then Code Composer Studio IDE connections get disconnected, which can be inconvenient for the user. Note that unlocking ECSL doesn't enable access to secure code but only avoids disconnection of CCS (JTAG).

### 3.13.3.5 ECSL Password Match Flow

A password match flow (PMF) is essentially a sequence of eight dummy reads from password locations (PWL) followed by two writes to KEY registers. Figure 3-23 shows how the PMF helps to initialize the security logic registers and disable security logic.

**Figure 3-23. ECSL Password Match Flow (PMF)**

### 3.13.3.6 ECSL Disable Considerations for any Zone

A zone with ECSL enabled must have a predetermined ECSL password stored in the ECSL password locations in Flash (same as lower 64 bits of CSM passwords). The following are steps to disable the ECSL for any particular zone:

- Perform a dummy read of CAM password locations of that Zone
- Write the password into the CSMKEYx registers, corresponding to that Zone.
- If the password is correct, the ECSL gets disabled; otherwise, the ECSL stays enabled.

#### 3.13.3.6.1 C Code Example to Disable ECSL for C28x-Zone1

```
volatile long int *ECSL = (volatile int *)0x5F010; //ECSL register file
volatile long int *ECSLPWL = (volatile int *)0x78028; //ECSL Password location (assuming default
Zone sel block)
volatile int tmp;

int I;
// Read the 64-bits of the password locations (PWL)
for (I=0;I<2; I++) tmp = *ECSLPWL++;
// If the ECSL password locations (ECSLPWL) are all = ones (0xFFFF),
// then the ECSL will now be disable. If the password
// is not all ones (0xFFFF), then the code below is required
// to disable the ECSL.
// Write the 64-bit password to the CSMKEYx registers
// If this password matches that stored in the
// CSMPWL then ECSL will get disable. If it does not
// match, then the zone will remain secure.
// An example password of:
// 0x1111222233334444 is used.
*ECSL++ = 0x22221111; // Register Z1_CSMKEY0 at 0x5F010
*ECSL++ = 0x44443333; // Register Z1_CSMKEY1 at 0x5F012
```

### 3.13.3.7 Device Unique ID

The bank 0 OTP memory contains a 256-bit value that is made up of both pseudo-random and sequential parts. This value may be used as a seed for code encryption. The starting address of the value is 0x703C0. The first 192 bits are pseudo-random, the next 32 bits are sequential, and the last 32 bits are a checksum value. The degree of randomness is not specified.

### 3.14 JTAG

Gel files perform certain initialization tasks. This helps the users in a debug environment. However, when executed standalone (without the emulator connected) the application may not work as expected, since there is no gel file to perform those initializations. For example, gel file disables watchdog. If user code does not service the watchdog in the application (or fails to disable it), there is difference in how the application behaves with the debugger and without.

Common tasks performed by the gel files (but not boot-ROM)

On Reset:

- Disable Flash ECC on some devices.
  - Disabling ECC only when using Flash API functions, see the Flash API User Guide for details. Otherwise, TI suggests to always program ECC and enable ECC-check.
- Disable Watchdog
- Enable CLA clock
- Select real-time mode or C28x mode

On Restart:

- Select real-time mode or C28x mode
- Clear IER and IFR

On Target Connect:

- Select real-time mode or C28x mode

### 3.15 System Control Register Configuration Restrictions

Memory-mapped registers in the System Control operate on INTOSC1 clock domain; hence, any CPU writes to these registers requires a delay between subsequent writes otherwise a second write can be lost. The application needs to take this into consideration and add a delay in terms of the number of NOP instructions after every write to these registers that are mentioned in [Table 3-19](#). The formula to compute delay between subsequent writes:

$$\text{Delay (in SYSCLK cycles)} = 3 \times (F_{\text{SYSCLK}} \div F_{\text{INTOSC1}}) + 9$$

For Example - For SYSCLK = 100 MHz

$$\text{Delay (in SYSCLK cycles)} = 3 \times (100 \text{ MHz} \div 10 \text{ MHz}) + 9 = 39 \text{ SYSCLK cycles}$$

**Table 3-19. System Control Registers Impacted**

Registers requiring delay after every write
PERCLKDIVSEL
SYSCLKDIVSEL
SYSPLLCTL1
SYSPLLMULT
WDCR
XCLKOUTDIVSEL

## 3.16 Software

### 3.16.1 SYSCTL Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/sysctl

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

#### 3.16.1.1 Missing clock detection (MCD)

FILE: sysctl\_ex1\_missing\_clock\_detection.c

This example demonstrates the missing clock detection functionality and the way to handle it. Once the MCD is simulated by disconnecting the OSCCLK to the MCD module an NMI would be generated. This NMI determines that an MCD was generated due to a clock failure which is handled in the ISR.

Before an MCD the clock frequency would be as per device initialization (200Mhz). Post MCD the frequency would move to 10Mhz or INTOSC1.

The example also shows how we can lock the PLL after missing clock, detection, by first explicitly switching the clock source to INTOSC1, resetting the missing clock detect circuit and then re-locking the PLL. Post a re-lock the clock frequency would be 200Mhz but using the INTOSC1 as clock source.

##### External Connections

- None.

##### Watch Variables

- *fail* - Indicates that a missing clock was either not detected or was not handled correctly.
- *mcd\_clkfail\_isr* - Indicates that the missing clock failure caused an NMI to be triggered and called an the ISR to handle it.
- *mcd\_detect* - Indicates that a missing clock was detected.
- *result* - Status of a successful handling of missing clock detection

#### 3.16.1.2 XCLKOUT (External Clock Output) Configuration

FILE: sysctl\_ex2\_xclkout\_config.c

This example demonstrates how to configure the XCLKOUT pin for observing internal clocks through an external pin, for debugging and testing purposes.

In this example, we are using INTOSC1 as the XCLKOUT clock source and configuring the divider as 8. Expected frequency of XCLKOUT = (INTOSC1 freq)/8 = 10/8 = 1.25MHz

View the XCLKOUT on GPIO73 using an oscilloscope.

### 3.16.2 TIMER Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/timer

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

#### 3.16.2.1 CPU Timers

FILE: timer\_ex1\_cputimers.c

This example configures CPU Timer0, 1, and 2 and increments a counter each time the timer asserts an interrupt. In order to migrate the project within syscfg to any device, click the swtich button under the device view and select your corresponding device to migrate, saving the project will auto-migrate your project settings.

##### External Connections

- None

##### Watch Variables

- cpuTimer0IntCount
- cpuTimer1IntCount
- cpuTimer2IntCount

### 3.16.2.2 CPU Timers

FILE: timer\_ex1\_cputimers\_sysconfig.c

This example configures CPU Timer0, 1, and 2 and increments a counter each time the timer asserts an interrupt.

#### External Connections

- None

#### Watch Variables

- cpuTimer0IntCount
- cpuTimer1IntCount
- cpuTimer2IntCount

### 3.16.3 MEMCFG Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/memcfg

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

### 3.16.4 INTERRUPT Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location: C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/interrupt

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 3.16.4.1 External Interrupts (ExternalInterrupt)

FILE: interrupt\_ex1\_external.c

This program sets up GPIO0 as XINT1 and GPIO1 as XINT2. Two other GPIO signals are used to trigger the interrupt (GPIO10 triggers XINT1 and GPIO11 triggers XINT2). The user is required to externally connect these signals for the program to work properly.

XINT1 input is synced to SYSCLKOUT.

XINT2 has a long qualification - 6 samples at 510\*SYSCLKOUT each.

GPIO16 will go high outside of the interrupts and low within the interrupts. This signal can be monitored on a scope.

Each interrupt is fired in sequence - XINT1 first and then XINT2

#### External Connections

- Connect GPIO10 to GPIO0. GPIO0 will be assigned to XINT1
- Connect GPIO11 to GPIO1. GPIO1 will be assigned to XINT2

Monitor GPIO16 with an oscilloscope. GPIO16 will be high outside of the ISRs and low within each ISR.

#### Watch Variables

- xint1Count for the number of times through XINT1 interrupt
- xint2Count for the number of times through XINT2 interrupt
- loopCount for the number of times through the idle loop

#### 3.16.4.2 Multiple interrupt handling of I2C, SCI & SPI Digital Loopback

FILE: interrupt\_ex2\_with\_i2c\_sci\_spi\_loopback.c

This program is used to demonstrate how to handle multiple interrupts when using multiple communication peripherals like I2C, SCI & SPI Digital Loopback all in a single example. The data transfers would be done with FIFO Interrupts.

It uses the internal loopback test mode of these modules. Both the TX and RX FIFOs and their interrupts are used. Other than boot mode pin configuration, no other hardware configuration is required.

A stream of data is sent and then compared to the received stream. The sent data looks like this for I2C and SCI:

```
0000 0001
0001 0002
0002 0003
....
00FE 00FF
00FF 0000
etc..
```

The sent data looks like this for SPI:

```
0000 0001
0001 0002
0002 0003
....
FFFE FFFF
FFFF 0000
etc..
```

This pattern is repeated forever.

#### *External Connections*

- None

#### *Watch Variables*

- *sDataI2cA* - Data to send through I2C
- *rDataI2cA* - Received I2C data
- *rDataPoint* - Used to keep track of the last position in the receive I2C stream for error checking
- *sDataSpiA* - Data to send through SPI
- *rDataSpiA* - Received SPI data
- *rDataPointSpiA* - Used to keep track of the last position in the receive SPI stream for error checking
- *sDataSciA* - SCI Data being sent
- *rDataSciA* - SCI Data received
- *rDataPointA* - Keep track of where we are in the SCI data stream. This is used to check the incoming data

### **3.16.4.3 CPU Timer Interrupt Software Prioritization**

FILE: interrupt\_ex3\_sw\_prioritization.c

This examples demonstrates the software prioritization of interrupts through CPU Timer Interrupts. Software prioritization of interrupts is achieved by enabling interrupt nesting.

In this device, hardware priorities for CPU Timer 0, 1 and 2 are set as timer 0 being highest priority and timer 2 being lowest priority. This example configures CPU Timer0, 1, and 2 priority in software with timer 2 priority being highest and timer 0 being lowest in software and prints a trace for the order of execution.

For most applications, the hardware prioritizing of the interrupts is sufficient. For applications that need custom prioritizing, this example illustrates how this can be done through software. User specific priorities can be configured in sw\_prioritized\_isr\_level.h header file.

To enable interrupt nesting, following sequence needs to followed in ISRs. *Step 1:* Set the global priority: Modify the IER register to allow CPU interrupts with a higher user priority to be serviced. Note: at this time IER has already been saved on the stack. *Step 2:* Set the group priority: (optional) Modify the appropriate PIEIERx

register to allow group interrupts with a higher user set priority to be serviced. Do NOT clear PIEIER register bits from another group other than that being serviced by this ISR. Doing so can cause erroneous interrupts to occur. *Step 3:* Enable interrupts: There are three steps to do this: a. Clear the PIEACK bits b. Wait at least one cycle c. Clear the INTM bit. *Step 4:* Run the main part of the ISR *Step 5:* Set INTM to disable interrupts. *Step 6:* Restore PIEIERx (optional depending on step 2) *Step 7:* Return from ISR

Refer to below link on more details on Interrupt nesting in C28x devices:

[C2000Ware\docs\c28x\\_interrupt\\_nesting\html\index.html](http://<C2000Ware>\docs\c28x_interrupt_nesting\html\index.html)

#### External Connections

- None

#### Watch Variables

- traceISR - shows the order in which ISRs are executed.

### 3.16.4.4 EPWM Real-Time Interrupt

FILE: interrupt\_ex4\_epwm\_realtime\_interrupt.c

This example configures the ePWM1 Timer and increments a counter each time the ISR is executed. ePWM interrupt can be configured as time critical to demonstrate real-time mode functionality and real-time interrupt capability.

The example uses 2 LEDs - LED1 is toggled in the main loop and LED2 is toggled in the EPWM Timer Interrupt. FREE\_SOFT bits and DBGIER.INT3 bit must be set to enable ePWM1 interrupt to be time critical and operational in real time mode after halt command

How to run the example?

- Add the watch variables as mentioned below and enable Continuous Refresh.
- Enable real-time mode (Run->Advanced->Enable Silicon Real-time Mode)
- Initially, the DBGIER register is set to 0 and the EPWM emulation mode is set to EPWM\_EMULATION\_STOP\_AFTER\_NEXT\_TB (FREE\_SOFT = 0)
- When the application is running, you will find both LEDs toggling and the watch variables EPwm1TimerIntCount, EPwm1Regs.TBCTR getting updated.
- When the application is halted, both LEDs stop toggling and the watch variables remain constant. EPWM counter is stopped on debugger halt.
- To enable EPWM counter run during debugger halt, set emulation mode as EPWM\_EMULATION\_FREE\_RUN (FREE\_SOFT = 2). You will find EPwm1Regs.TBCTR is running, but EPwm1TimerIntCount remains constant. This means, the EPWM counter is running, but the ISRs are not getting serviced.
- To enable real-time interrupts, set DBGIER.INT3 = 1 (EPWM1 interrupt is part of PIE Group 3). You will find that the EPwm1TimerIntCount is incrementing and the LED starts toggling. The EPWM ISR is getting serviced even during a debugger halt.

For more details, watch this video : [C2000 Real-Time Features](#)

#### External Connections

- None

#### Watch Variables

- EPwm1TimerIntCount - EPWM1 ISR counter
- EPwm1Regs.TBCTR.TBCTR - EPWM1 Time Base counter
- EPwm1Regs.TBCTL.FREE\_SOFT - Set this to 2 to enable free run
- DBGIER.INT3 - Set to 1 to enable real time interrupt

### 3.16.5 LPM Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/lpm

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

### 3.16.6 WATCHDOG Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/watchdog

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 3.16.6.1 Watchdog

FILE: watchdog\_ex1\_service.c

This example shows how to service the watchdog or generate a wakeup interrupt using the watchdog. By default the example will generate a Wake interrupt. To service the watchdog and not generate the interrupt, uncomment the SysCtl\_serviceWatchdog() line in the main for loop.

##### *External Connections*

- None.

##### *Watch Variables*

- wakeCount - The number of times entered into the watchdog ISR
- loopCount - The number of loops performed while not in ISR

## 3.17 System Control Registers

### 3.17.1 System Control Base Addresses

**Table 3-20. System Control Base Address Table**

Device Registers	Register Name	Start Address	End Address
CpuTimer0Regs	CPUTIMER_REGS	0x0000_0C00	0x0000_0C07
CpuTimer1Regs	CPUTIMER_REGS	0x0000_0C08	0x0000_0C0F
CpuTimer2Regs	CPUTIMER_REGS	0x0000_0C10	0x0000_0C17

### 3.17.2 CPUTIMER\_REGS Registers

Table 3-21 lists the memory-mapped registers for the CPUTIMER\_REGS registers. All register offset addresses not listed in Table 3-21 should be considered as reserved locations and the register contents should not be modified.

**Table 3-21. CPUTIMER\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	TIM	CPU-Timer, Counter Register		<a href="#">Go</a>
2h	PRD	CPU-Timer, Period Register		<a href="#">Go</a>
4h	TCR	CPU-Timer, Control Register		<a href="#">Go</a>
6h	TPR	CPU-Timer, Prescale Register		<a href="#">Go</a>
7h	TPRH	CPU-Timer, Prescale Register High		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-22 shows the codes that are used for access types in this section.

**Table 3-22. CPUTIMER\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
Reset or Default Value		
-n		Value after reset or the default value

### 3.17.2.1 TIM Register (Offset = 0h) [Reset = 0000FFFFh]

TIM is shown in [Figure 3-24](#) and described in [Table 3-23](#).

Return to the [Summary Table](#).

CPU-Timer, Counter Register

**Figure 3-24. TIM Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSW																LSW															
R/W-0h																R/W-FFFFh															

**Table 3-23. TIM Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	MSW	R/W	0h	CPU-Timer Counter Registers The TIMH register holds the high 16 bits of the current 32-bit count of the timer. The TIMH:TIM decrements by one every (TDDRH:TDDR+1) clock cycles, where TDDRH:TDDR is the timer prescale dividedown value. When the TIMH:TIM decrements to zero, the TIMH:TIM register is reloaded with the period value contained in the PRDH:PRD registers. The timer interrupt (TINT) signal is generated. Reset type: SYSRSn
15-0	LSW	R/W	FFFFh	CPU-Timer Counter Registers The TIM register holds the low 16 bits of the current 32-bit count of the timer. The TIMH:TIM decrements by one every (TDDRH:TDDR+1) clock cycles, where TDDRH:TDDR is the timer prescale dividedown value. When the TIMH:TIM decrements to zero, the TIMH:TIM register is reloaded with the period value contained in the PRDH:PRD registers. The timer interrupt (TINT) signal is generated. Reset type: SYSRSn

### 3.17.2.2 PRD Register (Offset = 2h) [Reset = 0000FFFFh]

PRD is shown in [Figure 3-25](#) and described in [Table 3-24](#).

Return to the [Summary Table](#).

CPU-Timer, Period Register

**Figure 3-25. PRD Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSW																LSW															
R/W-0h																R/W-FFFFh															

**Table 3-24. PRD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	MSW	R/W	0h	CPU-Timer Period Registers The PRDH register holds the high 16 bits of the 32-bit period. When the TIMH:TIM decrements to zero, the TIMH:TIM register is reloaded with the period value contained in the PRDH:PRD registers, at the start of the next timer input clock cycle (the output of the prescaler). The PRDH:PRD contents are also loaded into the TIMH:TIM when you set the timer reload bit (TRB) in the Timer Control Register (TCR). Reset type: SYSRSn
15-0	LSW	R/W	FFFFh	CPU-Timer Period Registers The PRD register holds the low 16 bits of the 32-bit period. When the TIMH:TIM decrements to zero, the TIMH:TIM register is reloaded with the period value contained in the PRDH:PRD registers, at the start of the next timer input clock cycle (the output of the prescaler). The PRDH:PRD contents are also loaded into the TIMH:TIM when you set the timer reload bit (TRB) in the Timer Control Register (TCR). Reset type: SYSRSn

### 3.17.2.3 TCR Register (Offset = 4h) [Reset = 0001h]

TCR is shown in [Figure 3-26](#) and described in [Table 3-25](#).

Return to the [Summary Table](#).

CPU-Timer, Control Register

**Figure 3-26. TCR Register**

15		14		13		12		11		10		9		8	
TIF		TIE		RESERVED				FREE		SOFT		RESERVED			
R/W1C-0h		R/W-0h		R-0h				R/W-0h		R/W-0h		R-0h			
7		6		5		4		3		2		1		0	
RESERVED				TRB		TSS		RESERVED							
R-0h				R/W-0h		R/W-0h		R-1h							

**Table 3-25. TCR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	TIF	R/W1C	0h	CPU-Timer Overflow Flag. TIF indicates whether a timer overflow has happened since TIF was last cleared. TIF is not cleared automatically and does not need to be cleared to enable the next timer interrupt. Reset type: SYSRSn 0h (R/W) = The CPU-Timer has not decremented to zero. Writes of 0 are ignored. 1h (R/W) = This flag gets set when the CPU-timer decrements to zero. Writing a 1 to this bit clears the flag.
14	TIE	R/W	0h	CPU-Timer Interrupt Enable. Reset type: SYSRSn 0h (R/W) = The CPU-Timer interrupt is disabled. 1h (R/W) = The CPU-Timer interrupt is enabled. If the timer decrements to zero, and TIE is set, the timer asserts its interrupt request.
13-12	RESERVED	R	0h	Reserved
11	FREE	R/W	0h	If the FREE bit is set to 1, then, upon a software breakpoint, the timer continues to run. If FREE is 0, then the SOFT bit controls the emulation behavior. Reset type: SYSRSn 0h (R/W) = Stop after the next decrement of the TIMH:TIM (hard stop) (SOFT bit controls the emulation behavior) 1h (R/W) = Free Run (SOFT bit is don't care, counter is free running)
10	SOFT	R/W	0h	If the FREE bit is set to 1, then, upon a software breakpoint, the timer continues to run (that is, free runs). In this case, SOFT is a don't care. But if FREE is 0, then SOFT takes effect. Reset type: SYSRSn 0h (R/W) = Stop after the next decrement of the TIMH:TIM (hard stop). (ONLY if FREE=0, if FREE=1 this bit is don't care) 1h (R/W) = Stop after the TIMH:TIM decrements to 0 (soft stop) In the SOFT STOP mode, the timer generates an interrupt before shutting down (since reaching 0 is the interrupt causing condition). (ONLY if FREE=0, if FREE=1 this bit is don't care)
9-6	RESERVED	R	0h	Reserved

**Table 3-25. TCR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
5	TRB	R/W	0h	<p>Timer reload</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = The TRB bit is always read as zero. Writes of 0 are ignored.</p> <p>1h (R/W) = When you write a 1 to TRB, the TIMH:TIM is loaded with the value in the PRDH:PRD, and the prescaler counter (PSCH:PSC) is loaded with the value in the timer dividedown register (TDDR:H:TDDR).</p>
4	TSS	R/W	0h	<p>CPU-Timer stop status bit.</p> <p>TSS is a 1-bit flag that stops or starts the CPU-timer.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = Reads of 0 indicate the CPU-timer is running. To start or restart the CPU-timer, set TSS to 0. At reset, TSS is cleared to 0 and the CPU-timer immediately starts.</p> <p>1h (R/W) = Reads of 1 indicate that the CPU-timer is stopped. To stop the CPU-timer, set TSS to 1.</p>
3-0	RESERVED	R	1h	Reserved

### 3.17.2.4 TPR Register (Offset = 6h) [Reset = 0000h]

TPR is shown in [Figure 3-27](#) and described in [Table 3-26](#).

Return to the [Summary Table](#).

CPU-Timer, Prescale Register

**Figure 3-27. TPR Register**

R/W-0h							

**Table 3-26. TPR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-8	PSC	R	0h	<p>CPU-Timer Prescale Counter.</p> <p>These bits hold the current prescale count for the timer. For every timer clock source cycle that the PSCH:PSC value is greater than 0, the PSCH:PSC decrements by one. One timer clock (output of the timer prescaler) cycle after the PSCH:PSC reaches 0, the PSCH:PSC is loaded with the contents of the TDDRH:TDDR, and the timer counter register (TIMH:TIM) decrements by one. The PSCH:PSC is also reloaded whenever the timer reload bit (TRB) is set by software. The PSCH:PSC can be checked by reading the register, but it cannot be set directly. It must get its value from the timer divide-down register (TDDRH:TDDR). At reset, the PSCH:PSC is set to 0.</p> <p>Reset type: SYSRSn</p>
7-0	TDDR	R/W	0h	<p>CPU-Timer Divide-Down.</p> <p>Every (TDDRH:TDDR + 1) timer clock source cycles, the timer counter register (TIMH:TIM) decrements by one. At reset, the TDDRH:TDDR bits are cleared to 0. To increase the overall timer count by an integer factor, write this factor minus one to the TDDRH:TDDR bits. When the prescaler counter (PSCH:PSC) value is 0, one timer clock source cycle later, the contents of the TDDRH:TDDR reload the PSCH:PSC, and the TIMH:TIM decrements by one. TDDRH:TDDR also reloads the PSCH:PSC whenever the timer reload bit (TRB) is set by software.</p> <p>Reset type: SYSRSn</p>

### 3.17.2.5 TPRH Register (Offset = 7h) [Reset = 0000h]

TPRH is shown in [Figure 3-28](#) and described in [Table 3-27](#).

Return to the [Summary Table](#).

R-0h							R/W-0h

**Table 3-30. PIECTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-1	PIEVECT	R	0h	These bits indicate the vector address of the vector fetched from the ePIE vector table. The least significant bit of the address is ignored and only bits 1 to 15 of the address are shown. The vector value can be read by the user to determine which interrupt generated the vector fetch. Note: When a NMI is serviced, the PIEVECT bit-field does not reflect the vector as it does for other interrupts. Reset type: SYSRSn
0	ENPIE	R/W	0h	Enable vector fetching from ePIE block. This bit must be set to 1 for peripheral interrupts to work. All ePIE registers (PIEACK, PIEIFR, PIEIER) can be accessed even when the ePIE block is disabled. Reset type: SYSRSn

### 3.17.3.2 PIEACK Register (Offset = 1h) [Reset = 0000h]

PIEACK is shown in [Figure 3-30](#) and described in [Table 3-31](#).

Return to the [Summary Table](#).

#### Acknowledge Register

When an interrupt propagates from the ePIE to a CPU interrupt line, the interrupt group's PIEACK bit is set. This prevents other interrupts in that group from propagating to the CPU while the first interrupt is handled. Writing a 1 to a PIEACK bit clears it and allows another interrupt from the corresponding group to propagate. ISRs for PIE interrupts should clear the group's PIEACK bit before returning from the interrupt.

Writes of 0 are ignored.

**Figure 3-30. PIEACK Register**

### 3.17.3.3 PIEIER1 Register (Offset = 2h) [Reset = 0000h]

PIEIER1 is shown in [Figure 3-31](#) and described in [Table 3-32](#).

Return to the [Summary Table](#).

#### Interrupt Group 1 Enable Register

These register bits individually enable an interrupt within a group. They behave very much like the bits in the CPU interrupt enable register (IER).

Setting a bit to 1 allows the corresponding interrupt to propagate to the CPU.

Setting a bit to 0 prevents the corresponding interrupt from propagating. Note that a peripheral interrupt signal can still set the PIEIFR bit for the disabled interrupt.

**Figure 3-31. PIEIER1 Register**

### 3.17.3.4 PIEIFR1 Register (Offset = 3h) [Reset = 0000h]

PIEIFR1 is shown in [Figure 3-32](#) and described in [Table 3-33](#).

Return to the [Summary Table](#).

#### Interrupt Group 1 Flag Register

These register bits indicate whether each interrupt in the group is currently pending. They behave very much like the bits in the CPU interrupt flag register (IFR).

When a peripheral sends an interrupt, the corresponding bit is set. This bit is cleared when the interrupt propagates to the CPU, at which point PIEACK is set.

NOTE: PIE IFR flags can be written to create software interrupts.

The IFR flag will be cleared on a write of zero. Hence, when the intent is to fire an interrupt it may cause inadvertent cancellation of other interrupts. It is recommended to use this only for testing or with extreme caution in the application code. Reading the PIE IFR registers is safe.

**Figure 3-32. PIEIFR1 Register**

### 3.17.3.7 PIEIER3 Register (Offset = 6h) [Reset = 0000h]

PIEIER3 is shown in [Figure 3-35](#) and described in [Table 3-36](#).

Return to the [Summary Table](#).

#### Interrupt Group 3 Enable Register

These register bits individually enable an interrupt within a group. They behave very much like the bits in the CPU interrupt enable register (IER).

Setting a bit to 1 allows the corresponding interrupt to propagate to the CPU.

Setting a bit to 0 prevents the corresponding interrupt from propagating. Note that a peripheral interrupt signal can still set the PIEIFR bit for the disabled interrupt.

### 3.17.3.8 PIEIFR3 Register (Offset = 7h) [Reset = 0000h]

PIEIFR3 is shown in [Figure 3-36](#) and described in [Table 3-37](#).

Return to the [Summary Table](#).

#### Interrupt Group 3 Flag Register

These register bits indicate whether each interrupt in the group is currently pending. They behave very much like the bits in the CPU interrupt flag register (IFR).

When a peripheral sends an interrupt, the corresponding bit is set. This bit is cleared when the interrupt propagates to the CPU, at which point PIEACK is set.

NOTE: PIE IFR flags can be written to create software interrupts.

The IFR flag will be cleared on a write of zero. Hence, when the intent is to fire an interrupt it may cause inadvertent cancellation of other interrupts. It is recommended to use this only for testing or with extreme caution in the application code. Reading the PIE IFR registers is safe.

**Figure 3-36. PIEIFR3 Register**

### 3.17.3.15 PIEIER7 Register (Offset = Eh) [Reset = 0000h]

PIEIER7 is shown in [Figure 3-43](#) and described in [Table 3-44](#).

Return to the [Summary Table](#).

#### Interrupt Group 7 Enable Register

These register bits individually enable an interrupt within a group. They behave very much like the bits in the CPU interrupt enable register (IER).

Setting a bit to 1 allows the corresponding interrupt to propagate to the CPU.

Setting a bit to 0 prevents the corresponding interrupt from propagating. Note that a peripheral interrupt signal can still set the PIEIFR bit for the disabled interrupt.

### 3.17.3.16 PIEIFR7 Register (Offset = Fh) [Reset = 0000h]

PIEIFR7 is shown in [Figure 3-44](#) and described in [Table 3-45](#).

Return to the [Summary Table](#).

#### Interrupt Group 7 Flag Register

These register bits indicate whether each interrupt in the group is currently pending. They behave very much like the bits in the CPU interrupt flag register (IFR).

When a peripheral sends an interrupt, the corresponding bit is set. This bit is cleared when the interrupt propagates to the CPU, at which point PIEACK is set.

NOTE: PIE IFR flags can be written to create software interrupts.

The IFR flag will be cleared on a write of zero. Hence, when the intent is to fire an interrupt it may cause inadvertent cancellation of other interrupts. It is recommended to use this only for testing or with extreme caution in the application code. Reading the PIE IFR registers is safe.

### 3.17.3.24 PIEIFR11 Register (Offset = 17h) [Reset = 0000h]

PIEIFR11 is shown in [Figure 3-52](#) and described in [Table 3-53](#).

Return to the [Summary Table](#).

#### Interrupt Group 11 Flag Register

These register bits indicate whether each interrupt in the group is currently pending. They behave very much like the bits in the CPU interrupt flag register (IFR).

When a peripheral sends an interrupt, the corresponding bit is set. This bit is cleared when the interrupt propagates to the CPU, at which point PIEACK is set.

NOTE: PIE IFR flags can be written to create software interrupts.

The IFR flag will be cleared on a write of zero. Hence, when the intent is to fire an interrupt it may cause inadvertent cancellation of other interrupts. It is recommended to use this only for testing or with extreme caution in the application code. Reading the PIE IFR registers is safe.

### 3.17.3.25 PIEIER12 Register (Offset = 18h) [Reset = 0000h]

PIEIER12 is shown in [Figure 3-53](#) and described in [Table 3-54](#).

Return to the [Summary Table](#).

#### Interrupt Group 12 Enable Register

These register bits individually enable an interrupt within a group. They behave very much like the bits in the CPU interrupt enable register (IER).

Setting a bit to 1 allows the corresponding interrupt to propagate to the CPU.

Setting a bit to 0 prevents the corresponding interrupt from propagating. Note that a peripheral interrupt signal can still set the PIEIFR bit for the disabled interrupt.

**Figure 3-53. PIEIER12 Register**

### 3.17.4 WD\_REGS Registers

Table 3-56 lists the memory-mapped registers for the WD\_REGS registers. All register offset addresses not listed in Table 3-56 should be considered as reserved locations and the register contents should not be modified.

**Table 3-56. WD\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
22h	SCSR	System Control & Status Register	EALLOW	<a href="#">Go</a>
23h	WDCNTR	Watchdog Counter Register	EALLOW	<a href="#">Go</a>
25h	WDKEY	Watchdog Reset Key Register	EALLOW	<a href="#">Go</a>
29h	WDCR	Watchdog Control Register Note: IORSn reset type is asserted when XRSn or CPU1.SYSRSn or CPU1.WDRSn or CPU1.NMIRSn is asserted.	EALLOW	<a href="#">Go</a>
2Ah	WDWCR	Watchdog Windowed Control Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-57 shows the codes that are used for access types in this section.

**Table 3-57. WD\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1C	W1C	Write 1 to clear
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.4.1 SCSR Register (Offset = 22h) [Reset = 0005h]

SCSR is shown in [Figure 3-55](#) and described in [Table 3-58](#).

Return to the [Summary Table](#).

It is recommended to only use 16 bit accesses to write to this register. Use a read-modify-write instruction may inadvertently clear other bits.

**Figure 3-55. SCSR Register**

15	14	13	12	11	10	9	8
RESERVED							
R-0-0h							
7	6	5	4	3	2	1	0
RESERVED					WDINTS	WDENINT	WDOVERRIDE
R-0-0h					R-1h	R/W-0h	R/W1C-1h

**Table 3-58. SCSR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-3	RESERVED	R-0	0h	Reserved
2	WDINTS	R	1h	<p>Watchdog interrupt (WDINTn) status signal. This is a read only bit reflecting the current state of the WDINTn signal from the watchdog block (after synchronization with SYCLKOUT). If this bit is 1, the watchdog interrupt is not active. If this bit is 0, then the watchdog interrupt is active.</p> <p>Note: If the WDINTn signal is used to wake up from IDLE or STANDBY condition, then the user should make sure that the WDINTn signal goes back high again before attempting to go back into IDLE or STANDBY mode. Reading this bit will tell the user the current state of this signal.</p> <p>Reset type: SYSRSn</p>
1	WDENINT	R/W	0h	<p>If this bit is set to 1, the watchdog reset (WDRSTn) output signal is disabled and the watchdog interrupt (WDINTn) output signal is enabled. If this bit is zero, then the WDRSTn output signal is enabled and the WDINTn output signal is disabled. This is the default state on system reset (SYSRSn).</p> <p>Reset type: SYSRSn</p>
0	WDOVERRIDE	R/W1C	1h	<p>If this bit is set to 1, the user is allowed to change the state of the Watchdog disable (WDDIS) bit in the Watchdog Control (WDCR) register. If the WDOVERRIDE bit is cleared, by writing a 1 the WDDIS bit cannot be modified by the user. Writing a 0 will have no effect. If this bit is cleared, then it will remain in this state until a reset occurs. The current state of this bit is readable by the user.</p> <p>Reset type: SYSRSn</p>

### 3.17.4.2 WDCNTR Register (Offset = 23h) [Reset = 0000h]

WDCNTR is shown in [Figure 3-56](#) and described in [Table 3-59](#).

Return to the [Summary Table](#).

Watchdog Counter Register

NMIWDCNT							
R-0h							
7	6	5	4	3	2	1	0
NMIWDCNT							
R-0h							

**Table 3-69. NMIWDCNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	NMIWDCNT	R	0h	<p>NMI Watchdog Counter: This 16-bit incremental counter will start incrementing whenever any one of the enabled FAIL flags are set. If the counter reaches the period value, an NMIRSn signal is fired which will then resets the system. The counter will reset to zero when it reaches the period value and will then restart counting if any of the enabled FAIL flags are set.</p> <p>If no enabled FAIL flag is set, then the counter will reset to zero and remain at zero until an enabled FAIL flag is set.</p> <p>Normally, the software would respond to the NMI interrupt generated and clear the offending FLAG(s) before the NMI watchdog triggers a reset. In some situations, the software may decide to allow the watchdog to reset the device anyway.</p> <p>The counter is clocked at the SYSCLKOUT rate.</p> <p>Reset type: SYSRSn</p>

### 3.17.5.6 NMIWDPRD Register (Offset = 5h) [Reset = FFFFh]

NMIWDPRD is shown in [Figure 3-65](#) and described in [Table 3-70](#).

Return to the [Summary Table](#).

NMI Watchdog Period Register

### 3.17.6 XINT\_REGS Registers

Table 3-72 lists the memory-mapped registers for the XINT\_REGS registers. All register offset addresses not listed in Table 3-72 should be considered as reserved locations and the register contents should not be modified.

**Table 3-72. XINT\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	XINT1CR	XINT1 configuration register		<a href="#">Go</a>
1h	XINT2CR	XINT2 configuration register		<a href="#">Go</a>
2h	XINT3CR	XINT3 configuration register		<a href="#">Go</a>
3h	XINT4CR	XINT4 configuration register		<a href="#">Go</a>
4h	XINT5CR	XINT5 configuration register		<a href="#">Go</a>
8h	XINT1CTR	XINT1 counter register		<a href="#">Go</a>
9h	XINT2CTR	XINT2 counter register		<a href="#">Go</a>
Ah	XINT3CTR	XINT3 counter register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-73 shows the codes that are used for access types in this section.

**Table 3-73. XINT\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.6.1 XINT1CR Register (Offset = 0h) [Reset = 0000h]

INTCTR							
R-0h							

**Table 3-79. XINT1CTR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	INTCTR	R	0h	This is a free running 16-bit up-counter that is clocked at the SYSCLKOUT rate. The counter value is reset to 0x0000 when a valid interrupt edge is detected and then continues counting until the next valid interrupt edge is detected. The counter must only be reset by the selected POLARITY edge as selected in the respective interrupt control register. When the interrupt is disabled, the counter will stop. The counter is a free-running counter and will wrap around to zero when the max value is reached. The counter is a read only register and can only be reset to zero by a valid interrupt edge or by reset. Reset type: SYSRSn

### 3.17.6.7 XINT2CTR Register (Offset = 9h) [Reset = 0000h]

XINT2CTR is shown in [Figure 3-73](#) and described in [Table 3-80](#).

Return to the [Summary Table](#).

**Table 3-81. XINT3CTR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	INTCTR	R	0h	This is a free running 16-bit up-counter that is clocked at the SYSCLKOUT rate. The counter value is reset to 0x0000 when a valid interrupt edge is detected and then continues counting until the next valid interrupt edge is detected. The counter must only be reset by the selected POLARITY edge as selected in the respective interrupt control register. When the interrupt is disabled, the counter will stop. The counter is a free-running counter and will wrap around to zero when the max value is reached. The counter is a read only register and can only be reset to zero by a valid interrupt edge or by reset. Reset type: SYSRSn

### 3.17.7 SYNC\_SOC\_REGS Registers

Table 3-82 lists the memory-mapped registers for the SYNC\_SOC\_REGS registers. All register offset addresses not listed in Table 3-82 should be considered as reserved locations and the register contents should not be modified.

**Table 3-82. SYNC\_SOC\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	SYNCSELECT	Sync Input and Output Select Register	EALLOW	<a href="#">Go</a>
2h	ADCSOCOUTSELECT	External ADC (Off Chip) SOC Select Register	EALLOW	<a href="#">Go</a>
4h	SYNCSOCLOCK	SYNCSEL and EXTADC SOC Select Lock register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-83 shows the codes that are used for access types in this section.

**Table 3-83. SYNC\_SOC\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.7.1 SYNCSELECT Register (Offset = 0h) [Reset = 0000000h]

### 3.17.7.2 ADCSOCOUTSELECT Register (Offset = 2h) [Reset = 0000000h]

ADCSOCOUTSELECT is shown in [Figure 3-76](#) and described in [Table 3-85](#).

Return to the [Summary Table](#).

The ADCSOCAO and ADCSOCBO signals will be active low for 32 SYSCLK cycles. They can be used to trigger a conversion on an external ADC.

Notes: [1] Any bit in this register, once set can only be created through a CPU1.SYSRSn. Write of 0 to any bit of this register has no effect [2] The locking mechanism applies to only writes. Reads to the registers which have LOCK protection are always allowed Reset type: CPU1.SYSRSn
0	SYNCSELECT	R/WOnce	0h	SYNCSELECT Register Lock bit: 0: Respective register is not locked 1: Respective register is locked. Notes: [1] Any bit in this register, once set can only be created through a CPU1.SYSRSn. Write of 0 to any bit of this register has no effect [2] The locking mechanism applies to only writes. Reads to the registers which have LOCK protection are always allowed Reset type: CPU1.SYSRSn

### 3.17.8 DMA\_CLA\_SRC\_SEL\_REGS Registers

Table 3-87 lists the memory-mapped registers for the DMA\_CLA\_SRC\_SEL\_REGS registers. All register offset addresses not listed in Table 3-87 should be considered as reserved locations and the register contents should not be modified.

**Table 3-87. DMA\_CLA\_SRC\_SEL\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	CLA1TASKSRCSELLOCK	CLA1 Task Trigger Source Select Lock Register	EALLOW	<a href="#">Go</a>
4h	DMACHSRCSELLOCK	DMA Channel Trigger Source Select Lock Register	EALLOW	<a href="#">Go</a>
6h	CLA1TASKSRCSEL1	CLA1 Task Trigger Source Select Register-1	EALLOW	<a href="#">Go</a>
8h	CLA1TASKSRCSEL2	CLA1 Task Trigger Source Select Register-2	EALLOW	<a href="#">Go</a>
16h	DMACHSRCSEL1	DMA Channel Trigger Source Select Register-1	EALLOW	<a href="#">Go</a>
18h	DMACHSRCSEL2	DMA Channel Trigger Source Select Register-2	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-88 shows the codes that are used for access types in this section.

**Table 3-88. DMA\_CLA\_SRC\_SEL\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
WOnce	WOnce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.8.1 CLA1TASKSRCSELLOCK Register (Offset = 0h) [Reset = 0000000h]

CLA1TASKSRCSELLOCK is shown in [Figure 3-78](#) and described in [Table 3-89](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. [Table 3-96](#) shows the codes that are used for access types in this section.

**Table 3-96. DEV\_CFG\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Write once
WOnce	WOnce	Write Write once
WOnce	WOnce	Write Write once
WOnce	WOnce	Write Write once
WOnce	WOnce	Write Write once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.9.1 PARTIDL Register (Offset = 8h) [Reset = 0000000h]

PARTIDL is shown in [Figure 3-84](#) and described in [Table 3-97](#).

Return to the [Summary Table](#).

### 3.17.9.29 SOFTPRES4 Register (Offset = 8Ah) [Reset = 0000000h]

SOFTPRES4 is shown in [Figure 3-112](#) and described in [Table 3-125](#).

Return to the [Summary Table](#).

Peripheral Software Reset register

When bits in this register are set, the respective peripheral is in reset. All data is lost and the peripheral registers are returned to their reset states. Bits must be manually cleared after being set.

### 3.17.10 CLK\_CFG\_REGS Registers

Table 3-135 lists the memory-mapped registers for the CLK\_CFG\_REGS registers. All register offset addresses not listed in Table 3-135 should be considered as reserved locations and the register contents should not be modified.

**Table 3-135. CLK\_CFG\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
2h	CLKCFGLOCK1	Lock bit for CLKCFG registers	EALLOW	<a href="#">Go</a>
8h	CLKSRCCTL1	Clock Source Control register-1	EALLOW	<a href="#">Go</a>
Ah	CLKSRCCTL2	Clock Source Control register-2	EALLOW	<a href="#">Go</a>
Ch	CLKSRCCTL3	Clock Source Control register-3	EALLOW	<a href="#">Go</a>
Eh	SYSPLLCTL1	SYSPLL Control register-1	EALLOW	<a href="#">Go</a>
14h	SYSPLLMULT	SYSPLL Multiplier register	EALLOW	<a href="#">Go</a>
16h	SYSPLLSTS	SYSPLL Status register		<a href="#">Go</a>
18h	AUXPLLCTL1	AUXPLL Control register-1	EALLOW	<a href="#">Go</a>
1Eh	AUXPLLMULT	AUXPLL Multiplier register	EALLOW	<a href="#">Go</a>
20h	AUXPLLSTS	AUXPLL Status register		<a href="#">Go</a>
22h	SYSCLKDIVSEL	System Clock Divider Select register	EALLOW	<a href="#">Go</a>
24h	AUXCLKDIVSEL	Auxillary Clock Divider Select register	EALLOW	<a href="#">Go</a>
26h	PERCLKDIVSEL	Peripheral Clock Divider Selet register	EALLOW	<a href="#">Go</a>
28h	XCLKOUTDIVSEL	XCLKOUT Divider Select register	EALLOW	<a href="#">Go</a>
2Ch	LOSPCP	Low Speed Clock Source Prescalar	EALLOW	<a href="#">Go</a>
2Eh	MDCDR	Missing Clock Detect Control Register	EALLOW	<a href="#">Go</a>
30h	X1CNT	10-bit Counter on X1 Clock		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-136 shows the codes that are used for access types in this section.

**Table 3-136. CLK\_CFG\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
WOnce	WOnce	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

**Table 3-136. CLK\_CFG\_REGS Access Type Codes (continued)**

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.10.1 CLKCFGLOCK1 Register (Offset = 2h) [Reset = 0000000h]

CLKCFGLOCK1 is shown in [Figure 3-122](#) and described in [Table 3-137](#).

Return to the [Summary Table](#).

Lock bit for CLKCFG registers

Notes:

[1] Any bit in this register, once set can only be cleared through a CPU1.SYSRSn. Write of 0 to any bit of this register has no effect

[2] The locking mechanism applies to only writes. Reads to the registers which have LOCK protection are always allowed

### 3.17.10.2 CLKSRCCTL1 Register (Offset = 8h) [Reset = 0000000h]

CLKSRCCTL1 is shown in [Figure 3-123](#) and described in [Table 3-138](#).

Return to the [Summary Table](#).

Clock Source Control register-1

This memory mapped register requires a delay of 69 SYCLK cycles between subsequent writes to the register, otherwise a second write can be lost. This delay can be realized by adding 69 NOP instructions.

R-0-0h		R/W-0h	R/W-0h	R/W-0h	R-0-0h	R/W-0h	

**Table 3-138. CLKSRCCTL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R-0	0h	Reserved
15-6	RESERVED	R-0	0h	Reserved
5	WDHALTI	R/W	0h	Watchdog HALT Mode Ignore Bit: This bit determines if CPU1.WD is functional in the HALT mode or not. 0 = CPU1.WD is not functional in the HALT mode. Clock to CPU1.WD is gated when system enters HALT mode. Additionally, INTOSC1 and INTOSC2 are powered-down when system enters HALT mode 1 = CPU1.WD is functional in the HALT mode. Clock to CPU1.WD is not gated and INTOSC1/2 are not powered-down when system enters HALT mode Notes: [1] Clock to CPU2.WD clocks is always gated in the HALT mode. Reset type: XRSn
4	XTALOFF	R/W	0h	Crystal (External) Oscillator Off Bit: This bit turns external oscillator off: 0 = Crystal (External) Oscillator On (default on reset) 1 = Crystal (External) Oscillator Off NOTE: Ensure no resources are using a clock source prior to disabling it. For example OSCCLKSRCSEL (SYSPLL), AUXOSCCLKSRCSEL (AUXPLL), CANxBCLKSEL (CAN Clock), TMR2CLKSRCSEL (CPUTIMER2) and XCLKOUTSEL(XCLKOUT). Reset type: XRSn

**Table 3-138. CLKSRCCTL1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	INTOSC2OFF	R/W	0h	<p>Internal Oscillator 2 Off Bit: This bit turns oscillator 2 off:            0 = Internal Oscillator 2 On (default on reset)            1 = Internal Oscillator 2 Off            This bit could be used by the user to turn off the internal oscillator 2 if it is not used.            NOTE: Ensure no resources are using a clock source prior to disabling it. For example OSCCLKSRCSEL (SYSPLL), AUXOSCCLKSRCSEL (AUXPLL), TMR2CLKSRCSEL (CPUTIMER2) and XCLOCKOUT (XCLKOUT).            Reset type: XRSn</p>
2	RESERVED	R-0	0h	Reserved
1-0	OSCCLKSRCSEL	R/W	0h	<p>Oscillator Clock Source Select Bit: This bit selects the source for OSCCLK.            00 = INTOSC2 (default on reset)            01 = External Oscillator (XTAL)            10 = INTOSC1            11 = reserved (default to INTOSC1)            At power-up or after an XRSn, INTOSC2 is selected by default. Whenever the user changes the clock source using these bits, the SYSPLLMULT register will be forced to zero and the PLL will be bypassed and powered down. This prevents potential PLL overshoot. The user will then have to write to the SYSPLLMULT register to configure the appropriate multiplier.            The user must wait 10 OSCCLK cycles before writing to SYSPLLMULT or disabling the previous clock source to allow the change to complete..            Notes:            [1] Reserved selection defaults to 00 configuration            [2] INTOSC1 is recommended to be used only after missing clock detection. If user wants to re-lock the PLL with INTOSC1 (the back-up clock source) after missing clock is detected, he can do a MCLKCLR and lock the PLL.            Reset type: XRSn</p>

### 3.17.10.3 CLKSRCCTL2 Register (Offset = Ah) [Reset = 0000000h]

CLKSRCCTL2 is shown in [Figure 3-124](#) and described in [Table 3-139](#).

Return to the [Summary Table](#).

Clock Source Control register-2

This memory mapped register requires a delay of 69 SYCLK cycles between subsequent writes to the register, otherwise a second write can be lost. This delay can be realized by adding 69 NOP instructions.

### 3.17.10.14 XCLKOUTDIVSEL Register (Offset = 28h) [Reset = 0000003h]

XCLKOUTDIVSEL is shown in [Figure 3-135](#) and described in [Table 3-150](#).

Return to the [Summary Table](#).

XCLKOUT Divider Select register

This memory mapped register requires a delay of 69 SYCLK cycles between subsequent writes to the register, otherwise a second write can be lost. This delay can be realized by adding 69 NOP instructions.

15-10	RESERVED	R-0	0h	Reserved
9-0	X1CNT	R	0h	X1 Counter: - This counter increments on every X1 CLOCKS positive-edge. - Once it reaches the values of 0x3ff, it freezes - Before switching from INTOSC2 to X1, application must check this counter and make sure that it has saturated. This will ensure that the Crystal connected to X1/X2 is oscillating. Note: Since this bit counter cannot be reset locally, TI recommends using the 'SysCtl_pollCpuTimer' function in C2000Ware to detect the validity of the clock on X1 Reset type: POR

### 3.17.11 CPU\_SYS\_REGS Registers

Table 3-154 lists the memory-mapped registers for the CPU\_SYS\_REGS registers. All register offset addresses not listed in Table 3-154 should be considered as reserved locations and the register contents should not be modified.

**Table 3-154. CPU\_SYS\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	CPUSYSLOCK1	Lock bit for CPUSYS registers	EALLOW	<a href="#">Go</a>
6h	HIBBOOTMODE	HIB Boot Mode Register	EALLOW	<a href="#">Go</a>
8h	IORESTOREADDR	IORestore() routine Address Register	EALLOW	<a href="#">Go</a>
Ah	PIEVERRADDR	PIE Vector Fetch Error Address register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-155 shows the codes that are used for access types in this section.

**Table 3-155. CPU\_SYS\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1C	W1C	Write 1 to clear
W1S	W1S	Write 1 to set

**Table 3-155. CPU\_SYS\_REGS Access Type Codes (continued)**

Access Type	Code	Description
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.11.1 CPUSYSLOCK1 Register (Offset = 0h) [Reset = 0000000h]

CPUSYSLOCK1 is shown in [Figure 3-139](#) and described in [Table 3-156](#).

Return to the [Summary Table](#).

Lock bit for CPUSYS registers

Notes:

[1] Any bit in this register, once set can only be cleared through a CPU1.SYSRSn. Write of 0 to any bit of this register has no effect

[2] The locking mechanism applies to only writes. Reads to the registers which have LOCK protection are always allowed

1-0	PF1SEL	R/W	0h	This bit selects whether the dual ported bridge is connected with DMA or CLA as the secondary master (C28x is always connected as primary master) x0: Bridge is connected to CLA x1: Bridge is connected to DMA Reset type: SYSRSn

### 3.17.11.21 LPMCR Register (Offset = 76h) [Reset = 00000FCh]

LPMCR is shown in Figure 3-159 and described in Table 3-176.

Return to the [Summary Table](#).

LPM Control Register

**Figure 3-159. LPMCR Register**

31	30	29	28	27	26	25	24
IOISODIS	RESERVED						
R/W1S-0h				R-0-0h			
23	22	21	20	19	18	17	16
RESERVED						M0M1MODE	
R-0-0h				R/W-0h			
15	14	13	12	11	10	9	8
WDINTE	RESERVED						
R/W-0h				R-0-0h			
7	6	5	4	3	2	1	0
QUALSTDBY						LPM	
R/W-3Fh				R/W-0h			

**Table 3-176. LPMCR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	IOISODIS	R/W1S	0h	0: Indicates IO ISOLATION is not turned ON 1: Indicates IO ISOLATION is turned ON. This bit is set one by hardware ONLY during HIB. This bit cant be set to 1 by software Writing 0 to this bit has not effect. Writing 1 to this bit deactivates IO ISOLATION Notes: [1] This bit is reserved in the register mapped to CPU2 Reset type: raw-XRSn
30-18	RESERVED	R-0	0h	Reserved
17-16	M0M1MODE	R/W	0h	These bit control the state of CPU1's and CPU2's M0 & M1 memories when Device goes into HIB mode. 00: CPUx's M0 & M1 memories ON with low-leakage mode 01: CPUx's M0 & M1 memories OFF 1x: Reserved Notes: [1] Low-leakage mode for M0 & M1 memories uses the 'Retention' feature of the SRAMs. [2] These bits take effect only when device goes into HIB mode. If the device is not in HIB mode, the value in this bit doesn't control the state of CPU1's and CPU2's M0 & M1 memories Reset type: POR
15	WDINTE	R/W	0h	When this bit is set to 1, it enables the watchdog interrupt signal to wake the device from STANDBY mode. Note: [1] To use this signal, the user must also enable the WDINTn signal using the WDENINT bit in the SCSR register. This signal will not wake the device from HALT mode because the clock to watchdog module is turned off Reset type: SYSRSn
14-8	RESERVED	R-0	0h	Reserved

**Table 3-176. LPMCR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7-2	QUALSTDBY	R/W	3Fh	Select number of OSCCLK clock cycles to qualify the selected inputs when waking the from STANDBY mode: 000000 = 2 OSCCLKs 000001 = 3 OSCCLKs ..... 111111 = 65 OSCCLKs Note: The LPMCR.QUALSTDBY register should be set to a value greater than the ratio of INTOSC1/PLLSYSCLK to ensure proper wake up. Reset type: SYSRSn
1-0	LPM	R/W	0h	These bits set the low power mode for the device. Takes effect when CPU executes the IDLE instruction (when IDLE instruction is out of EXE Phase of the Pipeline) 00: IDLE Mode 01: STANDBY Mode 10: HALT Mode (treated as STANDBY for CPU2) 11: HIB Mode (treated as STANDBY for CPU2) Reset type: SYSRSn

### 3.17.11.22 GPIO\_LPMSEL0 Register (Offset = 78h) [Reset = 0000000h]

GPIO\_LPMSEL0 is shown in [Figure 3-160](#) and described in [Table 3-177](#).

Return to the [Summary Table](#).

GPIO LPM Wakeup select registers

Connects the selected pin to the LPM circuit. Refer to LPM section of the TRM for the wakeup capabilities of the selected pin.

### 3.17.11.24 TMR2CLKCTL Register (Offset = 7Ch) [Reset = 0000000h]

TMR2CLKCTL is shown in [Figure 3-162](#) and described in [Table 3-179](#).

Return to the [Summary Table](#).

Timer2 Clock Measurement functionality control register

This memory mapped register requires a delay of 69 SYCLK cycles between subsequent writes to the register, otherwise a second write can be lost. This delay can be realized by adding 69 NOP instructions.

2	WDRSn	R/W1C	0h	If this bit is set, indicates that the device was reset by WDRSn. Writing a 1 to this bit will force the bit to 0. Writing of 0 will have no effect. Reset type: POR
1	XRSn	R/W1C	1h	If this bit is set, indicates that the device was reset by XRSn. Writing a 1 to this bit will force the bit to 0. Writing of 0 will have no effect. Reset type: POR
0	POR	R/W1C	1h	If this bit is set, indicates that the device was reset by PORn. Writing a 1 to this bit will force the bit to 0. Writing of 0 will have no effect. Reset type: POR

### 3.17.12 ROM\_PREFETCH\_REGS Registers

Table 3-181 lists the memory-mapped registers for the ROM\_PREFETCH\_REGS registers. All register offset addresses not listed in Table 3-181 should be considered as reserved locations and the register contents should not be modified.

**Table 3-181. ROM\_PREFETCH\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	ROM_PREFETCH	ROM Prefetch Configuration Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-182 shows the codes that are used for access types in this section.

**Table 3-182. ROM\_PREFETCH\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.12.1 ROM PREFETCH Register (Offset = 0h) [Reset = 0000000h]

ROM PREFETCH is shown in [Figure 3-164](#) and described in [Table 3-183](#).

Return to the [Summary Table](#).

20h	Z1_EXEONLYRAMR	Zone 1 RAM Execute_Only Block Register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-185 shows the codes that are used for access types in this section.

**Table 3-185. DCSM\_Z1\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.13.1 Z1\_LINKPOINTER Register (Offset = 0h) [Reset = E000000h]

Z1\_LINKPOINTER is shown in [Figure 3-165](#) and described in [Table 3-186](#).

Return to the [Summary Table](#).

Zone 1 Link Pointer

**Figure 3-165. Z1\_LINKPOINTER Register**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED				CRCLOCK				PSWDLOCK				JTAGLOCK			
R-0h				R-Fh				R-Fh				R-Fh			

**Table 3-187. Z1\_OTPSECLOCK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-12	RESERVED	R	0h	Reserved
11-8	CRCLOCK	R	Fh	Value in this field gets loaded from Z1_CRCLOCK[3:0] when a read is issued to address location of Z1_CRCLOCK in OTP. 1111 : VCU has ability to calculate CRC on secure memories. Other Value : VCU doesn't have ability to calculate CRC on secure memories. Reset type: SYSRSn
7-4	PSWDLOCK	R	Fh	Value in this field gets loaded from Z1_PSWDLOCK[3:0] when a read is issued to address location of Z1_PSWDLOCK in OTP. 1111 : CSM password locations in OTP are not protected and can be read from debugger as well as code running from anywhere. Other Value : CSM password locations in OTP are protected and can't be read without unlocking CSM of that zone. Reset type: SYSRSn
3-0	JTAGLOCK	R	Fh	Value in this field gets loaded from Z1_JTAGLOCK[3:0] when a read is issued to address location of Z1_JTAGLOCK in OTP. 1111 : JTAG/Emulation access is allowed. Other Value : JTAG/Emulation access not allowed. Reset type: SYSRSn

### 3.17.13.3 Z1\_BOOTCTRL Register (Offset = 4h) [Reset = 0000000h]

Z1\_BOOTCTRL is shown in [Figure 3-167](#) and described in [Table 3-188](#).

Return to the [Summary Table](#).

Boot Mode

**Figure 3-167. Z1\_BOOTCTRL Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BOOTPIN1								BOOTPIN0								BMODE								KEY							
R-0h								R-0h								R-0h								R-0h							

**Table 3-188. Z1\_BOOTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	BOOTPIN1	R	0h	This field gets loaded with Z1_BOOTCTRL[31:24] when a dummy read is issued to address location of Z1_BOOTCTRL in OTP. This assigns the pin to be used as BOOTPIN1. 0 : Pick default bootmode pin. 1 : Pick GPIO0 as BOOTPIN1. 2 : Pick GPIO1 as BOOTPIN1. .... .... n : Pick GPIO <sub>n-1</sub> as BOOTPIN1. Reset type: SYSRSn
23-16	BOOTPIN0	R	0h	This field gets loaded with Z1_BOOTCTRL[23:16] when a dummy read is issued to address location of Z1_BOOTCTRL in OTP. This assigns the pin to be used as BOOTPIN1. 0 : Pick default bootmode pin. 1 : Pick GPIO0 as BOOTPIN1. 2 : Pick GPIO1 as BOOTPIN1. .... .... n : Pick GPIO <sub>n-1</sub> as BOOTPIN1. Reset type: SYSRSn
15-8	BMODE	R	0h	This field gets loaded with Z1_BOOTCTRL[15:8] when a dummy read is issued to address location of Z1_BOOTCTRL in OTP. Reset type: SYSRSn
7-0	KEY	R	0h	This field gets loaded with Z1_BOOTCTRL[7:0] when a dummy read is issued to address location of Z1_BOOTCTRL in OTP. Reset type: SYSRSn

### 3.17.13.4 Z1\_LINKPOINTERERR Register (Offset = 6h) [Reset = FFFFFFFFh]

Z1\_LINKPOINTERERR is shown in [Figure 3-168](#) and described in [Table 3-189](#).

Return to the [Summary Table](#).

Link Pointer Error

**Figure 3-168. Z1\_LINKPOINTERERR Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Z1_LINKPOINTERERR																															
R-FFFFFFFh																															

**Table 3-189. Z1\_LINKPOINTERERR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Z1_LINKPOINTERERR	R	FFFFFFFh	These bits indicate errors during formation of the resolved Link-Pointer value after the three physical Link-Pointer values loaded of OTP. 0 : No Error. Other : Error on bit positions which is set to 1. Reset type: SYSRSn

### 3.17.13.5 Z1\_CSMKEY0 Register (Offset = 10h) [Reset = 0000000h]

Z1\_CSMKEY0 is shown in [Figure 3-169](#) and described in [Table 3-190](#).

Return to the [Summary Table](#).

Zone 1 CSM Key 0

**Figure 3-169. Z1\_CSMKEY0 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Z1_CSMKEY0																															
R-0h																															

**Table 3-190. Z1\_CSMKEY0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Z1_CSMKEY0	R	0h	To unlock Zone1, user needs to write this register with exact value as Z1_CSMPSWD0, programmed in OTP (zone gets unlock only if 128 bit password in OTP match with value written in four CSMKEY registers.) Reset type: SYSRSn

### 3.17.13.6 Z1\_CSMKEY1 Register (Offset = 12h) [Reset = 0000000h]

Z1\_CSMKEY1 is shown in [Figure 3-170](#) and described in [Table 3-191](#).

Return to the [Summary Table](#).

Zone 1 CSM Key 1

**Figure 3-170. Z1\_CSMKEY1 Register**

### 3.17.14 DCSM\_Z2\_REGS Registers

Table 3-199 lists the memory-mapped registers for the DCSM\_Z2\_REGS registers. All register offset addresses not listed in Table 3-199 should be considered as reserved locations and the register contents should not be modified.

**Table 3-199. DCSM\_Z2\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	Z2_LINKPOINTER	Zone 2 Link Pointer		<a href="#">Go</a>
2h	Z2_OTPSECLOCK	Zone 2 OTP Secure JTAG lock		<a href="#">Go</a>
4h	Z2_BOOTCTRL	Boot Mode		<a href="#">Go</a>
6h	Z2_LINKPOINTERERR	Link Pointer Error		<a href="#">Go</a>
10h	Z2_CSMKEY0	Zone 2 CSM Key 0		<a href="#">Go</a>
12h	Z2_CSMKEY1	Zone 2 CSM Key 1		<a href="#">Go</a>
14h	Z2_CSMKEY2	Zone 2 CSM Key 2		<a href="#">Go</a>
16h	Z2_CSMKEY3	Zone 2 CSM Key 3		<a href="#">Go</a>
19h	Z2_CR	Zone 2 CSM Control Register		<a href="#">Go</a>
1Ah	Z2_GRABSECTR	Zone 2 Grab Flash Sectors Register		<a href="#">Go</a>
1Ch	Z2_GRABRAMR	Zone 2 Grab RAM Blocks Register		<a href="#">Go</a>
1Eh	Z2_EXEONLYSECTR	Zone 2 Flash Execute_Only Sector Register		<a href="#">Go</a>
20h	Z2_EXEONLYRAMR	Zone 2 RAM Execute_Only Block Register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-200 shows the codes that are used for access types in this section.

**Table 3-200. DCSM\_Z2\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.14.1 Z2\_LINKPOINTER Register (Offset = 0h) [Reset = E000000h]

Z2\_LINKPOINTER is shown in [Figure 3-178](#) and described in [Table 3-201](#).

Return to the [Summary Table](#).

Zone 2 Link Pointer

**Figure 3-178. Z2\_LINKPOINTER Register**

R-0h				R-Fh				R-Fh				R-Fh			

**Table 3-202. Z2\_OTPSECLOCK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-12	RESERVED	R	0h	Reserved
11-8	CRCLOCK	R	Fh	Value in this field gets loaded from Z2_CRCLOCK[3:0] when a read is issued to address location of Z2_CRCLOCK in OTP. 1111 : VCU has ability to calculate CRC on secure memories. Other Value : VCU doesn't have ability to calculate CRC on secure memories. Reset type: SYSRSn
7-4	PSWDLOCK	R	Fh	Value in this field gets loaded from Z2_PSWDLOCK[3:0] when a read is issued to address location of Z2_PSWDLOCK in OTP. 1111 : CSM password locations in OTP are not protected and can be read from debugger as well as code running from anywhere. Other Value : CSM password locations in OTP are protected and can't be read without unlocking CSM of that zone. Reset type: SYSRSn
3-0	JTAGLOCK	R	Fh	Value in this field gets loaded from Z2_JTAGLOCK[3:0] when a read is issued to address location of Z2_JTAGLOCK in OTP. 1111 : JTAG/Emulation access is allowed. Other Value : JTAG/Emulation access not allowed. Reset type: SYSRSn

### 3.17.14.3 Z2\_BOOTCTRL Register (Offset = 4h) [Reset = 0000000h]

Z2\_BOOTCTRL is shown in [Figure 3-180](#) and described in [Table 3-203](#).

Return to the [Summary Table](#).

Boot Mode

**Figure 3-180. Z2\_BOOTCTRL Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BOOTPIN1								BOOTPIN0								BMODE								KEY							
R-0h								R-0h								R-0h								R-0h							

**Table 3-203. Z2\_BOOTCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	BOOTPIN1	R	0h	This field gets loaded with Z2_BOOTCTRL[31:24] when a dummy read is issued to address location of Z2_BOOTCTRL in OTP. This assigns the pin to be used as BOOTPIN1. 0 : Pick default bootmode pin. 1 : Pick GPIO0 as BOOTPIN1. 2 : Pick GPIO1 as BOOTPIN1. .... .... n : Pick GPIO <sub>n-1</sub> as BOOTPIN1. Reset type: SYSRSn
23-16	BOOTPIN0	R	0h	This field gets loaded with Z2_BOOTCTRL[23:16] when a dummy read is issued to address location of Z2_BOOTCTRL in OTP. This assigns the pin to be used as BOOTPIN1. 0 : Pick default bootmode pin. 1 : Pick GPIO0 as BOOTPIN1. 2 : Pick GPIO1 as BOOTPIN1. .... .... n : Pick GPIO <sub>n-1</sub> as BOOTPIN1. Reset type: SYSRSn
15-8	BMODE	R	0h	This field gets loaded with Z2_BOOTCTRL[15:8] when a dummy read is issued to address location of Z2_BOOTCTRL in OTP. Reset type: SYSRSn
7-0	KEY	R	0h	This field gets loaded with Z2_BOOTCTRL[7:0] when a dummy read is issued to address location of Z2_BOOTCTRL in OTP. Reset type: SYSRSn

### 3.17.14.4 Z2\_LINKPOINTERERR Register (Offset = 6h) [Reset = FFFFFFFFh]

Z2\_LINKPOINTERERR is shown in [Figure 3-181](#) and described in [Table 3-204](#).

Return to the [Summary Table](#).

Link Pointer Error

**Figure 3-181. Z2\_LINKPOINTERERR Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Z2_LINKPOINTERERR																															
R-FFFFFFFh																															

**Table 3-204. Z2\_LINKPOINTERERR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	Z2_LINKPOINTERERR	R	FFFFFFFh	These bits indicate errors during formation of the resolved Link-Pointer value after the three physical Link-Pointer values loaded of OTP. 0 : No Error. Other : Error on bit positions which is set to 1. Reset type: SYSRSn

### 3.17.14.5 Z2\_CSMKEY0 Register (Offset = 10h) [Reset = 0000000h]

Z2\_CSMKEY0 is shown in [Figure 3-182](#) and described in [Table 3-205](#).

Return to the [Summary Table](#).

Zone 2 CSM Key 0

**Figure 3-182. Z2\_CSMKEY0 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 3.17.15 DCSM\_COMMON\_REGS Registers

Table 3-214 lists the memory-mapped registers for the DCSM\_COMMON\_REGS registers. All register offset addresses not listed in Table 3-214 should be considered as reserved locations and the register contents should not be modified.

**Table 3-214. DCSM\_COMMON\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	FLSEM	Flash Wrapper Semaphore Register	EALLOW	<a href="#">Go</a>
2h	SECTSTAT	Sectors Status Register		<a href="#">Go</a>
4h	RAMSTAT	RAM Status Register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-215 shows the codes that are used for access types in this section.

**Table 3-215. DCSM\_COMMON\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.15.1 FLSEM Register (Offset = 0h) [Reset = 0000000h]

FLSEM is shown in [Figure 3-191](#) and described in [Table 3-216](#).

Return to the [Summary Table](#).

**Table 3-217. SECTSTAT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-28	STATUS_BANK1	R	0h	Reflects the status of flash BANK1. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
27-26	STATUS_SECTN	R	0h	Reflects the status of flash sector N. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
25-24	STATUS_SECTM	R	0h	Reflects the status of flash sector M. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
23-22	STATUS_SECTL	R	0h	Reflects the status of flash sector L. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn

**Table 3-217. SECTSTAT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
21-20	STATUS_SECTK	R	0h	Reflects the status of flash sector K. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
19-18	STATUS_SECTJ	R	0h	Reflects the status of flash sector J. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
17-16	STATUS_SECTI	R	0h	Reflects the status of flash sector I. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
15-14	STATUS_SECTH	R	0h	Reflects the status of flash sector H. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
13-12	STATUS_SECTG	R	0h	Reflects the status of flash sector G. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
11-10	STATUS_SECTF	R	0h	Reflects the status of flash sector F. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
9-8	STATUS_SECTE	R	0h	Reflects the status of flash sector E. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
7-6	STATUS_SECTD	R	0h	Reflects the status of flash sector D. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn

**Table 3-217. SECTSTAT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
5-4	STATUS_SECTC	R	0h	Reflects the status of flash sector C. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
3-2	STATUS_SECTB	R	0h	Reflects the status of flash sector B. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn
1-0	STATUS_SECTA	R	0h	Reflects the status of flash sector A. 00 : Sector is in-accessible 01 : Sector belongs to Zone1. 10 : Sector belongs to Zone2. 11: Sector is un-secure and code running in both zone have full access to it. Reset type: SYSRSn

### 3.17.15.3 RAMSTAT Register (Offset = 4h) [Reset = 0000000h]

RAMSTAT is shown in [Figure 3-193](#) and described in [Table 3-218](#).

Return to the [Summary Table](#).

50h	GSxTEST	Global Shared RAM TEST Register	EALLOW	<a href="#">Go</a>
52h	GSxINIT	Global Shared RAM Init Register	EALLOW	<a href="#">Go</a>
54h	GSxINITDONE	Global Shared RAM InitDone Status Register		<a href="#">Go</a>
70h	MSGxTEST	Message RAM TEST Register	EALLOW	<a href="#">Go</a>
72h	MSGxINIT	Message RAM Init Register	EALLOW	<a href="#">Go</a>
74h	MSGxINITDONE	Message RAM InitDone Status Register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-220 shows the codes that are used for access types in this section.

**Table 3-220. MEM\_CFG\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set

**Table 3-220. MEM\_CFG\_REGS Access Type Codes (continued)**

Access Type	Code	Description
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.16.1 DxLOCK Register (Offset = 0h) [Reset = 0000000h]

DxLOCK is shown in [Figure 3-194](#) and described in [Table 3-221](#).

Return to the [Summary Table](#).

Dedicated RAM Config Lock Register

### 3.17.17 ACCESS\_PROTECTION\_REGS Registers

Table 3-248 lists the memory-mapped registers for the ACCESS\_PROTECTION\_REGS registers. All register offset addresses not listed in Table 3-248 should be considered as reserved locations and the register contents should not be modified.

**Table 3-248. ACCESS\_PROTECTION\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	NMAVFLG	Non-Master Access Violation Flag Register		<a href="#">Go</a>
2h	NMAVSET	Non-Master Access Violation Flag Set Register	EALLOW	<a href="#">Go</a>
4h	NMAVCLR	Non-Master Access Violation Flag Clear Register	EALLOW	<a href="#">Go</a>
6h	NMAVINTEN	Non-Master Access Violation Interrupt Enable Register	EALLOW	<a href="#">Go</a>
8h	NMCPURDAVADDR	Non-Master CPU Read Access Violation Address		<a href="#">Go</a>
Ah	NMCPUWRAVADDR	Non-Master CPU Write Access Violation Address		<a href="#">Go</a>
Ch	NMCPUFAVADDR	Non-Master CPU Fetch Access Violation Address		<a href="#">Go</a>
Eh	NMDMAWRAVADDR	Non-Master DMA Write Access Violation Address		<a href="#">Go</a>
10h	NMCLA1RDAVADDR	Non-Master CLA1 Read Access Violation Address		<a href="#">Go</a>
12h	NMCLA1WRAVADDR	Non-Master CLA1 Write Access Violation Address		<a href="#">Go</a>
14h	NMCLA1FAVADDR	Non-Master CLA1 Fetch Access Violation Address		<a href="#">Go</a>
20h	MAVFLG	Master Access Violation Flag Register		<a href="#">Go</a>
22h	MAVSET	Master Access Violation Flag Set Register	EALLOW	<a href="#">Go</a>
24h	MAVCLR	Master Access Violation Flag Clear Register	EALLOW	<a href="#">Go</a>
26h	MAVINTEN	Master Access Violation Interrupt Enable Register	EALLOW	<a href="#">Go</a>
28h	MCPUFAVADDR	Master CPU Fetch Access Violation Address		<a href="#">Go</a>
2Ah	MCPUWRAVADDR	Master CPU Write Access Violation Address		<a href="#">Go</a>
2Ch	MDMAWRAVADDR	Master DMA Write Access Violation Address		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-249 shows the codes that are used for access types in this section.

**Table 3-249. ACCESS\_PROTECTION\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

**Table 3-249. ACCESS\_PROTECTION\_REGS Access Type Codes (continued)**

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.17.1 NMAVFLG Register (Offset = 0h) [Reset = 0000000h]

NMAVFLG is shown in [Figure 3-221](#) and described in [Table 3-250](#).

Return to the [Summary Table](#).

### 3.17.18 MEMORY\_ERROR\_REGS Registers

Table 3-268 lists the memory-mapped registers for the MEMORY\_ERROR\_REGS registers. All register offset addresses not listed in Table 3-268 should be considered as reserved locations and the register contents should not be modified.

**Table 3-268. MEMORY\_ERROR\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	UCERRFLG	Uncorrectable Error Flag Register		<a href="#">Go</a>
2h	UCERRSET	Uncorrectable Error Flag Set Register	EALLOW	<a href="#">Go</a>
4h	UCERRCLR	Uncorrectable Error Flag Clear Register	EALLOW	<a href="#">Go</a>
6h	UCCPUREADDR	Uncorrectable CPU Read Error Address		<a href="#">Go</a>
8h	UCDMAREADDR	Uncorrectable DMA Read Error Address		<a href="#">Go</a>
Ah	UCCLA1READDR	Uncorrectable CLA1 Read Error Address		<a href="#">Go</a>
20h	CERRFLG	Correctable Error Flag Register		<a href="#">Go</a>
22h	CERRSET	Correctable Error Flag Set Register	EALLOW	<a href="#">Go</a>
24h	CERRCLR	Correctable Error Flag Clear Register	EALLOW	<a href="#">Go</a>
26h	CCPUREADDR	Correctable CPU Read Error Address		<a href="#">Go</a>
2Eh	CERRCNT	Correctable Error Count Register		<a href="#">Go</a>
30h	CERRTHRES	Correctable Error Threshold Value Register	EALLOW	<a href="#">Go</a>
32h	CEINTFLG	Correctable Error Interrupt Flag Status Register		<a href="#">Go</a>
34h	CEINTCLR	Correctable Error Interrupt Flag Clear Register	EALLOW	<a href="#">Go</a>
36h	CEINTSET	Correctable Error Interrupt Flag Set Register	EALLOW	<a href="#">Go</a>
38h	CEINTEN	Correctable Error Interrupt Enable Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-269 shows the codes that are used for access types in this section.

**Table 3-269. MEMORY\_ERROR\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.18.1 UCERRFLG Register (Offset = 0h) [Reset = 0000000h]

UCERRFLG is shown in [Figure 3-239](#) and described in [Table 3-270](#).

Return to the [Summary Table](#).

### 3.17.19 ROM\_WAIT\_STATE\_REGS Registers

Table 3-286 lists the memory-mapped registers for the ROM\_WAIT\_STATE\_REGS registers. All register offset addresses not listed in Table 3-286 should be considered as reserved locations and the register contents should not be modified.

**Table 3-286. ROM\_WAIT\_STATE\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	ROMWAITSTATE	ROM Wait State Configuration Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-287 shows the codes that are used for access types in this section.

**Table 3-287. ROM\_WAIT\_STATE\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.19.1 ROMWAITSTATE Register (Offset = 0h) [Reset = 0000000h]

ROMWAITSTATE is shown in [Figure 3-255](#) and described in [Table 3-288](#).

Return to the [Summary Table](#).

ROM Wait State Configuration Register

**Figure 3-255. ROMWAITSTATE Register**

31-16	RESERVED	R	0h	Reserved
15-1	RESERVED	R	0h	Reserved
0	WSDISABLE	R/W	0h	0: C28x ROM Wait State is enabled. C28x CPU accesses to ROM are 1-wait. 1: C28x ROM Wait State is disabled. C28x CPU accesses to ROM are 0-wait. Reset type: SYSRSn

### 3.17.20 FLASH\_CTRL\_REGS Registers

Table 3-289 lists the memory-mapped registers for the FLASH\_CTRL\_REGS registers. All register offset addresses not listed in Table 3-289 should be considered as reserved locations and the register contents should not be modified.

**Table 3-289. FLASH\_CTRL\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	FRDCNTL	Flash Read Control Register	EALLOW	<a href="#">Go</a>
1Eh	FBAC	Flash Bank Access Control Register	EALLOW	<a href="#">Go</a>
20h	FBFALLBACK	Flash Bank Fallback Power Register	EALLOW	<a href="#">Go</a>
22h	FBPRDY	Flash Bank Pump Ready Register	EALLOW	<a href="#">Go</a>
24h	FPAC1	Flash Pump Access Control Register 1	EALLOW	<a href="#">Go</a>
2Ah	FMSTAT	Flash Module Status Register	EALLOW	<a href="#">Go</a>
180h	FRD_INTF_CTRL	Flash Read Interface Control Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-290 shows the codes that are used for access types in this section.

**Table 3-290. FLASH\_CTRL\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.20.1 FRDCNTL Register (Offset = 0h) [Reset = 0000F00h]

FRDCNTL is shown in [Figure 3-256](#) and described in [Table 3-291](#).

Return to the [Summary Table](#).

Flash Read Control Register

**Figure 3-256. FRDCNTL Register**

12	PGV	R	0h	Program verify When set, indicates that a word is not successfully programmed after the maximum allowed number of program pulses are given for program operation. Reset type: SYSRSn
11	RESERVED	R	0h	Reserved
10	EV	R	0h	Erase verify When set, indicates that a sector is not successfully erased after the maximum allowed number of erase pulses are given for erase operation. Reset type: SYSRSn
9	RESERVED	R	0h	Reserved
8	BUSY	R	0h	When set, this bit indicates that a program, erase, or suspend operation is being processed. Reset type: SYSRSn
7	ERS	R	0h	Erase Active. When set, this bit indicates that the flash module is actively performing an erase operation. This bit is set when erasing starts and is cleared when erasing is complete. It is also cleared when the erase is suspended and set when the erase resumes. Reset type: SYSRSn
6	PGM	R	0h	Program Active. When set, this bit indicates that the flash module is currently performing a program operation. This bit is set when programming starts and is cleared when programming is complete. It is also cleared when programming is suspended and set when programming is resumed. Reset type: SYSRSn

**Table 3-296. FMSTAT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
5	INVDAT	R	0h	Invalid Data. When set, this bit indicates that the user attempted to program a '1' where a '0' was already present. Reset type: SYSRSn
4	CSTAT	R	0h	Command Status. Once the FSM starts any failure will set this bit. When set, this bit informs the host that the program, erase, or validate sector command failed and the command was stopped. This bit is cleared by the Clear Status command. For some errors, this will be the only indication of an FSM error because the cause does not fall within the other error bit types. Reset type: SYSRSn
3	VOLTSTAT	R	0h	Core Voltage Status. When set, this bit indicates that the core voltage generator of the pump power supply dipped below the lower limit allowable during a program or erase operation. Reset type: SYSRSn
2	ESUSP	R	0h	When set, this bit indicates that the flash module has received and processed an erase suspend operation. This bit remains set until the erase resume command has been issued or until the Clear_More command is run. Reset type: SYSRSn
1	PSUSP	R	0h	When set, this bit indicates that the flash module has received and processed a program suspend operation. This bit remains set until the program resume command has been issued or until the Clear_More command is run. Reset type: SYSRSn
0	RESERVED	R	0h	Reserved

### 3.17.20.7 FRD\_INTF\_CTRL Register (Offset = 180h) [Reset = 0000000h]

FRD\_INTF\_CTRL is shown in [Figure 3-262](#) and described in [Table 3-297](#).

Return to the [Summary Table](#).

15-2	RESERVED	R	0h	Reserved
1	DATA_CACHE_EN	R/W	0h	Data cache enable. 0 A value of 0 disables the data cache. 1 A value of 1 enables the data cache. Reset type: SYSRSn
0	PREFETCH_EN	R/W	0h	Prefetch enable. 0 A value of 0 disables prefetch mechanism. 1 A value of 1 enables pre-fetch mechanism. Reset type: SYSRSn

### 3.17.21 FLASH\_ECC\_REGS Registers

Table 3-298 lists the memory-mapped registers for the FLASH\_ECC\_REGS registers. All register offset addresses not listed in Table 3-298 should be considered as reserved locations and the register contents should not be modified.

**Table 3-298. FLASH\_ECC\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	ECC_ENABLE	ECC Enable	EALLOW	<a href="#">Go</a>
2h	SINGLE_ERR_ADDR_LOW	Single Error Address Low	EALLOW	<a href="#">Go</a>
4h	SINGLE_ERR_ADDR_HIGH	Single Error Address High	EALLOW	<a href="#">Go</a>
6h	UNC_ERR_ADDR_LOW	Uncorrectable Error Address Low	EALLOW	<a href="#">Go</a>
8h	UNC_ERR_ADDR_HIGH	Uncorrectable Error Address High	EALLOW	<a href="#">Go</a>
Ah	ERR_STATUS	Error Status	EALLOW	<a href="#">Go</a>
Ch	ERR_POS	Error Position	EALLOW	<a href="#">Go</a>
Eh	ERR_STATUS_CLR	Error Status Clear	EALLOW	<a href="#">Go</a>
10h	ERR_CNT	Error Control	EALLOW	<a href="#">Go</a>
12h	ERR_THRESHOLD	Error Threshold	EALLOW	<a href="#">Go</a>
14h	ERR_INTFLG	Error Interrupt Flag	EALLOW	<a href="#">Go</a>

24h	FOUTL_TEST	Test Data Out Low	EALLOW	<a href="#">Go</a>
26h	FECC_STATUS	ECC Status	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-299 shows the codes that are used for access types in this section.

**Table 3-299. FLASH\_ECC\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

**Table 3-299. FLASH\_ECC\_REGS Access Type Codes (continued)**

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.21.1 ECC\_ENABLE Register (Offset = 0h) [Reset = 000000Ah]

ECC\_ENABLE is shown in [Figure 3-263](#) and described in [Table 3-300](#).

Return to the [Summary Table](#).

ECC Enable

**Figure 3-263. ECC\_ENABLE Register**

**Table 3-305. ERR\_STATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	UNC_ERR_H	R	0h	Uncorrectable error. A value of 1 indicates that an un-correctable error occurred in upper 64bits of a 128-bit aligned address. Cleared by writing a 1 to UNC_ERR_H_CLR bit of ERR_STATUS_CLR register. Reset type: SYSRSn
17	FAIL_1_H	R	0h	Fail on 1. 0 Fail on 1 single bit error did not occur in upper 64bits of a 128-bit aligned address. 1 A value of 1 would indicate that a single bit error occurred in upper 64bits of a 128-bit aligned address and the corrected value was 1. Cleared by writing a 1 to FAIL_1_H_CLR bit of ERR_STATUS_CLR register. Note: This bit is updated on every flash access which results in a single bit error, So, in case of multiple single bit error, the status would correspond to the last error which occurred. Reset type: SYSRSn
16	FAIL_0_H	R	0h	Fail on 0. 0 Fail on 0 single bit error did not occur in upper 64bits of a 128-bit aligned address. 1 A value of 1 would indicate that a single bit error occurred in upper 64bits of a 128-bit aligned address and the corrected value was 0. Cleared by writing a 1 to FAIL_0_H_CLR bit of ERR_STATUS_CLR register. Note: This bit is updated on every flash access which results in a single bit error, So, in case of multiple single bit error, the status would correspond to the last error which occurred. Reset type: SYSRSn
15-3	RESERVED	R	0h	Reserved

**Table 3-305. ERR\_STATUS Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
2	UNC_ERR_L	R	0h	Uncorrectable error. A value of 1 indicates that an un-correctable error occurred in lower 64bits of a 128-bit aligned address. Cleared by writing a 1 to UNC_ERR_L_CLR bit of ERR_STATUS_CLR register. Reset type: SYSRSn
1	FAIL_1_L	R	0h	Fail on 1. 0 Fail on 1 single bit error did not occur in lower 64bits of a 128-bit aligned address. 1 A value of 1 would indicate that a single bit error occurred in lower 64bits of a 128-bit aligned address and the corrected value was 1. Cleared by writing a 1 to FAIL_1_L_CLR bit of ERR_STATUS_CLR register. Note: This bit is updated on every flash access which results in a single bit error. So, in case of multiple single bit error, the status would correspond to the last error which occurred. Reset type: SYSRSn
0	FAIL_0_L	R	0h	Fail on 0. 0 Fail on 0 single bit error did not occur in lower 64bits of a 128-bit aligned address. 1 Would indicate that a single bit error occurred in lower 64bits of a 128-bit aligned address and the corrected value was 0. Cleared by writing a 1 to FAIL_0_L_CLR bit of ERR_STATUS_CLR register. Note: This bit is updated on every flash access which results in a single bit error. So, in case of multiple single bit error, the status would correspond to the last error which occurred. Reset type: SYSRSn

### 3.17.21.7 ERR\_POS Register (Offset = Ch) [Reset = 0000000h]

ERR\_POS is shown in [Figure 3-269](#) and described in [Table 3-306](#).

Return to the [Summary Table](#).

Error Position

**Figure 3-269. ERR\_POS Register**

31	30	29	28	27	26	25	24

31-19	RESERVED	R	0h	Reserved
18	UNC_ERR_H_CLR	R-0/W1S	0h	Uncorrectable error clear. Writing a 1 to this bit will clear the UNC_ERR_H bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn
17	FAIL_1_H_CLR	R-0/W1S	0h	Fail on 1 clear. Writing a 1 to this bit will clear the FAIL_1_H bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn
16	FAIL_0_H_CLR	R-0/W1S	0h	Fail on 0 clear. Writing a 1 to this bit will clear the FAIL_0_H bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn
15-3	RESERVED	R	0h	Reserved
2	UNC_ERR_L_CLR	R-0/W1S	0h	Uncorrectable error clear. Writing a 1 to this bit will clear the UNC_ERR_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn
1	FAIL_1_L_CLR	R-0/W1S	0h	Fail on 1 clear. Writing a 1 to this bit will clear the FAIL_1_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn
0	FAIL_0_L_CLR	R-0/W1S	0h	Fail on 0 clear. Writing a 1 to this bit will clear the FAIL_0_L bit of ERR_STATUS register. Writes of 0 have no effect. Read returns 0. Reset type: SYSRSn

### 3.17.21.9 ERR\_CNT Register (Offset = 10h) [Reset = 0000000h]

ERR\_CNT is shown in [Figure 3-271](#) and described in [Table 3-308](#).

Return to the [Summary Table](#).

Error Control

**Figure 3-271. ERR\_CNT Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ERR_CNT															
R-0h																R/W-0h															

**Table 3-308. ERR\_CNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-0	ERR_CNT	R/W	0h	Single bit error count. This counter increments with every single bit ECC error occurrence. Upon reaching the threshold value counter stops counting on single bit errors. ERR_CNT can be cleared (irrespective of whether threshold is met or not) using 'Single Err Int Clear' bit. This is applicable for ECC logic test mode and normal operational mode. Reset type: SYSRSn

### 3.17.21.10 ERR\_THRESHOLD Register (Offset = 12h) [Reset = 0000000h]

ERR\_THRESHOLD is shown in [Figure 3-272](#) and described in [Table 3-309](#).

Return to the [Summary Table](#).

Error Threshold

**Figure 3-272. ERR\_THRESHOLD Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																ERR_THRESHOLD															
R-0h																R/W-0h															

**Table 3-309. ERR\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-0	ERR_THRESHOLD	R/W	0h	Single bit error threshold. Sets the threshold for single bit errors. When the ERR_CNT value equals the THRESHOLD value and a single bit error occurs, SINGLE_ERR_INT flag is set, and an interrupt is fired. Reset type: SYSRSn

### 3.17.21.11 ERR\_INTFLG Register (Offset = 14h) [Reset = 0000000h]

ERR\_INTFLG is shown in [Figure 3-273](#) and described in [Table 3-310](#).

Return to the [Summary Table](#).

**Table 3-319. FECC\_STATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15-9	RESERVED	R	0h	Reserved
8	ERR_TYPE	R	0h	Test mode ECC single bit error indicator. When 1, indicates that the single bit error is in check bits. When 0, indicates that the single bit error is in data bits (If SINGLE_ERR field is also set). Reset type: SYSRSn
7-2	DATA_ERR_POS	R	0h	Test mode single bit error position. Holds the bit position where the single bit error occurred. The position is interpreted depending on whether the CHK_ERR bit indicates a check bit or a data bit. If CHK_ERR indicates a check bit error, the error position could range from 0 to 7, or it could range from 0 to 63. Reset type: SYSRSn
1	UNC_ERR	R	0h	Test mode ECC double bit error. When 1 indicates that the ECC test resulted in an uncorrectable bit error. Reset type: SYSRSn
0	SINGLE_ERR	R	0h	Test mode ECC single bit error. When 1 indicates that the ECC test resulted in a single bit error. Reset type: SYSRSn

### 3.17.22 UID\_REGS Registers

Table 3-320 lists the memory-mapped registers for the UID\_REGS registers. All register offset addresses not listed in Table 3-320 should be considered as reserved locations and the register contents should not be modified.

**Table 3-320. UID\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	UID_PSRAND0	UID Psuedo-random 192 bit number		<a href="#">Go</a>
2h	UID_PSRAND1	UID Psuedo-random 192 bit number		<a href="#">Go</a>
4h	UID_PSRAND2	UID Psuedo-random 192 bit number		<a href="#">Go</a>
6h	UID_PSRAND3	UID Psuedo-random 192 bit number		<a href="#">Go</a>
8h	UID_PSRAND4	UID Psuedo-random 192 bit number		<a href="#">Go</a>
Ah	UID_PSRAND5	UID Psuedo-random 192 bit number		<a href="#">Go</a>
Ch	UID_UNIQUE	UID Unique 32 bit number		<a href="#">Go</a>
Eh	UID_CHECKSUM	UID Checksum		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-321 shows the codes that are used for access types in this section.

31-0	Checksum	R	0h	Fletcher checksum of UID_PSRANDx and UID_UNIQUE Reset type: N/A

### 3.17.23 DCSM\_Z1\_OTP Registers

Table 3-330 lists the memory-mapped registers for the DCSM\_Z1\_OTP registers. All register offset addresses not listed in Table 3-330 should be considered as reserved locations and the register contents should not be modified.

**Table 3-330. DCSM\_Z1\_OTP Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	Z1OTP_LINKPOINTER1	Zone 1 Link Pointer1 in Z1 OTP		<a href="#">Go</a>
4h	Z1OTP_LINKPOINTER2	Zone 1 Link Pointer2 in Z1 OTP		<a href="#">Go</a>
8h	Z1OTP_LINKPOINTER3	Zone 1 Link Pointer3 in Z1 OTP		<a href="#">Go</a>
10h	Z1OTP_PSWDLOCK	Secure Password Lock in Z1 OTP		<a href="#">Go</a>
14h	Z1OTP_CRCLOCK	Secure CRC Lock in Z1 OTP		<a href="#">Go</a>
1Eh	Z1OTP_BOOTCTRL	Boot Mode in Z1 OTP		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-331 shows the codes that are used for access types in this section.

**Table 3-331. DCSM\_Z1\_OTP Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.23.1 Z1OTP\_LINKPOINTER1 Register (Offset = 0h) [Reset = FFFFFFFFh]

Z1OTP\_LINKPOINTER1 is shown in [Figure 3-291](#) and described in [Table 3-332](#).

Return to the [Summary Table](#).

Zone 1 Link Pointer1 in Z1 OTP

**Figure 3-291. Z1OTP\_LINKPOINTER1 Register**

### 3.17.24 DCSM\_Z2\_OTP Registers

Table 3-338 lists the memory-mapped registers for the DCSM\_Z2\_OTP registers. All register offset addresses not listed in Table 3-338 should be considered as reserved locations and the register contents should not be modified.

**Table 3-338. DCSM\_Z2\_OTP Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	Z2OTP_LINKPOINTER1	Zone 2 Link Pointer1 in Z2 OTP		<a href="#">Go</a>
4h	Z2OTP_LINKPOINTER2	Zone 2 Link Pointer2 in Z2 OTP		<a href="#">Go</a>
8h	Z2OTP_LINKPOINTER3	Zone 2 Link Pointer3 in Z2 OTP		<a href="#">Go</a>
10h	Z2OTP_PSWDLOCK	Secure Password Lock in Z2 OTP		<a href="#">Go</a>
14h	Z2OTP_CRCLOCK	Secure CRC Lock in Z2 OTP		<a href="#">Go</a>
1Eh	Z2OTP_BOOTCTRL	Boot Mode in Z2 OTP		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 3-339 shows the codes that are used for access types in this section.

**Table 3-339. DCSM\_Z2\_OTP Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 3.17.24.1 Z2OTP\_LINKPOINTER1 Register (Offset = 0h) [Reset = FFFFFFFFh]

Z2OTP\_LINKPOINTER1 is shown in [Figure 3-297](#) and described in [Table 3-340](#).

Return to the [Summary Table](#).

Zone 2 Link Pointer1 in Z2 OTP

**Figure 3-297. Z2OTP\_LINKPOINTER1 Register**

## Chapter 4 ROM Code and Peripheral Booting

---

This chapter describes the booting functionality.

Further information about the boot-loading process can be found in the [TMS320F28004x Boot Features and Configurations Application Report](#).

<b>4.1 Introduction</b> .....	<b>572</b>
<b>4.2 Boot ROM Registers</b> .....	<b>572</b>

<b>4.8 Device Boot Flow Diagrams</b> .....	<b>577</b>
<b>4.9 Device Reset and Exception Handling</b> .....	<b>580</b>
<b>4.10 Boot ROM Description</b> .....	<b>582</b>

## 4.1 Introduction

This chapter explains the boot ROM code functionality including the boot procedure when executed, the functions and features of the boot ROM code, and details the ROM memory map contents. On every reset, the device executes a boot sequence in the ROM depending on the reset type and boot configuration. This sequence initializes the device to run application code. The boot ROM also contains peripheral bootloaders which can be used to load an application into RAM. ROM Memory is shown in [Table 4-1](#).

**Table 4-1. ROM Memory**

ROM	CPU Size
Unsecure boot ROM	64 KB
Secure ROM	64 KB
CLA Data ROM	8 KB

## 4.2 Boot ROM Registers

The boot process code accesses several memory addresses and registers during execution. There are two sets of addresses, one for emulation and one for standalone boot flow. The emulation boot-control locations emulate OTP configurations and can be written to as many times as needed. The user configurable DCSM OTP locations used in the standalone boot flow program the device OTP and thus can only be written once. [Table 4-2](#) details these locations.

**Table 4-2. Boot ROM Registers**

Boot Flow	Register Name	Boot ROM Name	Address
Emulation	-	EMU_BOOTCTRL	0x0000 0D00
Standalone (Using Z1)	Z1_BOOTCTRL	Z1_BOOTCTRL	0x0005 F004
Standalone (Using Z2)	Z2_BOOTCTRL	Z2_BOOTCTRL	0x0005 F044

## 4.3 Device Boot Sequence

The boot sequence, [Table 4-3](#), describes the general boot ROM procedure each time the CPU core is reset.

During booting, the boot ROM code updates a boot status location in RAM that details the actions taken during this process. Refer to [Section 4.10.10](#) for more details.

**Table 4-3. Boot ROM Sequence**

Step	CPU Action
1	After reset, the FUSE error register is checked for any errors and are handled accordingly.
2	Clock and Flash Configuration
3	Device configuration registers are programmed from OTP.
4	All CPU RAMs are initialized.
5	Any pending NMI is handled by the code.
6	DCSM initialization sequence is executed.
7	Based on the boot mode select GPIO pins and boot mode set in OTP, the boot mode is determined, and the appropriate boot sequence is executed. Refer to <a href="#">Section 4.8</a> for a flow chart of the device boot sequences.

## 4.4 Device Boot Modes

This section explains the boot modes supported on this device. The boot ROM uses the boot select GPIO pins to determine the boot mode configuration. The device can be configured to boot to RAM, boot to Flash, execute a bootloader, or hold in a wait mode.

Table 4-4 shows the boot mode options available through selection by the default boot mode select pins. The boot mode select pins' GPIOs and realized boot mode for when Get boot mode is selected can be customized through the BOOTCTRL register detailed in Section 4.5.

**Table 4-4. Device Default Boot Modes**

Boot Mode	GPIO72 (Default boot mode select pin 1)	GPIO84 (Default boot mode select pin 0)
Parallel IO	0	0
SCI	0	1
Wait	1	0
Get / Flash <sup>(1)</sup>	1	1

- (1) Get boot mode, by default, on an unprogrammed device, or when the BOOTCTRL register contains an invalid key, boots to Flash mode. Get boot mode can be programmed on the device to change the default boot mode. Refer to Section 4.6 for more details on using Get boot mode.

**Table 4-5. All Available Boot Modes**

Boot Mode
Parallel IO
SCI
Wait
Get
SPI
I2C
CAN
RAM
Flash
USB

### Note

All the peripheral boot modes that are supported use the first instance of the peripheral module (SCIA, SPIA, I2CA, CANA, and so forth). Whenever these boot modes are referred to in this chapter, such as SCI boot, the mode is actually referring to the first module instance, meaning the SCI boot on the SCIA port. The same applies to the other peripheral boots.

## 4.5 Configuring Boot Mode Pins

This section details how the boot mode select pins can be customized by the user, by programming the BOOTCTRL register location in user-configurable DCSM OTP. The BOOTCTRL register, when programmed with a valid key, allows different GPIOs to be used for the two boot mode select pins. Additionally, the boot mode select pins allow the same GPIO to be assigned to each pin for single GPIO use cases. Also within the BOOTCTRL register, the default boot mode for use with Get boot can be changed. When debugging, EMU\_BOOTCTRL is the emulation equivalent of the BOOTCTRL register and allows users to experiment with different boot modes without writing to OTP memory. Refer to [Section 4.7](#) for details on values that can be set in the EMU\_BOOTCTRL control word.

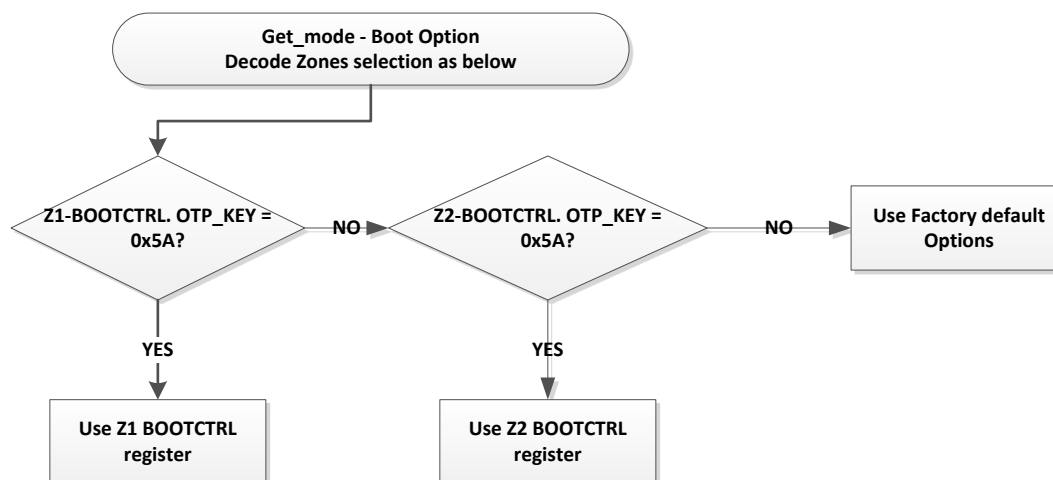

### Note

Refer to [Section 3.13](#) for the address of the BOOTCTRL register location in the user-configurable DCSM OTP.

**Table 4-6. BOOTCTRL Register Bit Fields**

Bit	Name	Description
31-24	Boot Mode Select Pin 1 (BMSP1)	Set to the GPIO pin to be used during boot (up to 255). 0 = Default BMSP1 1 = GPIO0; 2 = GPIO1 and so on to 255 = GPIO254
23-16	Boot Mode Select Pin 0 (BMSP0)	Set to the GPIO pin to be used during boot (up to 255). 0 = Default BMSP0 1 = GPIO0; 2 = GPIO1 and so on to 255 = GPIO254
15-8	Boot Mode (BMODE)	Boot mode definition when using Get boot mode option. Refer to <a href="#">Section 4.6</a> for valid BMODE values.
7 - 0	Key	Write 0x5A to these 8-bits to tell the boot ROM code that the bits in this register are valid

On this device, the DCSM has two zones. Each zone, Z1 and Z2, has a copy of the BOOTCTRL register. The boot ROM is designed to be able to read from either location and uses the procedure in [Figure 4-1](#) to identify which register to use. By default, if the Z1 BOOTCTRL is programmed, then that register is given the priority. If the Z1 BOOTCTRL is not programmed, then the boot ROM checks if Z2 BOOTCTRL is programmed; if not programmed, then the factory default options are used.

**Figure 4-1. Z1 and Z2 BOOTCTRL Selection**

## 4.6 Configuring Get Boot Options

In Get boot mode, the boot ROM reads the boot mode (BMODE) bit field in the BOOTCTRL register to determine which boot procedure to execute. By default, Get boot mode executes Flash boot when in standalone mode or wait boot mode when an emulator is connected to the device. [Table 4-7](#) lists the values that can be set to the BMODE field in BOOTCTRL and the corresponding boot mode represented. For additional details on the GPIOs used for each boot mode, refer to [Section 4.10.6](#). When debugging the device using an emulator and EMU\_BOOTCTRL, the BMODE field has some additional values that can be found in [Section 4.7](#).

**Table 4-7. Get Mode Decoding**

Key	BMODE Value	Realized Boot Mode
!= 0x5A	Don't Care	Flash Boot / Wait Boot <sup>(1)</sup>
= 0x5A	0x00	Parallel Boot
	0x01	SCI Boot 0
	0x02	Wait Boot
	0x04	SPI Boot 0
	0x05	I2C Boot 0
	0x07	CAN Boot 0
	0x0A	RAM Boot
	0x0B	Flash Boot
	0x0C	USB Boot
	0x81	SCI Boot 1
	0x84	SPI Boot 1
	0x85	I2C Boot 1
	0x87	CAN Boot 1
	Other	Flash Boot / Wait Boot <sup>(1)</sup>

- (1) When an emulator is connected (TRSTn = 1) to the device, then an invalid EMU BOOTCTRL key or invalid EMU configured boot mode results in wait boot mode. If an emulator is connected with a valid EMU BOOTCTRL key and the EMU boot mode is configured to "Get Mode" boot then an invalid OTP BOOTCTRL key results in Flash boot mode. If an emulator is not connected with the boot mode selected to "Get Mode" boot, then an invalid OTP BOOTCTRL key or invalid OTP memory configured boot mode results in Flash boot mode.

## 4.7 Configuring Emulation Boot Options

When connected to the device using an emulator, the EMU\_BOOTCTRL control word is used to determine the boot mode. This control word allows the user to experiment with various boot mode settings before writing to the BOOTCTRL register in the user-configurable DCSM OTP. The values that can be set in the BMODE field of the EMU\_BOOTCTRL control word are listed in [Section 4.7](#). Some notable options include being able to have emulation boot read from the boot mode select pins, emulate standalone boot using the values in OTP, and boot according to the Get boot value stored in OTP memory. Refer to [Section 4.10.6](#) for details on the GPIOs used in the various boot modes.

### Note

EMU\_BOOTCTRL is not actually a register, but refers to a location in RAM (PIE RAM). PIE RAM starts at 0xD00, but the first few locations are reserved (when initializing the PIE vector table in application code) for these boot ROM variables.

**Table 4-8. Emulation Boot Options**

Key	BMODE Value	Realized Boot Mode
!= 0x5A	Don't Care	Wait Boot
= 0x5A	0xFE	Boot as per BMSP0 and BMSP1
	0xFF	Emulate Standalone boot
	0x00	Parallel Boot
	0x01	SCI Boot 0
	0x02	Wait Boot
	0x03	Get Mode (read OTP BOOTCTRL)
	0x04	SPI Boot 0
	0x05	I2C Boot 0
	0x07	CAN Boot 0
	0x0A	RAM Boot
	0x0B	Flash Boot
	0x0C	USB Boot
	0x81	SCI Boot 1
	0x84	SPI Boot 1
	0x85	I2C Boot 1
	0x87	CAN Boot 1
	Other	Wait Boot

### 4.8 Device Boot Flow Diagrams

Figure 4-2 shows the device boot flow detailing the actions executed by boot ROM after a reset.

**Note**

The PLL is not used in the device clock path during boot, only INTOSC is used.

Figure 4-2. CPU Device Boot Flow

### 4.8.1 Emulation Boot Flow Diagrams

Figure 4-3 shows the boot flow when running the device in emulation mode.

Figure 4-3. CPU Emulation Boot Flow

### 4.8.2 Standalone and Hibernate Boot Flow Diagrams

Figure 4-4 shows the device boot flow when running the device in standalone boot mode or when booting from hibernate.

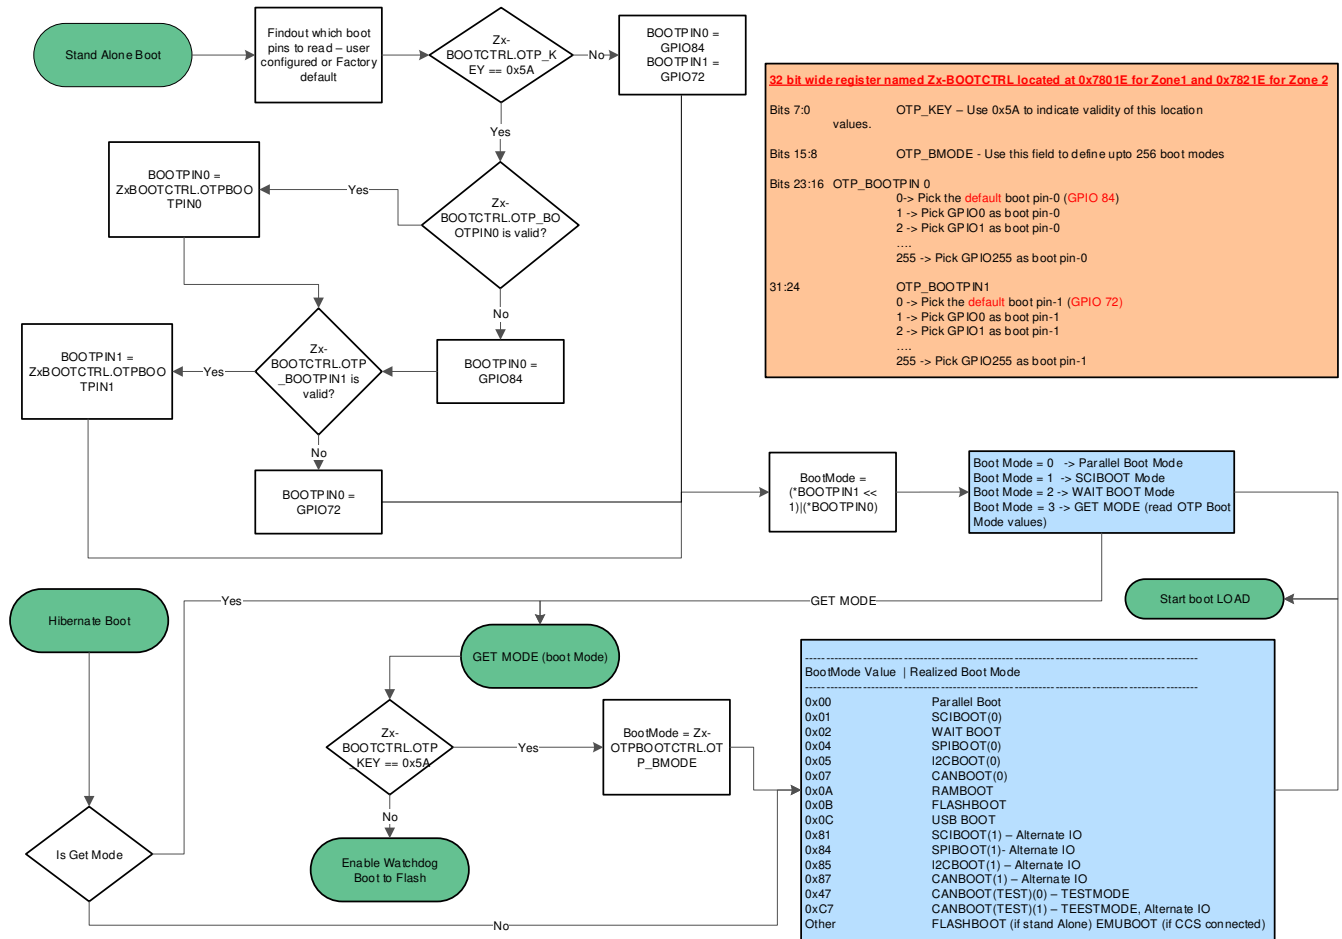

Figure 4-4. CPU Standalone and Hibernate Boot Flow

## 4.9 Device Reset and Exception Handling

### 4.9.1 Reset Causes and Handling

This section explains the actions boot ROM performs upon reset after checking the reset cause.

**Table 4-9. Boot ROM Reset Causes and Actions**

Reset Source	CPU Boot ROM Action
POR	<ol style="list-style-type: none"> <li>1. Adjust clock divider to /1</li> <li>2. Device configuration</li> <li>3. RAM initialization</li> <li>4. Continue default boot flow</li> </ol>
XRS	<ol style="list-style-type: none"> <li>1. Adjust clock divider to /1</li> <li>2. Device configuration</li> <li>3. RAM initialization</li> <li>4. Continue default boot flow</li> </ol>
HWBIST	Branch to application code
Hibernate	<ol style="list-style-type: none"> <li>1. Adjust clock divider to /1</li> <li>2. Device configuration</li> <li>3. RAM initialization (Either all RAMS except for M0M1 or all RAMS)</li> <li>4. Continue default boot flow</li> </ol>
WDRS	<ol style="list-style-type: none"> <li>1. Adjust clock divider to /1</li> <li>2. Device configuration</li> <li>3. RAM initialization</li> <li>4. Continue default boot flow</li> </ol>
NMIWDRS	<ol style="list-style-type: none"> <li>1. Adjust clock divider to /1</li> <li>2. Device configuration</li> <li>3. RAM initialization</li> <li>4. Continue default boot flow</li> </ol>
Debugger	<ol style="list-style-type: none"> <li>1. Clear boot stack</li> <li>2. Continue default boot flow</li> </ol>
SCCRESET	<ol style="list-style-type: none"> <li>1. Clear boot stack</li> <li>2. Continue default boot flow</li> </ol>

## 4.9.2 Exceptions and Interrupts Handling

This section explains the actions boot ROM performs if any exceptions that can occur happen during boot.

**Table 4-10. Boot ROM Exceptions and Actions**

Exception Event Source	CPU Boot ROM Action	Event Logged
Single-bit error in FUSEERR	Ignore and continue to boot	No
Multi-bit error in FUSEERR	Reset the device	No
Clock fail condition detected	Clear the NMI and continue to boot	Yes
Double-bit ECC error from RAM	Reset the device	Yes
Double-bit error from Flash	Reset the device	Yes
PIE Vector Error	Ignore and continue to boot	Yes
HWBIST Error	Ignore and continue to boot	Yes
ITRAP Exception	Provide ROM location where ROM loops	Yes
Any spurious PIE interrupt occurs	Acknowledge interrupt and continue to boot	No

## 4.10 Boot ROM Description

This section explains the details regarding the device boot ROM.

### 4.10.1 Entry Points

[Table 4-11](#) gives the entry point addresses for various boot modes. These entry points indicate to the boot ROM where to branch to at the end of booting as per the selected boot mode.

**Table 4-11. Entry Point Addresses**

Entry Point	Address
RAM	0x0000 0000
Flash	0x0008 0000

### 4.10.2 Wait Points

During boot ROM execution, there are situations where the CPU can enter a wait loop in the code. This state can occur for a variety of reasons.

[Table 4-12](#) gives the address ranges that the CPU PC register value falls between, if the boot code has entered one of these instances.

**Table 4-12. Wait Point Addresses**

Address Range	Description
0x003FE2D4 – 0x003FE2EF	In Wait Boot
0x003FE73E – 0x003FE824	In NMI Handler (startup)
0x003FE35A – 0x003FE468	In NMI Handler (PIE)
0x003FE468 – 0x003FE495	In ITRAP ISR

### 4.10.3 Memory Maps

This section details the ROM memory maps.

#### 4.10.3.1 Boot ROM Memory Map

**Table 4-13. Boot ROM Memory Map**

Memory	Start Address	End Address	Length
ROM Signature	0x003F 8000	0x003F 8001	0x0002
TI-RTOS (ROM) <sup>(1)</sup>	0x003F 8002	0x003F 9E0F	0x1E0E
PLC Tables 1	0x003F 9E10	0x003F D817	0x3A08
PLC Tables 2	0x003F D818	0x003F DE17	0x0600
Boot	0x003F DE18	0x003F FF31	0x211A
CRC Table	0x003F FF32	0x003F FF39	0x0008
BIST Signature	0x003F FF3A	0x003F FF79	0x0040
Version	0x003F FF7A	0x003F FF7B	0x0002
Checksum	0x003F FF7C	0x003F FFBD	0x0042
Vectors	0x003F FFBE	0x003F FFFF	0x0042
TI-RTOS (Flash)	0x0008 2000	0x0008 3FFF	0x2000

(1) The SYS/BIOS (TI-RTOS) section in ROM is no longer supported and must not be used for new designs.

#### 4.10.3.2 CLA Data ROM Memory Map

**Table 4-14. CLA Data ROM Memory Map**

Memory	Start Address	End Address	Length
FFT Tables (Load)	0x0100 1070	0x0100 186F	0x0800
Data (Load)	0x0100 1870	0x0100 1FF9	0x078A
Version (Load)	0x0100 1FFA	0x0100 1FFF	0x0006

#### 4.10.3.3 Reserved RAM and Flash Memory-Map

**Table 4-15. Reserved RAM and Flash Memory-Map**

Memory	Description	Start Address	End Address	Length
RAM	Boot ROM	0x0000 0002	0x0000 0122	0x0121
	TI-RTOS <sup>(1)</sup>	0x0000 0780	0x0000 07FF	0x0080
Flash	TI-RTOS <sup>(1) (2)</sup>	0x0008 2000	0x0008 2823	0x0824

- (1) If not planning on using TI-RTOS in ROM, then these memory locations are free to be used by the application.
- (2) For using the TI-RTOS in Flash sector A, TI recommends that this sector be made unsecure, or at minimum, the sector must be verified that there is no secure zone claiming this sector.

#### 4.10.3.4 ROM Tables

This section details the boot ROM and CLA ROM symbol tables.

##### 4.10.3.4.1 Boot ROM Tables

The boot ROM symbols and their addresses can be located in the .map file that is included with the released boot ROM source and header code. Within the .map file, locate the Global Symbols category to get a list of the boot ROM symbols and addresses present.

##### 4.10.3.4.2 CLA ROM Tables

#### 4.10.4 Boot Modes

The available boot modes supported on this device are detailed in this section. Each boot mode allows for various options, providing configurations with different IOs to be used, depending on the application.

While each subsection gives details regarding the implementation of the native boot modes on the device, the subsections do not address utilizing each boot mode for common system operations such as:

- Device Firmware Upgrade (DFU)
- Erasing the Flash memory
- Verifying the Flash memory
- Unlocking the security zones
- Running the embedded code from "main"
- Resetting the MCU

These operations and more are covered in the [Serial Flash Programming of C2000™ Microcontrollers Application Report](#).

##### 4.10.4.1 Wait Boot Mode

The wait boot mode puts the CPU in a loop and does not branch to the user application code. The device can enter wait boot mode either manually or because an error occurred during boot up. TI recommends using wait boot when using a debugger to avoid any JTAG complications.

Actions resulting in entering wait boot mode:

- Wait boot is set by the user as the boot mode
- The boot mode is unrecognized and a debugger is connected to the device
- The emulation BOOCTRL key is not equal to 0xA5 or 0x5A
- An error occurs during emulation boot and the boot mode pins are decoded with a value not recognized as a valid boot mode

#### 4.10.4.2 SCI Boot Mode

The SCI boot mode asynchronously transfers code from SCI-A to internal memory. This boot mode only supports an incoming 8-bit data stream and follows the data flow as outlined in [Example 4-1](#).

**Figure 4-5. Overview of SCI Bootloader Operation**

The device communicates with the external host by communication through the SCI-A peripheral. The autobaud feature of the SCI port is used to lock baud rates with the host. For this reason the SCI loader is very flexible and you can use a number of different baud rates to communicate with the device.

After each data transfer, the bootloader echoes back the 8-bit character received to the host. This allows the host to check that each character was received by the bootloader.

At higher baud rates, the slew rate of the incoming data bits can be affected by transceiver and connector performance. While normal serial communications can work well, this slew rate can limit reliable auto-baud detection at higher baud rates (typically beyond 100kbaud) and cause the auto-baud lock feature to fail. To avoid this, the following is recommended:

1. Achieve a baud-lock between the host and SCI bootloader using a lower baud rate.
2. Load the incoming application or custom loader at this lower baud rate.
3. The host can then handshake with the loaded application to set the SCI baud rate register to the desired high baud rate.

Figure 4-6. Overview of SCI Boot Function

#### 4.10.4.3 SPI Boot Mode

The SPI loader expects an SPI-compatible 16-bit or 24-bit addressable serial EEPROM or serial Flash device to be present on the SPI-A pins as indicated in Figure 4-7. The SPI bootloader supports an 8-bit data stream and does not support a 16-bit data stream.

**Figure 4-7. SPI Loader**

The SPI boot ROM loader initializes the SPI module to interface to a serial SPI EEPROM or Flash. Devices of this type include, but are not limited to, the Xicor X25320 (4Kx8) and Xicor X25256 (32Kx8) SPI serial SPI EEPROMs and the Atmel AT25F1024A Serial Flash.

The SPI boot ROM loader initializes the SPI with the following settings: FIFO enabled, 8-bit character, internal SPICLK master mode and talk mode, clock phase = 1, polarity = 0, using the slowest baud rate.

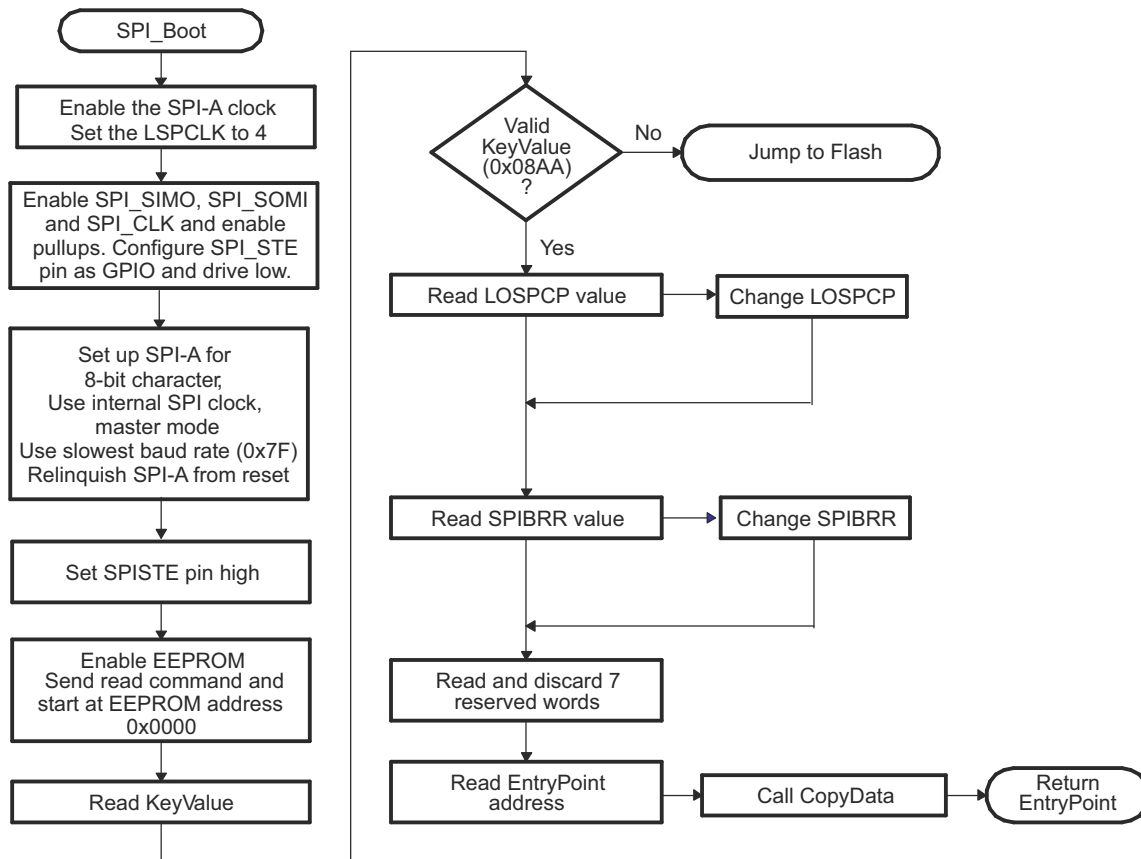

If the download is to be performed from an SPI port on another device, then that device must be setup to operate in the slave mode and mimic a serial SPI EEPROM. Immediately after entering the SPI\_Boot function, the pin functions for the SPI pins are set to primary and the SPI is initialized. The initialization is done at the slowest speed possible. Once the SPI is initialized and the key value read, you can specify a change in baud rate or low-speed peripheral clock.

**Table 4-17. SPI 8-Bit Data Stream**

Byte	Contents
1	LSB: AA (KeyValue for memory width = 8-bits)
2	MSB: 08h (KeyValue for memory width = 8-bits)

...	...
...	Data for this section.
n	LSB: 00h
n+1	MSB: 00h - indicates the end of the source

The data transfer is done in "burst" mode from the serial SPI EEPROM. The transfer is carried out entirely in byte mode (SPI at 8 bits/character). A step-by-step description of the sequence follows:

1. The SPI-A port is initialized
2. The GPIO19 (SPISTE) pin is used as a chip-select for the serial SPI EEPROM or Flash
3. The SPI-A outputs a read command for the serial SPI EEPROM or Flash
4. The SPI-A sends the serial SPI EEPROM an address 0x0000; that is, the host requires that the EEPROM or Flash must have the downloadable packet starting at address 0x0000 in the EEPROM or Flash. The loader is compatible with both 16-bit addresses and 24-bit addresses.
5. The next word fetched must match the key value for an 8-bit data stream (0x08AA). The least significant byte of this word is the byte read first and the most significant byte is the next byte fetched. This is true of all word transfers on the SPI. If the key value does not match, then the load is aborted and the bootloader jumps to Flash.
6. The next 2 bytes fetched can be used to change the value of the low speed peripheral clock register (LOSPCP) and the SPI baud rate register (SPIBRR). The first byte read is the LOSPCP value and the second byte read is the SPIBRR value. The next 7 words are reserved for future enhancements. The SPI bootloader reads these 7 words and discards them.
7. The next two words makeup the 32-bit entry point address where execution can continue after the boot load process is complete. This is typically the entry point for the program being downloaded through the SPI port.
8. Multiple blocks of code and data are then copied into memory from the external serial SPI EEPROM through the SPI port. The blocks of code are organized in the standard data stream structure presented earlier. This is done until a block size of 0x0000 is encountered. At that point in time the entry point address is returned to the calling routine that then exits the bootloader and resumes execution at the address specified.

**Figure 4-8. Data Transfer From EEPROM Flow**

#### 4.10.4.4 I2C Boot Mode

The I2C bootloader expects an 8-bit wide I2C-compatible EEPROM device to be present at address 0x50 on the I2C-A bus as indicated in Figure 4-9. The EEPROM must adhere to conventional I2C EEPROM protocol, as described in this section, with a 16-bit base address architecture.

**Figure 4-9. EEPROM Device at Address 0x50**

If the download is to be performed from a device other than an EEPROM, then that device must be set up to operate in the slave mode and mimic the I2C EEPROM. Immediately after entering the I2C boot function, the GPIO pins are configured for I2C-A operation and the I2C is initialized. The following requirements must be met when booting from the I2C module:

- The input frequency to the device must be in the appropriate range.
- The EEPROM must be at slave address 0x50.

The bit-period prescalers (I2CCLKH and I2CCLKL) are configured by the bootloader to run the I2C at a 50 percent duty cycle at 100-kHz bit rate (standard I2C mode) when the system clock is 10 MHz. These registers can be modified after receiving the first few bytes from the EEPROM. This allows the communication to be increased up to a 400-kHz bit rate (fast I2C mode) during the remaining data reads.

Arbitration, bus busy, and slave signals are not checked. Therefore, no other master is allowed to control the bus during this initialization phase. If the application requires another master during I2C boot mode, that master must be configured to hold off sending any I2C messages until the application software signals that it is past the bootloader portion of initialization.

The non-acknowledgment bit is checked only during the first message sent to initialize the EEPROM base address. This is to make sure that an EEPROM is present at address 0x50 before continuing. If an EEPROM is not present, the non-acknowledgment bit is not checked during the address phase of the data read messages (I2C\_Get Word). If a non-acknowledgment is received during the data read messages, the I2C bus hangs. Table 4-18 shows the 8-bit data stream used by the I2C.

Figure 4-10. Overview of I2C Boot Function

**Table 4-18. I2C 8-Bit Data Stream**

n+1	MSB: 00h - indicates the end of the source

The I2C EEPROM protocol required by the I2C bootloader is shown in [Figure 4-11](#) and [Figure 4-12](#). The first communication, which sets the EEPROM address pointer to 0x0000 and reads the KeyValue (0x08AA) from it, is shown in [Figure 4-11](#). All subsequent reads are shown in [Figure 4-12](#) and are read two bytes at a time.

**Figure 4-11. Random Read**

**Figure 4-12. Sequential Read**

#### 4.10.4.5 Parallel Boot Mode

The parallel general purpose I/O (GPIO) boot mode asynchronously transfers code from GPIO58 -GPIO63, GPIO64-GPIO65 to internal memory. Each value is 8 bits long and follows the same data flow as outlined in Figure 4-13.

Figure 4-13. Overview of Parallel GPIO Bootloader Operation

The control subsystem communicates with the external host device by polling/driving the GPIO70 and GPIO69 lines. The handshake protocol shown in Figure 4-14 must be used to successfully transfer each word using GPIO [63-58,64,65]. This protocol is very robust and allows for a slower or faster host to communicate with the master subsystem.

Two consecutive 8-bit words are read to form a single 16-bit word. The most significant byte (MSB) is read first followed by the least-significant byte (LSB). In this case, data is read from GPIO[63-58,64,65].

The 8-bit data stream is shown in Table 4-19.

Table 4-19. Parallel GPIO Boot 8-Bit Data Stream

Bytes	GPIO[63:58,64,65] (Byte 1 of 2)	GPIO[63:58,64,65] (Byte 2 of 2)	Description
1 2	AA	08	0x08AA (KeyValue for memory width = 16 bits)
3 4	00	00	8 reserved words (words 2 - 9)
...	...	...	...
17 18	00	00	Last reserved word
19 20	BB	00	Entry point PC[22:16]
21 22	DD	CC	Entry point PC[15:0] (PC = 0x00BBCCDD)
23 24	NN	MM	Block size of the first block of data to load = 0xMMNN words
25 26	BB	AA	Destination address of first block Addr[31:16]
27 28	DD	CC	Destination address of first block Addr[15:0] (Addr = 0xAABCCDD)
29 30	BB	AA	First word of the first block in the source being loaded = 0xAABB
...			...
...			Data for this section.
...			...
.	BB	AA	Last word of the first block of the source being loaded = 0xAABB
.	NN	MM	Block size of the 2nd block to load = 0xMMNN words
.	BB	AA	Destination address of second block Addr[31:16]
.	DD	CC	Destination address of second block Addr[15:0]
.	BB	AA	First word of the second block in the source being loaded
.			...
n n+1	BB	AA	Last word of the last block of the source being loaded (More sections if required)
n+2 n+3	00	00	Block size of 0000h - indicates end of the source program

The device first signals the host that the device is ready to begin data transfer by pulling the GPIO69 pin low. The host load then initiates the data transfer by pulling the GPIO70 pin low. The complete protocol is shown in Figure 4-14.

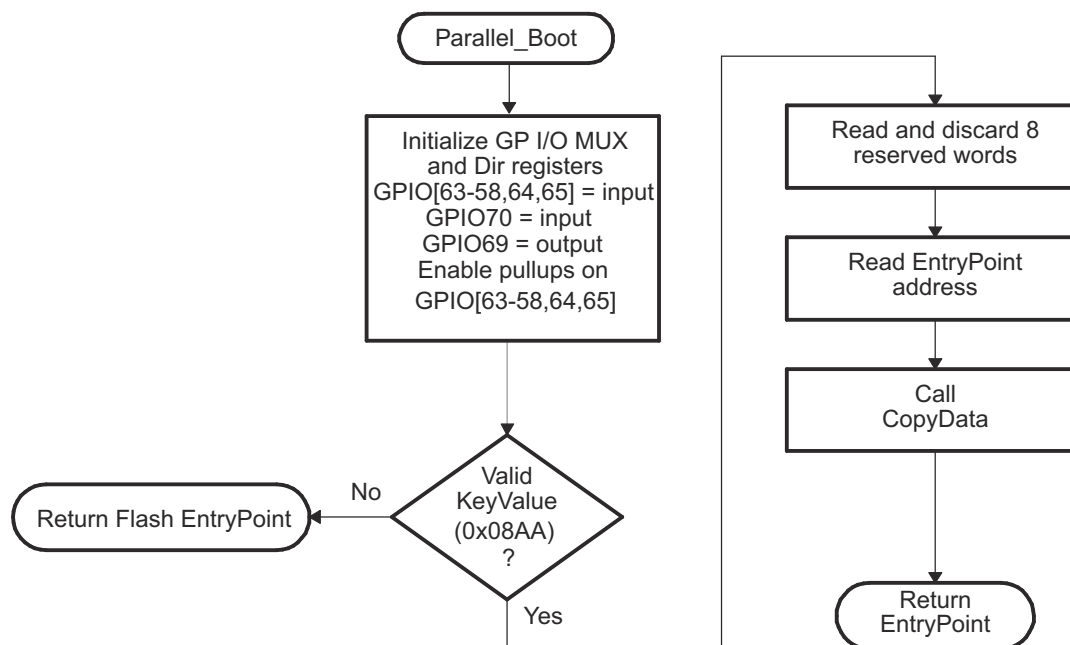

**Figure 4-14. Parallel GPIO Bootloader Handshake Protocol**

1. The device indicates the device is ready to start receiving data by pulling the GPIO69 pin low.
2. The bootloader waits until the host puts data on GPIO [63-58,64,65]. The host signals to the device that data is ready by pulling the GPIO70 pin low.
3. The device reads the data and signals the host that the read is complete by pulling GPIO69 high.
4. The bootloader waits until the host acknowledges the device by pulling GPIO70 high.
5. The device again indicates the device is ready for more data by pulling the GPIO69 pin low.

This process is repeated for each data value to be sent.

Figure 4-15 shows an overview of the Parallel GPIO bootloader flow.

**Figure 4-15. Parallel GPIO Mode Overview**

Figure 4-16 shows the transfer flow from the host side. The operating speed of the CPU and host are not critical in this mode as the host waits for the device and the device waits for the host. In this manner, the protocol works with both a host running faster and a host running slower than the device.

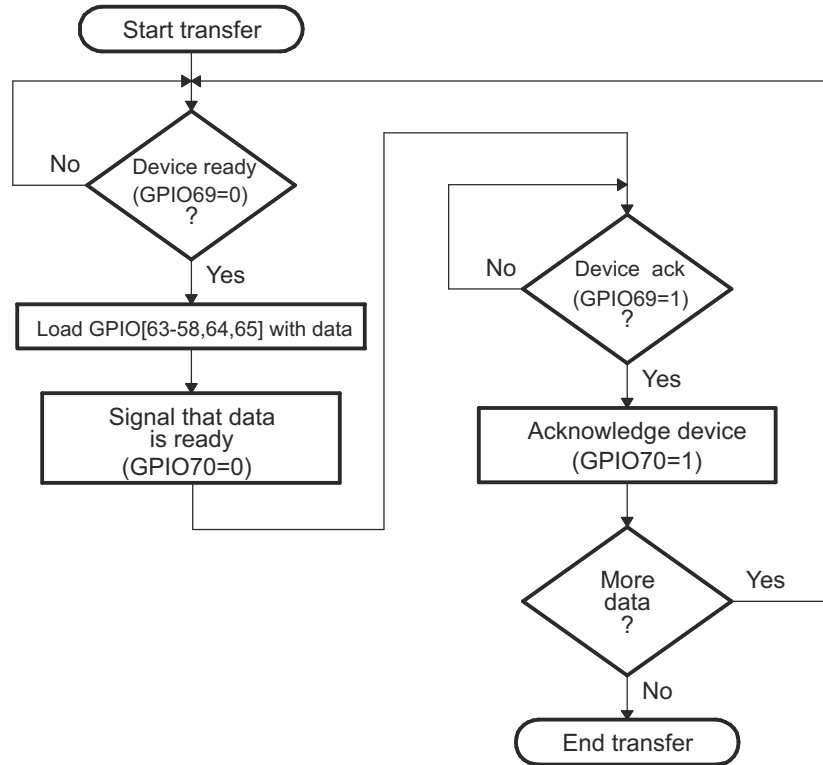

Figure 4-16. Parallel GPIO Mode - Host Transfer Flow

Figure 4-17 shows the flow used to read a single word of data from the parallel port.

- **8-bit data stream**

The 8-bit routine, shown in Figure 4-17, discards the upper 8 bits of the first read from the port and treats the lower 8 bits masked with GPIO65 in bit position 7 and GPIO64 in bit position 6 as the least-significant byte (LSB) of the word to be fetched. The routine then performs a second read to fetch the most-significant byte (MSB). The routine then combines the MSB and LSB into a single 16-bit value to be passed back to the calling routine.

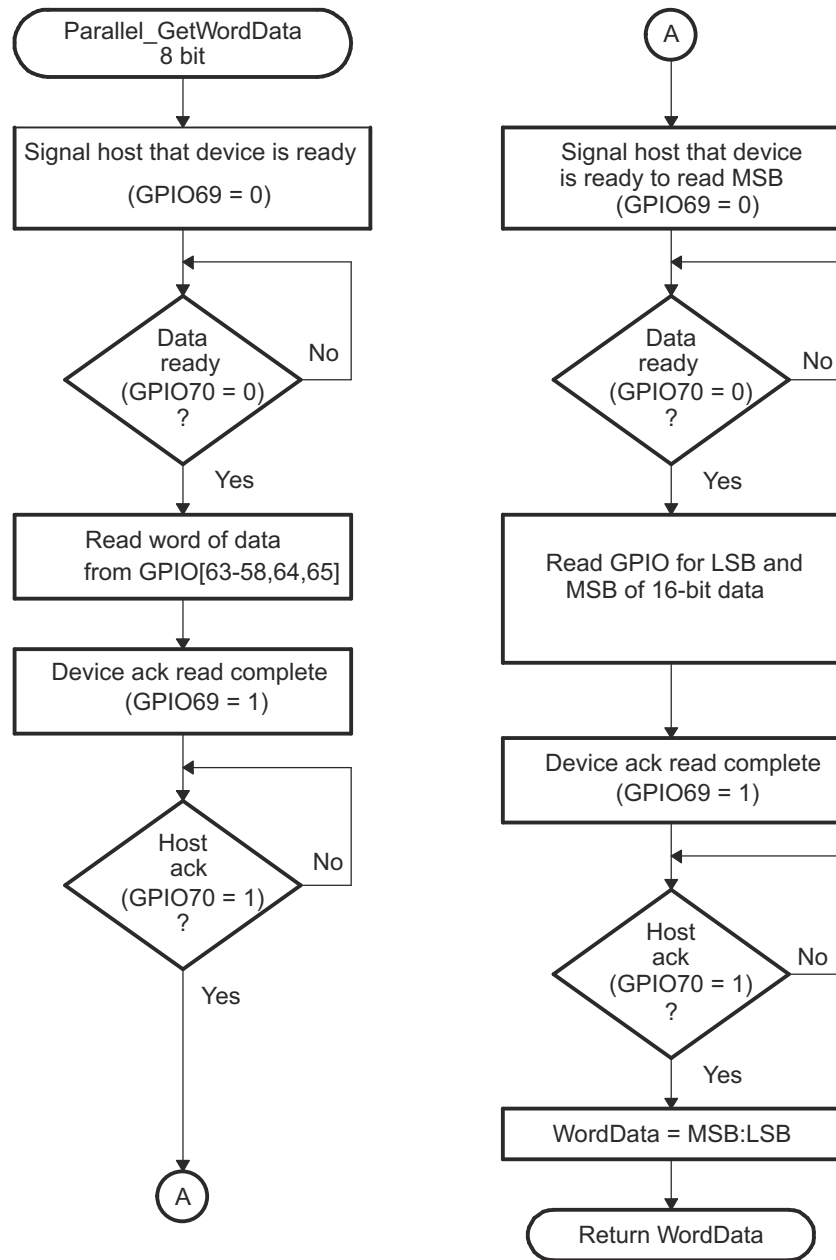

Figure 4-17. 8-Bit Parallel GetWord Function

#### 4.10.4.6 CAN Boot Mode

The CAN bootloader asynchronously transfers code from CAN-A to internal memory. The host can be any CAN node. The communication is first done with 11-bit standard identifiers (with a MSGID of 0x1) using two bytes per data frame. The host can download a kernel to reconfigure the CAN if higher data throughput is desired.

Figure 4-18. Overview of CAN-A Bootloader Operation

The bit timing registers are programmed in such a way that a 50-kbps bit rate is achieved with the 10-MHz INTOSC1 oscillator, as shown in [Table 4-20](#).

Table 4-20. Bit-Rate Value for Internal Oscillators

OSCCLK	SYSCLKOUT	Bit Rate
10 MHz	10 MHz	50 kbps

The SYSCLKOUT values shown are the reset values with the default PLL setting. The BRP and bit-time values are hard-coded to 10 and 20, respectively.

**Note**

The CPU CAN boot loader uses INTOSC as the bit clock source.

Mailbox 1 is programmed with a standard MSGID of 0x1 for boot-loader communication. The CAN host can transmit only 2 bytes at a time, LSB first and MSB next. For example, to transmit the word 0x08AA to the device, transmit AA first, followed by 08. The program flow of the CAN bootloader is identical to the SCI bootloader. The data sequence for the CAN bootloader is shown in [Table 4-21](#).

**Table 4-21. CAN 8-Bit Data Stream**

#### 4.10.4.7 USB Boot Mode

In USB boot mode, the device enumerates with vendor ID 0x1CBE and product ID 0x00FF. The device descriptor and interface descriptor both show the class as 0xFF (vendor-specific), the subclass as 0x00, and the protocol as 0x00. After enumeration, the device waits for data. Data can be sent using bulk OUT transfers to endpoint 1. The data is interpreted as a series of 8-bit bytes in the standard data stream format described in Section 4.10.5, shown here in Table 4-22. No reserved bytes are used. Once the data transfer is complete (block size of 0x0000 sent), the device disconnects from the USB bus, allowing other software to make use of the module if desired. Figure 4-19 illustrates the flow for USB boot mode.

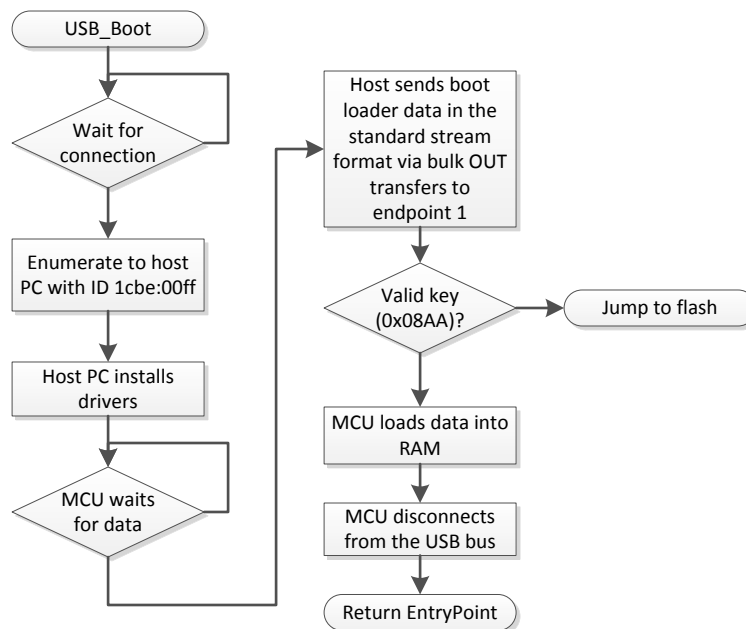

Figure 4-19. USB Boot Flow

Implementing PC-side USB software is not trivial. It is recommended to use the TI-provided tools and drivers to load data in USB boot mode. Hex and binary files for loader tools can be generated from COFF (.out) files using the hex2000 tool. To produce a plain binary file in the boot loader format, use the following command line:

```
hex2000 -boot -b Program_to_Load.out -o Binary_Loader_Data.dat
```

For more information on hex2000, see the [TMS320C28x Assembly Language Tools User's Guide](#).

**Table 4-22. USB 8-Bit Data Stream**

n+2 n+3	00	00	Block size of 0000h - indicates end of the source program

#### 4.10.5 Boot Data Stream Structure

This section details the data transfer protocols or stream structures that allow boot data transfer between boot ROM and host device. This data transfer protocol is compatible to the respective bootloaders on other C2000 devices.

##### 4.10.5.1 Bootloader Data Stream Structure

[Table 4-23](#) and [Example 4-1](#) show the structure of the data stream incoming to the bootloader. The basic structure is the same for all the bootloaders and is based on the C54x source data stream generated by the C54x hex utility. The C28x hex utility (hex2000.exe) has been updated to support this structure. The hex2000.exe utility is included with the C2000 code generation tools. All values in the data stream structure are in hex.

The first 16-bit word in the data stream is known as the key value. The key value is used to indicate to the bootloader the width of the incoming stream: 8 or 16 bits. Note that not all bootloaders accept both 8 and 16-bit streams. Refer to the detailed information on each loader for the valid data stream width. For an 8-bit data stream, the key value is 0x08AA and for a 16-bit stream the key value is 0x10AA. If a bootloader receives an invalid key value, then the load is aborted.

The next eight words are used to initialize register values or otherwise enhance the bootloader by passing values to it. If a bootloader does not use these values then they are reserved for future use and the bootloader

simply reads the value and then discards it. Currently only the SPI and I2C and parallel bootloaders use these words to initialize registers.

The tenth and eleventh words comprise the 22-bit entry point address. This address is used to initialize the PC after the boot load is complete. This address is most likely the entry point of the program downloaded by the bootloader.

The twelfth word in the data stream is the size of the first data block to be transferred. The size of the block is defined as 8-bit data stream format. For example, to transfer a block of 20 8-bit data values from an 8-bit data stream, the block size is 0x000A to indicate 10 16-bit words.

The next two words indicate to the loader the destination address of the block of data. Following the size and address is the 16-bit words that makeup that block of data.

This pattern of block size/destination address repeats for each block of data to be transferred. Once all the blocks have been transferred, a block size of 0x0000 signals to the loader that the transfer is complete. At this point, the loader returns the entry point address to the calling routine that cleans up and exits. Execution then continues at the entry point address as determined by the input data stream contents.

**Table 4-23. LSB/MSB Loading Sequence in 8-Bit Data Stream**

Byte		Contents	
		LSB (First Byte of 2)	MSB (Second Byte of 2)
1	2	LSB: AA (KeyValue for memory width = 8 bits)	MSB: 08h (KeyValue for memory width = 8 bits)
3	4	LSB: Register initialization value or reserved	MSB: Register initialization value or reserved
5	6	LSB: Register initialization value or reserved	MSB: Register initialization value or reserved
7	8	LSB: Register initialization value or reserved	MSB: Register initialization value or reserved
...	...	...	...
17	18	LSB: Register initialization value or reserved	MSB: Register initialization value or reserved
19	20	LSB: Upper half of Entry point PC[23:16]	MSB: Upper half of entry point PC[31:24] (Always 0x00)
21	22	LSB: Lower half of Entry point PC[7:0]	MSB: Lower half of Entry point PC[15:8]
23	24	LSB: Block size in words of the first block to load. If the block size is 0, this indicates the end of the source program. Otherwise another block follows. For example, a block size of 0x000A indicates 10 words or 20 bytes in the block.	MSB: block size
25	26	LSB: MSW destination address, first block Addr[23:16]	MSB: MSW destination address, first block Addr[31:24]
27	28	LSB: LSW destination address, first block Addr[7:0]	MSB: LSW destination address, first block Addr[15:8]
29	30	LSB: First word of the first block being loaded	MSB: First word of the first block being loaded
...	...	...	...
.	.	LSB: Last word of the first block to load	MSB: Last word of the first block to load
.	.	LSB: Block size of the second block	MSB: Block size of the second block
.	.	LSB: MSW destination address, second block Addr[23:16]	MSB: MSW destination address, second block Addr[31:24]
.	.	LSB: LSW destination address, second block Addr[7:0]	MSB: LSW destination address, second block Addr[15:8]
.	.	LSB: First word of the second block being loaded	MSB: First word of the second block being loaded
...	...	...	...
.	.	LSB: Last word of the second block	MSB: Last word of the second block
.	.	LSB: Block size of the last block	MSB: Block size of the last block
.	.	LSB: MSW of destination address of last block Addr[23:16]	MSB: MSW destination address, last block Addr[31:24]
.	.	LSB: LSW destination address, last block Addr[7:0]	MSB: LSW destination address, last block Addr[15:8]
.	.	LSB: First word of the last block being loaded	MSB: First word of the last block being loaded
...	...	...	...
.	.	LSB: Last word of the last block	MSB: Last word of the last block
n	n+1	LSB: 00h	MSB: 00h - indicates the end of the source

**Example 4-1. Data Stream Structure 8-bit**

```

AA 08      ; 0x08AA 8-bit key value
00 00 00 00 ; 8 reserved words
00 00 00 00

### 4.10.7 Secure ROM Function APIs

Within secure ROM of each core, functions are available to be called by the application to perform EXEONLY Flash/RAM tasks in a secure manner.

#### Note

The application must disable interrupts before calling one of the EXEONLY function APIs.

If a vector fetch request is given by the CPU while the program counter (PC) is within the EXEONLY function API code of the Secure ROM, a reset fires. The consequence of this is if an NMI or ITRAP occurs while the PC is executing one of the EXEONLY API functions, the NMI/ITRAP cannot be serviced because a reset is fired to that subsystem.

The **safe copy code zone 1 and zone 2 functions** allow EXEONLY Flash to be copied to EXEONLY RAM in a secure manner. The source must be from EXEONLY Flash and the destination to EXEONLY RAM. There is no support to copy EXEONLY ROM or EXEONLY RAM to RAM. Both Flash and RAM must be set to EXEONLY and configured for the same zone. Additionally, the copy size must not cross over the Flash sector boundary. Any violations of these requirements results in a failure status returned. Upon successful copy of the data, the number of 16-bit words copied is returned.

**Table 4-33. Safe Copy Code Function**

CPU	Function Prototype	Function Parameters	Function Return Value
CPU	<code>Uint16 SafeCopyCodeZ1(Uint32 size, Uint16 *dst, Uint16 *src)</code>	<p><i>size</i> : The number of 16-bit words to copy</p> <p><i>dst</i> : The destination memory address in EXEONLY RAM</p> <p><i>src</i> : The source memory address in EXEONLY Flash</p>	<p>0xFFFF : Returns the number of 16-bit words copied</p> <p>0x0000 : Indicates one of the following: Copy length is zero; Copy size crosses over Flash sector boundary; Flash and RAM do not belong to the same zone; Flash and/or RAM are not set to EXEONLY; Error occurred during data copy</p>
	<code>Uint16 SafeCopyCodeZ2(Uint32 size, Uint16 *dst, Uint16 *src)</code>		

The **safe CRC calculation zone 1 and zone 2 functions** allow a safety CRC check of EXEONLY memory in a secure manner. The CRC length provided must be a value from 1 to 8 where 1 represents a CRC size of 32 16-bit words and 8 represents a CRC size of 4096 16-bit words. The source address specifies the starting address for the CRC and the destination address is the location that the resulting CRC value is stored. The source and destination memories must be configured for the same zone. Additionally, the CRC length must not cross over the Flash sector or RAM block boundary. Any violations of these requirements results in a failure status returned. Upon successful CRC, the number of 16-bit words CRC'd is returned.

**Table 4-34. Safe CRC Calculation Function**

CPU	Function Prototype	Function Parameters	Function Return Value
CPU	<code>Uint16 SafeCRCCalcZ1(Uint16 len_id, Uint16 *dst, Uint16 *src)</code>	<p><i>len_id</i> : A number from 1 to 8 that corresponds to length options of 32, 64, 128, 256, 512, 1024, 2048, or 4096 16-bit words</p> <p><i>dst</i> : The destination memory address for resulting CRC</p> <p><i>src</i> : The source memory address to begin CRC calculation</p>	<p>0xFFFF : Returns the number of 16-bit words CRC'd</p> <p>0x0000 : Indicates one of the following: Invalid length option; Source address is not modulo of length value; Destination address is not within secure RAM; CRC size crosses over Flash sector or RAM block boundary; The source and destination memory do not belong to the same zone</p>
	<code>Uint16 SafeCRCCalcZ2(Uint16 size, Uint16 *dst, Uint16 *src)</code>		

#### 4.10.8 Clock Initializations

During boot up, the boot ROM initializes the device clocking, depending upon the reset source, to assist in faster boot time response. Clock configurations are performed by the boot ROM code only for POR, XRS, and HIBERNATE reset types. For all other resets, the boot ROM starts executing with the clocks that were already set up before reset.

**Table 4-35. Boot Clock Sources**

Source	Frequency	Description
INTOSC1	10 MHz	Set as clock source, if missing clock is detected at power up or right after device reset.

**Table 4-36. Clock State After Boot ROM**

Reset Source	Clock State
POR/XRS/HIBERNATE	Bypassed PLL.
	PLL multiplier is set to 0x0
	Clock divider is set to /1.
All other Resets	Maintain clocks setup before device reset.

#### Note

If the PLL is used during the boot process, the PLL is bypassed by the boot ROM code before branching to the user application.

#### 4.10.9 Wait State Configuration

This section details the ROM memory wait state configurations. By default, the CPU ROM memory on this device is not zero-wait state; the ROM memory is 1-wait state with prefetch disabled. ROM does support prefetch enable and disable configurations to provide better execution speeds at varying clock frequencies. Configuring the wait state enables user applications to adjust for when performing callbacks into ROM or secure copy code (SCC).

**Table 4-37. ROM Wait States**

Wait State Disable Bit ROMWAITSTATE Register (Bit 0 – 0x5F540)	Pre-Fetch Enable Bit ROMPREFETCH Register (Bit 0 – 0x5E608)	C28x ROM Configuration
0	0	<ul style="list-style-type: none"> <li>Wait state enabled</li> <li>Prefetch disabled</li> <li>Maximum Frequency: 200 MHz</li> </ul>
0	1	<ul style="list-style-type: none"> <li>Wait state enabled</li> <li>Prefetch enabled</li> <li>Maximum Frequency: 180 MHz</li> </ul>
1	Don't Care	<ul style="list-style-type: none"> <li>0 Wait state</li> <li>Prefetch disabled</li> <li>Maximum Frequency: 150 MHz</li> </ul>

#### 4.10.10 Boot Status information

Boot ROM keeps a record of the different events that can occur during boot ROM execution. This is because NMI and other exceptions are enabled by default in the device, and must be handled accordingly. Boot ROM stores the boot status information in a RAM location so that the user application can look at this boot status and take the necessary actions per the application's needs to handle these events.

##### 4.10.10.1 CPU Booting Status

This section details the boot status RAM location and the bit field definitions. When the specific bit field is set, the described event or action has occurred.

**Table 4-38. CPU Boot Status Address**

Description	Address
CPU Boot ROM Status	0x0000 002C

**Table 4-39. CPU Boot Status Bit Fields**

Bit	Description
31	CPU Boot ROM has finished running
30	Boot ROM detected a missing clock NMI
29	Boot ROM detected a RAM bit error NMI
28	Boot ROM detected a Flash bit error NMI
27	Boot ROM detected CPU HWBIST error NMI
25	Boot ROM detected PIE vector error NMI
20	Boot ROM detected OVF NMI
19	Boot ROM detected a PIE mismatch
17	Boot ROM detected an ITRAP
15	Boot ROM handled POR
14	Boot ROM handled XRS
13	Boot ROM handled HWBIST reset
12	Boot ROM handled hibernate reset
11	Boot ROM handled all the resets
10	DCSM initialization has completed
9	Flash boot has started
8	CPU Boot ROM has started running

#### 4.10.11 ROM Version

The ROM revision and release date information is stored at the ROM locations specified in [Table 4-40](#).

**Table 4-40. Boot ROM Version Information**

Start Address	End Address	Contents
0x003F FF7A	0x003F FF7A	Revision Number
0x003F FF7B	0x003F FF7B	Revision Date

Interpreting the contents:

- Reading a revision value of 0x100 represents version 1.0.
- Reading a revision date value of 0x0715 represents 07/15 or July 2015.

Chapter 5  
**Direct Memory Access (DMA)**

---

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and memory without intervention from the CPU; thereby, freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as the data is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for CPU processing.

## 5.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of their bandwidth moving data, whether moving data from off-chip memory to on-chip memory, from a peripheral such as an analog-to-digital converter (ADC) to RAM, or from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this chapter has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning the DMA module requires a peripheral or software trigger to start a DMA transfer. Although the DMA module can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module itself to start memory transfers periodically. The DMA module has six independent DMA channels that can be configured separately and each channel contains their own independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. This address control logic allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features is discussed in detail in this chapter.

### 5.1.1 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

### 5.1.2 Block Diagram

Figure 5-1 shows a device-level block diagram of the DMA.

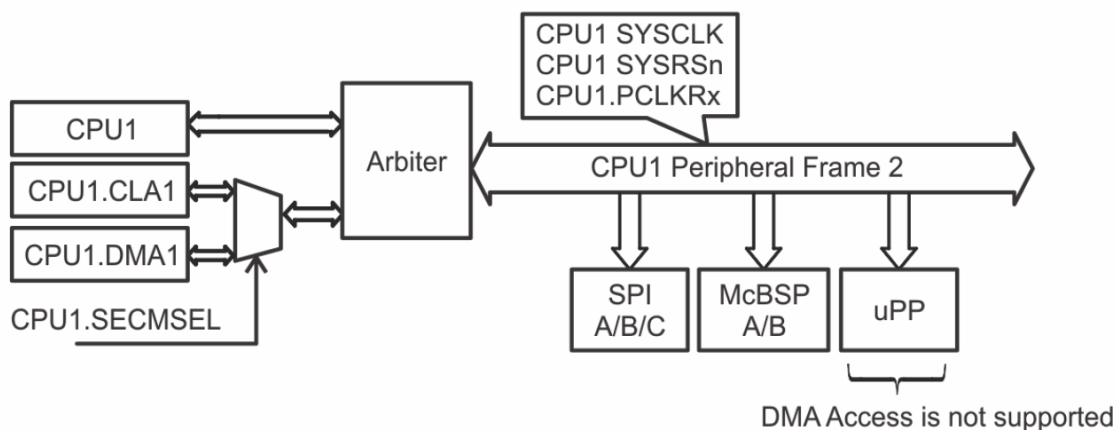

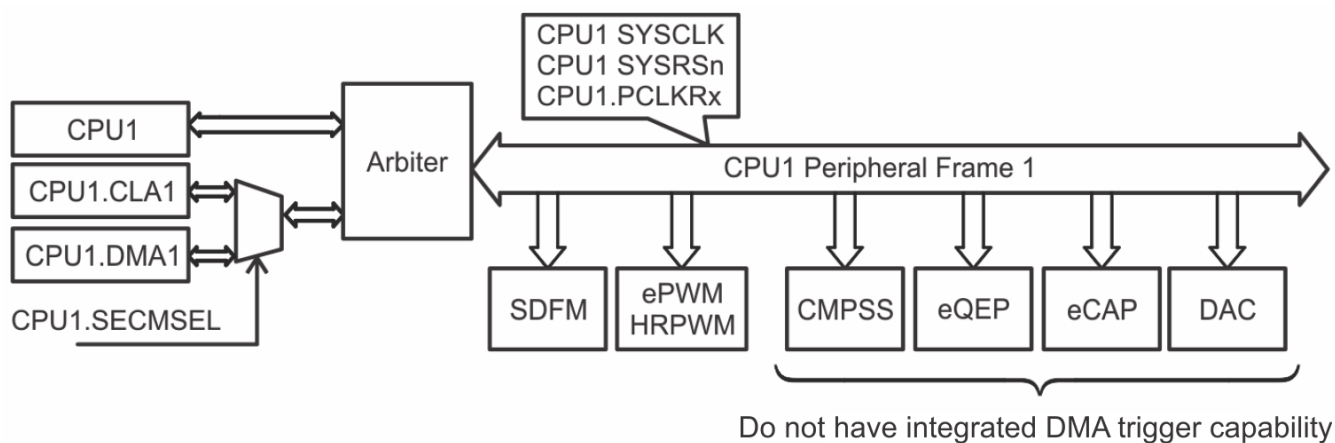

Figure 5-1. DMA Block Diagram

## 5.2 Architecture

### 5.2.1 Common Peripheral Architecture

The architecture of this device allows for common peripherals to be accessed by different masters. A peripheral can be accessed by the CPU and one of the secondary masters (DMA or CLA1). The secondary master is selected using the SECMSEL register. Refer to the SECMSEL register definition for more details. If a secondary master is not selected, all writes from that master are ignored and all reads return 0x0.

Refer to [Section 5.5](#) for more details on the arbitration scheme for all masters.

**Figure 5-2. Common Peripheral Architecture**

#### Note

If CPU and DMA make an access to the same peripheral frame in the same cycle, the DMA has priority and the CPU is stalled.

### 5.2.2 Peripheral Interrupt Event Trigger Sources

Each DMA Channel can be configured to trigger by software and other peripheral triggers events. DMACHSRCSELx register can be used to configure DMA Trigger sources for each DMA channel. CHx.MODE.PERINTSEL register bit field can be set to channel number (CHx.MODE.PERINTSEL = x) as shown in [Figure 5-3](#). Included in these DMA Trigger sources are five external interrupt signals that can be connected to most of the general-purpose input/output (GPIO) pins on the device. This adds significant flexibility to the event trigger capabilities. Upon receipt of a peripheral interrupt event signal, the DMA automatically sends a clear signal to the interrupt source so that subsequent interrupt events occur.

---

**Note**

To use the system-level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel can be done using the DMACHSRCSELx register and the CHx.MODE.PERINTSEL register. See [Table 5-1](#) or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

---

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst completes before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG remains set.

[Figure 5-4](#) shows a diagram of the trigger select circuit.

[Table 5-1](#) shows the peripheral trigger source options that are available for each channel.

**CAUTION**

See the Device Errata "ADC:DMA Read of Stale Result" Advisory regarding the potential for the DMA to read the ADC result registers before the result is ready

Figure 5-3. DMA Trigger Architecture

Note: See Figure 5-3.

### 5.2.3 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus by way of interfaces that sometimes share resources with the CPU memory or peripheral bus. Arbitration rules are defined in [Section 5.5](#).

### 5.3 Address Pointer and Transfer Control

The DMA state machine is, at the most basic level, two nested loops.

#### Burst (Inner) Loop:

The burst (inner) loop transfers a programmable number of words set by (BURST\_SIZE + 1) register when a DMA channel trigger (Peripheral or Software trigger) is received. The BURST\_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit or 32-bit word burst that can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC\_ADDR\_SHADOW) and the destination (DST\_ADDR\_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into the respective active (SRC\_ADDR\_ACTIVE or DST\_ADDR\_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST\_STEP register is added to the active register:

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_BURST\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_BURST\_STEP}$$

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral or Software trigger) is received.

#### Transfer (Outer) Loop:

The Transfer (outer) loop transfers a programmable number of bursts set by (TRANSFER\_SIZE + 1) register for each channel. Since TRANSFER\_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer:

**Method 1 (Default):** When address wrapping is disabled (SRC\_WRAP\_SIZE or DST\_WRAP\_SIZE is greater than TRANSFER\_SIZE), active address pointer is updated as shown below

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_TRANSFER\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_TRANSFER\_STEP}$$

**Method 2:** Address wrapping gets enabled when SRC\_WRAP\_SIZE or DST\_WRAP\_SIZE is less than TRANSFER\_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST\_WRAP\_SIZE + 1) register, the state machine modifies the active address pointers as:

$$\text{SRC\_BEG\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE} + \text{SRC\_WRAP\_STEP}$$

$$\text{DST\_BEG\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE} + \text{DST\_WRAP\_STEP}$$

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE}$$

At the end of DMA transfer, DMA can have transferred  $(\text{BURST\_SIZE} + 1) \times (\text{TRANSFER\_SIZE} + 1)$  words.

### OneShot Mode:

OneShot mode is disabled by default.

When OneShot mode is disabled ( $\text{MODE.CHx}[\text{ONESHOT}] = 0$ ), DMA transfers one burst  $[(\text{BURST\_SIZE} + 1)$  words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled ( $\text{MODE.CHx}[\text{ONESHOT}] = 1$ ), DMA transfers all the bursts  $[(\text{BURST\_SIZE} + 1) \times (\text{TRANSFER\_SIZE} + 1)$  words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

### Continuous Mode:

Continuous mode is disabled by default.

When Continuous mode is disabled ( $\text{MODE.CHx}[\text{CONTINUOUS}] = 0$ ), DMA state machine disables channel after all bursts in a transfer loop ( $\text{TRANSFER\_COUNT} = 0$ ) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuous mode is enabled ( $\text{MODE.CHx}[\text{CONTINUOUS}] = 1$ ), DMA state machine keep channel active even after all bursts in a transfer loop ( $\text{TRANSFER\_COUNT} = 0$ ) are complete.

Each DMA channel can trigger their own EPIE interrupt for each DMA transfer either at start of DMA transfer or end of DMA transfer using  $\text{MODE.CHx}[\text{CHINTMODE}]$  bit.

**Source/Destination Address Pointers (SRC/DST\_ADDR)** The value written into the shadow register is the start address of the first location where data is read or written to.

At the beginning of a transfer the shadow register ( $\text{SRC/DST\_ADDR\_SHADOW}$ ) is copied into the active register ( $\text{SRC/DST\_ADDR\_ACTIVE}$ ). The active register performs as the current address pointer.

**Source/Destination Begin Address Pointers (SRC/DST\_BEG\_ADDR)** This is the wrap pointer.

The value written into the shadow register ( $\text{SRC/DST\_BEG\_ADDR\_SHADOW}$ ) is loaded into the active register ( $\text{SRC/DST\_BEG\_ADDR\_ACTIVE}$ ) at the start of a transfer. On a wrap condition, the active register ( $\text{SRC/DST\_BEG\_ADDR\_ACTIVE}$ ) is incremented by the signed value in the appropriate  $\text{SRC/DST\_WRAP\_STEP}$  register prior to being loaded into the active register ( $\text{SRC/DST\_ADDR\_ACTIVE}$ ).

For each channel, the transfer process can be controlled with the following size values:

**Source and  
Destination  
Burst Size  
(BURST\_SIZE)**

This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST\_COUNT register at the beginning of each burst. The BURST\_COUNT decrements each word that is transferred and when the register reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE\_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size can be all 16 registers (if all 16 registers are used). For RAM, the burst size can be up to the maximum allowed by the BURST\_SIZE register, which is 32. See [Table 5-2](#) to understand how BURST\_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

**Table 5-2. BURSTSIZE versus DATASIZE Behavior**

BURSTSIZE	Number of 16-bit words transferred in	
	DataSize = 16-bit data	DataSize = 32-bit data
0	1	2
1	2	2
2	3	4
3	4	4
4	5	6
5	6	6
6	7	8
7	8	8
8	9	10
9	10	10
10	11	12
11	12	12
*	*	*
*	*	*
*	*	*
30	31	32
31	32	32

**Source and  
Destination  
Transfer Size  
(TRANSFER\_SIZE)**

This specifies the number of bursts to be transferred per CPU interrupt (if enabled).

Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER\_SIZE register is loaded into the TRANSFER\_COUNT register at the beginning of each transfer. The TRANSFER\_COUNT register keeps track of how many bursts of data the channel has transferred and when the register reaches zero, the DMA transfer is complete.

**Source/Destination Wrap Size (SRC/DST\_WRAP\_SIZE)** This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning.

This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST\_WRAP\_COUNT register at the beginning of each transfer. The SRC/DST\_WRAP\_COUNT registers keep track of how many bursts of data the channel has transferred and when the registers reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To disable the wrap function, assign the value of these registers to be larger than the TRANSFER\_SIZE.

---

#### Note

The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 can be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 can be placed in the SIZE register.

---

For each source/destination pointer, the address changes can be controlled with the following step values:

**Source/Destination Burst Step (SRC/DST\_BURST\_STEP)** Within each burst transfer, the address source and destination step sizes are specified by these registers.

This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers can be set to zero.

**Source/Destination Transfer Step (SRC/DST\_TRANSFER\_STEP)** This specifies the address offset to start the next burst transfer after completing the current burst transfer.

This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

**Source/Destination Wrap Step (SRC/DST\_WRAP\_STEP)** When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST\_BEG\_ADDR pointer and hence sets the new start address.

This implements a circular type of addressing mode, useful in many applications. This value is a signed 2s compliment number so that the address pointer can be incremented or decremented as required.

---

#### Note

Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 can be placed in these registers.

---

**Channel Interrupt Mode (CHINTMODE)** This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer.

If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt can be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.

All of the previous features and modes are shown in [Figure 5-5](#). The following items are in reference to [Figure 5-5](#).

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST\_ADDR\_ACTIVE registers are not affected by SRC/DST\_BEG\_ADDR\_ACTIVE at the start of a transfer. SRC/DST\_BEG\_ADDR\_ACTIVE only affects the SRC/DST\_ADDR\_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_SHADOW
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_ADDR\_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE += SRC/DST\_WRAP\_STEP
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_ACTIVE
- The best way to remember this is:
  - The shadow registers never change except by software.
  - The active registers never change except by hardware, and a shadow register is only copied into their own active register, never an active register by another name.

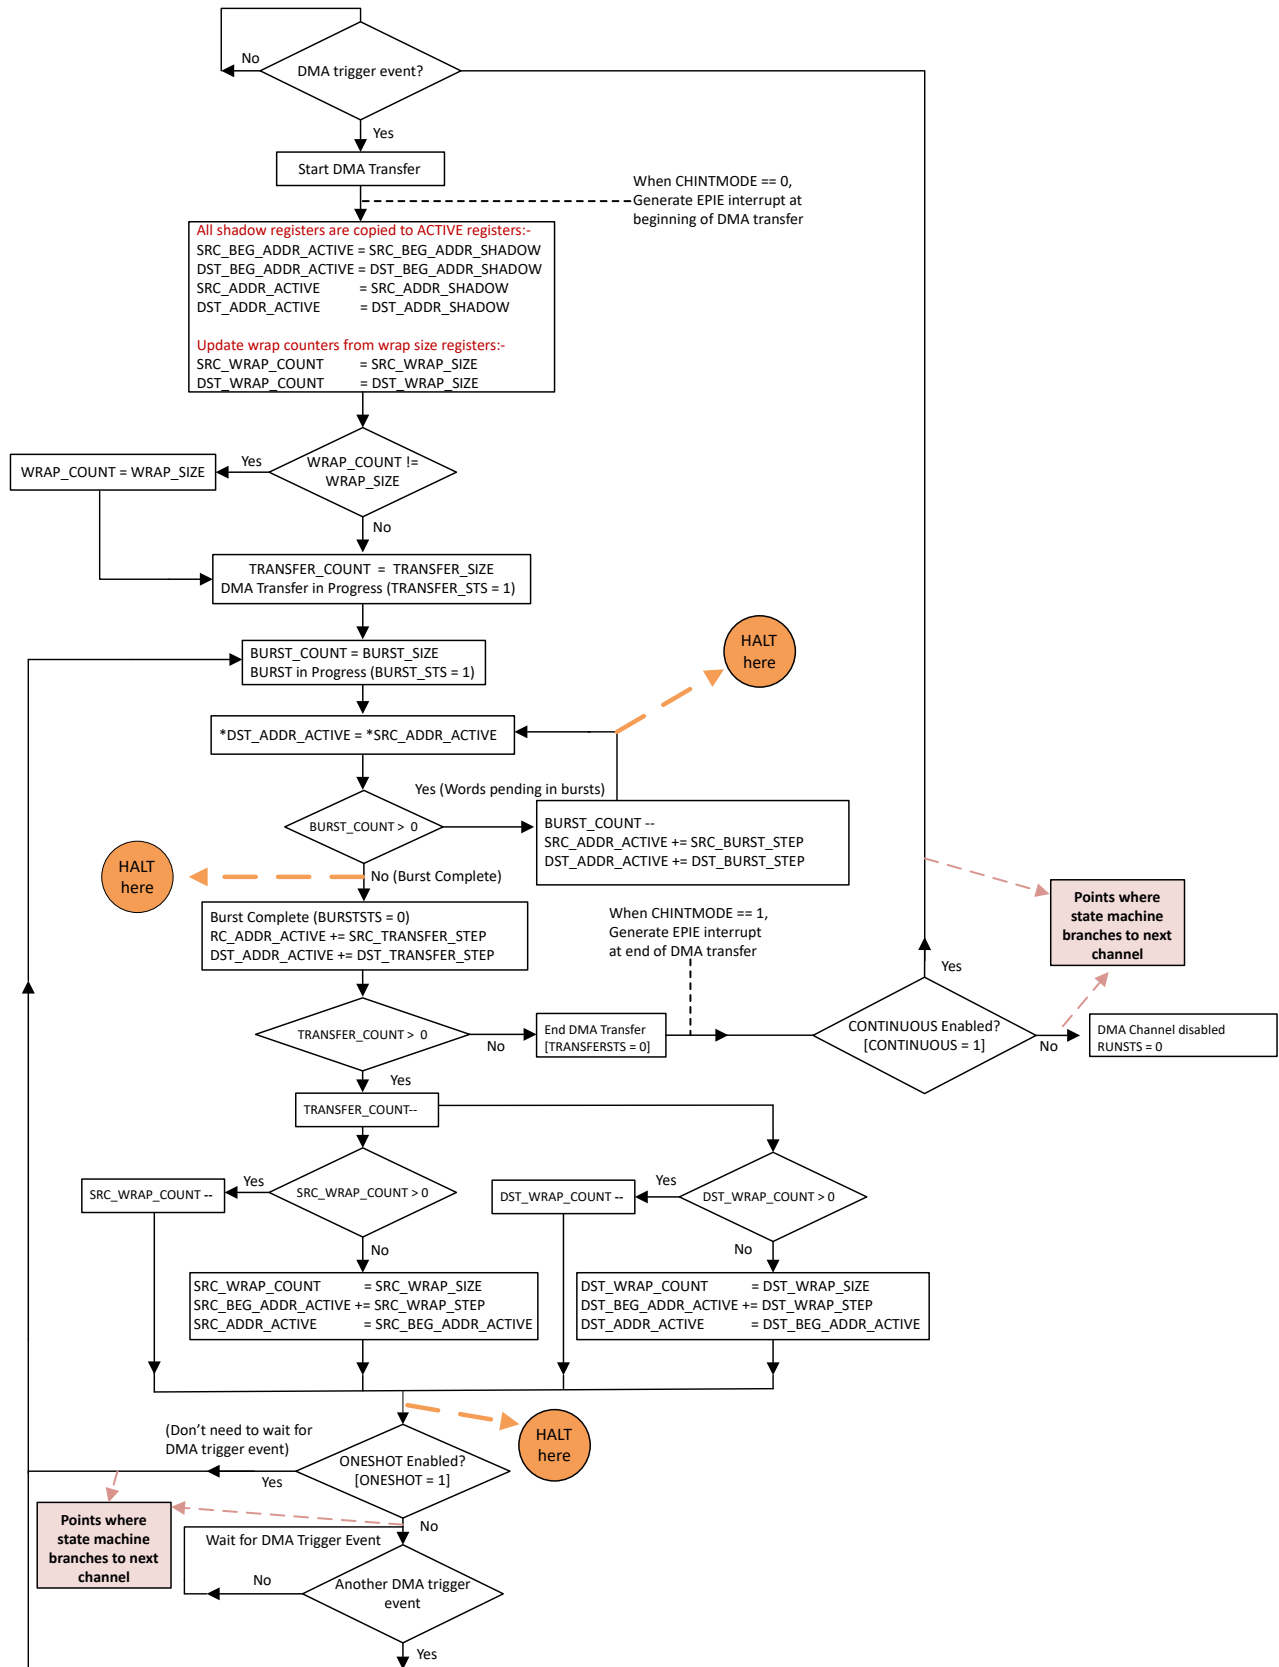

Figure 5-5. DMA State Diagram

### 5.4 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect the total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high-priority interrupt
- Collisions with the CPU can add delay slots (see [Section 5.5](#))
- 32-bit transfers run at double the speed of a 16-bit transfer (takes the same amount of time to transfer a 32-bit word as to transfer a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This gives:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 16 \text{ words/burst}) + 1] = 392 \text{ cycles}$$

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits), the transfer can take:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 8 \text{ words/burst}) + 1] = 200 \text{ cycles}$$

The DMA module consists of a 3-stage pipeline as shown in [Figure 5-6](#) and [Figure 5-7](#).

Figure 5-6. 3-Stage Pipeline DMA Transfer

Figure 5-7. 3-stage Pipeline with One Read Stall

## 5.5 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict. Accesses to global shared RAM, across different instances, do not have this conflict. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, CMPSS, DAC , SDFM
- Peripheral frame 2: PMBus, SPI

**Conflict Example:** The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

**Conflict Example:** The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

**Non-conflict Example:** The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

**Non-conflict Example:** The CPU is accessing GS0 while the DMA is accessing GS1

The exception to all this is the ADC result registers, which are duplicated for each bus master. The CPU, DMA, and CLA can all simultaneously read these result registers with no stalls or arbitration needed for any master.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see [Section 5.4](#)). Suppose CPU accesses a peripheral/memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device:

- The fixed priority scheme for the peripheral frames is:
  - CLA/DMA Write
  - CLA/DMA Read
  - CPU Write
  - CPU Read
- The priority scheme for GSx RAM accesses is round-robin.
- The ADC results are duplicated for CPU, CLA, and DMA so that no arbitration is needed when reading the result registers. This allows all masters to access the ADC result registers simultaneously without delay.

---

### Note

If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write can be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

---

Arbitration within DMA channels is based on a round-robin priority or Channel 1 high-priority scheme described in [Section 5.6](#).

## 5.6 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

### 5.6.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as:

$$\text{CH1} \rightarrow \text{CH2} \rightarrow \text{CH3} \rightarrow \text{CH4} \rightarrow \text{CH5} \rightarrow \text{CH6} \rightarrow \text{CH1} \rightarrow \text{CH2} \rightarrow \dots$$

In the case above, after each channel has transferred a burst of words, the next channel is serviced. The user can specify the size of the burst for each channel. Once CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel *x*, all other pending channels between *x* and the end of the round are serviced before CH1. All the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes the burst, CH5 is serviced next. Only after CH5 completes is CH1 serviced. Upon completion of CH1, if there are no more channels pending, the round-robin state machine enters an idle state.

A more complicated example is:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 is serviced since this channel is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst is serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 starts after the completion of the CH5 burst, since this channel is the next channel after CH5 in the round-robin scheme.
- This is followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine enters an idle state.

The round-robin state machine can be reset to the idle state using the DMACTRL[PRIORITYRESET] bit.

### 5.6.2 Channel 1 High-Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channels 2 to 6 have equal priority and each enabled channel is serviced in a round-robin fashion.

Higher priority: CH1

Lower priority: CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → ...

Given an example where CH1, CH4, and CH5 are enabled in Channel 1 high-priority mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 word transfer is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution is suspended and CH1 is serviced. After the CH1 burst completes, CH4 resumes execution.

Upon completion of CH4, CH5 is serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine enters an idle state.

Typically Channel 1 is used in this mode for the ADC, since the data rate is so high. However, Channel 1 high-priority mode can be used in conjunction with any peripheral.

#### Note

High-priority mode and ONESHOT mode cannot be used at the same time on Channel 1. Other channels can use ONESHOT mode when Channel 1 is in high-priority mode.

### 5.7 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger is lost. This condition sets the OVRFLG bit in the CONTROL register as in Figure 5-8. If the overrun interrupt is enabled, the channel interrupt is generated to the PIE module.

**Figure 5-8. Overrun Detection Logic**

## 5.8 Software

### 5.8.1 DMA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/dma

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 5.8.1.1 DMA GSRAM Transfer (*dma\_ex1\_gsram\_transfer*)

FILE: dma\_ex1\_gsram\_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

##### *Watch Variables*

- *sData* - Data to send
- *rData* - Received data

#### 5.8.1.2 DMA Transfer Shared Peripheral - C28X\_DUAL

FILE: dma\_ex1\_shared\_periph\_cpu1.c

This example shows how to initiate a DMA transfer on CPU1 from a shared peripheral which is owned by CPU2. In this specific example, a timer ISR is used on CPU2 to initiate a SPI transfer which will trigger the CPU1 DMA. CPU1's DMA will then in turn update the ePWM1 CMPA value for the PWM which it owns. The PWM output can be observed on the GPIO pins. It is recommended to run the c28x1 core first, followed by the C28x2 core.

##### *Watch Pins*

- GPIO0 and GPIO1 - ePWM output can be viewed with oscilloscope

#### 5.8.1.3 DMA Transfer for Shared Peripheral Example (CPU2) - C28X\_DUAL

FILE: dma\_ex1\_shared\_periph\_cpu2.c

This example shows how to initiate a DMA transfer on CPU1 from a shared peripheral that is owned by CPU2. In this specific example, a timer ISR is used on CPU2 to initiate a SPI transfer that triggers the CPU1 DMA. CPU1 DMA then updates the ePWM1 CMPA value for the PWM that the DMA owns. The PWM output can be observed on the GPIO pins. It is recommended to run the c28x1 core first, followed by the C28x2 core.

#### 5.8.1.4 DMA GSRAM Transfer (*dma\_ex2\_gsram\_transfer*)

FILE: dma\_ex2\_gsram\_transfer.c

This example uses one DMA channel to transfer data from a buffer in RAMGS0 to a buffer in RAMGS1. The example sets the DMA channel PERINTFRC bit repeatedly until the transfer of 16 bursts (where each burst is 8 16-bit words) has been completed. When the whole transfer is complete, it will trigger the DMA interrupt.

##### *Watch Variables*

- *sData* - Data to send
- *rData* - Received data

## 5.9 DMA Registers

This section describes the Direct Memory Access Registers.

### 5.9.1 DMA Base Addresses

**Table 5-3. DMA Base Address Table**

Device Registers	Register Name	Start Address	End Address
DmaRegs	DMA_REGS	0x0000_1000	0x0000_11FF

## 5.9.2 DMA\_REGS Registers

Table 5-4 lists the memory-mapped registers for the DMA\_REGS registers. All register offset addresses not listed in Table 5-4 should be considered as reserved locations and the register contents should not be modified.

**Table 5-4. DMA\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	DMACTRL	DMA Control Register	EALLOW	<a href="#">Go</a>
1h	DEBUGCTRL	Debug Control Register	EALLOW	<a href="#">Go</a>
4h	PRIORITYCTRL1	Priority Control 1 Register	EALLOW	<a href="#">Go</a>
6h	PRIORITYSTAT	Priority Status Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 5-5 shows the codes that are used for access types in this section.

**Table 5-5. DMA\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

### 5.9.2.1 DMACTRL Register (Offset = 0h) [Reset = 0000h]

DMACTRL is shown in [Figure 5-9](#) and described in [Table 5-6](#).

Return to the [Summary Table](#).

DMA Control Register

**Figure 5-9. DMACTRL Register**

15	14	13	12	11	10	9	8
RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED						PRIORITYRESET	HARDRESET
R-0h						R-0/W1S-0h	R-0/W1S-0h

**Table 5-6. DMACTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-2	RESERVED	R	0h	Reserved
1	PRIORITYRESET	R-0/W1S	0h	The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0. When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset. If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel). Reset type: SYSRSn
0	HARDRESET	R-0/W1S	0h	Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0. For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers. When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn

### 5.9.2.2 DEBUGCTRL Register (Offset = 1h) [Reset = 0000h]

DEBUGCTRL is shown in [Figure 5-10](#) and described in [Table 5-7](#).

Return to the [Summary Table](#).

Debug Control Register

**Figure 5-10. DEBUGCTRL Register**

1Ch	DST_BEG_ADDR_ACTIVE	Destination Begin Address Active Register	EALLOW	<a href="#">Go</a>
1Eh	DST_ADDR_ACTIVE	Destination Address Active Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 5-11 shows the codes that are used for access types in this section.

**Table 5-11. DMA\_CH\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

### 5.9.3.1 MODE Register (Offset = 0h) [Reset = 0000h]

MODE is shown in [Figure 5-13](#) and described in [Table 5-12](#).

Return to the [Summary Table](#).

Mode Register

**Figure 5-13. MODE Register**

15		14		13		12		11		10		9		8	
CHINTE	DATASIZE	RESERVED	RESERVED	CONTINUOUS	ONESHOT	CHINTMODE	PERINTE								
R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h								
7		6		5		4		3		2		1		0	
OVRINTE	RESERVED			PERINTSEL											
R/W-0h	R-0h			R/W-0h											

**Table 5-12. MODE Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	CHINTE	R/W	0h	Channel Interrupt Enable Bit This bit enables the DMA channel's CPU interrupt. Reset type: SYSRSn 0h (R/W) = Interrupt disabled 1h (R/W) = Interrupt enabled
14	DATASIZE	R/W	0h	Data Size Mode Bit This bit determines whether the DMA channel transfers 16 bits or 32 bits of data per read/write operation. Regardless of this setting, all data lengths and offsets in other DMA registers refer to 16-bit words. The pointer step increments must be configured to accommodate 32-bit words. Reset type: SYSRSn 0h (R/W) = 16-bit data transfer size 1h (R/W) = 32-bit data transfer size
13	RESERVED	R/W	0h	Reserved
12	RESERVED	R/W	0h	Reserved
11	CONTINUOUS	R/W	0h	Continuous Mode Bit If this bit is set to 1, then the channel re-initializes when TRANSFER_COUNT is zero and waits for the next event trigger. Otherwise, the DMA stops and clears the RUNSTS bit. Reset type: SYSRSn
10	ONESHOT	R/W	0h	One Shot Mode If this bit is set to 1, each peripheral event trigger causes the channel to perform an entire transfer. Otherwise, the channel only performs one burst per trigger. Reset type: SYSRSn
9	CHINTMODE	R/W	0h	Channel Interrupt Generation Mode This bit specifies when the DMA channel generates a CPU interrupt for a transfer. Reset type: SYSRSn 0h (R/W) = Generate interrupt at beginning of new transfer 1h (R/W) = Generate interrupt at end of transfer.
8	PERINTE	R/W	0h	Peripheral Event Trigger Enable This bit enables peripheral event triggers on the DMA channel. Reset type: SYSRSn 0h (R/W) = Peripheral event trigger disabled. Neither the selected peripheral nor software can start a DMA burst. 1h (R/W) = Peripheral event trigger enabled.

**Table 5-12. MODE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7	OVRINTE	R/W	0h	Overflow Interrupt Enable The bit determines whether the DMA module generates a CPU interrupt when it detects an overflow event. Reset type: SYSRSn 0h (R/W) = Overflow interrupt disabled 1h (R/W) = Overflow interrupt enabled
6-5	RESERVED	R	0h	Reserved
4-0	PERINTSEL	R/W	0h	Peripheral Event Trigger Source Select These are legacy bits and should be set to the channel number. The actual source selection is done via the DMACHSRCSELn registers, which are part of the DMA_CLA_SRC_SEL_REGS group. Reset type: SYSRSn

### 5.9.3.2 CONTROL Register (Offset = 1h) [Reset = 0000h]

CONTROL is shown in [Figure 5-14](#) and described in [Table 5-13](#).

Return to the [Summary Table](#).

**Table 5-13. CONTROL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	RESERVED	R	0h	Reserved
14	OVRFLG	R	0h	<p>Overflow Flag</p> <p>This bit indicates that a peripheral event trigger was received while PERINTFLG was already set. It can be cleared by writing to the ERRCLR bit.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = No overflow detected</p> <p>1h (R/W) = Overflow detected</p>
13	RUNSTS	R	0h	<p>Run Status Flag</p> <p>This bit indicates that the DMA channel is ready to respond to peripheral event triggers. This bit is set when a 1 is written to the RUN bit. It is cleared when a transfer completes (TRANSFER_COUNT = 0) and continuous mode is disabled, or when the HARDRESET, SOFTRESET, or HALT bit is set.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = The channel is disabled</p> <p>1h (R/W) = The channel is enabled</p>
12	BURSTSTS	R	0h	<p>Burst Status Flag</p> <p>This bit is set when a DMA burst begins. The BURST_COUNT is set to the BURST_SIZE. This bit is cleared when BURST_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = No burst activity</p> <p>1h (R/W) = The DMA is currently servicing or suspending a burst transfer from this channel</p>
11	TRANSFERSTS	R	0h	<p>Transfer Status Flag</p> <p>This bit is set when a DMA transfer begins. The address registers are copied to the shadow set and the TRANSFER_COUNT is set to the TRANSFER_SIZE. This bit is cleared when TRANSFER_COUNT reaches zero, or when the HARDRESET or SOFTRESET bit is set.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = No transfer activity</p> <p>1h (R/W) = The channel is currently in the middle of a transfer regardless of whether a burst of data is actively being transferred or not</p>
10	RESERVED	R	0h	Reserved
9	RESERVED	R	0h	Reserved

**Table 5-13. CONTROL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
8	PERINTFLG	R	0h	Peripheral Event Trigger Flag This bit indicates whether a peripheral event trigger has arrived. This bit is automatically cleared when the first burst transfer begins. Reset type: SYSRSn 0h (R/W) = Waiting for event trigger 1h (R/W) = Event trigger pending
7	ERRCLR	R-0/W1S	0h	Clear Error Writing a 1 to this bit will clear the OVRFLG bit. This is normally done when initializing the DMA module or if an overflow condition is detected. If an overflow event occurs at the same time this bit is set, the overrun has priority and the OVRFLG bit is set. Reset type: SYSRSn
6	RESERVED	R-0/W1S	0h	Reserved
5	RESERVED	R-0/W1S	0h	Reserved
4	PERINTCLR	R-0/W1S	0h	Clear Peripheral Event Trigger Writing a 1 to this bit clears PERINTFLG, which cancels a pending event trigger. This is normally done when initializing the DMA module. If an event trigger arrives at the same time this bit is set, the trigger has priority and PERINTFLG is set. Reset type: SYSRSn
3	PERINTFRC	R-0/W1S	0h	Force Peripheral Event Trigger If the PERINTE bit of the MODE register is set, writing a 1 to this bit sets PERINTFLG, which triggers a DMA burst. This bit can be used to start a DMA transfer in software. Reset type: SYSRSn
2	SOFTRESET	R-0/W1S	0h	Channel Soft Reset Writing a 1 to this bit places the channel into its default state after the current read/write access has completed: RUNSTS = 0 TRANSFERSTS = 0 BURSTSTS = 0 BURST_COUNT = 0 TRANSFER_COUNT = 0 SRC_WRAP_COUNT = 0 DST_WRAP_COUNT = 0 When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register. Reset type: SYSRSn
1	HALT	R-0/W1S	0h	Halt Channel Writing a 1 to this bit halts the DMA channel in its current state after any ongoing read/write access has completed. Reset type: SYSRSn
0	RUN	R-0/W1S	0h	Run Channel Writing a 1 to this bit enables the DMA channel and sets the RUNSTS bit to 1. This bit is also used to resume after a channel halt. The RUN bit is typically used to start the DMA channel after configuration. The channel will then wait for the first peripheral event trigger (PERINTFLG == 1) to start a burst. Reset type: SYSRSn

### 5.9.3.3 BURST\_SIZE Register (Offset = 2h) [Reset = 0000h]

BURST\_SIZE is shown in [Figure 5-15](#) and described in [Table 5-14](#).

Return to the [Summary Table](#).

Burst Size Register

**Figure 5-15. BURST\_SIZE Register**

## Chapter 6 Control Law Accelerator (CLA)

The Control Law Accelerator (CLA) Type-1 is an independent, fully-programmable, 32-bit floating-point math processor that brings concurrent control-loop execution to the C28x family. The low interrupt latency of the CLA allows the CLA to read ADC samples "just-in-time." This significantly reduces the ADC sample to output delay to enable faster system response and higher MHz control loops. By using the CLA to service time-critical control loops, the main CPU is free to perform other system tasks such as communications and diagnostics. This chapter provides an overview of the architectural structure and components of the control law accelerator.

<b>6.1 Introduction</b> .....	<b>662</b>
<b>6.2 CLA Interface</b> .....	<b>664</b>

<b>6.7 Instruction Set</b> .....	<b>684</b>
<b>6.8 CLA Registers</b> .....	<b>814</b>

## 6.1 Introduction

The Control Law Accelerator extends the capabilities of the C28x CPU by adding parallel processing. Time-critical control loops serviced by the CLA can achieve low ADC sample to output delay. Thus, the CLA enables faster system response and higher frequency control loops. Utilizing the CLA for time-critical tasks frees up the main CPU to perform other system and communication functions concurrently.

### 6.1.1 Features

The following is a list of major features of the CLA:

- C compilers are available for CLA software development.
- Clocked at the same rate as the main CPU (SYSCLKOUT).
- An independent architecture allowing CLA algorithm execution independent of the main C28x CPU.
  - Complete bus architecture:
    - Program Address Bus (PAB) and Program Data Bus (PDB)
    - Data Read Address Bus (DRAB), Data Read Data Bus (DRDB), Data Write Address Bus (DWAB), and Data Write Data Bus (DWDB)
  - Independent eight stage pipeline.
  - 16-bit program counter (MPC)
  - Four 32-bit result registers (MR0-MR3)
  - Two 16-bit auxiliary registers (MAR0, MAR1)
  - Status register (MSTF)
- Instruction set includes:
  - IEEE single-precision (32-bit) floating-point math operations
  - Floating-point math with parallel load or store
  - Floating-point multiply with parallel add or subtract
  - 1/X and 1/sqrt(X) estimations
  - Data type conversions.
  - Conditional branch and call
  - Data load/store operations
- The CLA program code can consist of up to eight tasks or interrupt service routines
  - The start address of each task is specified by the MVECT registers.
  - No limit on task size as long as the tasks fit within the configurable CLA program memory space.
  - One task is serviced at a time until completion. There is no nesting of tasks.
  - Upon task completion a task-specific interrupt is flagged within the PIE.
  - When a task finishes the next highest-priority pending task is automatically started.
- Task trigger mechanisms:
  - C28x CPU using the IACK instruction
  - Task1 to Task8: up to 256 possible trigger sources from peripherals connected to the shared bus on which the CLA assumes secondary ownership.
- Memory and Shared Peripherals:
  - Two dedicated message RAMs for communication between the CLA and the main CPU.
  - The C28x CPU can map CLA program and data memory to the main CPU space or CLA space.
  - The CLA, on reset, is the secondary master for all peripherals that can have either the CLA or DMA as their secondary master.

**Figure 6-1. CLA (Type 1) Block Diagram**

## 6.2 CLA Interface

This section describes how the C28x main CPU can interface to the CLA and conversely.

### 6.2.1 CLA Memory

The CLA can access three types of memory: program, data and message RAMs. The behavior and arbitration for each type of memory is described in this chapter. The CLA RAMs are protected by the DCSM module. Refer to the *Dual Code Security Module (DCSM)* section of the *System Control and Interrupts* chapter for more details on the security scheme.

- **CLA Program Memory**

The CLA program can be loaded with any of the local shared memories (LSxRAM). At reset, all memory blocks are mapped to the CPU. While mapped to the CPU space, the CPU can copy the CLA program code into the memory. During debug, the memory can also be loaded directly by the Code Composer Studio™ IDE.

Once the memory is initialized with CLA code, the CPU maps the memory to the CLA program space by:

1. Assigning ownership of the memory block to the CLA by writing a 1 to the memory block's MemCfgRegs.LSxMSEL[MSEL\_LSx] bit.
2. Specifying the memory block as a code block for the CLA by writing a 1 to the MemCfgRegs.LSxCLAPGM[CLAPGM\_LSx] bit.

When a memory block is configured as CLA program memory, debug accesses are allowed only on cycles where the CLA is not fetching a new instruction. A detailed explanation of the memory configurations and access arbitration (CPU, CLA, and DEBUG) process can be found in the *Memory Controller Module* section of the *System Control and Interrupts* chapter.

All CLA program fetches are performed as 32-bit read operations and all opcodes must be aligned to an even address. Since all CLA opcodes are 32-bits, this alignment occurs naturally.

- **CLA Data Memory**

Any of the device's LSxRAMs can serve as data memory blocks to the CLA. At reset, all blocks are mapped to the CPU memory space, whereby the CPU can initialize the memory with data tables, coefficients, and so on, for the CLA to use.

Once the memory is initialized with CLA data, the CPU maps the memory to the CLA data space by:

1. Assigning ownership of the memory block to the CLA by writing a 1 to the memory block's MemCfgRegs.LSxMSEL[MSEL\_LSx] bit.
2. Specifying the memory block as a data block for the CLA by writing a 0 to the MemCfgRegs.LSxCLAPGM[CLAPGM\_LSx] bit. The value of this bit at reset is 0.

When a memory block is configured as CLA data memory, CLA read and write accesses are arbitrated along with CPU accesses. The user has the option of turning on CPU fetch or write protection to the memory by writing to the appropriate bits of the MemCfgRegs.LSxACCPROT<sub>x</sub> registers. A detailed explanation of the memory configurations and access arbitration (CPU, CLA, and DEBUG) process can be found in the *Memory Controller Module* section of the *System Control and Interrupts* chapter.

- **CLA Shared Message RAMs**

There are two memory blocks for data sharing and communication between the CLA and the CPU. The message RAMs are always mapped to both CPU and CLA memory spaces, and only data access is allowed; no program fetches can be performed.

- **CLA to CPU Message RAM:** The CLA can use this block to pass data to the CPU. This block is both readable and writable by the CLA. This block is also readable by the CPU but writes by the CPU are ignored.
- **CPU to CLA Message RAM:** The CPU can use this block to pass data and messages to the CLA. This message RAM is both readable and writable by the CPU. The CLA can perform reads but writes by the CLA are ignored.

### 6.2.2 CLA Memory Bus

The CLA has dedicated bus architecture similar to that of the C28x CPU where there are separate program read, data read, and data write buses. Thus, there can be simultaneous instruction fetch, data read, and data write in a single cycle. Like the C28x CPU, the CLA expects memory logic to align any 32-bit read or write to an even address. If the address-generation logic generates an odd address, the CLA can begin reading or writing at the previous even address. This alignment does not affect the address values generated by the address-generation logic.

- **CLA Program Bus**

The CLA program bus has an access range of 32K 32-bit instructions. Since all CLA instructions are 32 bits, this bus always fetches 32 bits at a time and the opcodes must be even-word aligned. The amount of program space available for the CLA is limited to the number of available LSxRAM blocks. This number is device-dependent and can be described in the device-specific data sheet.

- **CLA Data Read Bus**

The CLA data read bus has a 64K x 16 address range. The bus can perform 16 or 32-bit reads and can automatically stall if there are memory access conflicts. The data read bus has access to both the message RAMs, CLA data memory, and the shared peripherals.

- **CLA Data Write Bus**

The CLA data write bus has a 64K x 16 address range. This bus can perform 16 or 32-bit writes. The bus can automatically stall if there are memory access conflicts. The data write bus has access to the CLA to CPU message RAM, CLA data memory, and the shared peripherals.

### 6.2.3 Shared Peripherals and EALLOW Protection

For a given CPU subsystem, the CLA and DMA share secondary access to some peripherals. The secondary ownership of the bus is determined by the `CpuSysRegs.SECMSEL[VBUS32_x]` bit. If the bit is set to 0, the CLA is the secondary owner. If the bit is set to 1, the DMA is the secondary owner. By default, at reset, the CLA is given the secondary ownership of the bus and, therefore, can access all the peripherals connected to the bus.

---

#### Note

The CLA read access time to the bus is 2-wait states while write access is 0-wait.

---

Refer to the device data sheet for the list of peripherals connected to the bus.

Several peripheral control registers are protected from spurious 28x CPU writes by the EALLOW protection mechanism. These same registers are also protected from spurious CLA writes. The EALLOW bit in the CPU status register 1 (ST1) indicates the state of protection for the CPU. Likewise, the MEALLOW bit in the CLA status register (MSTF) indicates the state of write protection for the CLA. The MEALLOW CLA instruction enables write access by the CLA to EALLOW protected registers. Likewise, the MEDIS CLA instruction disables write access. This way the CLA can enable and disable write access independent of the CPU.

The ADC offers the option to generate an early interrupt pulse at the start of a sample conversion. If this option is used to start an ADC-triggered CLA task, use the intervening cycles until the completion of the conversion to perform preliminary calculations or loads and stores before finally reading the ADC value. The CLA pipeline activity for this scenario is shown in [Section 6.5](#).

### 6.2.4 CLA Tasks and Interrupt Vectors

The CLA program code is divided up into tasks or interrupt service routines. Tasks do not have a fixed starting location or length. The CLA program memory can be divided up as desired. The CLA uses the contents of the interrupt vectors (MVECT1 to MVECT8) to determine where a task begins; tasks are terminated by the MSTOP instruction.

The CLA supports eight tasks. Task 1 has the highest priority and task 8 has the lowest priority.

A task can be requested by a peripheral interrupt or by software:

- **Peripheral interrupt trigger**

Each task can be triggered by software-selectable interrupt sources. The trigger for each task is defined by writing an appropriate value to the `DmaClaSrcSelRegs.CLA1TASKSRCSELx[TASKx]` bit field. Each option specifies an interrupt source from a specific peripheral on the shared bus. The peripheral interrupt triggers are listed in [Table 6-1](#).

For example, task 1 (MVECT1) can be set to trigger on EPWMINT1 by writing 36 to `DmaClaSrcSelRegs.CLA1TASKSRCSEL1.TASK1`. To disable the triggering of a task by a peripheral, set the `DmaClaSrcSelRegs.CLA1TASKSRCSELx[TASKx]` bit field to 0. Note that a CLA task only triggers on a level transition (an edge) of the configured interrupt source.

- **Software Trigger**

CPU software can trigger tasks by writing to the MIFRC register or by the IACK instruction. Using the IACK instruction is more efficient because the instruction does not require the need to issue an EALLOW to set MIFR bits. Set the MCTL[IACKE] bit to enable the IACK feature. Each bit in the operand of the IACK instruction corresponds to a task. For example, IACK #0x0001 sets bit 0 in the MIFR register to start task 1. Likewise, IACK #0x0003 set bits 0 and 1 in the MIFR register to start task 1 and task 2.

The CLA has their own fetch mechanism and can run and execute a task independent of the CPU. Only one task is serviced at a time; there is no nesting of tasks. The task currently running is indicated in the MIRUN register. Interrupts that have been received but not yet serviced are indicated in the flag register (MIFR). If an interrupt request from a peripheral is received and that same task is already flagged, then the overflow flag bit is set. Overflow flags remain set until the flags are cleared by the CPU.

If the CLA is idle (no task is currently running), then the highest priority interrupt request that is both flagged (MIFR) and enabled (MIER) starts.

The flow is as follows:

1. The associated RUN register bit is set (MIRUN) and the flag bit (MIFR) is cleared.
2. The CLA begins execution at the location indicated by the associated interrupt vector (MVECTx). MVECTx contains the absolute 16-bit address of the task in the lower 64K memory space.
3. The CLA executes instructions until the MSTOP instruction is found. This indicates the end of the task.
4. The MIRUN bit is cleared.
5. The task-specific interrupt to the PIE is issued. This informs the main CPU that the task has completed.
6. The CLA returns to idle.

Once a task completes the next highest-priority pending task is automatically serviced and this sequence repeats.

### 6.2.5 CLA Software Interrupt to CPU

The CLA can issue a software interrupt to the C28x CPU at any point in the code through the use of the CLA1SOFTINTEN and CLA1INTFRC registers. See [Section 6.8](#) for a description of these registers. If a software interrupt is selected for a CLA task, then an end-of-task interrupt is not issued to the C28x CPU when that task completes.

## 6.3 CLA and CPU Arbitration

Typically, CLA activity is independent of the CPU activity. Under the circumstance where the CLA or CPU attempt to concurrently access memory or a peripheral register within the same interface, an arbitration procedure occurs. This section describes this arbitration.

The arbitration follows a fixed arbitration scheme with highest priority first:

1. CLA WRITE
2. CLA READ
3. CPU WRITE
4. CPU READ

Refer to the Memory Controller Module section of the *System Control and Interrupts* chapter.

### 6.3.1 CLA Message RAM

Message RAMs consist of two blocks:

- CLA to CPU Message RAM
- CPU to CLA Message RAM

These blocks are useful for passing data between the CLA and CPU. No opcode fetches, from either the CLA or CPU, are allowed from the message RAMs. A write protection violation is not generated if the CLA attempts to write to the CPU to CLA message RAM, but the write is ignored. The arbitration scheme for the message RAMs are the same as those for the shared memories, described in the Memory Controller Module section of the *System Control and Interrupts* chapter.

The message RAMs have the following characteristics:

- CLA to CPU Message RAM:  
The following accesses are allowed:
  - CPU reads
  - CLA data reads and writes
  - CPU debug reads and writesThe following accesses are ignored:
  - CPU writes
- CPU to CLA Message RAM:  
The following accesses are allowed:
  - CPU reads and writes
  - CLA reads
  - CPU debug reads and writesThe following accesses are ignored:
  - CLA writes

### 6.3.2 CLA Program Memory

The behavior of the program memory depends on the state of the MMEMCFG[PROGE] bit. This bit controls whether the memory is mapped to CLA space or CPU space.

- **MMEMCFG[PROGE] == 0**

In this case, the memory is mapped to the CPU. The CLA is halted and no tasks can be incoming.

- Any CLA fetch is treated as an illegal opcode condition as described in [Section 6.4.4](#). This condition does not occur, if the proper procedure is followed to map the program memory.
- CLA reads and writes cannot occur
- The memory block behaves as any normal RAM block mapped to CPU memory space.

Priority of accesses are (highest priority first):

1. CPU data write, program write, debug write
2. CPU data read, program read, debug read
3. CPU fetch, program read

- **MMEMCFG[PROGE] == 1**

In this case, the memory block is mapped to CLA space. The CPU can only make debug accesses.

- CLA reads and writes cannot occur
- CLA fetches are allowed
- CPU fetches return 0 that is an illegal opcode and causes an ITRAP interrupt.
- CPU data reads and program reads return 0
- CPU data writes and program writes are ignored

Priority of accesses are (highest priority first):

1. CLA fetch
2. CPU debug write
3. CPU debug read

---

#### Note

Because the CLA fetch has higher priority than CPU debug reads, there is a possibility for the CLA to permanently block debug accesses if the CLA is executing in a loop. This can occur when initially developing CLA code due to a bug. To avoid this issue, the program memory returns all 0x0000 for CPU debug reads (ignore writes) when the CLA is running. When the CLA is halted or idle, then normal CPU debug read and write access can be performed.

---

### 6.3.3 CLA Data Memory

There are independent data memory blocks. The behavior of the data memory depends on the state of the MMEMCFG[RAM0E] MMEMCFG[RAM1E] bits. These bits determine whether the memory blocks are mapped to CLA space or CPU space.

- **MMEMCFG[RAMxE] == 0**

In this case the memory block is mapped to the CPU.

- CLA fetches cannot occur to this block.
- CLA reads return 0.
- CLA writes are ignored.
- The memory block behaves as any normal RAM block mapped to the CPU memory space.

Priority of accesses are (highest priority first):

1. CPU data write/program write/debug access write
2. CPU data read/debug access read
3. CPU fetch/program read

- **MMEMCFG[RAMxE] == 1**

In this case the memory block is mapped to CLA space. The CPU can make only debug accesses.

- CLA fetches cannot occur to this block.
- CLA read and CLA writes are allowed.
- CPU fetches return 0
- CPU data reads and program reads return 0.
- CPU data writes and program writes are ignored.

Priority of accesses are (highest priority first):

1. CLA data write
2. CPU debug write
3. CPU debug read
4. CLA read

### 6.3.4 Peripheral Registers (ePWM, HRPWM, Comparator)

Accesses to the registers follow these rules:

- If both the CPU and CLA request access at the same time, then the CLA has priority and the main CPU is stalled.
- If a CPU access is in-progress and another CPU access is pending, then the CLA has priority over the pending CPU access. In this case, the CLA access begins when the current CPU access completes.
- While a CPU access is in-progress, any incoming CLA access is stalled.
- While a CLA access is in-progress, any incoming CPU access is stalled.
- A CPU write operation has priority over a CPU read operation.
- A CLA write operation has priority over a CLA read operation.
- If the CPU is performing a read-modify-write operation and the CLA performs a write to the same location, the CLA write can be lost if the operation occurs in-between the CPU read and write. For this reason, do not mix CPU and CLA accesses to same location.

## 6.4 CLA Configuration and Debug

This section discusses the steps necessary to configure and debug the CLA.

### 6.4.1 Building a CLA Application

The control law accelerator can be programmed in either CLA assembly code, using the instructions described in [Section 6.7](#), or a reduced subset of the C language. CLA assembly code resides in the same project with C28x code. The only restriction is the CLA code must be in the assembly section. This can be easily done using the `.sect` assembly directive. This does not prevent CLA and C28x code from being linked into the same memory region in the linker command file.

System and CLA initialization are performed by the main CPU. This can typically be done in C or C++ but can also include C28x assembly code. The main CPU also copies the CLA code to the program memory and, if needed, initialize the CLA data RAMs. Once system initialization is complete and the application begins, the CLA services the interrupts using the CLA assembly code (or tasks). The main CPU can perform other tasks concurrently with CLA program execution.

The CLA Type 1 requires Codegen V6.2.4 or later with the compiler switch: `--cla_support=cla1`.

### 6.4.2 Typical CLA Initialization Sequence

A typical CLA initialization sequence is performed by the main CPU as described in this section.

#### 1. Copy CLA code into the CLA program RAM

The source for the CLA code can initially reside in the Flash or a data stream from a communications peripheral or anywhere the main CPU can access. The debugger can also be used to load code directly to the CLA program RAM during development.

#### 2. Initialize CLA data RAM, if necessary

Populate the CLA data RAM with any required data coefficients or constants.

#### 3. Configure the CLA registers

Configure the CLA registers, but keep interrupts disabled until later (leave `MIER = 0`):

- **Enable the CLA peripheral clock using the assigned PCLKCRn register**

The peripheral clock control (PCLKCRn) registers are defined in the *System Control and Interrupts* chapter.

- **Populate the CLA task interrupt vectors**

- MVECT1 to MVECT8

Each vector needs to be initialized with the start address of the task to be executed when the CLA receives the associated interrupt. This address is the full 16-bit starting address of the task in the lower 64K section of memory.

- **Select the task interrupt sources**

For each task select the interrupt source in the `CLA1TASKSRCSELx` register. If a task is software triggered, select no interrupt.

- **Enable IACK to start a task from software, if desired**

To enable the IACK instruction to start a task set the `MCTL[IACKE]` bit. Using the IACK instruction avoids having to set and clear the `EALLOW` bit.

- **Map CLA data RAM to CLA space, if necessary**

Map the data RAM to the CLA space by first, assigning ownership of the memory block to the CLA by writing a 1 to the memory block's MemCfgRegs.LSxMSEL[MSEL\_LSx] bit, and then specifying the memory block as a CLA data block by writing a 0 to the MemCfgRegs.LSxCLAPGM[CLAPGM\_LSx] bit. When an LSx memory is configured as a CLA data memory, the CLA read/write accesses are arbitrated along with CPU accesses. The user has the option of turning on CPU fetch or write protection to the memory by writing to the appropriate bits of the MemCfgRegs.LSxACCPROTx registers.

- **Map CLA program RAM to CLA space**

Map the CLA program RAM to CLA space by first assigning ownership of the memory block to the CLA by writing a 1 to the memory block's MemCfgRegs.LSxMSEL[MSEL\_LSx] bit, and then specifying the memory block as CLA code memory by writing a 1 to the MemCfgRegs.LSxCLAPGM[CLAPGM\_LSx] bit. When an LSx memory is configured as CLA program memory, only debug accesses are allowed on cycles in which the CLA is not fetching a new instruction.

#### 4. **Initialize the PIE vector table and registers**

When a CLA task completes, the associated interrupt in the PIE is flagged. The CLA overflow and underflow flags also have associated interrupts within the PIE.

#### 5. **Enable CLA tasks/interrupts**

Set appropriate bits in the interrupt enable register (MIER) to allow the CLA to service interrupts. Note that a CLA task only triggers on a level transition (a falling edge) of the configured interrupt source. If a peripheral is enabled and an interrupt fires before the CLA is configured, then the CLA does not recognize the interrupt edge and does not respond. To avoid this, configure the CLA before the peripherals or clear any pending peripheral interrupts before setting bits in the MIER register.

#### 6. **Initialize other peripherals**

Initialize any peripherals (such as ePWM, ADC, and others) that generate interrupt triggers for enabled CLA tasks.

The CLA is now ready to service interrupts and the message RAMs can be used to pass data between the CPU and the CLA. Mapping of the CLA program and data RAMs typically occurs only during the initialization process. If the RAM mapping needs to be changed after initialization, the CLA interrupts must be disabled and all tasks must be completed (by checking the MIRUN register) prior to modifying the RAM ownership.

### 6.4.3 Debugging CLA Code

Debugging the CLA code is a simple process that occurs independently of the main CPU.

### 6.4.3.1 Breakpoint Support (MDEBUGSTOP)

#### 1. Insert a breakpoint in CLA code

Insert a CLA breakpoint (MDEBUGSTOP instruction) into the code where the CLA is to halt, then rebuild and reload the code. Because the CLA does not flush the pipeline when in single-step, the MDEBUGSTOP instruction must be inserted as part of the code. The debugger cannot insert the MDEBUGSTOP instruction as needed.

If CLA breakpoints are not enabled, then the MDEBUGSTOP instruction is ignored and is treated as a MNOP. The MDEBUGSTOP instruction can be placed anywhere in the CLA code as long as the MDEBUGSTOP instruction is not within three instructions of a MBCNDD, MCCNDD, or MRCNDD instruction. When programming in C, the user can use the `__mdebugstop()` intrinsic instead; the compiler makes sure that the placement of the MDEBUSTOP instruction in the generated assembly does not violate any of the pipeline restrictions.

#### 2. Enable CLA breakpoints

Enable the CLA breakpoints in the debugger. In the Code Composer Studio™ IDE, this is done by connecting to the CLA core (or tap) from the debug perspective. Breakpoints are disabled when the core is disconnected.

#### 3. Start the task

There are three ways to start the task:

- a. The peripheral can assert an interrupt,
- b. The main CPU can execute an IACK instruction, or
- c. The user can manually write to the MIFRC register in the debugger window

When the task starts, the CLA executes instructions until the MDEBUGSTOP is in the D2 phase of the pipeline. At this point, the CLA halts and the pipeline is frozen. The MPC register reflects the address of the MDEBUGSTOP instruction.

#### 4. Single-step the CLA code

Once halted, the user can single-step the CLA code. The behavior of a CLA single-step is different than the main C28x. When issuing a CLA single-step, the pipeline is clocked only one cycle and then again frozen. On the C28x CPU, the pipeline is flushed for each single-step.

Run to the next MDEBUGSTOP or to the end of the task. If another task is pending, the task automatically starts when run to the end of the task.

---

#### Note

A CLA fetch has higher priority than CPU debug reads. For this reason, it is possible for the CLA to permanently block CPU debug accesses if the CLA is executing in a loop. This can occur when initially developing CLA code due to a bug that causes an infinite loop. To avoid locking up the main CPU, the program memory returns all 0x0000 for CPU debug reads when the CLA is running. When the CLA is halted or idle, then normal CPU debug read and write access to CLA program memory can be performed.

If the CLA gets caught in an infinite loop, use a soft or hard reset to exit the condition. A debugger reset also exits the condition.

---

There are special cases that can occur when single-stepping a task such that the program counter, MPC, reaches the MSTOP instruction at the end of the task.

- **MPC halts at or after the MSTOP with a task already pending**

If single-stepping or halted in "task A" and "task B" comes in before the MPC reaches the MSTOP, then "task B" starts if continuing to step through the MSTOP instruction. Basically, if "task B" is pending before the MPC reaches MSTOP in "task A" then there is no issue in "task B" starting and no special action is required.

- **MPC halts at or after the MSTOP with no task pending**

In this case, if single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. If "task B" comes in at this point, "task B" is flagged in the MIFR register but "task B" can or cannot start if continuing to single-step through the MSTOP instruction of "task A."

Depending on exactly when the new task comes in, to reliably start "task B", perform a soft reset and reconfigure the MIER bits. Once this is done, start single-stepping "task B."

This case can be handled slightly differently if there is control over when "task B" comes in (for example, using the IACK instruction to start the task). In this case, the task is single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. Before forcing "task B," run free to force the CLA out of the debug state. Once this is done, force "task B" and continue debugging.

#### 5. Disable CLA breakpoints, if desired

In the Code Composer Studio™ IDE, disable the CLA breakpoints by disconnecting the CLA core in the debug perspective. Make sure to first issue a run or reset; otherwise, the CLA is halted and no other tasks start.

#### 6.4.4 CLA Illegal Opcode Behavior

If the CLA fetches an opcode that does not correspond to a legal instruction, the CLA behaves as follows:

- The CLA halts with the illegal opcode in the D2 phase of the pipeline as if a breakpoint. This occurs whether CLA breakpoints are enabled or not.
- The CLA issues the task-specific interrupt to the PIE.
- The MIRUN bit for the task remains set.

Further single-stepping is ignored once execution halts due to an illegal op-code. To exit this situation, issue either a soft or hard reset of the CLA as described in [Section 6.4.5](#).

### 6.4.5 Resetting the CLA

There are times when resetting the CLA is needed. For example, during code debug the CLA can enter an infinite loop due to a code bug. The CLA has two types of resets: hard and soft. Both of these resets can be performed by the debugger or by the main CPU.

- **Hard Reset** Writing a 1 to the MCTL[HARDRESET] bit performs a hard reset of the CLA. The behavior of a hard reset is the same as a system reset (using  $\overline{XRS}$  or the debugger). In this case, all CLA configuration and execution registers can be set to their default state and CLA execution halts.
- **Soft Reset** Writing a 1 to the MCTL[SOFTRESET] bit performs a soft reset of the CLA. If a task is executing, the task halts and the associated MIRUN bit is cleared. All bits within the interrupt enable (MIER) register are also cleared, so that no new tasks start.

## 6.5 Pipeline

This section describes the CLA pipeline stages and presents cases where pipeline alignment must be considered.

### 6.5.1 Pipeline Overview

The CLA pipeline is very similar to the C28x pipeline with eight stages:

1. **Fetch 1 (F1):** During the F1 stage the program read address is placed on the CLA program address bus.
2. **Fetch 2 (F2):** During the F2 stage the instruction is read using the CLA program data bus.
3. **Decode 1 (D1):** During D1 the instruction is decoded.
4. **Decode 2 (D2):** Generate the data read address. Changes to MAR0 and MAR1 due to post-increment using indirect addressing takes place in the D2 phase. Conditional branch decisions are also made at this stage based on the MSTF register flags.
5. **Read 1 (R1):** Place the data read address on the CLA data-read address bus. If a memory conflict exists, the R1 stage is stalled.
6. **Read 2 (R2):** Read the data value using the CLA data read data bus.
7. **Execute (EXE):** Execute the operation. Changes to MAR0 and MAR1 due to loading an immediate value or value from memory take place in this stage.
8. **Write (W):** Place the write address and write data on the CLA write data bus. If a memory conflict exists, the W stage is stalled.

## 6.5.2 CLA Pipeline Alignment

The majority of the CLA instructions do not require any special pipeline considerations. This section lists the few operations that do require special consideration.

- **Write Followed by Read**

In both the C28x pipeline and the CLA pipeline, the read operation occurs before the write. This means that if a read operation immediately follows a write, then the read completes first as shown in [Table 6-2](#). In most cases this does not cause a problem since the contents of one memory location does not depend on the state of another. For accesses to peripherals where a write to one location can affect the value in another location, the code must wait for the write to complete before issuing the read as shown in [Table 6-3](#).

This behavior is different for the C28x CPU. For the C28x CPU, any write followed by read to the same location is protected by what is called write-followed-by-read protection. This protection automatically stalls the pipeline so that the write completes before the read. In addition, some peripheral frames are protected such that a C28x CPU write to one location within the frame always completes before a read to the frame. The CLA does not have this protection mechanism. Instead, the code must wait to perform the read.

**Table 6-2. Write Followed by Read - Read Occurs First**

Instruction	F1	F2	D1	D2	R1	R2	E	W
I1 MMOV16 @Reg1, MR3	I1							
I2 MMOV16 MR2, @Reg2	I2	I1						
		I2	I1					
			I2	I1				
				I2	I1			
					I2	I1		
						I2	I1	
							I2	I1

**Table 6-3. Write Followed by Read - Write Occurs First**

Instruction	F1	F2	D1	D2	R1	R2	E	W
I1 MMOV16 @Reg1, MR3	I1							
I2	I2	I1						
I3	I3	I2	I1					
I4	I4	I3	I2	I1				
I5 MMOV16 MR2, @Reg2	I5	I4	I3	I2	I1			
		I5	I4	I3	I2	I1		
			I5	I4	I3	I2	I1	
				I5	I4	I3	I2	I1
					I5	I4	I3	I1
						I5	I4	I1
							I5	I1

- **Delayed Conditional instructions: MBCNDD, MCCNDD, and MRCNDD**

Referring to [Example 6-1](#), the following applies to delayed conditional instructions:

- **I1:** I1 is the last instruction that can effect the CNDF flags for the branch, call, or return instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to branch or not when MBCNDD, MCCNDD, or MRCNDD is in the D2 phase.
- **I2, I3, and I4:** The three instructions preceding MBCNDD can change the MSTF flags but have no effect on whether the MBCNDD instruction branches or not. This is because the flag modification occurs after the D2 phase of the branch, call, or return instruction. These three instructions must not be a MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.
- **I5, I6, and I7:** The three instructions following a branch, call, or return are always executed irrespective of whether the condition is true or not. These instructions must not be MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.

For a more detailed description, refer to the description for [MBCNDD](#), [MCCNDD](#), and [MRCNDD](#).

**Example 6-1. Code Fragment For MBCNDD, MCCNDD, or MRCNDD**

```

<Instruction 1>      ; I1 Last instruction that can affect flags for
                    ;   the branch, call or return operation
<Instruction 2>      ; I2 Cannot be stop, branch, call or return
<Instruction 3>      ; I3 Cannot be stop, branch, call or return
<Instruction 4>      ; I4 Cannot be stop, branch, call or return
<branch/call/ret>    ; MBCNDD, MCCNDD or MRCNDD
                    ; I5-I7: Three instructions after are always
                    ;   executed whether the branch/call or return is
                    ;   taken or not
<Instruction 5>      ; I5 Cannot be stop, branch, call or return
<Instruction 6>      ; I6 Cannot be stop, branch, call or return
<Instruction 7>      ; I7 Cannot be stop, branch, call or return
<Instruction 8>      ; I8
<Instruction 9>      ; I9
....

```

- **Stop or Halting a Task: MSTOP and MDEBUGSTOP**

The MSTOP and MDEBUGSTOP instructions cannot be placed three instructions before or after a conditional branch, call or return instruction (MBCNDD, MCCNDD, or MRCNDD). Refer to [Example 6-1](#). To single-step through a branch/call or return, insert the MDEBUGSTOP at least four instructions back and step from there.

- **Loading MAR0 or MAR1**

A load of auxiliary register MAR0 or MAR1 occurs in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing occurs in the D2 phase of the pipeline. Referring to [Example 6-2](#), the following applies when loading the auxiliary registers:

- **I1 and I2:** The two instructions following the load instruction use the value in MAR0 or MAR1 before the update occurs.
- **I3:** Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there is a conflict. In the case of a conflict, the update due to address-mode post increment wins and the auxiliary register is not updated with #\_X.
- **I4:** Starting with the 4th instruction MAR0 or MAR1 has the new value.

**Example 6-2. Code Fragment for Loading MAR0 or MAR1**

```

; Assume MAR0 is 50 and #_X is 20
MMOVI16 MAR0, #_X ; Load MAR0 with address of x (20)
<Instruction 1> ; I1 will use the old value of MAR0 (50)
<Instruction 2> ; I2 will use the old value of MAR0 (50)
<Instruction 3> ; I3 Cannot use MAR0
<Instruction 4> ; I4 will use the new value of MAR0 (20)
<Instruction 5> ; I5 will use the new value of MAR0 (20)
....
    
```

### 6.5.2.1 ADC Early Interrupt to CLA Response

The ADC can be configured to generate an early interrupt pulse before the ADC conversion completes. If this option is used to start a CLA task, the CLA is able to read the result as soon as the conversion result is available in the ADC result register. This combination of just-in-time sampling along with the low interrupt response of the CLA enable faster system response and higher frequency control loops. The CLA task trigger to first instruction fetch interrupt latency is 4 cycles.

Timings for ADC conversions are shown in the timing diagrams of the ADC chapter. If the ADCCLK is a divided down version of the SYSCLK, the user has to account for the conversion time in SYSCLK cycles.

For example, if using the 12-bit ADC with ADCCLK at SYSCLK / 4, the ADC can take  $10.5 \text{ ADCCLK} \times 4 \text{ SYSCLK} = 42 \text{ SYSCLK}$  cycles to complete a conversion.

From a CLA perspective, the pipeline activity is shown in Table 6-4 for an N-cycle (SYSCLK) ADC conversion. The N-2 instruction arrives in the R2 phase just in time to read the result register. While the prior instructions enter the R2 phase of the pipeline too soon to read the conversion, the instructions can be efficiently used for pre-processing calculations needed by the task.

**Table 6-4. ADC to CLA Early Interrupt Response**

ADC Activity	CLA Activity	F1	F2	D1	D2	R1	R2	E	W
Sample

<b>RESULT Available</b>							<b>Read RESULT</b>		

### 6.5.3 Parallel Instructions

Parallel instructions are single opcodes that perform two operations in parallel. The following types of parallel instructions are available: math operation in parallel with a move operation, or two math operations in parallel. Both operations complete in a single cycle and there are no special pipeline alignment requirements.

#### Example 6-3. Math Operation with Parallel Load

```

; MADDF32 || MMOV32 instruction: 32-bit floating-point add with parallel move
; MADDF32 is a 1 cycle operation
; MMOV32 is a 1 cycle operation
    MADDF32    MR0, MR1, #2    ; MR0 = MR1 + 2,
    || MMOV32  MR1, @val       ; MR1 gets the contents of val
                                ; <-- MMOV32 completes here (MR1 is valid)
                                ; <-- DDF32 completes here (MR0 is valid)
    MPPYF32 MR0, MR0, MR1     ; Any instruction, can use MR1 and/or MR0

```

#### Example 6-4. Multiply with Parallel Add

```

; MPPYF32 || MADDF32 instruction: 32-bit floating-point multiply with parallel add
; MPPYF32 is a 1 cycle operation
; MADDF32 is a 1 cycle operation
    MPPYF32 MR0, MR1, MR3     ; MR0 = MR1 * MR3
    || MADDF32 MR1, MR2, MR0   ; MR1 = MR2 + MR0 (Uses value of MR0 before MPPYF32)
                                ; <-- MPPYF32 and MADDF32 complete here (MR0 and MR1 are valid)
    MPPYF32 MR1, MR1, MR0     ; Any instruction, can use MR1 and/or MR0

```

### 6.5.4 CLA Task Execution Latency

The CLA task execution latency depends on the state of the system:

- CLA task trigger of new task (normal or background) without background task active:

Task takes 8 cycles from CLA task trigger to first instruction of task to reach the D2 phase of pipeline.

#### Note

If background task has been configured in the system, then the compiler during code compilation adds context save instructions at the start of each regular task and restore instructions at end of each task so that register content can be saved and restored in case a background task is executing while the regular task is triggered. When a regular task is entered, this compiler-generated context save instruction is the first instruction of the task.

- CLA task trigger of normal task when background task is active:

Task takes 9 cycles from CLA task trigger to first instruction of normal task to reach the D2 phase of pipeline. There is a difference of one clock cycle to force the MSTOP in the D2 phase of the background task before the task exits as compared to a new task trigger without the background task active.

#### Note

If the MBCNDD/MCCNDD/MRCNDD instructions in the background task are in the D2 phase of the pipeline when a new task gets triggered, the task takes a minimum of 3 more cycles to complete these uninterruptible instructions adding to the delay.

- Returning to background task from normal task:

The task takes 5 cycles to return from a normal task to resume the background task instruction at the D2 phase of the pipeline.

## 6.6 Software

### 6.6.1 CLA Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/cla

Cloud access to these examples is available at the following link: [dev.ti.com](http://dev.ti.com) [C2000Ware Examples](#).

#### 6.6.1.1 CLA arcsine(x) using a lookup table (cla\_asin\_cpu01)

FILE: cla\_ex1\_asin.c

In this example, Task 1 of the CLA will calculate the arcsine of an input argument in the range (-1.0 to 1.0) using a lookup table.

##### *Memory Allocation*

- CLA1 Math Tables (RAMLS0)
- CLA1 to CPU Message RAM
  - fResult - Result of the lookup algorithm
- CPU to CLA1 Message RAM
  - fVal - Sample input to the lookup algorithm

##### *Watch Variables*

- fVal - Argument to task 1
- fResult - Result of arcsin(fVal)

#### 6.6.1.2 CLA arctangent(x) using a lookup table (cla\_atan\_cpu01)

FILE: cla\_ex2\_atan.c

In this example, Task 1 of the CLA will calculate the arctangent of an input argument using a lookup table.

##### *Memory Allocation*

- CLA1 Math Tables (RAMLS0)
- CLA1 to CPU Message RAM
  - fResult - Result of the lookup algorithm
- CPU to CLA1 Message RAM
  - fNum - Numerator of sample input
  - fDen - Denominator of sample input

##### *Watch Variables*

- fVal - Argument to task 1
- fResult - Result of arctan(fVal)

## 6.7 Instruction Set

This section describes the assembly language instructions of the control law accelerator. Also described are parallel operations, conditional operations, resource constraints, and addressing modes. The instructions listed here are independent from C28x and C28x+FPU instruction sets.

### 6.7.1 Instruction Descriptions

This section gives detailed information on the instruction set. Each instruction presents the following information:

- Operands
- Opcode
- Description
- Exceptions
- Pipeline
- Examples
- See also

The example INSTRUCTION is shown to familiarize you with the way each instruction is described. The example describes the kind of information you find in each part of the individual instruction description and where to obtain more information. CLA instructions follow the same format as the C28x instructions; the source operands are always on the right and the destination operands are on the left.

The explanations for the syntax of the operands used in the instruction descriptions for the C28x CLA are given in [Table 6-5](#).

**Table 6-5. Operand Nomenclature**

Symbol	Description
#16FHi	16-bit immediate (hex or float) value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FHiHex	16-bit immediate hex value that represents the upper 16-bits of an IEEE 32-bit floating-point value. Lower 16-bits of the mantissa are assumed to be zero.
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value
#32Fhex	32-bit immediate value that represents an IEEE 32-bit floating-point value
#32F	Immediate float value represented in floating-point representation
#0.0	Immediate zero
#SHIFT	Immediate value of 1 to 32 used for arithmetic and logical shifts.
addr	Opcode field indicating the addressing mode
CNDF	Condition to test the flags in the MSTF register
FLAG	Selected flags from MSTF register (OR) 8 bit mask indicating which floating-point status flags to change
MAR0	Auxiliary register 0
MAR1	Auxiliary register 1
MARx	Either MAR0 or MAR1
mem16	16-bit memory location accessed using direct, indirect, or offset addressing modes
mem32	32-bit memory location accessed using direct, indirect, or offset addressing modes
MRa	MR0 to MR3 registers
MRb	MR0 to MR3 registers
MRc	MR0 to MR3 registers
MRd	MR0 to MR3 registers
MRe	MR0 to MR3 registers
MRf	MR0 to MR3 registers
MSTF	CLA Floating-point Status Register
shift	Opcode field indicating the number of bits to shift.
VALUE	Flag value of 0 or 1 for selected flag (OR) 8 bit mask indicating the flag value; 0 or 1

Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operands first followed by the source operands.

**Table 6-6. INSTRUCTION dest, source1, source2 Short Description**

	Description
dest1	Description for the 1st operand for the instruction
source1	Description for the 2nd operand for the instruction
source2	Description for the 3rd operand for the instruction
Opcode	This section shows the opcode for the instruction
Description	Detailed description of the instruction execution is described. Any constraints on the operands imposed by the processor or the assembler are discussed.
Restrictions	Any constraints on the operands or use of the instruction imposed by the processor are discussed.
Pipeline	This section describes the instruction in terms of pipeline cycles as described in <a href="#">Section 6.5</a>
Example	Examples of instruction execution. If applicable, register and memory values are given before and after instruction execution. Some examples are code fragments while other examples are full tasks that assume the CLA is correctly configured and the main CPU has passed the CLA data.
Operands	Each instruction has a table that gives a list of the operands and a short description. Instructions always have their destination operands first followed by the source operands.

### 6.7.2 Addressing Modes and Encoding

The CLA uses the same address to access data and registers as the main CPU. For example, if the main CPU accesses an ePWM register at address 0x00 6800, then the CLA accesses the register using address 0x6800. Since all CLA accessible memory and registers are within the low 64k x 16 of memory, only the low 16-bits of the address are used by the CLA.

To address the CLA data memory, message RAMs and shared peripherals, the CLA supports two addressing modes:

- Direct addressing mode: Uses the address of the variable or register directly.
- Indirect addressing with 16-bit post increment. This mode uses either XAR0 or XAR1.

The CLA does not use a data page pointer or a stack pointer. The two addressing modes are encoded as shown [Table 6-7](#).

**Table 6-7. Addressing Modes**

Addressing Mode	'addr' Opcode Field Encode <sup>(1)</sup>	Description
<b>@dir</b>	<b>0000</b>	<p><b>Direct Addressing Mode</b></p> <p>Example 1: <code>MMOV32 MR1, @_VarA</code></p> <p>Example 2: <code>MMOV32 MR1, @_EPwm1Regs.CMPA.all</code></p> <p>In this case, the 'mmm mmmm mmmm mmmm' opcode field is populated with the 16-bit address of the variable. This is the low 16-bits of the address to access the variable using the main CPU.</p> <p>For example, <code>@_VarA</code> populates the address of the variable <code>VarA</code>. and <code>@_EPwm1Regs.CMPA.all</code> populates the address of the <code>CMPA</code> register.</p>
<b>*MAR0[#imm16]++</b>	<b>0001</b>	<p><b>MAR0 Indirect Addressing with 16-bit Immediate Post Increment</b></p> <p><b>MAR1 Indirect Addressing with 16-bit Immediate Post Increment</b></p> <p><code>addr = MAR0 (or MAR1)</code> Access memory using the address stored in <code>MAR0 (or MAR1)</code>.  <code>MAR0 (or MAR1) += #imm16</code> Then post increment <code>MAR0 (or MAR1)</code> by <code>#imm16</code>.</p> <p>Example 1: <code>MMOV32 MR0, *MAR0[2]++</code></p> <p>Example 2: <code>MMOV32 MR1, *MAR1[-2]++</code></p> <p>For a post increment of 0, the assembler accepts both <code>*MAR0</code> and <code>*MAR0[0]++</code>.</p> <p>The 'mmm mmmm mmmm mmmm' opcode field is populated with the signed 16-bit pointer offset. For example, if <code>#imm16</code> is 2, then the opcode field is <code>0x0002</code>. Likewise, if <code>#imm16</code> is -2, then the opcode field is <code>0xFFFFE</code>.</p> <p>If addition of the 16-bit immediate causes overflow, then the value wraps around on a 16-bit boundary.</p>
<b>*MAR1[#imm16]++</b>	<b>0010</b>	
<b>*MAR0+[#imm16]</b>	<b>0101</b>	<p><b>MAR0 Offset Addressing with 16-bit Immediate Offset</b></p> <p><b>MAR1 Offset Addressing with 16-bit Immediate Offset</b></p> <p><code>addr = MAR0 (or MAR1) + #imm16</code> Add the offset <code>#imm16</code> to the address stored in <code>MAR0(MAR1)</code> to access the desired memory location.</p> <p>Example 1: <code>MMOV32 MR0, *MAR0+[2]</code></p> <p>Example 1: <code>MMOV32 MR1, *MAR1+[-2]</code></p> <p>The 'mmm mmmm mmmm mmmm' opcode field is populated with the signed 16-bit pointer offset. For example, if <code>#imm16</code> is 2, then the opcode field is <code>0x0002</code>. Likewise, if <code>#imm16</code> is -2, then the opcode field is <code>0xFFFFE</code>.</p> <p>If the addition of the 16-bit immediate causes overflow, the value wraps around on a 16-bit boundary.</p>
<b>*MAR1+[#imm16]</b>	<b>0110</b>	

(1) Values not shown are reserved.

Encoding for the shift fields in the `MASR32`, `MLSR32` and `MLSL32` instructions is shown in [Table 6-8](#).

**Table 6-8. Shift Field Encoding**

Shift Value	'shift' Opcode Field Encode
1	0000
2	0001
3	0010
....	....
32	1111

For instructions that use MRx (where x can be 'a' through 'f') as operands, the trailing alphabet appears in the opcode as a two-bit field. For example:

```
MMPYF32 MRa, MRb, MRc ||
MADDF32 MRd, MRe, MRf
```

whose opcode is,

```
LSW: 0000 ffee ddc bbaa
MSW: 0111 1010 0000 0000
```

The two-bit field specifies one of four working registers according to [Table 6-9](#).

**Table 6-9. Operand Encoding**

Two-Bit Field	Working Register
00	MR0
01	MR1
10	MR2
11	MR3

[Table 6-10](#) shows the condition field encoding for conditional instructions such as MNEGF, MSWAPF, MBCNDD, MCCNDD, and MRCNDD.

**Table 6-10. Condition Field Encoding**

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

### 6.7.3 Instructions

The instructions are listed alphabetically.

#### Instruction Set Summary

<b>MABSF32 MRa, MRb</b> — 32-Bit Floating-Point Absolute Value.....	690
<b>MADD32 MRa, MRb, MRc</b> — 32-Bit Integer Add.....	691
<b>MADDF32 MRa, #16FHi, MRb</b> — 32-Bit Floating-Point Addition.....	692
<b>MADDF32 MRa, MRb, #16FHi</b> — 32-Bit Floating-Point Addition.....	694
<b>MADDF32 MRa, MRb, MRc</b> — 32-Bit Floating-Point Addition.....	696
<b>MADDF32 MRd, MRe, MRf   MMOV32 mem32, MRa</b> — 32-Bit Floating-Point Addition with Parallel Move.....	697
<b>MADDF32 MRd, MRe, MRf   MMOV32 MRa, mem32</b> — 32-Bit Floating-Point Addition with Parallel Move.....	698
<b>MAND32 MRa, MRb, MRc</b> — Bitwise AND.....	700
<b>MASR32 MRa, #SHIFT</b> — Arithmetic Shift Right.....	701
<b>MBCNDD 16BitDest {, CNDF}</b> — Branch Conditional Delayed.....	703
<b>MCCNDD 16BitDest {, CNDF}</b> — Call Conditional Delayed.....	708
<b>MCMP32 MRa, MRb</b> — 32-Bit Integer Compare for Equal, Less Than or Greater Than.....	712
<b>MCMPF32 MRa, MRb</b> — 32-Bit Floating-Point Compare for Equal, Less Than or Greater Than.....	714
<b>MCMPF32 MRa, #16FHi</b> — 32-Bit Floating-Point Compare for Equal, Less Than or Greater Than.....	715
<b>MDEBUGSTOP</b> — Debug Stop Task.....	717
<b>MEALLOW</b> — Enable CLA Write Access to EALLOW Protected Registers.....	718
<b>MEDIS</b> — Disable CLA Write Access to EALLOW Protected Registers.....	719
<b>MEINVF32 MRa, MRb</b> — 32-Bit Floating-Point Reciprocal Approximation.....	720
<b>MEISQRTF32 MRa, MRb</b> — 32-Bit Floating-Point Square-Root Reciprocal Approximation.....	722
<b>MF32TOI16 MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 16-Bit Integer.....	724
<b>MF32TOI16R MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 16-Bit Integer and Round.....	725
<b>MF32TOI32 MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 32-Bit Integer.....	726
<b>MF32TOUI16 MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 16-bit Unsigned Integer .....	728
<b>MF32TOUI16R MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 16-bit Unsigned Integer and Round.....	729
<b>MF32TOUI32 MRa, MRb</b> — Convert 32-Bit Floating-Point Value to 32-Bit Unsigned Integer .....	730
<b>MFRACF32 MRa, MRb</b> — Fractional Portion of a 32-Bit Floating-Point Value.....	731
<b>MI16TOF32 MRa, MRb</b> — Convert 16-Bit Integer to 32-Bit Floating-Point Value .....	732
<b>MI16TOF32 MRa, mem16</b> — Convert 16-Bit Integer to 32-Bit Floating-Point Value .....	733
<b>MI32TOF32 MRa, mem32</b> — Convert 32-Bit Integer to 32-Bit Floating-Point Value .....	734
<b>MI32TOF32 MRa, MRb</b> — Convert 32-Bit Integer to 32-Bit Floating-Point Value .....	735
<b>MLSL32 MRa, #SHIFT</b> — Logical Shift Left.....	736
<b>MLSR32 MRa, #SHIFT</b> — Logical Shift Right.....	738
<b>MMACF32 MR3, MR2, MRd, MRe, MRf   MMOV32 MRa, mem32</b> — 32-Bit Floating-Point Multiply and Accumulate with Parallel Move.....	739
<b>MMAXF32 MRa, MRb</b> — 32-Bit Floating-Point Maximum.....	742
<b>MMAXF32 MRa, #16FHi</b> — 32-Bit Floating-Point Maximum.....	744
<b>MMINF32 MRa, MRb</b> — 32-Bit Floating-Point Minimum.....	746
<b>MMINF32 MRa, #16FHi</b> — 32-Bit Floating-Point Minimum.....	748
<b>MMOV16 MARx, MRa, #16I</b> — Load the Auxiliary Register with MRa + 16-bit Immediate Value.....	750
<b>MMOV16 MARx, mem16</b> — Load MAR1 with 16-bit Value.....	753
<b>MMOV16 mem16, MARx</b> — Move 16-Bit Auxiliary Register Contents to Memory.....	756
<b>MMOV16 mem16, MRa</b> — Move 16-Bit Floating-Point Register Contents to Memory.....	757
<b>MMOV32 mem32, MRa</b> — Move 32-Bit Floating-Point Register Contents to Memory .....	759
<b>MMOV32 mem32, MSTF</b> — Move 32-Bit MSTF Register to Memory.....	761
<b>MMOV32 MRa, mem32 {, CNDF}</b> — Conditional 32-Bit Move.....	762
<b>MMOV32 MRa, MRb {, CNDF}</b> — Conditional 32-Bit Move.....	764
<b>MMOV32 MSTF, mem32</b> — Move 32-Bit Value from Memory to the MSTF Register.....	766
<b>MMOVD32 MRa, mem32</b> — Move 32-Bit Value from Memory with Data Copy.....	767
<b>MMOVF32 MRa, #32F</b> — Load the 32-Bits of a 32-Bit Floating-Point Register.....	769

<b>MMOVE16 MARx, #16I</b> — Load the Auxiliary Register with the 16-Bit Immediate Value.....	771
<b>MMOVEI32 MRa, #32FHex</b> — Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate.....	773
<b>MMOVIZ MRa, #16FHi</b> — Load the Upper 16-Bits of a 32-Bit Floating-Point Register .....	775
<b>MMOVZ16 MRa, mem16</b> — Load MRx with 16-Bit Value.....	776
<b>MMOVXI MRa, #16FLoHex</b> — Move Immediate Value to the Lower 16-Bits of a Floating-Point Register.....	777
<b>MMPYF32 MRa, MRb, MRc</b> — 32-Bit Floating-Point Multiply.....	778
<b>MMPYF32 MRa, #16FHi, MRb</b> — 32-Bit Floating-Point Multiply .....	779
<b>MMPYF32 MRa, MRb, #16FHi</b> — 32-Bit Floating-Point Multiply .....	781
<b>MMPYF32 MRa, MRb, MRc  MADDF32 MRd, MRe, MRf</b> — 32-Bit Floating-Point Multiply with Parallel Add...	783
<b>MMPYF32 MRd, MRe, MRf   MMOV32 MRa, mem32</b> — 32-Bit Floating-Point Multiply with Parallel Move.....	785
<b>MMPYF32 MRd, MRe, MRf   MMOV32 mem32, MRa</b> — 32-Bit Floating-Point Multiply with Parallel Move.....	787
<b>MMPYF32 MRa, MRb, MRc   MSUBF32 MRd, MRe, MRf</b> — 32-Bit Floating-Point Multiply with Parallel Subtract .....	788
<b>MNEGF32 MRa, MRb{, CNDF}</b> — Conditional Negation.....	790
<b>MNOP</b> — No Operation.....	792
<b>MOR32 MRa, MRb, MRc</b> — Bitwise OR.....	793
<b>MRCNDD {CNDF}</b> — Return Conditional Delayed.....	794
<b>MSETFLG FLAG, VALUE</b> — Set or Clear Selected Floating-Point Status Flags.....	797
<b>MSTOP</b> — Stop Task.....	798
<b>MSUB32 MRa, MRb, MRc</b> — 32-Bit Integer Subtraction.....	800
<b>MSUBF32 MRa, MRb, MRc</b> — 32-Bit Floating-Point Subtraction.....	801
<b>MSUBF32 MRa, #16FHi, MRb</b> — 32-Bit Floating-Point Subtraction.....	802
<b>MSUBF32 MRd, MRe, MRf   MMOV32 MRa, mem32</b> — 32-Bit Floating-Point Subtraction with Parallel Move....	804
<b>MSUBF32 MRd, MRe, MRf   MMOV32 mem32, MRa</b> — 32-Bit Floating-Point Subtraction with Parallel Move....	805
<b>MSWAPF MRa, MRb {, CNDF}</b> — Conditional Swap.....	806
<b>MTESTTF CNDF</b> — Test MSTF Register Flag Condition.....	808
<b>MUI16TOF32 MRa, mem16</b> — Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value.....	810
<b>MUI16TOF32 MRa, MRb</b> — Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value.....	811
<b>MUI32TOF32 MRa, mem32</b> — Convert Unsigned 32-Bit Integer to 32-Bit Floating-Point Value.....	812
<b>MUI32TOF32 MRa, MRb</b> — Convert Unsigned 32-Bit Integer to 32-Bit Floating-Point Value.....	813
<b>MXOR32 MRa, MRb, MRc</b> — Bitwise Exclusive Or.....	814

**MABSF32 MRa, MRb****32-Bit Floating-Point Absolute Value****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 0010 0000
```

**Description**

The absolute value of MRb is loaded into MRa. Only the sign bit of the operand is modified by the MABSF32 instruction.

```
if (MRb < 0) {MRa = -MRb};
else {MRa = MRb};
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified as follows:

```
NF = 0;
ZF = 0;
if ( MRa(30:23) == 0) ZF = 1;
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ MR0, #-2.0 ; MR0 = -2.0 (0xC0000000)
MABSF32 MR0, MR0 ; MR0 = 2.0 (0x40000000), ZF = NF = 0
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MABSF32 MR0, MR0 ; MR0 = 5.0 (0x40A00000), ZF = NF = 0
MMOVIZ MR0, #0.0 ; MR0 = 0.0
MABSF32 MR0, MR0 ; MR0 = 0.0 ZF = 1, NF = 0
```

[MNEGF32 MRa, MRb {, CNDF}](#)

## MADD32 MRa, MRb, MRc

### 32-Bit Integer Add

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point destination register (MR0 to MR3)
MRc	CLA floating-point destination register (MR0 to MR3)

#### Opcode

```
LSW: 0000 0000 000cc bbaa
MSW: 0111 1110 1100 0000
```

#### Description

32-bit integer addition of MRb and MRc.

```
MRa(31:0) = MRb(31:0) + MRc(31:0);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; };
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Given A = (int32)1
; B = (int32)2
; C = (int32)-7
;
; Calculate Y2 = A + B + C
;
_Cla1Task1:
    MMOV32 MR0, @_A      ; MR0 = 1 (0x00000001)
    MMOV32 MR1, @_B      ; MR1 = 2 (0x00000002)
    MMOV32 MR2, @_C      ; MR2 = -7 (0xFFFFFFFF9)
    MADD32 MR3, MR0, MR1 ; A + B
    MADD32 MR3, MR2, MR3 ; A + B + C = -4 (0xFFFFFFFFFC)
    MMOV32 @_y2, MR3     ; Store y2
    MSTOP                ; end of task
```

**MADDF32 MRa, #16FHi, MRb****32-Bit Floating-Point Addition****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 0111 1100 bbaa
```

**Description**

Add MRb to the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = MRb + #16FHi:0;
```

This instruction can also be written as MADDF32 MRa, MRb, #16FHi.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MADDF32 generates an underflow condition.
- LVF = 1 if MADDF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Add to MR1 the value 2.0 in 32-bit floating-point format
; Store the result in MR0
MADDF32 MR0, #2.0, MR1 ; MR0 = 2.0 + MR1
; Add to MR3 the value -2.5 in 32-bit floating-point format
; Store the result in MR2
MADDF32 MR2, #-2.5, MR3 ; MR2 = -2.5 + MR3
; Add to MR3 the value 0x3FC00000 (1.5)
; Store the result in MR3
MADDF32 MR3, #0x3FC0, MR3 ; MR3 = 1.5 + MR3
```

**MADDF32 MRa, MRb, #16FHi****32-Bit Floating-Point Addition****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 0111 1100 bbaa
```

**Description**

Add MRb to the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = MRb + #16FHi:0;
```

This instruction can also be written as MADDF32 MRa, #16FHi, MRb.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MADDF32 generates an underflow condition.
- LVF = 1 if MADDF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**MADDF32 MRa, MRb, #16FHi** (continued)

**32-Bit Floating-Point Addition**
**Example 1**

```

; X is an array of 32-bit floating-point values
; Find the maximum value in an array X
; and store the value in Result
;
;
_Cla1Task1:
  MMOV16   MAR1, #_X           ; Start address
  MUI16TOF32 MR0, @_len       ; Length of the array
  MNOP                    ; delay for MAR1 load
  MNOP                    ; delay for MAR1 load
  MMOV32   MR1, *MAR1[2]++    ; MR1 = X0
LOOP
  MMOV32   MR2, *MAR1[2]++    ; MR2 = next element
  MMAXF32  MR1, MR2           ; MR1 = MAX(MR1, MR2)
  MADDF32  MR0, MR0, #-1.0    ; Decrement the counter
  MCMPF32  MR0, #0.0          ; Set/clear flags for MBCNDD
  MNOP
  MNOP
  MNOP
  MBCNDD   LOOP, NEQ          ; Branch if not equal to zero
  MMOV32   @_Result, MR1     ; Always executed
  MNOP
  MNOP
  MSTOP
; End of task

```

**Example 2**

```

; Show the basic operation of MADDF32
;
; Add to MR1 the value 2.0 in 32-bit floating-point format
; Store the result in MR0
  MADDF32 MR0, MR1, #2.0     ; MR0 = MR1 + 2.0
; Add to MR3 the value -2.5 in 32-bit floating-point format
; Store the result in MR2
  MADDF32 MR2, MR3, #-2.5    ; MR2 = MR3 + (-2.5)
; Add to MR0 the value 0x3FC00000 (1.5)
; Store the result in MR0
  MADDF32 MR0, MR0, #0x3FC0  ; MR0 = MR0 + 1.5

**MADDF32 MRa, MRb, MRc****32-Bit Floating-Point Addition****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
MRc	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 000 0000 00cc bbaa
MSW: 0111 1100 0010 0000
```

**Description**

Add the contents of MRc to the contents of MRb and load the result into MRa.

```
MRa = MRb + MRc;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MADDF32 generates an underflow condition.
- LVF = 1 if MADDF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Given M1, X1, and B1 are 32-bit floating-point numbers
; Calculate Y1 = M1*X1+B1
;
;_Cla1Task1:
MMOV32 MR0,@M1      ; Load MR0 with M1
MMOV32 MR1,@X1      ; Load MR1 with X1
MMPYF32 MR1,MR1,MR0 ; Multiply M1*X1
|| MMOV32 MR0,@B1    ; and in parallel load MR0 with B1
MADDF32 MR1,MR1,MR0 ; Add M*X1 to B1 and store in MR1
MMOV32 @Y1,MR1      ; Store the result
MSTOP               ; end of task
```

**MADDF32 MRd, MRe, MRf|MMOV32 mem32, MRa**
**32-Bit Floating-Point Addition with Parallel Move**
**Operands**

MRd	CLA floating-point destination register for the MADDF32 (MR0 to MR3)
MRe	CLA floating-point source register for the MADDF32 (MR0 to MR3)
MRf	CLA floating-point source register for the MADDF32 (MR0 to MR3)
mem32	32-bit memory location accessed using one of the available addressing modes. This is the destination of the MMOV32.
MRa	CLA floating-point source register for the MMOV32 (MR0 to MR3)

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0101 ffee ddaa addr
```

**Description**

Perform an MADDF32 and a MMOV32 in parallel. Add MRf to the contents of MRe and store the result in MRd. In parallel move the contents of MRa to the 32-bit location mem32.

```
MRd = MRe + MRf;
[mem32] = MRa;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MADDF32 generates an underflow condition.
- LVF = 1 if MADDF32 generates an overflow condition.

**Pipeline**

Both MADDF32 and MMOV32 complete in a single cycle.

**Example**

```
; Given A, B, and C are 32-bit floating-point numbers
; Calculate Y2 = (A * B)
;           Y3 = (A * B) + C
;
;
_Cla1Task2:
  MMOV32  MR0, @_A      ; Load MR0 with A
  MMOV32  MR1, @_B      ; Load MR1 with B
  MMPYF32 MR1, MR1, MR0 ; Multiply A*B
  || MMOV32 MR0, @_C      ; and in parallel load MR0 with C
  MADDF32 MR1, MR1, MR0 ; Add (A*B) to C
  || MMOV32 @_Y2, MR1    ; and in parallel store A*B
  MMOV32  @_Y3, MR1    ; Store the A*B + C
  MSTOP                    ; end of task
```

[MADDF32 MRd, MRe, MRf || MMOV32 MRa, mem32](#)

**MADDF32 MRd, MRe, MRf ||MMOV32 MRa, mem32**
**32-Bit Floating-Point Addition with Parallel Move**
**Operands**

MRd	CLA floating-point destination register for the MADDF32 (MR0 to MR3). MRd cannot be the same register as MRa.
MRe	CLA floating-point source register for the MADDF32 (MR0 to MR3)
MRf	CLA floating-point source register for the MADDF32 (MR0 to MR3)
MRa	CLA floating-point destination register for the MMOV32 (MR0 to MR3). MRa cannot be the same register as MRd.
mem32	32-bit memory location accessed using one of the available addressing modes. This is the source for the MMOV32.

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0001 ffee ddaa addr
```

**Description**

Perform an MADDF32 and a MMOV32 operation in parallel. Add MRf to the contents of MRe and store the result in MRd. In parallel move the contents of the 32-bit location mem32 to MRa.

```
MRd = MRe + MRf;
MRa = [mem32];
```

**Restrictions**

The destination register for the MADDF32 and the MMOV32 must be unique. That is, MRa and MRd cannot be the same register.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MADDF32 generates an underflow condition.
- LVF = 1 if MADDF32 generates an overflow condition.

The MMOV32 Instruction sets the NF and ZF flags as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; };
```

**Pipeline**

The MADDF32 and the MMOV32 both complete in a single cycle.

**MADDF32 MRd, MRe, MRf || MMOV32 MRa, mem32 (continued)**
**32-Bit Floating-Point Addition with Parallel Move**
**Example 1**

```

; Given A, B, and C are 32-bit floating-point numbers
; Calculate Y1 = A + 4B
;           Y2 = A + C
;
;
_Cla1Task1:
    MMOV32 MR0, @A          ; Load MR0 with A
    MMOV32 MR1, @B          ; Load MR1 with B
    MMPYF32 MR1, MR1, #4.0 ; Multiply 4 * B
||  MMOV32 MR2, @C          ; and in parallel load C
    MADDF32 MR3, MR0, MR1  ; Add A + 4B
    MADDF32 MR3, MR0, MR2  ; Add A + C
||  MMOV32 @Y1, MR3        ; and in parallel store A+4B
    MMOV32 @Y2, MR3        ; store A + C
                                ; end of task

```

**Example 2**

```

; Given A, B, and C are 32-bit floating-point numbers
; Calculate Y3 = (A + B)
;           Y4 = (A + B) * C
;
;
_Cla1Task2:
    MMOV32 MR0, @A          ; Load MR0 with A
    MMOV32 MR1, @B          ; Load MR1 with B
    MADDF32 MR1, MR1, MR0  ; Add A+B
||  MMOV32 MR0, @C          ; and in parallel load MR0 with C
    MMPYF32 MR1, MR1, MR0  ; Multiply (A+B) by C
||  MMOV32 @Y3, MR1        ; and in parallel store A+B
    MMOV32 @Y4, MR1        ; Store the (A+B) * C
    MSTOP                  ; end of task

```

**MAND32 MRa, MRb, MRc****Bitwise AND****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
MRc	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 0110 0000
```

**Description**

Bitwise AND of MRb with MRc.

```
MRa(31:0) = MRb(31:0) AND MRc(31:0);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA
MMOVIZ MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI MR1, #0xFEDC
; 0101 AND 0101 = 0101 (5)
; 0101 AND 0100 = 0100 (4)
; 0101 AND 0011 = 0001 (1)
; 0101 AND 0010 = 0000 (0)
; 1010 AND 1111 = 1010 (A)
; 1010 AND 1110 = 1010 (A)
; 1010 AND 1101 = 1000 (8)
; 1010 AND 1100 = 1000 (8)
MAND32 MR2, MR1, MR0 ; MR3 = 0x5410AA88

## MASR32 MRa, #SHIFT

### Arithmetic Shift Right

#### Operands

MRa	CLA floating-point source/destination register (MR0 to MR3)
#SHIFT	Number of bits to shift (1 to 32)

#### Opcode

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 0100 0000
```

#### Description

Arithmetic shift right of MRa by the number of bits indicated. The number of bits can be 1 to 32.

```
MARa(31:0) = Arithmetic Shift(MARa(31:0) by #SHIFT bits);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Given m2 = (int32)32
; x2 = (int32)64
; b2 = (int32)-128
;
; calculate
; m2 = m2/2
; x2 = x2/4
; b2 = b2/8
;
_Cla1Task2:
  MMOV32 MR0, @_m2 ; MR0 = 32 (0x00000020)
  MMOV32 MR1, @_x2 ; MR1 = 64 (0x00000040)
  MMOV32 MR2, @_b2 ; MR2 = -128 (0xFFFFFFFF80)
  MASR32 MR0, #1 ; MR0 = 16 (0x00000010)
  MASR32 MR1, #2 ; MR1 = 16 (0x00000010)
  MASR32 MR2, #3 ; MR2 = -16 (0xFFFFFFFFF0)
  MMOV32 @_m2, MR0 ; store results
  MMOV32 @_x2, MR1
  MMOV32 @_b2, MR2
  MSTOP ; end of task
```

## MBCNDD 16BitDest {, CNDF}

### Branch Conditional Delayed

#### Operands

16BitDest	16-bit destination if condition is true
CNDF	Optional condition tested

#### Opcode

```
LSW: dest dest dest dest
MSW: 0111 1001 1000 cndf
```

#### Description

If the specified condition is true, then branch by adding the signed 16BitDest value to the MPC value. Otherwise, continue without branching. If the address overflows, the address wraps around. Therefore, a value of "0xFFFFE" puts the MPC back to the MBCNDD instruction.

Refer to the Pipeline section for important information regarding this instruction.

```
if (CNDF == TRUE) MPC += 16BitDest;
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

#### Restrictions

The MBCNDD instruction is not allowed three instructions before or after a MBCNDD, MCCNDD, or MRCNDD instruction. Refer to the Pipeline section for more information.

#### Flags

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**MBCNDD 16BitDest {, CNDF}** (continued)

**Branch Conditional Delayed**
**Pipeline**

The MBCNDD instruction alone is a single-cycle instruction. As shown in [Table 6-11](#), 6 instruction slots are executed for each branch; 3 slots before the branch instruction (I2-I4) and 3 slots after the branch instruction (I5-I7). The total number of cycles for a branch taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled. The effective number of cycles for a branch can, therefore, range from 1 to 7 cycles. The number of cycles for a branch taken cannot be the same as for a branch not taken.

Referring to [Table 6-11](#) and [Table 6-12](#), the instructions before and after MBCNDD have the following properties:

- **I1**
  - I1 is the last instruction that can effect the CNDF flags for the MBCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to branch or not when MBCNDD is in the D2 phase.
  - There are no restrictions on the type of instruction for I1.
- **I2, I3, and I4**
  - The three instructions proceeding MBCNDD can change MSTF flags but have no effect on whether the MBCNDD instruction branches or not. This is because the flag modification occurs after the D2 phase of the MBCNDD instruction.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.
- **I5, I6, and I7**
  - The three instructions following MBCNDD are always executed irrespective of whether the branch is taken or not.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.

```

<Instruction 1> ; I1 Last instruction that can affect flags for
                ; the MBCNDD operation
<Instruction 2> ; I2 Cannot be stop, branch, call or return
<Instruction 3> ; I3 Cannot be stop, branch, call or return
<Instruction 4> ; I4 Cannot be stop, branch, call or return
MBCNDD _Skip, NEQ ; Branch to Skip if not equal to zero
                ; Three instructions after MBCNDD are always
                ; executed whether the branch is taken or not
<Instruction 5> ; I5 Cannot be stop, branch, call or return
<Instruction 6> ; I6 Cannot be stop, branch, call or return
<Instruction 7> ; I7 Cannot be stop, branch, call or return
<Instruction 8> ; I8
<Instruction 9> ; I9
....
_Skip:
<Destination 1> ; d1 Can be any instruction
<Destination 2> ; d2
<Destination 3> ; d3
....
MSTOP
....

```

## MCCNDD 16BitDest {, CNDF}

### Call Conditional Delayed

#### Operands

16BitDest	16-bit destination if condition is true
CNDF	Optional condition to be tested

#### Opcode

```
LSW: dest dest dest dest
MSW: 0111 1001 1001 cndf
```

#### Description

If the specified condition is true, then store the return address in the RPC field of MSTF and make the call by adding the signed 16BitDest value to the MPC value. Otherwise, continue code execution without making the call. If the address overflows, the address wraps around. Therefore a value of "0xFFFFE" puts the MPC back to the MCCNDD instruction.

Refer to the Pipeline section for important information regarding this instruction.

```
if (CNDF == TRUE)
{
    RPC = return address;
    MPC += 16BitDest;
};
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

#### Restrictions

The MCCNDD instruction is not allowed three instructions before or after a MBCNDD, MCCNDD, or MRCNDD instruction. Refer to the Pipeline section for more details.

#### Flags

This instruction does not modify flags in the MSTF register.

**MCCNDD 16BitDest {, CNDF}** (continued)

**Call Conditional Delayed**

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

The MCCNDD instruction alone is a single-cycle instruction. As shown in [Table 6-13](#), 6 instruction slots are executed for each call; 3 before the call instruction (I2-I4) and 3 after the call instruction (I5-I7). The total number of cycles for a call taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled. The effective number of cycles for a call can, therefore, range from 1 to 7 cycles. The number of cycles for a call taken cannot be the same as for a call not taken.

Referring to the following code fragment and the pipeline diagrams in [Table 6-13](#) and [Table 6-14](#), the instructions before and after MCCNDD have the following properties:

- **I1**
  - I1 is the last instruction that can effect the CNDF flags for the MCCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to branch or not when MCCNDD is in the D2 phase.
  - There are no restrictions on the type of instruction for I1.
- **I2, I3, and I4**
  - The three instructions proceeding MCCNDD can change MSTF flags but have no effect on whether the MCCNDD instruction makes the call or not. This is because the flag modification occurs after the D2 phase of the MCCNDD instruction.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.
- **I5, I6, and I7**
  - The three instructions following MBCNDD are always executed irrespective of whether the branch is taken or not.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.

**MCCNDD 16BitDest {, CNDF}** (continued)**Call Conditional Delayed**

```

<Instruction 1> ; I1 Last instruction that can affect flags for

**MCMP32 MRa, MRb****32-Bit Integer Compare for Equal, Less Than or Greater Than****Operands**

MRa	CLA floating-point source register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1111 0010 0000
```

**Description**

Set ZF and NF flags on the result of MRa - MRb where MRa and MRb are 32-bit integers. For a floating-point compare, refer to [MCMPF32](#).

**Note**

A known hardware issue exists in the MCMP32 instruction. Signed-integer comparisons using MCMP32 alone set the status bits in a way that is not useful for comparison when the difference between the two operands is too large, such as when the inputs have opposite sign and are near the extreme 32-bit signed values. This affects both signed and unsigned integer comparisons.

The compiler (version 18.1.5.LTS or higher) has implemented a workaround for this issue. The compiler checks the upper bits of the operands by performing a floating point comparison before proceeding to do the integer comparison or subtraction.

The compiler flag `--cla_signed_compare_workaround` enables this workaround.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
If(MRa == MRb) {ZF=1; NF=0;}
If(MRa > MRb) {ZF=0; NF=0;}
If(MRa < MRb) {ZF=0; NF=1;}
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Behavior of ZF and NF flags for different comparisons
;
; Given A = (int32)1
;       B = (int32)2
;       C = (int32)-7
;
MMOV32 MR0, @_A ; MR0 = 1 (0x00000001)
MMOV32 MR1, @_B ; MR1 = 2 (0x00000002)
MMOV32 MR2, @_C ; MR2 = -7 (0xFFFFFFFF9)
MCMP32 MR2, MR2 ; NF = 0, ZF = 1
MCMP32 MR0, MR1 ; NF = 1, ZF = 0
MCMP32 MR1, MR0 ; NF = 0, ZF = 0
```

**MCMP32 MRa, MRb** (continued)

***32-Bit Integer Compare for Equal, Less Than or Greater Than***

---

**See also**

**MCMPPF32 MRa, MRb****32-Bit Floating-Point Compare for Equal, Less Than or Greater Than****Operands**

MRa	CLA floating-point source register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1101 0000 0000
```

**Description**

Set ZF and NF flags on the result of MRa - MRb. The MCMPPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE format offsetting the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero is treated as positive zero.
- A denormalized value is treated as positive zero.
- Not-a-Number (NaN) is treated as infinity.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified as follows:

```
If(MRa == MRb) {ZF=1; NF=0;}
If(MRa > MRb) {ZF=0; NF=0;}
If(MRa < MRb) {ZF=0; NF=1;}
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Behavior of ZF and NF flags for different comparisons
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xc0000000)
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MCMPPF32 MR1, MR0 ; ZF = 0, NF = 1
MCMPPF32 MR0, MR1 ; ZF = 0, NF = 0
MCMPPF32 MR0, MR0 ; ZF = 1, NF = 0
```

## MCMPF32 MRa, #16FHi

### 32-Bit Floating-Point Compare for Equal, Less Than or Greater Than

#### Operands

MRa	CLA floating-point source register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

#### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 1100 00aa
```

#### Description

Compare the value in MRa with the floating-point value represented by the immediate operand. Set the ZF and NF flags on (MRa - #16FHi:0).

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

The MCMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero is treated as positive zero.
- Denormalized value is treated as positive zero.
- Not-a-Number (NaN) is treated as infinity.

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified as follows:

```
If(MRa == #16FHi:0) {ZF=1, NF=0;}
If(MRa > #16FHi:0) {ZF=0, NF=0;}
If(MRa < #16FHi:0) {ZF=0, NF=1;}

```

#### Pipeline

This is a single-cycle instruction

#### Example 1

```
; Behavior of ZF and NF flags for different comparisons
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MCMPF32 MR1, #-2.2 ; ZF = 0, NF = 0
MCMPF32 MR0, #6.5 ; ZF = 0, NF = 1
MCMPF32 MR0, #5.0 ; ZF = 1, NF = 0

```

**MCMPF32 MRa, #16FHi** (continued)

**32-Bit Floating-Point Compare for Equal, Less Than or Greater Than**
**Example 2**

```

; X is an array of 32-bit floating-point values
; and has length elements. Find the maximum value in
; the array and store the value in Result

## MDEBUGSTOP

### Debug Stop Task

#### Operands

none	This instruction does not have any operands
------	---

#### Opcode

LSW: 0000 0000 0000 0000
MSW: 0111 1111 0110 0000

#### Description

When CLA breakpoints are enabled, the MDEBUGSTOP instruction is used to halt a task so that the task can be debugged. That is, MDEBUGSTOP is the CLA breakpoint. If CLA breakpoints are not enabled, the MDEBUGSTOP instruction behaves like a MNOP. Unlike the MSTOP, the MIRUN flag is not cleared and an interrupt is not issued. A single-step or run operation continues execution of the task.

#### Restrictions

The MDEBUGSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### See also

[MSTOP](#)

## MEALLOW

### Enable CLA Write Access to EALLOW Protected Registers

#### Operands

none	This instruction does not have any operands
------	---

#### Opcode

LSW: 0000 0000 0000 0000
MSW: 0111 1111 1001 0000

#### Description

This instruction sets the MEALLOW bit in the CLA status register MSTF. When this bit is set, the CLA is allowed write access to EALLOW protected registers. To again protect against CLA writes to protected registers, use the MEDIS instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden using the JTAG port, allowing full control of register accesses during debug from Code Composer Studio.

#### Flags

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### Example

```

; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP

```

#### See also

[MEDIS](#)

**MEDIS****Disable CLA Write Access to EALLOW Protected Registers****Operands**

none	This instruction does not have any operands
------	---

**Opcode**

LSW: 0000 0000 0000 0000
MSW: 0111 1111 1011 0000

**Description**

This instruction clears the MEALLOW bit in the CLA status register MSTF. When this bit is clear, the CLA is not allowed write access to EALLOW-protected registers. To enable CLA writes to protected registers, use the MEALLOW instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden using the JTAG port, allowing full control of register accesses during debug from the Code Composer Studio™ IDE.

**Flags**

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP

```

**MEINVF32 MRa, MRb****32-Bit Floating-Point Reciprocal Approximation****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1111 0000 0000
```

**Description**

This operation generates an estimate of  $1/X$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/X);
Ye = Ye*(2.0 - Ye*X);
Ye = Ye*(2.0 - Ye*X);
```

After two iterations of the Newton-Raphson algorithm, you get an exact answer accurate to the 32-bit floating-point format. On each iteration, the mantissa bit accuracy approximately doubles. The MEINVF32 operation does not generate a negative zero, DeNorm, or NaN value.

```
MRa = Estimate of 1/MRb;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MEINVF32 generates an underflow condition.
- LVF = 1 if MEINVF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**MEINVF32 MRa, MRb** (continued)

**32-Bit Floating-Point Reciprocal Approximation**
**Example**

```

; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den

[MEISQRTF32 MRa, MRb](#)

**MEISQRTF32 MRa, MRb****32-Bit Floating-Point Square-Root Reciprocal Approximation****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 0100 0000
```

**Description**

This operation generates an estimate of  $1/\sqrt{X}$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/sqrt(X));
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
```

After 2 iterations of the Newton-Raphson algorithm, you get an exact answer accurate to the 32-bit floating-point format. On each iteration, the mantissa bit accuracy approximately doubles. The MEISQRTF32 operation does not generate a negative zero, DeNorm, or NaN value.

```
MRa = Estimate of 1/sqrt (MRb);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MEISQRTF32 generates an underflow condition.
- LVF = 1 if MEISQRTF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**MF32TOI16 MRa, MRb****Convert 32-Bit Floating-Point Value to 16-Bit Integer****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1101 1110 0000
```

**Description**

Convert a 32-bit floating point value in MRb to a 16-bit integer and truncate. The result is stored in MRa.

```
MRa(15:0) = F32TOI16(MRb);
MRa(31:16) = sign extension of MRa(15);
```

**Flags**

This instruction does not affect any flags:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ    MR0, #5.0 ; MR0      = 5.0 (0x40A00000)
MF32TOI16 MR1, MR0 ; MR1(15:0) = MF32TOI16(MR0) = 0x0005
           ; MR1(31:16) = Sign extension of MR1(15) = 0x0000
MMOVIZ    MR2, #-5.0 ; MR2      = -5.0 (0xC0A00000)
MF32TOI16 MR3, MR2 ; MR3(15:0) = MF32TOI16(MR2) = -5 (0xFFFFB)
           ; MR3(31:16) = Sign extension of MR3(15) = 0xFFFF
```

## MF32TOI16R MRa, MRb

### Convert 32-Bit Floating-Point Value to 16-Bit Integer and Round

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 0110 0000
```

#### Description

Convert the 32-bit floating point value in MRb to a 16-bit integer and round to the nearest even value. The result is stored in MRa.

```
MRa(15:0) = F32TOI16round(MRb);
MRa(31:16) = sign extension of MRa(15);
```

#### Flags

This instruction does not affect any flags:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR0, #0x3FD9 ; MR0(31:16) = 0x3FD9
MMOVXI MR0, #0x999A ; MR0(15:0) = 0x999A
; MR0 = 1.7 (0x3FD9999A)
MF32TOI16R MR1, MR0 ; MR1(15:0) = MF32TOI16round (MR0) = 2 (0x0002)
; MR1(31:16) = Sign extension of MR1(15) = 0x0000
MMOVF32 MR2, #-1.7 ; MR2 = -1.7 (0xBFD9999A)
MF32TOI16R MR3, MR2 ; MR3(15:0) = MF32TOI16round (MR2) = -2 (0xFFFFE)
; MR3(31:16) = Sign extension of MR2(15) = 0xFFFF
```

## MF32TOUI16R MRa, MRb

### Convert 32-Bit Floating-Point Value to 16-bit Unsigned Integer and Round

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 1100 0000
```

#### Description

Convert the 32-bit floating-point value in MRb to an unsigned 16-bit integer and round to the closest even value. The result is stored in MRa. To instead truncate the converted value, use the MF32TOUI16 instruction.

```
MRa(15:0) = MF32TOUI16round(MRb);
MRa(31:16) = 0x0000;
```

#### Flags

This instruction does not affect any flags:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ      MR0, #0x412C    ; MR0 = 0x412C
MMOVXI      MR0, #0xCCCC    ; MR0 = 0xCCCC ; MR0 = 10.8 (0x412CCCCD)
MF32TOUI16R MR1, MR0        ; MR1(15:0) = MF32TOUI16round(MR0) = 11 (0x000B)
                ; MR1(31:16) = 0x0000
MMOVF32     MR2, #-10.8     ; MR2 = -10.8 (0x0xc12CCCCD)
MF32TOUI16R MR3, MR2        ; MR3(15:0) = MF32TOUI16round(MR2) = 0 (0x0000)
                ; MR3(31:16) = 0x0000
```

**MLSL32 MRa, #SHIFT****Logical Shift Left****Operands**

MRa	CLA floating-point source/destination register (MR0 to MR3)
#SHIFT	Number of bits to shift (1 to 32)

**Opcode**

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 1100 0000
```

**Description**

Logical shift-left of MRa by the number of bits indicated. The number of bits can be 1 to 32.

```
MARa(31:0) = Logical Shift Left(MARa(31:0) by #SHIFT bits);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Given m2 = (int32)32
; x2 = (int32)64
; b2 = (int32)-128
;
; calculate:
; m2 = m2*2
; x2 = x2*4
; b2 = b2*8
;
_Cla1Task3:
  MMOV32 MR0, @_m2 ; MR0 = 32 (0x00000020)
  MMOV32 MR1, @_x2 ; MR1 = 64 (0x00000040)
  MMOV32 MR2, @_b2 ; MR2 = -128 (0xFFFFF80)
  MLSL32 MR0, #1 ; MR0 = 64 (0x00000040)
  MLSL32 MR1, #2 ; MR1 = 256 (0x00000100)
  MLSL32 MR2, #3 ; MR2 = -1024 (0xFFFFFC00)
  MMOV32 @_m2, MR0 ; Store results
  MMOV32 @_x2, MR1
  MMOV32 @_b2, MR2
  MSTOP ; end of task
```

## MLSR32 MRa, #SHIFT

### Logical Shift Right

#### Operands

MRa	CLA floating-point source/destination register (MR0 to MR3)
#SHIFT	Number of bits to shift (1 to 32)

#### Opcode

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 1000 0000
```

#### Description

Logical shift-right of MRa by the number of bits indicated. The number of bits can be 1 to 32. Unlike the arithmetic shift (MASR32), the logical shift does not preserve the number's sign bit. Every bit in the operand is moved the specified number of bit positions, and the vacant bit positions are filled in with zeros.

```
MARa(31:0) = Logical Shift Right(MARa(31:0) by #SHIFT bits);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1;}
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; illustrate the difference between MASR32 and MLSR32
MMOVIZ MR0, #0xAAAA ; MR0 = 0xAAAA5555
MMOVXI MR0, #0x5555
MMOV32 MR1, MR0 ; MR1 = 0xAAAA5555
MMOV32 MR2, MR0 ; MR2 = 0xAAAA5555
MASR32 MR1, #1 ; MR1 = 0xD5552AAA
MLSR32 MR2, #1 ; MR2 = 0x55552AAA
MASR32 MR1, #1 ; MR1 = 0xEAAA9555
MLSR32 MR2, #1 ; MR2 = 0x2AAA9555
MASR32 MR1, #6 ; MR1 = 0xFFAAA555
MLSR32 MR2, #6 ; MR2 = 0x00AAA555
```

**MMACF32 MR3, MR2, MRd, MRe, MRf ||MMOV32 MRa, mem32**
**32-Bit Floating-Point Multiply and Accumulate with Parallel Move**
**Operands**

MR3	floating-point destination/source register MR3 for the add operation
MR2	CLA floating-point source register MR2 for the add operation
MRd	CLA floating-point destination register (MR0 to MR3) for the multiply operation MRd cannot be the same register as MRa
MRe	CLA floating-point source register (MR0 to MR3) for the multiply operation
MRf	CLA floating-point source register (MR0 to MR3) for the multiply operation
MRa	CLA floating-point destination register for the MMOV32 operation (MR0 to MR3). MRa cannot be MR3 or the same register as MRd.
mem32	32-bit source for the MMOV32 operation

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0011 ffee ddaa addr
```

**Description**

Multiply and accumulate the contents of floating-point registers and move from register to memory. The destination register for the MMOV32 cannot be the same as the destination registers for the MMACF32.

```
MR3 = MR3 + MR2;
MRd = MRe * MRf;
MRa = [mem32];
```

**Restrictions**

The destination registers for the MMACF32 and the MMOV32 must be unique. That is, MRa cannot be MR3 and MRa cannot be the same register as MRd.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MMACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MMACF32 (add or multiply) generates an overflow condition.

MMOV32 sets the NF and ZF flags as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

**Pipeline**

MMACF32 and MMOV32 complete in a single cycle.

**MMACF32 MR3, MR2, MRd, MRe, MRf ||MMOV32 MRa, mem32 (continued)**
**32-Bit Floating-Point Multiply and Accumulate with Parallel Move**
**Example 1**

```

**MMAXF32 MRa, MRb****32-Bit Floating-Point Maximum****Operands**

MRa	CLA floating-point source/destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1101 0010 0000
```

**Description**

```
if(MRa < MRb) MRa = MRb;
```

Special cases for the output from the MMAXF32 operation:

- NaN output is converted to infinity
- A denormalized output is converted to positive zero.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == MRb) {ZF=1; NF=0;}
if(MRa > MRb) {ZF=0; NF=0;}
if(MRa < MRb) {ZF=0; NF=1;}
```

**Pipeline**

This is a single-cycle instruction.

**Example 1**

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMAXF32 MR2, MR1 ; MR2 = -1.5, ZF = NF = 0
MMAXF32 MR1, MR2 ; MR1 = -1.5, ZF = 0, NF = 1
MMAXF32 MR2, MR0 ; MR2 = 5.0, ZF = 0, NF = 1
MAXF32 MR0, MR2 ; MR2 = 5.0, ZF = 1, NF = 0
```

**MMAXF32 MRa, #16FHi****32-Bit Floating-Point Maximum****Operands**

MRa	CLA floating-point source/destination register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 1001 0000 00aa
```

**Description**

Compare MRa with the floating-point value represented by the immediate operand. If the immediate value is larger, then load the value into MRa.

```
if(MRa < #16FHi:0) MRa = #16FHi:0;
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MMAXF32 operation:

- NaN output is converted to infinity
- A denormalized output is converted to positive zero.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == #16FHi:0) {ZF=1; NF=0;}
if(MRa > #16FHi:0) {ZF=0; NF=0;}
if(MRa < #16FHi:0) {ZF=0; NF=1;}
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #4.0 ; MR1 = 4.0 (0x40800000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMAXF32 MR0, #5.5 ; MR0 = 5.5, ZF = 0, NF = 1
MMAXF32 MR1, #2.5 ; MR1 = 4.0, ZF = 0, NF = 0
MMAXF32 MR2, #-1.0 ; MR2 = -1.0, ZF = 0, NF = 1
MMAXF32 MR2, #-1.0 ; MR2 = -1.5, ZF = 1, NF = 0
```

**MMOV16 MARx, MRa, #16I****Load the Auxiliary Register with MRa + 16-bit Immediate Value****Operands**

MARx	Auxiliary register MAR0 or MAR1
MRa	CLA Floating-point register (MR0 to MR3)
#16I	16-bit immediate value

**Opcode**

```
LSW: IIII IIII IIII IIII (opcode of MMOV16 MAR0, MRa, #16I)
MSW: 0111 1111 1101 00AA
LSW: IIII IIII IIII IIII (opcode of MMOV16 MAR1, MRa, #16I)
MSW: 0111 1111 1111 00AA
```

**Description**

Load the auxiliary register, MAR0 or MAR1, with MRa(15:0) + 16-bit immediate value. Refer to the Pipeline section for important information regarding this instruction.

```
MARX = MRa(15:0) + #16I;
```

**Flags**

This instruction does not modify flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction. The load of MAR0 or MAR1 occurs in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing occurs in the D2 phase of the pipeline. Therefore, the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOV16 use MAR0 or MAR1 before the update occurs. Thus, these two instructions use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus, I3 cannot use the auxiliary register or there is a conflict. In the case of a conflict, the update due to address-mode post increment wins and the auxiliary register is not updated with #\_X.

- **I4**

Starting with the 4th instruction, MAR0 or MAR1 is the new value loaded with MMOV16.

```
; Assume MAR0 is 50, MR0 is 10, and #_X is 20
MMOV16 MAR0, MR0, #_X ; Load MAR0 with address of x (20) + MR0 (10)
<Instruction 1> ; I1 Uses the old value of MAR0 (50)
<Instruction 2> ; I2 Uses the old value of MAR0 (50)
<Instruction 3> ; I3 Cannot use MAR0
<Instruction 4> ; I4 Uses the new value of MAR0 (30)
<Instruction 5> ; I5
```

## MMOV16 MARx, mem16

### Load MAR1 with 16-bit Value

#### Operands

MARx	CLA auxiliary register MAR0 or MAR1
mem16	16-bit destination memory accessed using one of the available addressing modes

#### Opcode

```
LSW: mmmm mmmm mmmm mmmm (Opcode for MMOV16 MAR0, mem16)
MSW: 0111 0110 0000 addr
LSW: mmmm mmmm mmmm mmmm (Opcode for MMOV16 MAR1, mem16)
MSW: 0111 0110 0100 addr
```

#### Description

Load MAR0 or MAR1 with the 16-bit value pointed to by mem16. Refer to the Pipeline section for important information regarding this instruction.

```
MAR1 = [mem16];
```

#### Flags

No flags MSTF flags are affected.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction. The load of MAR0 or MAR1 occurs in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing occurs in the D2 phase of the pipeline. Therefore, the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOV16 use MAR0 or MAR1 before the update occurs. Thus, these two instructions use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus, I3 cannot use the auxiliary register or there is a conflict. In the case of a conflict, the update due to address-mode post increment, the auxiliary register is not updated with #\_X.

- **I4**

Starting with the 4th instruction, MAR0 or MAR1 is the new value loaded with MMOV16.

```
; Assume MAR0 is 50 and @_X is 20
MMOV16 MAR0, @_X ; Load MAR0 with the contents of x (20)
<Instruction 1> ; I1 Uses the old value of MAR0 (50)
<Instruction 2> ; I2 Uses the old value of MAR0 (50)
<Instruction 3> ; I3 Cannot use MAR0
<Instruction 4> ; I4 Uses the new value of MAR0 (20)
<Instruction 5> ; I5
....
```

## MMOV32 mem32, MSTF

### Move 32-Bit MSTF Register to Memory

#### Operands

MSTF	Floating-point status register
mem32	32-bit destination memory

#### Opcode

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0111 0111 0100 addr
```

#### Description

Copy the CLA floating-point status register, MSTF, to memory.

```
[mem32] = MSTF;
```

#### Flags

This instruction does not modify flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

One of the uses of this instruction is to save off the return PC (RPC) prior to calling a function. The decision to jump to a function is made when the MCCNDD is in the decode2 (D2) phase of the pipeline; the RPC is also updated in this phase. The actual jump occurs 3 cycles later when MCCNDD enters the execution (E) phase. You must save the old RPC before MCCNDD updates in the D2 phase; that is, save MSTF 3 instructions prior to the function call.

#### Example

The following example illustrates the pipeline flow for the context save (of the flags and RPC) prior to a function call. The first column in the comments shows the pipeline stages for the MMOV32 instruction while the second column pertains to the MCCNDD instruction.

```
MMOV32 @_temp, MSTF ; D2 | |
MNOP                ; R1 | F1 | MCCNDD is fetched
MNOP                ; R2 | F2 |
MNOP                ; E  | D1 |
MCCNDD _bar, UNC    ; W  | D2 | old RPC written to memory,
                   ;   |   | RPC updated with MPC+1
MNOP                ;   | R1 |
MNOP                ;   | R2 |
MNOP                ;   | E  | execution branches to _bar
```

[MMOV32 mem32, MRa](#)

**MMOV32 MRa, mem32 {, CNDF}****Conditional 32-Bit Move****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
mem32	32-bit memory location accessed using one of the available addressing modes
CNDF	Optional condition

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0111 00cn dfaa addr
```

**Description**

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by MRa.

```
if (CNDF == TRUE) MRa = [mem32];
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

```
if(CNDF == UNCF)
{
  NF = MRa(31);
  ZF = 0;
  if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
}
else No flags modified;
```

**MMOV32 MRa, mem32 {, CNDF}** (continued)

**Conditional 32-Bit Move**

---

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; Given A, B, X, M1 and M2 are 32-bit floating-point numbers
;
; if(A == B) calculate Y = X*M1
; if(A! = B) calculate Y = X*M2

**Description**

If the condition is true, then move the 32-bit value in MRb to the floating-point register indicated by MRa.

```
if (CNDF == TRUE) MRa = MRb;
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

```
if(CNDF == UNCF)
{
  NF = MRa(31); ZF = 0;
  if(MRa(30:23) == 0) {ZF = 1; NF = 0;}
}
else No flags modified;
```

**MMOV32 MRa, MRb {, CNDF}** (continued)

**Conditional 32-Bit Move**

---

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; Given: X = 8.0
;         Y = 7.0
;         A = 2.0
;         B = 5.0
; _ClTask1
MMOV32 MR3, @_X      ; MR3 = X = 8.0
MMOV32 MR0, @_Y      ; MR0 = Y = 7.0
MMAXF32 MR3, MR0     ; ZF = 0, NF = 0, MR3 = 8.0
MMOV32 MR1, @_A, GT  ; true, MR1 = A = 2.0
MMOV32 MR1, @_B, LT  ; false, does not load MR1
MMOV32 MR2, MR1, GT  ; true, MR2 = MR1 = 2.0
MMOV32 MR2, MR0, LT  ; false, does not load MR2
MSTOP

```

**MMOV32 MSTF, mem32****Move 32-Bit Value from Memory to the MSTF Register****Operands**

MSTF	CLA status register
mem32	32-bit source memory location

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0111 0111 0000 addr
```

**Description**

Move from memory to the CLA's status register MSTF. This instruction is most useful when nesting function calls (using MCCNDD).

```
MSTF = [mem32];
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes

Loading the status register can overwrite all flags and the RPC field. The MEALLOW field is not affected.

**Pipeline**

This is a single-cycle instruction.

## MMOVF32 MRa, #32F

### Load the 32-Bits of a 32-Bit Floating-Point Register

#### Operands

This instruction is an alias for the MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MMOVIZ MRa, #16FHiHex MMOVXI MRa, #16FLoHex
```

MRa	CLA floating-point destination register (MR0 to MR3)
#32F	Immediate float value represented in floating-point representation

#### Opcode

```
LSW: IIII IIII IIII IIII (opcode of MMOVIZ MRa, #16FHiHex)
MSW: 0111 1000 0100 00aa
LSW: IIII IIII IIII IIII (opcode of MMOVXI MRa, #16FLoHex)
MSW: 0111 1000 1000 00aa
```

#### Description

This instruction accepts the immediate operand only in floating-point representation. To specify the immediate value as a hex value (IEEE 32-bit floating-point format), use the MOVI32 MRa, #32FHex instruction.

Load the 32-bits of MRa with the immediate float value represented by #32F.

#32F is a float value represented in floating-point representation. The assembler only accepts a float value represented in floating-point representation. That is, 3.0 can only be represented as #3.0 (#0x40400000 results in an error).

```
MRa = #32F;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

Depending on #32F, this instruction takes one or two cycles. If all of the lower 16-bits of the IEEE 32-bit floating-point format of #32F are zeros, then the assembler converts MMOVF32 into only an MMOVIZ instruction. If the lower 16-bits of the IEEE 32-bit floating-point format of #32F are not zeros, then the assembler converts MMOVF32 into MMOVIZ and MMOVXI instructions.

#### Example

```
MMOVF32 MR1, #3.0 ; MR1 = 3.0 (0x40400000)
                  ; Assembler converts this instruction as
                  ; MMOVIZ MR1, #0x4040
MMOVF32 MR2, #0.0 ; MR2 = 0.0 (0x00000000)
                  ; Assembler converts this instruction as
                  ; MMOVIZ MR2, #0x0
MMOVF32 MR3, #12.265 ; MR3 = 12.625 (0x41443D71)
                    ; Assembler converts this instruction as
                    ; MMOVIZ MR3, #0x4144
                    ; MMOVXI MR3, #0x3D71
```

**MMOVF32 MRa, #32F** (continued)

## MMOVI16 MARx, #16I

### Load the Auxiliary Register with the 16-Bit Immediate Value

#### Operands

MARx	Auxiliary register MAR0 or MAR1
#16I	16-bit immediate value

#### Opcode

```
LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR0, #16I)
MSW: 0111 1111 1100 0000
LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR1, #16I)
MSW: 0111 1111 1110 0000
```

#### Description

Load the auxiliary register, MAR0 or MAR1, with a 16-bit immediate value. Refer to the Pipeline section for important information regarding this instruction.

```
MARx = #16I;
```

#### Flags

This instruction does not modify flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction. The immediate load of MAR0 or MAR1 occurs in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing occurs in the D2 phase of the pipeline. Therefore, the following applies when loading the auxiliary registers:

- **I1 and I2**

The two instructions following MMOVI16 use MAR0 or MAR1 before the update occurs. Thus, these two instructions use the old value of MAR0 or MAR1.

- **I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus, I3 cannot use the auxiliary register or there is a conflict. In the case of a conflict, the update due to address-mode post increment, the auxiliary register is not updated with #\_X.

- **I4**

Starting with the 4th instruction, MAR0 or MAR1 is the new value loaded with MMOVI16.

```
; Assume MAR0 is 50 and #_X is 20
MMOVI16 MAR0, #_X          ; Load MAR0 with address of X (20)
<Instruction 1>             ; I1 Uses the old value of MAR0 (50)
<Instruction 2>             ; I2 Uses the old value of MAR0 (50)
<Instruction 3>             ; I3 Cannot use MAR0
<Instruction 4>             ; I4 Uses the new value of MAR0 (20)
<Instruction 5>             ; I5
....
```

**MMOVI16 MARx, #16I** (continued)**Load the Auxiliary Register with the 16-Bit Immediate Value****Table 6-17. Pipeline Activity for MMOVI16 MAR0/MAR1, #16I**

Instruction	F1	F2	D1	D2	R1	R2	E	W
MMOVI16 MAR0, #_X	MMOVI16							
I1	I1	MMOVI16						
I2	I2	I1	MMOVI16					
I3	I3	I2	I1	MMOVI16

I5	I5	I4	I3	I2	I1	MMOVI16		
I6	I6	I5	I4	I3	I2	I1	MMOVI16	

## MMOVI32 MRa, #32FHex

### Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate

#### Operands

MRa	Floating-point register (MR0 to MR3)
#32FHex	A 32-bit immediate value that represents an IEEE 32-bit floating-point value.

This instruction is an alias for the MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MMOVIZ MRa, #16FHiHex
MMOVXI MRa, #16FLoHex
```

#### Opcode

```
LSW: IIII IIII IIII IIII (opcode of MMOVIZ MRa, #16FHiHex)
MSW: 0111 1000 0100 00aa
LSW: IIII IIII IIII IIII (opcode of MMOVXI MRa, #16FLoHex)
MSW: 0111 1000 1000 00aa
```

#### Description

This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation, use the MMOVF32 MRa, #32F instruction.

Load the 32-bits of MRa with the immediate 32-bit hex value represented by #32FHex.

#32FHex is a 32-bit immediate hex value that represents the IEEE 32-bit floating-point value of a floating-point number. The assembler only accepts a hex immediate value. That is, 3.0 can only be represented as #0x40400000 (#3.0 results in an error).

```
MRa = #32FHex;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

Depending on #32FHex, this instruction takes one or two cycles. If all of the lower 16-bits of #32FHex are zeros, then the assembler converts MOV32 to an MMOVIZ instruction. If the lower 16-bits of #32FHex are not zeros, then the assembler converts MOV32 to MMOVIZ and MMOVXI instructions.

**MMOVI32 MRa, #32FHex** (continued)

**Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate**
**Example**

```

MMOVI32 MR1, #0x40400000 ; MR1 = 0x40400000
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR1, #0x4040
MMOVI32 MR2, #0x00000000 ; MR2 = 0x00000000
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR2, #0x0
MMOVI32 MR3, #0x40004001 ; MR3 = 0x40004001
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR3, #0x4000
                          ; MMOVXI MR3, #0x4001
MMOVI32 MR0, #0x00004040 ; MR0 = 0x00004040
                          ; Assembler converts this instruction as
                          ; MMOVIZ MR0, #0x0000
                          ; MMOVXI MR0, #0x4040

```

## MMOVIZ MRa, #16FHi

### Load the Upper 16-Bits of a 32-Bit Floating-Point Register

#### Operands

MRa	Floating-point register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0.

#### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 0100 00aa
```

#### Description

Load the upper 16-bits of MRa with the immediate value #16FHi and clear the low 16-bits of MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. The assembler only accepts a decimal or hex immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

By itself, MMOVIZ is useful for loading a floating-point register with a constant in which the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). If a constant requires all 32-bits of a floating-point register to be initialized, then use MMOVIZ along with the MMOVXI instruction.

```
MRa(31:16) = #16FHi;
MRa(15:0) = 0;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Load MR0 and MR1 with -1.5 (0xBFC00000)
MMOVIZ MR0, #0xBFC0 ; MR0 = 0xBFC00000 (1.5)
MMOVIZ MR1, #-1.5 ; MR1 = -1.5 (0xBFC00000)
; Load MR2 with pi = 3.141593 (0x40490FDB)
MMOVIZ MR2, #0x4049 ; MR2 = 0x40490000
MMOVXI MR2, #0x0FDB ; MR2 = 0x40490FDB
```

**MMOVZ16 MRa, mem16****Load MRx with 16-Bit Value****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
mem16	16-bit source memory location

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0111 0101 10aa addr
```

**Description**

Move the 16-bit value referenced by mem16 to the floating-point register indicated by MRa.

```
MRa(31:16) = 0;
MRa(15:0) = [mem16];
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = 0;
if (MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**MMOVXI MRa, #16FLoHex**
**Move Immediate Value to the Lower 16-Bits of a Floating-Point Register**
**Operands**

MRa	CLA floating-point register (MR0 to MR3)
#16FLoHex	A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits are not modified.

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 1000 00aa
```

**Description**

Load the lower 16-bits of MRa with the immediate value #16FLoHex. #16FLoHex represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits of MRa are not modified. MMOVXI can be combined with the MMOVIZ instruction to initialize all 32-bits of a MRa register.

```
MRa(15:0) = #16FLoHex;
MRa(31:16) = Unchanged;
```

**Flags**

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Load MR0 with pi = 3.141593 (0x40490FDB)
MMOVIZ   MR0,#0x4049   ; MR0 = 0x40490000

## MMPYF32 MRa, #16FHi, MRb

### 32-Bit Floating-Point Multiply

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The lower 16-bits of the mantissa are assumed to be all 0.
MRb	CLA floating-point source register (MR0 to MR3)

#### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 0111 1000 bbaa
```

#### Description

Multiply MRb with the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The lower 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = MRb * #16FHi:0;
```

This instruction can also be written as MMPYF32 MRa, MRb, #16FHi.

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example 1

```
; Same as example 2 but #16FHi is represented in float
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, #3.0, MR3 ; MR0 = 3.0 * MR3 = 6.0 (0x40c00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

#### Example 2

```
; Same as example 1 but #16FHi is represented in Hex
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, #0x4040, MR3 ; MR0 = 0x4040 * MR3 = 6.0 (0x40c00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

## MMPYF32 MRa, MRb, #16FHi

### 32-Bit Floating-Point Multiply

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The lower 16-bits of the mantissa are assumed to be all 0.

#### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 0111 1000 bbaa
```

#### Description

Multiply MRb with the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = MRb * #16FHi:0;
```

This instruction can also be written as MMPYF32 MRa, #16FHi, MRb.

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example 1

```
;Same as example 2 but #16FHi is represented in float
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, MR3, #3.0 ; MR0 = MR3 * 3.0 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

#### Example 2

```
;Same as example 1 but #16FHi is represented in Hex
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, MR3, #0x4040 ; MR0 = MR3 * 0x4040 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

**MNEGF32 MRa, MRb{, CNDF}****Conditional Negation****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
CNDF	Condition tested

**Opcode**

```
LSW: 0000 0000 cndf bbaa
MSW: 0111 1010 1000 0000
```

**Description**

```
if (CNDF == true) {MRa = - MRb; }
else {MRa = MRb; }
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

**Pipeline**

This is a single-cycle instruction.

LSW: 0000 0000 0000 0000
MSW: 0111 1111 1010 0000

**Description**

Do nothing. This instruction is used to fill required pipeline delay slots when other instructions are not available to fill the slots.

**Flags**

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; X is an array of 32-bit floating-point values
; Find the maximum value in an array x
; and store the value in Result
;
;_Cla1Task1:
    MMOV16    MAR1,#_X          ; Start address
    MUI16TOF32 MR0,@_len      ; Length of the array
    MNOP                      ; delay for MAR1 load
    MNOP                      ; delay for MAR1 load
    MMOV32    MR1,*MAR1[2]++  ; MR1 = x0
LOOP
    MMOV32    MR2,*MAR1[2]++  ; MR2 = next element
    MMAXF32   MR1,MR2         ; MR1 = MAX(MR1, MR2)
    MADD32    MR0,MR0,#-1.0   ; Decrement the counter
    MCMPF32   MR0,#0.0       ; Set/clear flags for MBCNDD
    MNOP                      ; Too late to affect MBCNDD
    MNOP                      ; Too late to affect MBCNDD
    MNOP                      ; Too late to affect MBCNDD
    MBCNDD    LOOP,NEQ        ; Branch if not equal to zero
    MMOV32    @_Result,MR1    ; Always executed
    MNOP                      ; Pad to separate MBCNDD and MSTOP
    MNOP                      ; Pad to separate MBCNDD and MSTOP
    MSTOP

```

## MOR32 MRa, MRb, MRc

### Bitwise OR

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
MRc	CLA floating-point source register (MR0 to MR3)

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1000 0000
```

#### Description

Bitwise OR of MRb with MRc.

```
MARa(31:0) = MARb(31:0) OR MRC(31:0);
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA
MMOVIZ MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI MR1, #0xFEDC
; 0101 OR 0101 = 0101 (5)
; 0101 OR 0100 = 0101 (5)
; 0101 OR 0011 = 0111 (7)
; 0101 OR 0010 = 0111 (7)
; 1010 OR 1111 = 1111 (F)
; 1010 OR 1110 = 1110 (E)
; 1010 OR 1101 = 1111 (F)
; 1010 OR 1100 = 1110 (E)
MOR32 MR2, MR1, MR0 ; MR3 = 0x5555FEFE
```

**MRCNDD {CNDF}****Return Conditional Delayed****Operands**

CNDF	Optional condition
------	--------------------

**Opcode**

LSW: 0000 0000 0000 0000
MSW: 0111 1001 1010 cndf

**Description**

If the specified condition is true, then the RPC field of MSTF is loaded into MPC and fetching continues from that location. Otherwise, program fetches continue without the return.

Refer to the Pipeline section for important information regarding this instruction.

<code>if (CNDF == TRUE) MPC = RPC;</code>
---

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

The MRCNDD instruction by itself is a single-cycle instruction. As shown in [Table 6-18](#), 6 instruction slots are executed for each return; 3 slots before the return instruction (d5-d7) and 3 slots after the return instruction (d8-d10). The total number of cycles for a return taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled.

**MRCNDD {CNDF}** (continued)

**Return Conditional Delayed**

The effective number of cycles for a return can, therefore, range from 1 to 7 cycles. The number of cycles for a return taken cannot be the same as for a return not taken.

Referring to the following code fragment and the pipeline diagrams in [Table 6-18](#) and [Table 6-19](#), the instructions before and after MRCNDD have the following properties:

```

;
;
<Instruction 1> ; I1 Last instruction that can affect flags for
; the MCCNDD operation
<Instruction 2> ; I2 Cannot be stop, branch, call or return
<Instruction 3> ; I3 Cannot be stop, branch, call or return
<Instruction 4> ; I4 Cannot be stop, branch, call or return
MCCNDD _func, NEQ ; Call to func if not equal to zero
; Three instructions after MCCNDD are always
; executed whether the call is taken or not
<Instruction 5> ; I5 Cannot be stop, branch, call or return
<Instruction 6> ; I6 Cannot be stop, branch, call or return
<Instruction 7> ; I7 Cannot be stop, branch, call or return
<Instruction 8> ; I8 The address of this instruction is saved
; in the RPC field of the MSTF register.
; Upon return this value is loaded into MPC
; and fetching continues from this point.
<Instruction 9> ; I9
<Instruction 10> ; I10
....
....
_func:
<Destination 1> ; d1 Can be any instruction
<Destination 2> ; d2
<Destination 3> ; d3
<Destination 4> ; d4 Last instruction that can affect flags for
; the MRCNDD operation
<Destination 5> ; d5 Cannot be stop, branch, call or return
<Destination 6> ; d6 Cannot be stop, branch, call or return
<Destination 7> ; d7 Cannot be stop, branch, call or return
MRCNDD NEQ ; Return to <Instruction 8> if not equal to zero
; Three instructions after MRCNDD are always
; executed whether the return is taken or not
<Destination 8> ; d8 Cannot be stop, branch, call or return
<Destination 9> ; d9 Cannot be stop, branch, call or return
<Destination 10> ; d10 Cannot be stop, branch, call or return
<Destination 11> ; d11
<Destination 12> ; d12
....
....
MSTOP
....

```

- **d4**
  - d4 is the last instruction that can effect the CNDF flags for the MRCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to return or not when MRCNDD is in the D2 phase.
  - There are no restrictions on the type of instruction for d4.
- **d5, d6, and d7**
  - The three instructions proceeding MRCNDD can change MSTF flags but have no effect on whether the MRCNDD instruction makes the return or not. This is because the flag modification occurs after the D2 phase of the MRCNDD instruction.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.
- **d8, d9, and d10**
  - The three instructions following MRCNDD are always executed irrespective of whether the return is taken or not.

**MRCNDD {CNDF}** (continued)**Return Conditional Delayed**

- These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD, or MRCNDD.

**Table 6-18. Pipeline Activity for MRCNDD, Return Not Taken**

Instruction	F1	F2	D1	D2	R1	R2	E	W

## MSETFLG FLAG, VALUE

### Set or Clear Selected Floating-Point Status Flags

#### Operands

FLAG	8-bit mask indicating which floating-point status flags to change.
VALUE	8-bit mask indicating the flag value: 0 or 1.

#### Opcode

```
LSW: FFFF FFFF VVVV VVVV
MSW: 0111 1001 1100 0000
```

#### Description

The MSETFLG instruction is used to set or clear selected floating-point status flags in the MSTF register. The FLAG field is an 11-bit value that indicates which flags are changed. That is, if a FLAG bit is set to 1, that flag is changed; all other flags are not modified. The bit mapping of the FLAG field is:

9	8	7	6	5	4	3	2	1	0
RNDF 32	Reserved		TF	Reserved		ZF	NF	LUF	LVF

The VALUE field indicates the value the flag can be set to: 0 or 1.

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	Yes	Yes	Yes	Yes	Yes

Any flag can be modified by this instruction. The MEALLOW and RPC fields cannot be modified with this instruction.

#### Pipeline

This is a single-cycle instruction.

#### Example

To make it easier and legible, the assembler accepts a FLAG=VALUE syntax for the MSETFLG operation as:

```
MSETFLG RNDF32=0, TF=0, NF=1; FLAG = 11000100; VALUE = 00XXX1XX;
```

## MSTOP

### Stop Task

#### Operands

none	This instruction does not have any operands
------	---

#### Opcode

LSW: 0000 0000 0000 0000
MSW: 0111 1111 1000 0000

#### Description

The MSTOP instruction must be placed to indicate the end of each task. In addition, placing MSTOP in unused memory locations within the CLA program RAM can be useful for debugging and preventing run away CLA code. When MSTOP enters the D2 phase of the pipeline, the MIRUN flag for the task is cleared and the associated interrupt is flagged in the PIE vector table.

There are three special cases that can occur when single-stepping a task such that the MPC reaches the MSTOP instruction.

1. If you are single-stepping or halted in "task A" and "task B" comes in before the MPC reaches the MSTOP, then "task B" starts if you continue to step through the MSTOP instruction. Basically, if "task B" is pending before the MPC reaches MSTOP in "task A" then there is no issue in "task B" starting and no special action is required.
2. In this case, you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. If "task B" comes in at this point, "task B" is flagged in the MIFR register but "task B" can or cannot start if you continue to single-step through the MSTOP instruction of "task A". It depends on exactly when the new task comes in. To reliably start "task B", perform a soft reset and reconfigure the MIER bits. Once this is done, you can start single-stepping "task B".
3. Case 2 can be handled slightly differently if there is control over when "task B" comes in (for example using the IACK instruction to start the task). In this case you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. Before forcing "task B", run free to force the CLA out of the debug state. Once this is done you can force "task B" and continue debugging.

#### Restrictions

The MSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**MSTOP** (continued)

**Stop Task**
**Pipeline**

This is a single-cycle instruction. [Table 6-20](#) shows the pipeline behavior of the MSTOP instruction. The MSTOP instruction cannot be placed with 3 instructions of a [MBCNDD](#), [MCCNDD](#), or [MRCNDD](#) instruction.

**Table 6-20. Pipeline Activity for MSTOP**

Instruction	F1	F2	D1	D2	R1	R2	E	W
I1	I1							
I2	I2	I1						
I3	I3	I2	I1

**MSUB32 MRa, MRb, MRc****32-Bit Integer Subtraction****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point destination register (MR0 to MR3)
MRc	CLA floating-point destination register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1110 0000
```

**Description**

32-bit integer addition of MRb and MRc.

```
MARa(31:0) = MARb(31:0) - MRC(31:0);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
; Given A = (int32)1
;         B = (int32)2
;         C = (int32)-7
;
;
; Calculate Y2 = A - B - C
;
_Cla1Task3:
  MMOV32 MR0, @_A      ; MR0 = 1 (0x00000001)
  MMOV32 MR1, @_B      ; MR1 = 2 (0x00000002)
  MMOV32 MR2, @_C      ; MR2 = -7 (0xFFFFFFFF9)
  MSUB32 MR3, MR0, MR1 ; A + B
  MSUB32 MR3, MR3, MR2 ; A + B + C = 6 (0x00000006)
  MMOV32 @_y2, MR3     ; Store y2
  MSTOP                ; End of task
```

## MSUBF32 MRa, MRb, MRc

### 32-Bit Floating-Point Subtraction

#### Operands

MRa	CLA floating-point destination register (MR0 to R1)
MRb	CLA floating-point source register (MR0 to R1)
MRc	CLA floating-point source register (MR0 to R1)

#### Opcode

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 0100 0000
```

#### Description

Subtract the contents of two floating-point registers

```
MRa = MRb - MRc;
```

#### Flags

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; Given A, B, and C are 32-bit floating-point numbers
; Calculate Y2 = A + B - C
;
;
_Cla1Task5:
  MMOV32  MR0, @_A      ; Load MR0 with A
  MMOV32  MR1, @_B      ; Load MR1 with B
  MADD32  MR0, MR1, MR0 ; Add A + B
  || MMOV32 MR1, @_C      ; and in parallel load C
  MSUBF32 MR0, MR0, MR1 ; Subtract C from (A + B)
  MMOV32  @Y, MR0      ; (A+B) - C
  MSTOP
```

#### See also

**MSUBF32 MRa, #16FHi, MRb****32-Bit Floating-Point Subtraction****Operands**

MRa	CLA floating-point destination register (MR0 to R1)
#16FHi	A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The lower 16-bits of the mantissa are assumed to be all 0.
MRb	CLA floating-point source register (MR0 to R1)

**Opcode**

```
LSW: IIII IIII IIII IIII
MSW: 0111 1000 0000 baaa
```

**Description**

Subtract MRb from the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The lower 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler accepts either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

```
MRa = #16FHi:0 - MRb;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

**Pipeline**

This is a single-cycle instruction.

**MSUBF32 MRa, #16FHi, MRb** (continued)

**32-Bit Floating-Point Subtraction**
**Example**

```

; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
;
_Cla1Task3:
  MMOV32      MR0, @_x          ; MR0 = X
  MEISQRTF32 MR1, MR0          ; MR1 = Ye = Estimate(1/sqrt(X))
  MMOV32      MR1, @_x, EQ     ; if(X == 0.0) Ye = 0.0
  MMPYF32     MR3, MR0, #0.5   ; MR3 = X*0.5
  MMPYF32     MR2, MR1, MR3    ; MR2 = Ye*X*0.5
  MMPYF32     MR2, MR1, MR2    ; MR2 = Ye*Ye*X*0.5
  MSUBF32     MR2, #1.5, MR2   ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32     MR1, MR1, MR2    ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32     MR2, MR1, MR3    ; MR2 = Ye*X*0.5
  MMPYF32     MR2, MR1, MR2    ; MR2 = Ye*Ye*X*0.5
  MSUBF32     MR2, #1.5, MR2   ; MR2 = 1.5 - Ye*Ye*X*0.5
  MMPYF32     MR1, MR1, MR2    ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
  MMPYF32     MR0, MR1, MR0    ; MR0 = Y = Ye*X
  MMOV32      @_y, MR0        ; Store Y = sqrt(X)
  MSTOP
; end of task

```

**MSUBF32 MRd, MRe, MRf ||MMOV32 MRa, mem32**
**32-Bit Floating-Point Subtraction with Parallel Move**
**Operands**

MRd	CLA floating-point destination register (MR0 to MR3) for the MSUBF32 operation MRd cannot be the same register as MRa
MRe	CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation
MRf	CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation
MRa	CLA floating-point destination register (MR0 to MR3) for the MMOV32 operation MRa cannot be the same register as MRd
mem32	32-bit memory location accessed using one of the available addressing modes. Source for the MMOV32 operation.

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0010 ffee ddaa addr
```

**Description**

Subtract the contents of two floating-point registers and move from memory to a floating-point register.

```
MRd = MRe - MRf;
MRa = [mem32];
```

**Restrictions**

The destination register for the MSUBF32 and the MMOV32 must be unique. That is, MRa cannot be the same register as MRd.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

The MMOV32 instruction sets the NF and ZF flags.

**Pipeline**

Both MSUBF32 and MMOV32 complete in a single cycle.

**Example**

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

**MSUBF32 MRd, MRe, MRf ||MMOV32 mem32, MRa**
**32-Bit Floating-Point Subtraction with Parallel Move**
**Operands**

MRd	CLA floating-point destination register (MR0 to MR3) for the MSUBF32 operation
MRe	CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation
MRf	CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation
mem32	32-bit destination memory location for the MMOV32 operation
MRa	CLA floating-point source register (MR0 to MR3) for the MMOV32 operation

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0110 ffee ddaa addr
```

**Description**

Subtract the contents of two floating-point registers and move from a floating-point register to memory.

```
MRd = MRe - MRf;
[mem32] = MRa;
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	Yes	Yes

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

**Pipeline**

Both MSUBF32 and MMOV32 complete in a single cycle.

**MSWAPF MRa, MRb {, CNDF}****Conditional Swap****Operands**

MRa	CLA floating-point register (MR0 to MR3)
MRb	CLA floating-point register (MR0 to MR3)
CNDF	Optional condition tested based on the MSTF flags

**Opcode**

```
LSW: 0000 0000 CNDF bbaa
MSW: 0111 1011 0000 0000
```

**Description**

Conditional swap of MRa and MRb.

```
if (CNDF == true) swap MRa and MRb;
```

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

No flags affected

**Pipeline**

This is a single-cycle instruction.

**MSWAPF MRa, MRb {, CNDF}** (continued)

**Conditional Swap**
**Example**

```

; X is an array of 32-bit floating-point values
; and has length elements. Find the maximum value in
; the array and store the value in Result
;
; Note: MCMPPF32 and MSWAPF can be replaced by MMAXF32
;
_Cla1Task1:
  MMOV16    MAR1, #_X          ; Start address
  MUI16TOF32 MR0, @_len       ; Length of the array
  MNOP      ; delay for MAR1 load
  MNOP      ; delay for MAR1 load
  MMOV32    MR1, *MAR1[2]++   ; MR1 = X0
LOOP
  MMOV32    MR2, *MAR1[2]++   ; MR2 = next element
  MCMPPF32  MR2, MR1          ; Compare MR2 with MR1
  MSWAPF    MR1, MR2, GT      ; MR1 = MAX(MR1, MR2)
  MADD32    MR0, MR0, #-1.0   ; Decrement the counter
  MCMPPF32  MR0, #0.0         ; Set/clear flags for MBCNDD
  MNOP
  MNOP
  MNOP
  MBCNDD    LOOP, NEQ         ; Branch if not equal to zero
  MMOV32    @_Result, MR1     ; Always executed
  MNOP      ; Always executed
  MNOP      ; Always executed
  MSTOP
  ; End of task

```

**MTESTTF CNDF****Test MSTF Register Flag Condition****Operands**

CNDF	Condition to test based on MSTF flags
------	---------------------------------------

**Opcode**

LSW: 0000 0000 0000 cndf
MSW: 0111 1111 0100 0000

**Description**

Test the CLA floating-point condition and if true, set the MSTF[TF] flag. If the condition is false, clear the MSTF[TF] flag. This is useful for temporarily storing a condition for later use.

if (CNDF == true) TF = 1; else TF = 0;
---

CNDF is one of the following conditions:

Encode <sup>(1)</sup>	CNDF	Description	MSTF Flags Tested
0000	NEQ	Not equal to zero	ZF == 0
0001	EQ	Equal to zero	ZF == 1
0010	GT	Greater than zero	ZF == 0 AND NF == 0
0011	GEQ	Greater than or equal to zero	NF == 0
0100	LT	Less than zero	NF == 1
0101	LEQ	Less than or equal to zero	ZF == 1 OR NF == 1
1010	TF	Test flag set	TF == 1
1011	NTF	Test flag not set	TF == 0
1100	LU	Latched underflow	LUF == 1
1101	LV	Latched overflow	LVF == 1
1110	UNC	Unconditional	None
1111	UNCF <sup>(2)</sup>	Unconditional with flag modification	None

(1) Values not shown are reserved.

(2) This is the default operation, if no CNDF field is specified. This condition allows the ZF and NF flags to be modified when a conditional operation is executed. All other conditions do not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	Yes	No	No	No	No

TF = 0; if (CNDF == true) TF = 1;
--------------------------------------

Note: If (CNDF == UNC or UNCF), the TF flag is set to 1.

**Pipeline**

This is a single-cycle instruction.

**MTESTTF CNDF** (continued)

**Test MSTF Register Flag Condition**
**Example**

```

; if (State == 0.1)
;   RampState = RampState || RAMPMASK
; else if (State == 0.01)
;   CoastState = CoastState || COASTMASK
; else
;   SteadyState = SteadyState || STEADYMASK
;
_Cla1Task2:
  MMOV32   MR0, @_State
  MCMPF32  MR0, #0.1           ; Affects flags for 1st MBCNDD (A)
  MCMPF32  MR0, #0.01         ; Check used by 2nd MBCNDD (B)
  MTESTTF  EQ                 ; Store EQ flag in TF for 2nd MBCNDD (B)
  MNOP
  MBCNDD   _Skip1, NEQ        ; (A) If State != 0.1, go to Skip1
  MMOV32   MR1, @_RampState   ; Always executed
  MMOVXI   MR2, #RAMPMASK     ; Always executed
  MOR32    MR1, MR2           ; Always executed
  MMOV32   @_RampState, MR1   ; Execute if (A) branch not taken
  MSTOP    ; end of task if (A) branch not taken
_Skip1:
  MMOV32   MR3, @_SteadyState
  MMOVXI   MR2, #STEADYMASK
  MOR32    MR3, MR2
  MBCNDD   _Skip2, NTF        ; (B) if State != .01, go to Skip2
  MMOV32   MR1, @_CoastState  ; Always executed

  MSTOP    ; end of task if (B) branch not taken
_Skip2:
  MMOV32   @_SteadyState, MR3 ; Executed if (B) branch taken
  MSTOP

```

**MUI16TOF32 MRa, mem16****Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
mem16	16-bit source memory location

**Opcode**

```
LSW: mmmm mmmm mmmm mmmm
MSW: 0111 0101 01aa addr
```

**Description**

When converting F32 to I16/UI16 data format, the MF32TOI16/UI16 operation truncates to zero while the MF32TOI16R/UI16R operation rounds to the nearest (even) value.

```
MRa = UI16TOF32[mem16];
```

**Flags**

This instruction does not affect any flags:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

**Pipeline**

This is a single-cycle instruction.

## MUI16TOF32 MRa, MRb

### Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value

#### Operands

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)

#### Opcode

```
LSW: 0000 0000 0000 bbaa
MSW: 0111 1110 1110 0000
```

#### Description

Convert an unsigned 16-bit integer to a 32-bit floating-point value. When converting float32 to I16/UI16 data format, the MF32TOI16/UI16 operation truncates to zero while the MF32TOI16R/UI16R operation rounds to the nearest (even) value.

```
MRa = UI16TOF32[MRb];
```

#### Flags

This instruction does not affect any flags:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	No	No	No	No

#### Pipeline

This is a single-cycle instruction.

#### Example

```
MMOVXI MR1, #0x800F ; MR1(15:0) = 32783 (0x800F)
MUI16TOF32 MR0, MR1 ; MR0 = UI16TOF32 (MR1(15:0))
; = 32783.0 (0x47000F00)
```

**MXOR32 MRa, MRb, MRc****Bitwise Exclusive Or****Operands**

MRa	CLA floating-point destination register (MR0 to MR3)
MRb	CLA floating-point source register (MR0 to MR3)
MRc	CLA floating-point source register (MR0 to MR3)

**Opcode**

```
LSW: 0000 0000 00cc bbaa
MSW: 0111 1100 1010 0000
```

**Description**

Bitwise XOR of MRb with MRc.

```
MARa(31:0) = MARb(31:0) XOR MRC(31:0);
```

**Flags**

This instruction modifies the following flags in the MSTF register:

Flag	TF	ZF	NF	LUF	LVF
Modified	No	Yes	Yes	No	No

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA

**6.8 CLA Registers**

This section describes the Control Law Accelerator registers.

## 6.8.1 CLA Base Addresses

**Table 6-21. CLA Base Address Table**

Device Register	Register Name	Start Address	End Address
Cla1Regs	CLA_REGS	0x0000_1400	0x0000_147F
Cla1SoftIntRegs <sup>(1)</sup>	CLA_SOFTINT_REGS	0x0000_0CE0	0x0000_0CFF

(1) This register is only accessible from the CLA.

## 6.8.2 CLA\_REGS Registers

Table 6-22 lists the memory-mapped registers for the CLA\_REGS registers. All register offset addresses not listed in Table 6-22 should be considered as reserved locations and the register contents should not be modified.

**Table 6-22. CLA\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	MVECT1	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
1h	MVECT2	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
2h	MVECT3	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
3h	MVECT4	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
4h	MVECT5	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
5h	MVECT6	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
6h	MVECT7	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
7h	MVECT8	Task Interrupt Vector	EALLOW	<a href="#">Go</a>
10h	MCTL	Control Register	EALLOW	<a href="#">Go</a>
20h	MIFR	Interrupt Flag Register	EALLOW	<a href="#">Go</a>
21h	MIOVF	Interrupt Overflow Flag Register	EALLOW	<a href="#">Go</a>
22h	MIFRC	Interrupt Force Register	EALLOW	<a href="#">Go</a>
23h	MICLR	Interrupt Flag Clear Register	EALLOW	<a href="#">Go</a>
24h	MICLROVF	Interrupt Overflow Flag Clear Register	EALLOW	<a href="#">Go</a>
25h	MIER	Interrupt Enable Register	EALLOW	<a href="#">Go</a>
26h	MIRUN	Interrupt Run Status Register	EALLOW	<a href="#">Go</a>
28h	_MPC	CLA Program Counter		<a href="#">Go</a>
2Ah	_MAR0	CLA Auxiliary Register 0		<a href="#">Go</a>
2Bh	_MAR1	CLA Auxiliary Register 1		<a href="#">Go</a>
2Eh	_MSTF	CLA Floating-Point Status Register		<a href="#">Go</a>
30h	_MR0	CLA Floating-Point Result Register 0		<a href="#">Go</a>
34h	_MR1	CLA Floating-Point Result Register 1		<a href="#">Go</a>
38h	_MR2	CLA Floating-Point Result Register 2		<a href="#">Go</a>
3Ch	_MR3	CLA Floating-Point Result Register 3		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 6-23 shows the codes that are used for access types in this section.

**Table 6-23. CLA\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

**Table 6-23. CLA\_REGS Access Type Codes (continued)**

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 6.8.2.1 MVECT1 Register (Offset = 0h) [Reset = 0000h]

MVECT1 is shown in [Figure 6-2](#) and described in [Table 6-24](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 6-2. MVECT1 Register**

**Table 6-24. MVECT1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	MVECT	R/W	0h	<p>MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.</p> <p>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.</p> <p>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..</p> <p>Reset type: SYSRSn</p>

### 6.8.2.2 MVECT2 Register (Offset = 1h) [Reset = 0000h]

MVECT2 is shown in [Figure 6-3](#) and described in [Table 6-25](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 6-3. MVECT2 Register**

RESERVED							
R-0h							
7	6	5	4	3	2	1	0
RESERVED					IACKE	SOFTRESET	HARDRESET
R-0h					R/W-0h	R-0/W1S-0h	R-0/W1S-0h

**Table 6-32. MCTL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-3	RESERVED	R	0h	Reserved
2	IACKE	R/W	0h	<p>IACK Operation Enable Bit: Writing a '1' to this bit will enable the IACK operation for setting the MIFR bits in the same manner as the MIFRC register (write of '1' will set respective MIFR bit). At reset, this feature is disabled.</p> <p>This feature enables the C28 CPU to efficiently trigger a task.</p> <p>Note: IACK operation should ignore EALLOW status of C28 core when accessing the MIFRC register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = The CLA ignores the IACK instruction. (default)</p> <p>1h (R/W) = Enable the main CPU to use the IACK #16bit instruction to set MIFR bits in the same manner as writing to the MIFRC register. Each bit in the operand, #16bit, corresponds to a bit in the MIFRC register. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger a CLA task through software.</p> <p>Examples IACK #0x0001 Write a 1 to MIFRC bit 0 to force task 1</p> <p>IACK #0x0003 Write a 1 to MIFRC bit 0 and 1 to force task 1 and task 2</p>
1	SOFTRESET	R-0/W1S	0h	<p>Soft Reset Bit: Writing a '1' to this bit will stop a current task, clear the RUN flag and also clear all bits in the MIER register. Writes of '0' are ignored and reads always return a '0'.</p> <p>Note: After issuing SOFTRESET command, user should wait at least 1 clock cycle before attempting to write to MIER register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a soft reset of the CLA. This will stop the current task, clear the MIRUN flag and clear all bits in the MIER register. After a soft reset you must wait at least 1 SYSCLKOUT cycle before reconfiguring the MIER bits. If these two operations are done back-to-back then the MIER bits will not get set.</p>
0	HARDRESET	R-0/W1S	0h	<p>Hard Reset Bit: Writing a '1' to this bit will cause a HARD reset on the CLA. The behavior of a HARD reset is the same as a system reset SYSRSn on the CLA. Writes of '0' are ignored and reads always return a '0'.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a hard reset of the CLA. This will set all CLA registers to their default state.</p>

### 6.8.2.10 MIFR Register (Offset = 20h) [Reset = 0000h]

MIFR is shown in [Figure 6-11](#) and described in [Table 6-33](#).

Return to the [Summary Table](#).

Each bit in the interrupt flag register corresponds to a CLA task. The corresponding bit is automatically set when the task request is received from the peripheral interrupt. The bit can also be set by the main CPU writing to the MIFRC register or using the IACK instruction to start the task. To use the IACK instruction to begin a task first enable this feature in the MCTL register. If the bit is already set when a new peripheral interrupt is received, then the corresponding overflow bit will be set in the MIOVF register.

The corresponding MIFR bit is automatically cleared when the task begins execution. This will occur if the interrupt is enabled in the MIER register and no other higher priority task is pending. The bits can also be cleared manually by writing to the MICLR register. Writes to the MIFR register are ignored.

### 6.8.2.11 MIOVF Register (Offset = 21h) [Reset = 0000h]

MIOVF is shown in [Figure 6-12](#) and described in [Table 6-34](#).

Return to the [Summary Table](#).

Each bit in the overflow flag register corresponds to a CLA task. The bit is set when an interrupt overflow event has occurred for the specific task. An overflow event occurs when the MIFR register bit is already set when a new interrupt is received from a peripheral source. The MIOVF bits are only affected by peripheral interrupt events. They do not respond to a task request by the main CPU IACK instruction or by directly setting MIFR bits. The overflow flag will remain latched and can only be cleared by writing to the overflow flag clear (MICLROVF) register. Writes to the MIOVF register are ignored.

### 6.8.2.12 MIFRC Register (Offset = 22h) [Reset = 0000h]

MIFRC is shown in [Figure 6-13](#) and described in [Table 6-35](#).

Return to the [Summary Table](#).

The interrupt force register can be used by the main CPU to start tasks through software. Writing a 1 to a MIFRC bit will set the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0. The IACK #16bit operation can also be used to start tasks and has the same effect as the MIFRC register. To enable IACK to set MIFR bits you must first set the MCTL[IACKE] bit. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger CLA tasks through software.

### 6.8.2.13 MICLR Register (Offset = 23h) [Reset = 0000h]

MICLR is shown in [Figure 6-14](#) and described in [Table 6-36](#).

Return to the [Summary Table](#).

Normally bits in the MIFR register are automatically cleared when a task begins. The interrupt flag clear register can be used to instead manually clear bits in the interrupt flag (MIFR) register. Writing a 1 to a MICLR bit will clear the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0.

### 6.8.2.14 MICLROVF Register (Offset = 24h) [Reset = 0000h]

MICLROVF is shown in [Figure 6-15](#) and described in [Table 6-37](#).

Return to the [Summary Table](#).

Overflow flag bits in the MIOVF register are latched until manually cleared using the MICLROVF register. Writing a 1 to a MICLROVF bit will clear the corresponding bit in the MIOVF register. Writes of 0 are ignored and reads always return 0.

### 6.8.2.15 MIER Register (Offset = 25h) [Reset = 0000h]

MIER is shown in [Figure 6-16](#) and described in [Table 6-38](#).

Return to the [Summary Table](#).

Setting the bits in the interrupt enable register (MIER) allow an incoming interrupt or main CPU software to start the corresponding CLA task. Writing a 0 will block the task, but the interrupt request will still be latched in the flag register (MIFLG). Setting the MIER register bit to 0 while the corresponding task is executing will have no effect on the task. The task will continue to run until it hits the MSTOP instruction. When a soft reset is issued, the MIER bits are cleared. There should always be at least a 1 SYSCLKOUT delay between issuing the soft reset and reconfiguring the MIER bits.

### 6.8.2.16 MIRUN Register (Offset = 26h) [Reset = 0000h]

MIRUN is shown in [Figure 6-17](#) and described in [Table 6-39](#).

Return to the [Summary Table](#).

The interrupt run status register (MIRUN) indicates which task is currently executing. Only one MIRUN bit will ever be set to a 1 at any given time. The bit is automatically cleared when the task completes and the respective interrupt is fed to the peripheral interrupt expansion (PIE) block of the device. This lets the main CPU know when a task has completed. The main CPU can stop a currently running task by writing to the MCTL[SOFTRESET] bit. This will clear the MIRUN flag and stop the task. In this case no interrupt will be generated to the PIE.

### 6.8.2.20 \_MSTF Register (Offset = 2Eh) [Reset = 0000000h]

\_MSTF is shown in [Figure 6-21](#) and described in [Table 6-43](#).

Return to the [Summary Table](#).

The CLA status register (MSTF) reflects the results of different operations. These are the basic rules for the flags:

- Zero and negative flags are cleared or set based on:
- floating-point moves to registers
- the result of compare, minimum, maximum, negative and absolute value operations
- the integer result of operations such as MMOV16, MAND32, MOR32, MXOR32, MCMP32, MASR32, MLSR32
- Overflow and underflow flags are set by floating-point math instructions such as multiply, add, subtract and 1/x. These flags may also be connected to the peripheral interrupt expansion (PIE) block on your device. This can be useful for debugging underflow and overflow conditions within an application.

### 6.8.3 CLA\_SOFTINT\_REGS Registers

Table 6-48 lists the memory-mapped registers for the CLA\_SOFTINT\_REGS registers. All register offset addresses not listed in Table 6-48 should be considered as reserved locations and the register contents should not be modified.

**Table 6-48. CLA\_SOFTINT\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	SOFTINTEN	CLA Software Interrupt Enable Register		<a href="#">Go</a>
2h	SOFTINTFRC	CLA Software Interrupt Force Register		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 6-49 shows the codes that are used for access types in this section.

**Table 6-49. CLA\_SOFTINT\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
W1S	W1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 6.8.3.1 SOFTINTEN Register (Offset = 0h) [Reset = 0000h]

SOFTINTEN is shown in [Figure 6-26](#) and described in [Table 6-50](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA.

Chapter 7

## General-Purpose Input/Output (GPIO)

---

The GPIO module controls the device's digital multiplexing, which uses shared pins to maximize application flexibility. The pins are named by their general-purpose I/O name (for example, GPIO0, GPIO25, GPIO58). These pins can be individually selected to operate as digital I/O (also called GPIO mode), or connected to one of several peripheral I/O signals. The input signals can be qualified to remove unwanted noise.

<b>7.1 Introduction</b> .....	<b>862</b>

## 7.1 Introduction

Up to twelve independent peripheral signals are multiplexed on a single GPIO-enabled pin in addition to the CPU-controlled I/O capability. Each pin output can be controlled by either a peripheral or one of the two CPU masters.

- CPU1
- CPU1.CLA

There are up to 8 possible I/O ports:

- Port A consists of GPIO0-GPIO31
- Port B consists of GPIO32-GPIO63
- Port C consists of GPIO64-GPIO95
- Port D consists of GPIO96-GPIO127
- Port E consists of GPIO128-GPIO159
- Port F consists of GPIO160-GPIO191
- Port G consists of GPIO192-GPIO223
- Port H consists of GPIO224-GPIO255

---

### Note

Some GPIO and I/O ports can be unavailable on particular devices. See the *GPIO Registers* section for available GPIO and I/O ports.

---

[Figure 7-1](#) shows the GPIO logic for a single pin.

---

### Note

The USB PHY pin muxing is not shown in [Figure 7-1](#). For more details on USB pins, see [Section 7.5](#).

---

There are two key features to note in [Figure 7-1](#). The first is that the input and output paths are entirely separate, connecting only at the pin. The second is that peripheral muxing takes place far from the pin. As a result, it is always possible for both CPUs and CLAs to read the physical state of the pin independent of CPU mastering and peripheral muxing. Likewise, external interrupts can be generated from peripheral activity. All pin options such as input qualification and open-drain output are valid for all masters and peripherals. However, the peripheral muxing, CPU muxing, and pin options can only be configured by CPU1.

A separate configuration is required for the USB signals. See [Section 7.5](#) for details.

## 7.2 Configuration Overview

I/O pin configuration consists of several steps:

### 1. Plan the device pin-out

Make a list of all required peripherals for the application. Using the peripheral mux information in the device data sheet, choose which GPIOs to use for the peripheral signals. Decide which of the remaining GPIOs to use as inputs and outputs for each CPU and CLA.

Once the peripheral muxing has been chosen, implement the mux by writing the appropriate values to the GPyMUX1/2 and GPyGMUX1/2 registers. When changing the GPyGMUX value for a pin, always set the corresponding GPyMUX bits to zero first to avoid glitching in the muxes. By default, all pins are general-purpose I/Os, not peripheral signals.

### 2. (Optional) Enable internal pullup resistors

To enable or disable the pullup resistors, write to the appropriate bits in the GPIO pullup disable registers (GPyPUD). All pullups are disabled by default. Pullups can be used to keep input pins in a known state when there is no external signal driving them.

### 3. Select input qualification

If the pin is used as an input, specify the required input qualification, if any. The input qualification sampling period is selected in the GPyCTRL registers, while the type of qualification is selected in the GPyQSEL1 and GPyQSEL2 registers. By default, all qualification is synchronous with a sampling period equal to PLLSYSCLK. For an explanation of input qualification, see [Section 7.4](#).

### 4. Select the direction of any general-purpose I/O pins

For each pin configured as a GPIO, specify the direction of the pin as either input or output using the GPyDIR registers. By default, all GPIO pins are inputs. Before changing a pin to an output, load the output latch with the value to be driven by writing that value to the GPySET, GPyCLEAR, or GPyDAT registers. Once the latch is loaded, write to GPyDIR to change the pin direction. By default, all output latches are zero.

### 5. Select low-power mode wake-up sources

GPIOs 0-63 can be used to wake the system up from low power modes. To select one or more GPIOs for wake-up, write to the appropriate bits in the GPIOLPMSEL0 and GPIOLPMSEL1 registers. These registers are part of the CPU system register space. In Hibernate mode, GPIO 41 is the only wake-up pin. For more information on low-power modes and GPIO wake-up, see the Low-Power Modes section in the *System Control and Interrupts* chapter.

### 6. Select external interrupt sources

Configuring external interrupts is a two-step process. First, the interrupts themselves must be enabled and their polarity must be configured using the XINTnCR registers. Second, the XINT1-5 GPIO pins must be set by selecting the sources for Input X-BAR signals 4, 5, 6, 13, and 14, respectively. For more information on the Input X-BAR architecture, see the *Crossbar (X-BAR)* chapter.

---

#### Note

Configure the GPIO registers GPxMUX1, GPxMUX2, GPxINV, GPxGMUX1, and GPxGMUX2 as per [Section 7.7](#) before a peripheral starts using the respective GPIOs. The configuration is expected to be static during runtime.

---

## 7.3 Digital General-Purpose I/O Control

The values on the pins that are configured as GPIO can be changed by using the following registers.

- **GPyDAT Registers**

Each I/O port has one data register. Each bit in the data register corresponds to one GPIO pin. No matter how the pin is configured (GPIO or peripheral function), the corresponding bit in the data register reflects the current state of the pin after qualification. Writing to the GPyDAT register clears or sets the corresponding output latch and if the pin is enabled as a general-purpose output (GPIO output), the pin is also driven either low or high. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin.

When using the GPyDAT register to change the level of an output pin, be cautious to not accidentally change the level of another pin. For example, to change the output latch level of GPIOA1 by writing to the GPADAT register bit 0 using a read-modify-write instruction, a problem can occur if another I/O port A signal changes level between the read and the write stage of the instruction. Following is an analysis of why this happens:

The GPyDAT registers reflect the state of the pin, not the latch. This means the register reflects the actual pin value. However, there is a lag between when the register is written to when the new pin value is reflected back in the register. This can pose a problem when this register is used in subsequent program statements to alter the state of GPIO pins. An example is shown below where two program statements attempt to drive two different GPIO pins that are currently low to a high state.

If Read-Modify-Write operations are used on the GPyDAT registers, because of the delay between the output and the input of the first instruction (I1), the second instruction (I2) reads the old value and writes the value back.

```
GpioDataRegs.GPADAT.bit.GPIO1 = 1; //I1 performs read-modify-write of GPADAT
GpioDataRegs.GPADAT.bit.GPIO2 = 1; //I2 also a read-modify-write of GPADAT
//GPADAT gets the old value of GPIO1 due to the delay
```

The second instruction waits for the first to finish the write due to the write-followed-by-read protection on this peripheral frame. There is some lag, however, between the write of (I1) and the GPyDAT bit reflecting the new value (1) on the pin. During this lag, the second instruction reads the old value of GPIO1 (0) and writes the value back along with the new value of GPIO2 (1). Therefore, GPIO1 pin stays low.

One answer is to put some NOPs between instructions. A better answer is to use the GPySET/GPyCLEAR/GPyTOGGLE registers instead of the GPyDAT registers. These registers always read back a 0 and writes of 0 have no effect. Only bits that need to be changed can be specified without disturbing any other bits that are currently in the process of changing.

- **GPySET Registers**

The set registers are used to drive specified GPIO pins high without disturbing other pins. Each I/O port has one set register and each bit corresponds to one GPIO pin. The set registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the set register sets the output latch high and the corresponding pin is driven high. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the set registers has no effect.

- **GPyCLEAR Registers**

The clear registers are used to drive specified GPIO pins low without disturbing other pins. Each I/O port has one clear register. The clear registers always read back 0. If the corresponding pin is configured as a general-purpose output, then writing a 1 to the corresponding bit in the clear register clears the output latch and the pin is driven low. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the clear registers has no effect.

- **GPyTOGGLE Registers**

The toggle registers are used to drive specified GPIO pins to the opposite level without disturbing other pins. Each I/O port has one toggle register. The toggle registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the toggle register flips the output latch and pulls the corresponding pin in the opposite direction. That is, if the output pin is driven low, then writing a 1 to the corresponding bit in the toggle register pulls the pin high. Likewise, if the output pin is high, then writing a 1 to the corresponding bit in the toggle register pulls the pin low. If the pin is not configured as a GPIO output, then the value is latched but the pin is not driven. Only if the pin is later configured as a GPIO output is the latched value driven onto the pin. Writing a 0 to any bit in the toggle registers has no effect.

## 7.4 Input Qualification

The input qualification scheme has been designed to be very flexible. Select the type of input qualification for each GPIO pin by configuring the GPyQSEL1 and GPyQSEL2 registers. In the case of a GPIO input pin, the qualification can be specified as only synchronized to SYSCLKOUT or qualification by a sampling window. For pins that are configured as peripheral inputs, the input can also be asynchronous in addition to synchronized to SYSCLKOUT or qualified by a sampling window. The remainder of this section describes the options available.

### 7.4.1 No Synchronization (Asynchronous Input)

This mode is used for peripherals where input synchronization is not required or the peripheral itself performs the synchronization. Examples include communication ports McBSP, SCI, SPI, and I<sup>2</sup>C. In addition, the ePWM trip zone ( $\overline{TZn}$ ) signals can function independent of the presence of SYSCLKOUT.

---

#### Note

Using input synchronization when the peripheral itself performs the synchronization can cause unexpected results. The user must make sure that the GPIO pin is configured for asynchronous in this case.

---

### 7.4.2 Synchronization to SYSCLKOUT Only

This is the default qualification mode of all the pins at reset. In this mode, the input signal is only synchronized to the system clock (SYSCLKOUT). Because the incoming signal is asynchronous, a SYSCLKOUT period of delay is needed for the input to the device to be changed. No further qualification is performed on the signal.

### 7.4.3 Qualification Using a Sampling Window

In this mode, the signal is first synchronized to the system clock (SYSCLKOUT) and then qualified by a specified number of cycles before the input is allowed to change. Figure 7-2 and Figure 7-3 show how the input qualification is performed to eliminate unwanted noise. Two parameters are specified by the user for this type of qualification: 1) the sampling period, or how often the signal is sampled, and 2) the number of samples to be taken.

Figure 7-2. Input Qualification Using a Sampling Window

#### Time between samples (sampling period):

To qualify the signal, the input signal is sampled at a regular period. The sampling period is specified by the user and determines the time duration between samples, or how often the signal is sampled, relative to the CPU clock (SYSCLKOUT).

The sampling period is specified by the qualification period (QUALPRDn) bits in the GPxCTRL register. The sampling period is configurable in groups of 8 input signals. For example, GPIO0 to GPIO7 use GPxCTRL[QUALPRD0] setting and GPIO8 to GPIO15 use GPxCTRL[QUALPRD1]. Table 7-1 and Table 7-2 show the relationship between the sampling period or sampling frequency and the GPxCTRL[QUALPRDn] setting.

Table 7-1. Sampling Period

Sampling Period	
If GPxCTRL[QUALPRDn] = 0	$1 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] $\neq$ 0	$2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT	

Table 7-2. Sampling Frequency

Sampling Frequency	
If GPxCTRL[QUALPRDn] = 0	$f_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] $\neq$ 0	$f_{\text{SYSCLKOUT}} \times 1 + (2 \times \text{GPxCTRL[QUALPRDn]})$
Where $f_{\text{SYSCLKOUT}}$ is the frequency of SYSCLKOUT	

From these equations, the minimum and maximum time between samples can be calculated for a given SYSCLKOUT frequency:

**Example: Maximum Sampling Frequency:**

If GPxCTRL[QUALPRDn] = 0

then the sampling frequency is  $f_{\text{SYSCLKOUT}}$

If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$

then the signal is sampled at 60 MHz or one sample every 16.67 ns.

**Example: Minimum Sampling Frequency:**

If GPxCTRL[QUALPRDn] = 0xFF (255)

then the sampling frequency is  $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPxCTRL[QUALPRDn]})$

If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$

then the signal is sampled at  $60 \text{ MHz} \times 1 \div (2 \times 255)$  (117.647 kHz) or one sample every 8.5  $\mu\text{s}$ .

**Number of samples:**

The number of times the signal is sampled is either three samples or six samples as specified in the qualification selection (GPAQSEL1, GPAQSEL2, GPBQSEL1, and GPBQSEL2) registers. When three or six consecutive cycles are the same, then the input change is passed through to the device.

**Total Sampling Window Width:**

The sampling window is the time during which the input signal is sampled as shown in [Figure 7-3](#). By using the equation for the sampling period, along with the number of samples to be taken, the total width of the window can be determined.

For the input qualifier to detect a change in the input, the level of the signal must be stable for the duration of the sampling window width or longer.

The number of sampling periods within the window is always one less than the number of samples taken. For a three-sample window, the sampling window width is two sampling periods wide where the sampling period is defined in [Table 7-1](#). Likewise, for a six-sample window, the sampling window width is five sampling periods wide. [Table 7-3](#) and [Case 2: Six-Sample Sampling Window Width](#) show the calculations used to determine the total sampling window width based on GPxCTRL[QUALPRDn] and the number of samples taken.

**Table 7-3. Case 1: Three-Sample Sampling Window Width**

Total Sampling Window Width	
If GPxCTRL[QUALPRDn] = 0	$2 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] $\neq$ 0	$2 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT	

**Table 7-4. Case 2: Six-Sample Sampling Window Width**

Total Sampling Window Width	
If GPxCTRL[QUALPRDn] = 0	$5 \times T_{\text{SYSCLKOUT}}$
If GPxCTRL[QUALPRDn] $\neq$ 0	$5 \times 2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$
Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT	

**Note**

The external signal change is asynchronous with respect to both the sampling period and SYSCLKOUT. Due to the asynchronous nature of the external signal, the input must be held stable for a time greater than the sampling window width to make sure the logic detects a change in the signal. The extra time required can be up to an additional sampling period + T<sub>SYSCLKOUT</sub>.

The required duration for an input signal to be stable for the qualification logic to detect a change is described in the data sheet.

**Example Qualification Window:**

For the example shown in Figure 7-3, the input qualification has been configured as follows:

- GPxQSEL1/2 = 1,0. This indicates a six-sample qualification.
- GPxCTRL[QUALPRDn] = 1. The sampling period is  $t_w(SP) = 2 \times GPxCTRL[QUALPRDn] \times T_{SYSCLKOUT} = 2 \times T_{SYSCLKOUT}$ .

This configuration results in the following:

- The width of the sampling window is:

$$t_w(IQSW) = 5 \times t_w(SP) = 5 \times 2 \times GPxCTRL[QUALPRDn] \times T_{SYSCLKOUT} = 5 \times 2 \times T_{SYSCLKOUT}$$

- If, for example, T<sub>SYSCLKOUT</sub> = 16.67 ns, then the duration of the sampling window is:

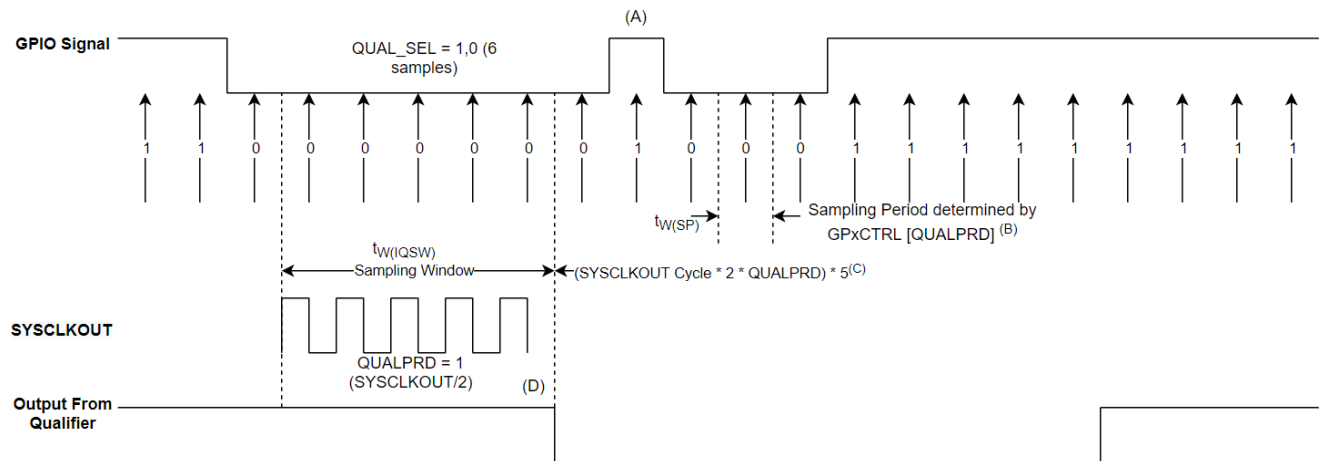

$$\text{Sampling period, } t_w(SP) = 2 \times T_{SYSCLKOUT} = 2 \times 16.67 \text{ ns} = 33.3 \text{ ns}$$

$$\text{Sampling window, } t_w(IQSW) = 5 \times t_w(SP) = 5 \times 33.3 \text{ ns} = 166.7 \text{ ns}$$

- To account for the asynchronous nature of the input relative to the sampling period and SYSCLKOUT, up to a single additional sampling period and SYSCLK period is required to detect a change in the input signal. For this example:

$$t_w(IQSW) + t_w(SP) + T_{SYSCLKOUT} = 166.7 \text{ ns} + 33.3 \text{ ns} + 16.67 \text{ ns} = 216.7 \text{ ns}$$

- In Figure 7-3, the glitch (A) is shorter than the qualification window and is ignored by the input qualifier.

A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period in 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).  
 B. The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.  
 C. The qualification block can take either three or six samples. The QUAL\_SEL Register selects which sample mode is used.  
 D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. That would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, an 13-SYSCLKOUT-wide pulse ensures reliable recognition.

**Figure 7-3. Input Qualifier Clock Cycles**

## 7.5 USB Signals

The USB module on this device has an internal physical layer transceiver (PHY). The I/O signals are not normal digital signals, and as a result, the signals do not connect to the pins through the normal GPIO mux path. Instead, a special analog mux is used. To connect the USB signals to the device pins, set the GPyAMSEL bits appropriately as shown in [Table 7-5](#). Do not enable pullups or any other special pin option when using the USB signals.

**Table 7-5. USB I/O Signal Muxing**

Signal	GPIO	AMSEL
USBDM	42	GPBAMSEL[10]
USBDP	43	GPBAMSEL[11]

## 7.6 SPI Signals

The SPI module on this device has a high-speed mode that enables 40 Mbps communication. To achieve the highest possible speed, a special GPIO configuration is used on a single GPIO mux option for each SPI. These GPIOs can also be used by the SPI when not in high-speed mode (HS\_MODE = 0). [Table 7-6](#) shows which GPIOs have the special mux option to allow SPI high-speed mode.

To select these mux options, configure the GPyGMUX and GPyMUX registers as shown in [Table 7-6](#).

**Table 7-6. GPIO Configuration for High-Speed SPI**

GPIO	SPI Signal	Mux Configuration	
		GPBGMUX2	GPCMUX1
GPIO58	SPISIMOA	GPBGMUX2[21:20]=11	GPBMUX2[21:20]=11
GPIO59	SPISOMIA	GPBGMUX2[23:22]=11	GPBMUX2[23:22]=11
GPIO60	SPICLKA	GPBGMUX2[25:24]=11	GPBMUX2[25:24]=11
GPIO61	SPISTEA	GPBGMUX2[27:26]=11	GPBMUX2[27:26]=11

GPIO66	SPISTEB	GPCGMUX1[5:4]=11	GPCMUX1[5:4]=11
GPIO69	SPISIMOC	GPCGMUX1[11:10]=11	GPCMUX1[11:10]=11
GPIO70	SPISOMIC	GPCGMUX1[13:12]=11	GPCMUX1[13:12]=11
GPIO71	SPICLKC	GPCGMUX1[15:14]=11	GPCMUX1[15:14]=11
GPIO72	SPISTEC	GPCGMUX1[17:16]=11	GPCMUX1[17:16]=11

## 7.7 GPIO and Peripheral Muxing

### 7.7.1 GPIO Muxing

Up to twelve different peripheral functions are multiplexed to each pin along with a general-purpose input/output (GPIO) function. This allows you to choose the peripheral mix and pinout that works best for your particular application. Refer to [Table 7-7](#) for muxing combinations and definitions.

**Table 7-7. GPIO Muxed Pins**

	GPIO167	EPWM12A (O)						
	GPIO168	EPWM12B (O)						

(1) (I) = Input, (O) = Output, (OD) = Open Drain

(2) GPIO Index settings of 9, 10, 11, 13, and 14 are reserved.

(3) High-Speed SPI-enabled GPIO mux option. This pin mux option is required when using the SPI in High-Speed Mode (HS\_MODE = 1 in SPICCR). This mux option is still available when not using the SPI in High-Speed Mode (HS\_MODE = 0 in SPICCR).

## 7.7.2 Peripheral Muxing

For example, multiplexing for the GPIO6 pin is controlled by writing to GPAGMUX[13:12] and GPAMUX[13:12]. By writing to these bits, GPIO6 is configured as either a general-purpose digital I/O or one of several different peripheral functions. An example of GPyGMUX and GPyMUX selection and options for a single GPIO are shown in [Table 7-8](#).

### Note

The following table is for example only. Refer to the device data sheet to check the availability of GPIO6 on this device. If GPIO6 is available, the functions mentioned in the table may not match the actual functions available. See [Section 7.7.1](#) for correct list of GPIOs and corresponding mux options for this device.

**Table 7-8. GPIO and Peripheral Muxing**

GPAGMUX1[13:12]	GPAMUX1[13:12]	Pin Functionality
00	00	GPIO6
00	01	Peripheral 1
00	10	Peripheral 2
00	11	Peripheral 3
01	00	GPIO6
01	01	Peripheral 4
01	10	Peripheral 5
01	11	
10	00	GPIO6
10	01	
10	10	Peripheral 6
10	11	Peripheral 7
11	00	GPIO6
11	01	Peripheral 8
11	10	Peripheral 9
11	11	Peripheral 10

The devices have different multiplexing schemes. If a peripheral is not available on a particular device, that mux selection is reserved on that device and must not be used.

### CAUTION

If a reserved GPIO mux configuration that is not mapped to either a peripheral or GPIO mode is selected, the state of the pin is undefined and the pin is driven. Unimplemented configurations are for future expansion and must not be selected. In the device mux table (see the data sheet), these options are indicated as Reserved or left blank.

Some peripherals can be assigned to more than one pin by way of the mux registers. For example, OUTPUTXBAR1 can be assigned to GPIOs p, q, or r (where p, q, and r are example GPIO numbers), depending on individual system requirements. An example of this is shown in [Table 7-9](#).

### Note

The following table is for example only. Bit ranges cannot correspond to OUTPUTXBAR1 on this device. See [Section 7.7.1](#) for correct list of GPIOs and corresponding mux options for this device.

If none or more than one of the GPIO pins is configured as peripheral input pins, then that GPIO is set to a hard-wired default value.

**Table 7-9. Peripheral Muxing (Multiple Pins Assigned)**

GMUX Configuration	MUX Configuration	
Choice 1: GPIOp	GPyGMUX1[5:4]=01	GPyMUX1[5:4]=01
or Choice 2: GPIOq	GPyGMUX2[17:16]=00	GPyMUX2[17:16]=01
or Choice 3: GPIOr	GPyGMUX1[7:6]=01	GPyMUX1[7:6]=01

## 7.8 Internal Pullup Configuration Requirements

On reset, GPIOs are in input mode and have the internal pullups disabled. An un-driven input can float to a mid-rail voltage and cause wasted shoot-through current on the input buffer. The user must always put each GPIO in one of these configurations:

- Input mode and driven on the board by another component to a level above  $V_{ih}$  or below  $V_{il}$
- Input mode with GPIO internal pullup enabled
- Output mode

On devices with lesser pin count packages, pull-ups on unbonded GPIOs are by default enabled to prevent floating inputs. The user must take care to avoid disabling these pullups in their application code.

On devices with larger pin count packages, the pullups for any internally unbonded GPIO must be enabled to prevent floating inputs. TI has provided functions in controlSUITE/C2000Ware that users can call to enable the pullup on any unbonded GPIO for the package they are using. This function, `GPIO_EnabledUnbondedIOPullups()`, resides in the `(Device)_Sysctrl.c` file and is called by default from `InitSysCtrl()`. The user must take care to avoid disabling these pullups in their application code.

## 7.9 Software

### 7.9.1 GPIO Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/gpio

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

#### 7.9.1.1 Device GPIO Setup

FILE: gpio\_ex1\_setup.c

Configures the device GPIO into two different configurations. This code is verbose to illustrate how the GPIO could be setup. In a real application, lines of code can be combined for improved code size and efficiency.

This example only sets-up the GPIO. Nothing is actually done with the pins after setup.

*In general:*

- All pullup resistors are enabled. For ePWMs this may not be desired.
- Input qual for communication ports (CAN, SPI, SCI, I2C) is asynchronous
- Input qual for Trip pins (TZ) is asynchronous
- Input qual for eCAP and eQEP signals is synch to SYSCLKOUT
- Input qual for some I/O's and \_\_interrupts may have a sampling window

#### 7.9.1.2 Device GPIO Toggle

FILE: gpio\_ex2\_toggle.c

Configures the device GPIO through the sysconfig file. The GPIO pin is toggled in the infinite loop. In order to migrate the project within syscfg to any device, click the switch button under the device view and select your corresponding device to migrate, saving the project will auto-migrate your project settings.

#### 7.9.1.3 Device GPIO Interrupt

FILE: gpio\_ex3\_interrupt.c

Configures the device GPIOs through the sysconfig file. One GPIO output pin, and one GPIO input pin is configured. The example then configures the GPIO input pin to be the source of an external interrupt which toggles the GPIO output pin.

### 7.9.2 LED Examples

NOTE: These examples are located in the [C2000Ware](#) installation at the following location:  
C2000Ware\_VERSION#/driverlib/DEVICE\_GPN/examples/CORE\_IF\_MULTICORE/led

Cloud access to these examples is available at the following link: [dev.ti.com C2000Ware Examples](#).

## 7.10 GPIO Registers

This section describes the General-Purpose Input/Output Registers.

**Table 7-10** provides both specific and generic terms for registers described in this section and throughout this chapter.

**Table 7-10. Specific versus Generic Terminology for Registers**

Specific Term	Generic Term Used in the Document
GPAQSEL1, GPAQSEL2, GPBQSEL1, GPBQSEL2, GPCQSEL1, GPCQSEL2, GPDQSEL1, GPDQSEL2, GPEQSEL1, GPEQSEL2, GPFQSEL1, GPFQSEL2	GPxQSEL
GPACTRL, GPBCTRL, GPCCTRL, GPDCTRL, GPECTRL, GPFCTRL	GPxCTRL
GPADIR, GPBDIR, GPCDIR, GPDDIR, GPEDIR, GPFDIR	GPxDIR
GPAPUD, GPBPUD, GPCPUD, GPDPU, GPEPUD, GPFPU	GPxPUD
GPAINV, GPBINV, GPCINV, GPDINV, GPEINV, GPFINV	GPxINV
GPAODR, GPBODR, GPCODR, GPDODR, GPEODR, GPFODR, GPxODR	GPxODR
GPALOCK, GPBLOCK, GPCLOCK, GPDLOCK, GPELOCK, GPFLOCK	GPxLOCK
GPACR, GPBCR, GPCCR, GPD CR, GPECR, GPF CR	GPxCR
GPAMUX1, GPAMUX2, GPBMUX1, GPBMUX2, GPCMUX1, GPCMUX2, GPDMUX1, GPDMUX2, GPEMUX1, GPEMUX2, GPFMUX1, GPFMUX2	GPxMUX
GPAGMUX1, GPAGMUX2, GPBGMUX1, GPBGMUX2, GPCGMUX1, GPCGMUX2, GPDGMUX1, GPDGMUX2, GPEGMUX1, GPEGMUX2, GPFGMUX1, GPFGMUX2	GPxGMUX
GPADAT, GPBDAT, GPCDAT, GPDDAT, GPEDAT, GPF DAT	GPxDAT

### 7.10.1 GPIO Base Addresses

**Table 7-11. GPIO Base Address Table**

Device Registers	Register Name	Start Address	End Address
GpioCtrlRegs <sup>(1)</sup>	GPIO_CTRL_REGS	0x0000_7C00	0x0000_7D7F
GpioDataRegs	GPIO_DATA_REGS	0x0000_7F00	0x0000_7F2F

(1) Only available on CPU1.

## 7.10.2 GPIO\_CTRL\_REGS Registers

Table 7-12 lists the memory-mapped registers for the GPIO\_CTRL\_REGS registers. All register offset addresses not listed in Table 7-12 should be considered as reserved locations and the register contents should not be modified.

**Table 7-12. GPIO\_CTRL\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	GPACTRL	GPIO A Qualification Sampling Period Control (GPIO0 to 31)	EALLOW	<a href="#">Go</a>
2h	GPAQSEL1	GPIO A Qualifier Select 1 Register (GPIO0 to 15)	EALLOW	<a href="#">Go</a>
4h	GPAQSEL2	GPIO A Qualifier Select 2 Register (GPIO16 to 31)	EALLOW	<a href="#">Go</a>
6h	GPAMUX1	GPIO A Mux 1 Register (GPIO0 to 15)	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. [Table 7-13](#) shows the codes that are used for access types in this section.

**Table 7-13. GPIO\_CTRL\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		

**Table 7-13. GPIO\_CTRL\_REGS Access Type Codes (continued)**

Access Type	Code	Description
R	R	Read
Write Type		
W	W	Write
WOnce	W Once	Write Write once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 7.10.2.1 GPECTRL Register (Offset = 0h) [Reset = 00000000h]

GPECTRL is shown in [Figure 7-4](#) and described in [Table 7-14](#).

Return to the [Summary Table](#).

GPIO A Qualification Sampling Period Control (GPIO0 to 31)

**Figure 7-4. GPECTRL Register**

Bit	Field	Type	Reset	Description
1-0	GPIO16	R/W	0h	Input qualification type Reset type: SYSRSn

### 7.10.2.4 GPAMUX1 Register (Offset = 6h) [Reset = 0000000h]

GPAMUX1 is shown in [Figure 7-7](#) and described in [Table 7-17](#).

Return to the [Summary Table](#).

GPIO A Mux 1 Register (GPIO0 to 15)  
Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-7. GPAMUX1 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W-0h		R/W-0h		R/W-0h		R/W-0h		R/W-0h		R/W-0h		R/W-0h		R/W-0h	

**Table 7-17. GPAMUX1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	GPIO15	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
29-28	GPIO14	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
27-26	GPIO13	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
25-24	GPIO12	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
23-22	GPIO11	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
21-20	GPIO10	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
19-18	GPIO9	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
17-16	GPIO8	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
15-14	GPIO7	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
13-12	GPIO6	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
11-10	GPIO5	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
9-8	GPIO4	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
7-6	GPIO3	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
5-4	GPIO2	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
3-2	GPIO1	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

**Table 7-17. GPAMUX1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	GPIO0	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.5 GPAMUX2 Register (Offset = 8h) [Reset = 0000000h]

GPAMUX2 is shown in [Figure 7-8](#) and described in [Table 7-18](#).

Return to the [Summary Table](#).

GPIO A Mux 2 Register (GPIO16 to 31)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-8. GPAMUX2 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**Table 7-18. GPAMUX2 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	GPIO16	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.6 GPADIR Register (Offset = Ah) [Reset = 0000000h]

GPADIR is shown in [Figure 7-9](#) and described in [Table 7-19](#).

Return to the [Summary Table](#).

GPIO A Direction Register (GPIO0 to 31)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

**Figure 7-9. GPADIR Register**

### 7.10.2.7 GPAPUD Register (Offset = Ch) [Reset = FFFFFFFFh]

GPAPUD is shown in [Figure 7-10](#) and described in [Table 7-20](#).

Return to the [Summary Table](#).

GPIO A Pull Up Disable Register (GPIO0 to 31)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

**Figure 7-10. GPAPUD Register**

### 7.10.2.8 GPAINV Register (Offset = 10h) [Reset = 0000000h]

GPAINV is shown in [Figure 7-11](#) and described in [Table 7-21](#).

Return to the [Summary Table](#).

GPIO A Input Polarity Invert Registers (GPIO0 to 31)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 7-11. GPAINV Register**

### 7.10.2.9 GPAODR Register (Offset = 12h) [Reset = 0000000h]

GPAODR is shown in [Figure 7-12](#) and described in [Table 7-22](#).

Return to the [Summary Table](#).

GPIO A Open Drain Output Register (GPIO0 to GPIO31)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

Bit	Field	Type	Reset	Description
31-30	GPIO15	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
29-28	GPIO14	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
27-26	GPIO13	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
25-24	GPIO12	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
23-22	GPIO11	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
21-20	GPIO10	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
19-18	GPIO9	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
17-16	GPIO8	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
15-14	GPIO7	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
13-12	GPIO6	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
11-10	GPIO5	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
9-8	GPIO4	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
7-6	GPIO3	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
5-4	GPIO2	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
3-2	GPIO1	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
1-0	GPIO0	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.11 GPAGMUX2 Register (Offset = 22h) [Reset = 0000000h]

GPAGMUX2 is shown in [Figure 7-14](#) and described in [Table 7-24](#).

Return to the [Summary Table](#).

GPIO A Peripheral Group Mux (GPIO16 to 31)

Defines pin-muxing selection for GPIO.

Note: For complete pin-mux selection on GPIOx, GPAMUXy.GPIOx configuration is also required.

**Figure 7-14. GPAGMUX2 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 7.10.2.21 GPBMUX1 Register (Offset = 46h) [Reset = 0000000h]

GPBMUX1 is shown in [Figure 7-24](#) and described in [Table 7-34](#).

Return to the [Summary Table](#).

GPIO B Mux 1 Register (GPIO32 to 47)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-24. GPBMUX1 Register**

### 7.10.2.22 GPBMUX2 Register (Offset = 48h) [Reset = 0000000h]

GPBMUX2 is shown in [Figure 7-25](#) and described in [Table 7-35](#).

Return to the [Summary Table](#).

GPIO B Mux 2 Register (GPIO48 to 63)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-25. GPBMUX2 Register**

### 7.10.2.23 GPBDIR Register (Offset = 4Ah) [Reset = 0000000h]

GPBDIR is shown in [Figure 7-26](#) and described in [Table 7-36](#).

Return to the [Summary Table](#).

GPIO B Direction Register (GPIO32 to 63)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

**Figure 7-26. GPBDIR Register**

### 7.10.2.24 GPBPUD Register (Offset = 4Ch) [Reset = FFFFFFFh]

GPBPUD is shown in [Figure 7-27](#) and described in [Table 7-37](#).

Return to the [Summary Table](#).

GPIO B Pull Up Disable Register (GPIO32 to 63)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

**Figure 7-27. GPBPUD Register**

### 7.10.2.25 GPBINV Register (Offset = 50h) [Reset = 0000000h]

GPBINV is shown in [Figure 7-28](#) and described in [Table 7-38](#).

Return to the [Summary Table](#).

GPIO B Input Polarity Invert Registers (GPIO32 to 63)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 7-28. GPBINV Register**

### 7.10.2.26 GPBODR Register (Offset = 52h) [Reset = 0000000h]

GPBODR is shown in [Figure 7-29](#) and described in [Table 7-39](#).

Return to the [Summary Table](#).

GPIO B Open Drain Output Register (GPIO32 to GPIO63)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

### 7.10.2.27 GPBAMSEL Register (Offset = 54h) [Reset = 0000000h]

GPBAMSEL is shown in [Figure 7-30](#) and described in [Table 7-40](#).

Return to the [Summary Table](#).

GPIO B Analog Mode Select register

Selects between digital and analog functionality for GPIO pins.

0: The pin is configured to digital functions according to the other GPIO configuration registers

1: The analog function of the pin is enabled

### 7.10.2.28 GPBGMUX1 Register (Offset = 60h) [Reset = 0000000h]

GPBGMUX1 is shown in [Figure 7-31](#) and described in [Table 7-41](#).

Return to the [Summary Table](#).

GPIO B Peripheral Group Mux (GPIO32 to 47)

Defines pin-muxing selection for GPIO.

Note: For complete pin-mux selection on GPIOx, GPAMUXy.GPIOx configuration is also required.

**Figure 7-31. GPBGMUX1 Register**

R/W-0h				R/W-0h				R/W-0h				R/W-0h			

**Table 7-46. GPBCSEL4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	GPIO63	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
27-24	GPIO62	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
23-20	GPIO61	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
19-16	GPIO60	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
15-12	GPIO59	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
11-8	GPIO58	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
7-4	GPIO57	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
3-0	GPIO56	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.34 GPBLOCK Register (Offset = 7Ch) [Reset = 0000000h]

GPBLOCK is shown in [Figure 7-37](#) and described in [Table 7-47](#).

Return to the [Summary Table](#).

GPIO B Lock Configuration Register (GPIO32 to 63)

GPIO Configuration Lock for GPIO.

0: Bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx register which control the same pin can be changed

1: Locks changes to the bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx registers which control the same pin

**Figure 7-37. GPBLOCK Register**

### 7.10.2.35 GPBCR Register (Offset = 7Eh) [Reset = 0000000h]

GPBCR is shown in [Figure 7-38](#) and described in [Table 7-48](#).

Return to the [Summary Table](#).

GPIO B Lock Commit Register (GPIO32 to 63)

GPIO Configuration Lock Commit for GPIO:

1: Locks changes to the bit in GPyLOCK register which controls the same pin

0: Bit in the GPyLOCK register which controls the same pin can be changed

### 7.10.2.39 GPCMUX1 Register (Offset = 86h) [Reset = 0000000h]

GPCMUX1 is shown in [Figure 7-42](#) and described in [Table 7-52](#).

Return to the [Summary Table](#).

GPIO C Mux 1 Register (GPIO64 to 79)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-42. GPCMUX1 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**Table 7-53. GPCMUX2 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1-0	GPIO80	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.41 GPCDIR Register (Offset = 8Ah) [Reset = 0000000h]

GPCDIR is shown in [Figure 7-44](#) and described in [Table 7-54](#).

Return to the [Summary Table](#).

GPIO C Direction Register (GPIO64 to 95)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

**Figure 7-44. GPCDIR Register**

### 7.10.2.42 GPCPUD Register (Offset = 8Ch) [Reset = FFFFFFFFh]

GPCPUD is shown in [Figure 7-45](#) and described in [Table 7-55](#).

Return to the [Summary Table](#).

GPIO C Pull Up Disable Register (GPIO64 to 95)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

### 7.10.2.43 GPCINV Register (Offset = 90h) [Reset = 0000000h]

GPCINV is shown in [Figure 7-46](#) and described in [Table 7-56](#).

Return to the [Summary Table](#).

GPIO C Input Polarity Invert Registers (GPIO64 to 95)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 7-46. GPCINV Register**

### 7.10.2.44 GPCODR Register (Offset = 92h) [Reset = 0000000h]

GPCODR is shown in [Figure 7-47](#) and described in [Table 7-57](#).

Return to the [Summary Table](#).

GPIO C Open Drain Output Register (GPIO64 to GPIO95)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

3-0	GPIO88	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.51 GPCLOCK Register (Offset = BCh) [Reset = 0000000h]

GPCLOCK is shown in [Figure 7-54](#) and described in [Table 7-64](#).

Return to the [Summary Table](#).

GPIO C Lock Configuration Register (GPIO64 to 95)

GPIO Configuration Lock for GPIO.

0: Bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx register which control the same pin can be changed

1: Locks changes to the bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx registers which control the same pin

**Figure 7-54. GPCLOCK Register**

### 7.10.2.56 GPDMUX1 Register (Offset = C6h) [Reset = 0000000h]

GPDMUX1 is shown in [Figure 7-59](#) and described in [Table 7-69](#).

Return to the [Summary Table](#).

GPIO D Mux 1 Register (GPIO96 to 111)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

### 7.10.2.57 GPDMUX2 Register (Offset = C8h) [Reset = 0000000h]

GPDMUX2 is shown in [Figure 7-60](#) and described in [Table 7-70](#).

Return to the [Summary Table](#).

GPIO D Mux 2 Register (GPIO112 to 127)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

### 7.10.2.58 GPDDIR Register (Offset = CAh) [Reset = 0000000h]

GPDDIR is shown in [Figure 7-61](#) and described in [Table 7-71](#).

Return to the [Summary Table](#).

GPIO D Direction Register (GPIO96 to 127)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

**Figure 7-61. GPDDIR Register**

### 7.10.2.59 GPDPU Register (Offset = CCh) [Reset = FFFFFFFFh]

GPDPU is shown in [Figure 7-62](#) and described in [Table 7-72](#).

Return to the [Summary Table](#).

GPIO D Pull Up Disable Register (GPIO96 to 127)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

**Figure 7-62. GPDPU Register**

31	30	29	28	27	26	25	24

### 7.10.2.60 GPDINV Register (Offset = D0h) [Reset = 0000000h]

GPDINV is shown in [Figure 7-63](#) and described in [Table 7-73](#).

Return to the [Summary Table](#).

GPIO D Input Polarity Invert Registers (GPIO96 to 127)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 7-63. GPDINV Register**

### 7.10.2.61 GPDODR Register (Offset = D2h) [Reset = 0000000h]

GPDODR is shown in [Figure 7-64](#) and described in [Table 7-74](#).

Return to the [Summary Table](#).

GPIO D Open Drain Output Register (GPIO96 to GPIO127)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

0	GPIO96	R/W	0h	Output Open-Drain control for this pin Reset type: SYSRSn

### 7.10.2.62 GPDGMUX1 Register (Offset = E0h) [Reset = 0000000h]

GPDGMUX1 is shown in [Figure 7-65](#) and described in [Table 7-75](#).

Return to the [Summary Table](#).

GPIO D Peripheral Group Mux (GPIO96 to 111)

Defines pin-muxing selection for GPIO.

Note: For complete pin-mux selection on GPIOx, GPAMUXy.GPIOx configuration is also required.

**Figure 7-65. GPDGMUX1 Register**

31	30	29	28	27	26	25	24

Bit	Field	Type	Reset	Description
31-30	GPIO111	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
29-28	GPIO110	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
27-26	GPIO109	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
25-24	GPIO108	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
23-22	GPIO107	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
21-20	GPIO106	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
19-18	GPIO105	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
17-16	GPIO104	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
15-14	GPIO103	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
13-12	GPIO102	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
11-10	GPIO101	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
9-8	GPIO100	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

**Table 7-75. GPDGMUX1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7-6	GPIO99	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
5-4	GPIO98	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
3-2	GPIO97	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
1-0	GPIO96	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.63 GPDGMUX2 Register (Offset = E2h) [Reset = 0000000h]

GPDGMUX2 is shown in [Figure 7-66](#) and described in [Table 7-76](#).

Return to the [Summary Table](#).

GPIO D Peripheral Group Mux (GPIO112 to 127)

Defines pin-muxing selection for GPIO.

Note: For complete pin-mux selection on GPIOx, GPAMUXy.GPIOx configuration is also required.

**Figure 7-66. GPDGMUX2 Register**

**Table 7-76. GPDGMUX2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	GPIO127	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
29-28	GPIO126	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
27-26	GPIO125	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
25-24	GPIO124	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
23-22	GPIO123	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
21-20	GPIO122	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
19-18	GPIO121	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
17-16	GPIO120	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
15-14	GPIO119	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
13-12	GPIO118	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
11-10	GPIO117	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
9-8	GPIO116	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

**Table 7-76. GPDGMUX2 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7-6	GPIO115	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
5-4	GPIO114	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
3-2	GPIO113	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn
1-0	GPIO112	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.64 GPDCSEL1 Register (Offset = E8h) [Reset = 0000000h]

GPDCSEL1 is shown in [Figure 7-67](#) and described in [Table 7-77](#).

Return to the [Summary Table](#).

GPIO D Core Select Register (GPIO96 to 103)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

xx00: CPU1 selected

xx01: CPU1.CLA1 selected

xx1x: Reserved

**Figure 7-67. GPDCSEL1 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**Table 7-77. GPDCSEL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	GPIO103	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
27-24	GPIO102	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
23-20	GPIO101	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
19-16	GPIO100	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
15-12	GPIO99	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
11-8	GPIO98	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
7-4	GPIO97	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
3-0	GPIO96	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.65 GPDCSEL2 Register (Offset = EAh) [Reset = 0000000h]

GPDCSEL2 is shown in [Figure 7-68](#) and described in [Table 7-78](#).

Return to the [Summary Table](#).

GPIO D Core Select Register (GPIO104 to 111)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

xx00: CPU1 selected

xx01: CPU1.CLA1 selected

xx1x: Reserved

**Figure 7-68. GPDCSEL2 Register**

GPIO107				GPIO106				GPIO105				GPIO104			
R/W-0h				R/W-0h				R/W-0h				R/W-0h			

**Table 7-78. GPDCSEL2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	GPIO111	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
27-24	GPIO110	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
23-20	GPIO109	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
19-16	GPIO108	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
15-12	GPIO107	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
11-8	GPIO106	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
7-4	GPIO105	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
3-0	GPIO104	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.66 GPDCSEL3 Register (Offset = ECh) [Reset = 0000000h]

GPDCSEL3 is shown in [Figure 7-69](#) and described in [Table 7-79](#).

Return to the [Summary Table](#).

GPIO D Core Select Register (GPIO112 to 119)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

xx00: CPU1 selected

xx01: CPU1.CLA1 selected

xx1x: Reserved

**Figure 7-69. GPDCSEL3 Register**

GPIO119				GPIO118				GPIO117				GPIO116			
R/W-0h				R/W-0h				R/W-0h				R/W-0h			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GPIO115				GPIO114				GPIO113				GPIO112			
R/W-0h				R/W-0h				R/W-0h				R/W-0h			

**Table 7-79. GPDCSEL3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	GPIO119	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
27-24	GPIO118	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
23-20	GPIO117	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
19-16	GPIO116	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
15-12	GPIO115	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
11-8	GPIO114	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
7-4	GPIO113	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
3-0	GPIO112	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.67 GPCSEL4 Register (Offset = EEh) [Reset = 0000000h]

GPCSEL4 is shown in [Figure 7-70](#) and described in [Table 7-80](#).

Return to the [Summary Table](#).

GPIO D Core Select Register (GPIO120 to 127)

Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin

xx00: CPU1 selected

xx01: CPU1.CLA1 selected

xx1x: Reserved

**Figure 7-70. GPCSEL4 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GPIO127				GPIO126				GPIO125				GPIO124

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GPIO123				GPIO122				GPIO121				GPIO120			
R/W-0h				R/W-0h				R/W-0h				R/W-0h			

**Table 7-80. GPCSEL4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	GPIO127	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
27-24	GPIO126	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
23-20	GPIO125	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
19-16	GPIO124	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
15-12	GPIO123	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
11-8	GPIO122	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
7-4	GPIO121	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn
3-0	GPIO120	R/W	0h	Selects which master's GPIODAT/SET/CLEAR/TOGGLE registers control this GPIO pin Reset type: SYSRSn

### 7.10.2.68 GPDLOCK Register (Offset = FCh) [Reset = 0000000h]

GPDLOCK is shown in [Figure 7-71](#) and described in [Table 7-81](#).

Return to the [Summary Table](#).

GPIO D Lock Configuration Register (GPIO96 to 127)

GPIO Configuration Lock for GPIO.

0: Bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx register which control the same pin can be changed

1: Locks changes to the bits in GPyMUX1, GPyMUX2, GPyDIR, GPyINV, GPyODR, GPyAMSEL, GPyGMUX1, GPyGMUX2 and GPyCSELx registers which control the same pin

**Figure 7-71. GPDLOCK Register**

31	30	29	28	27	26	25	24
GPIO127	GPIO126	GPIO125	GPIO124	GPIO123	GPIO122	GPIO121	GPIO120

1	GPIO97	R/W	0h	Configuration Lock bit for this pin Reset type: SYSRSn
0	GPIO96	R/W	0h	Configuration Lock bit for this pin Reset type: SYSRSn

### 7.10.2.69 GPDCR Register (Offset = FEh) [Reset = 0000000h]

GPDCR is shown in [Figure 7-72](#) and described in [Table 7-82](#).

Return to the [Summary Table](#).

GPIO D Lock Commit Register (GPIO96 to 127)

GPIO Configuration Lock Commit for GPIO:

1: Locks changes to the bit in GPyLOCK register which controls the same pin

0: Bit in the GPyLOCK register which controls the same pin can be changed

### 7.10.2.73 GPEMUX1 Register (Offset = 106h) [Reset = 0000000h]

GPEMUX1 is shown in [Figure 7-76](#) and described in [Table 7-86](#).

Return to the [Summary Table](#).

GPIO E Mux 1 Register (GPIO128 to 143)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

**Figure 7-76. GPEMUX1 Register**

31	30	29	28	27	26	25	24

### 7.10.2.75 GPEDIR Register (Offset = 10Ah) [Reset = 0000000h]

GPEDIR is shown in [Figure 7-78](#) and described in [Table 7-88](#).

Return to the [Summary Table](#).

GPIO E Direction Register (GPIO128 to 159)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

**Figure 7-78. GPEDIR Register**

### 7.10.2.76 GPEPUD Register (Offset = 10Ch) [Reset = FFFFFFFh]

GPEPUD is shown in [Figure 7-79](#) and described in [Table 7-89](#).

Return to the [Summary Table](#).

GPIO E Pull Up Disable Register (GPIO128 to 159)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

### 7.10.2.77 GPEINV Register (Offset = 110h) [Reset = 0000000h]

GPEINV is shown in [Figure 7-80](#) and described in [Table 7-90](#).

Return to the [Summary Table](#).

GPIO E Input Polarity Invert Registers (GPIO128 to 159)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

**Figure 7-80. GPEINV Register**

### 7.10.2.78 GPEODR Register (Offset = 112h) [Reset = 0000000h]

GPEODR is shown in [Figure 7-81](#) and described in [Table 7-91](#).

Return to the [Summary Table](#).

GPIO E Open Drain Output Register (GPIO128 to GPIO159)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

### 7.10.2.89 GPFMUX1 Register (Offset = 146h) [Reset = 0000000h]

GPFMUX1 is shown in [Figure 7-92](#) and described in [Table 7-102](#).

Return to the [Summary Table](#).

GPIO F Mux 1 Register (GPIO160 to 168)

Defines pin-muxing selection for GPIO.

Notes:

The respective GPyGMUXn.GPIOz must be configured prior to this register to avoid intermediate peripheral selects being mapped to the GPIO.

Bit	Field	Type	Reset	Description
1-0	GPIO160	R/W	0h	Defines pin-muxing selection for GPIO Reset type: SYSRSn

### 7.10.2.90 GPFDIR Register (Offset = 14Ah) [Reset = 0000000h]

GPFDIR is shown in [Figure 7-93](#) and described in [Table 7-103](#).

Return to the [Summary Table](#).

GPIO F Direction Register (GPIO160 to 168)

Controls direction of GPIO pins when the specified pin is configured in GPIO mode.

0: Configures pin as input.

1: Configures pin as output.

Reading the register returns the current value of the register setting.

### 7.10.2.91 GPFPU Register (Offset = 14Ch) [Reset = FFFFFFFFh]

GPFPU is shown in [Figure 7-94](#) and described in [Table 7-104](#).

Return to the [Summary Table](#).

GPIO F Pull Up Disable Register (GPIO160 to 168)

Disables the Pull-Up on GPIO.

0: Enables the Pull-Up.

1: Disables the Pull-Up.

Reading the register returns the current value of the register setting.

### 7.10.2.92 GPFINV Register (Offset = 150h) [Reset = 0000000h]

GPFINV is shown in [Figure 7-95](#) and described in [Table 7-105](#).

Return to the [Summary Table](#).

GPIO F Input Polarity Invert Registers (GPIO160 to 168)

Selects between non-inverted and inverted GPIO input to the device.

0: selects non-inverted GPIO input

1: selects inverted GPIO input

Reading the register returns the current value of the register setting.

### 7.10.2.93 GPFODR Register (Offset = 152h) [Reset = 0000000h]

GPFODR is shown in [Figure 7-96](#) and described in [Table 7-106](#).

Return to the [Summary Table](#).

GPIO F Open Drain Output Register (GPIO160 to GPIO168)

Selects between normal and open-drain output for the GPIO pin.

0: Normal Output

1: Open Drain Output

Reading the register returns the current value of the register setting.

Note:

[1] In the Open Drain output mode, if the buffer is configured for output mode, a 0 value to be driven out comes out on the on the PAD while a 1 value to be driven out tri-states the buffer.

### 7.10.2.98 GPFCCR Register (Offset = 17Eh) [Reset = 0000000h]

GPFCCR is shown in [Figure 7-101](#) and described in [Table 7-111](#).

Return to the [Summary Table](#).

GPIO F Lock Commit Register (GPIO160 to 168)

GPIO Configuration Lock Commit for GPIO:

1: Locks changes to the bit in GPyLOCK register which controls the same pin

0: Bit in the GPyLOCK register which controls the same pin can be changed

### 7.10.3 GPIO\_DATA\_REGS Registers

Table 7-112 lists the memory-mapped registers for the GPIO\_DATA\_REGS registers. All register offset addresses not listed in Table 7-112 should be considered as reserved locations and the register contents should not be modified.

**Table 7-112. GPIO\_DATA\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	GPADAT	GPIO A Data Register (GPIO0 to 31)		<a href="#">Go</a>
2h	GPASET	GPIO A Data Set Register (GPIO0 to 31)		<a href="#">Go</a>
4h	GPACLEAR	GPIO A Data Clear Register (GPIO0 to 31)		<a href="#">Go</a>
6h	GPATOGGLE	GPIO A Data Toggle Register (GPIO0 to 31)		<a href="#">Go</a>
8h	GPBDAT	GPIO B Data Register (GPIO32 to 63)		<a href="#">Go</a>
Ah	GPBSET	GPIO B Data Set Register (GPIO32 to 63)		<a href="#">Go</a>
Ch	GPBCLEAR	GPIO B Data Clear Register (GPIO32 to 63)		<a href="#">Go</a>

1Ah	GPDSET	GPIO D Data Set Register (GPIO96 to 127)		<a href="#">Go</a>
1Ch	GPDCLEAR	GPIO D Data Clear Register (GPIO96 to 127)		<a href="#">Go</a>
1Eh	GPDTOGGLE	GPIO D Data Toggle Register (GPIO96 to 127)		<a href="#">Go</a>
20h	GPEDAT	GPIO E Data Register (GPIO128 to 159)		<a href="#">Go</a>
22h	GPESET	GPIO E Data Set Register (GPIO128 to 159)		<a href="#">Go</a>
24h	GPECLEAR	GPIO E Data Clear Register (GPIO128 to 159)		<a href="#">Go</a>
26h	GPETOGGLE	GPIO E Data Toggle Register (GPIO128 to 159)		<a href="#">Go</a>
28h	GPFDAT	GPIO F Data Register (GPIO160 to 168)		<a href="#">Go</a>
2Ah	GPFSET	GPIO F Data Set Register (GPIO160 to 168)		<a href="#">Go</a>
2Ch	GPFCLEAR	GPIO F Data Clear Register (GPIO160 to 168)		<a href="#">Go</a>
2Eh	GPFTOGGLE	GPIO F Data Toggle Register (GPIO160 to 168)		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 7-113 shows the codes that are used for access types in this section.

**Table 7-113. GPIO\_DATA\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.

**Table 7-113. GPIO\_DATA\_REGS Access Type Codes (continued)**

Access Type	Code	Description
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 7.10.3.1 GPADAT Register (Offset = 0h) [Reset = 0000000h]

GPADAT is shown in [Figure 7-102](#) and described in [Table 7-114](#).

Return to the [Summary Table](#).

#### GPIO A Data Register (GPIO0 to 31)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

### 7.10.3.5 GPBDAT Register (Offset = 8h) [Reset = 0000000h]

GPBDAT is shown in [Figure 7-106](#) and described in [Table 7-118](#).

Return to the [Summary Table](#).

GPIO B Data Register (GPIO32 to 63)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

### 7.10.3.9 GPCDAT Register (Offset = 10h) [Reset = 0000000h]

GPCDAT is shown in [Figure 7-110](#) and described in [Table 7-122](#).

Return to the [Summary Table](#).

GPIO C Data Register (GPIO64 to 95)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

### 7.10.3.12 GPCTOGGLE Register (Offset = 16h) [Reset = 0000000h]

GPCTOGGLE is shown in [Figure 7-113](#) and described in [Table 7-125](#).

Return to the [Summary Table](#).

GPIO C Data Toggle Register (GPIO64 to 95)

Writing a 1 will toggle GPIO0 output data latch 1 to 0 or 0 to 1.

Writes of 0 are ignored.

Always reads back a 0.

### 7.10.3.13 GPDDAT Register (Offset = 18h) [Reset = 0000000h]

GPDDAT is shown in [Figure 7-114](#) and described in [Table 7-126](#).

Return to the [Summary Table](#).

#### GPIO D Data Register (GPIO96 to 127)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

### 7.10.3.15 GPD CLEAR Register (Offset = 1Ch) [Reset = 0000000h]

GPD CLEAR is shown in [Figure 7-116](#) and described in [Table 7-128](#).

Return to the [Summary Table](#).

GPIO D Data Clear Register (GPIO96 to 127)

Writing a 1 will force GPIO0 output data latch to 0.

Writes of 0 are ignored.

Always reads back a 0.

### 7.10.3.16 GPDTOGGLE Register (Offset = 1Eh) [Reset = 0000000h]

GPDTOGGLE is shown in [Figure 7-117](#) and described in [Table 7-129](#).

Return to the [Summary Table](#).

GPIO D Data Toggle Register (GPIO96 to 127)

Writing a 1 will toggle GPIO0 output data latch 1 to 0 or 0 to 1.

Writes of 0 are ignored.

Always reads back a 0.

### 7.10.3.17 GPEDAT Register (Offset = 20h) [Reset = 0000000h]

GPEDAT is shown in [Figure 7-118](#) and described in [Table 7-130](#).

Return to the [Summary Table](#).

GPIO E Data Register (GPIO128 to 159)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

### 7.10.3.20 GPETOGGLE Register (Offset = 26h) [Reset = 0000000h]

GPETOGGLE is shown in [Figure 7-121](#) and described in [Table 7-133](#).

Return to the [Summary Table](#).

GPIO E Data Toggle Register (GPIO128 to 159)

Writing a 1 will toggle GPIO0 output data latch 1 to 0 or 0 to 1.

Writes of 0 are ignored.

Always reads back a 0.

### 7.10.3.21 GPFDAT Register (Offset = 28h) [Reset = 00000000h]

GPFDAT is shown in [Figure 7-122](#) and described in [Table 7-134](#).

Return to the [Summary Table](#).

GPIO F Data Register (GPIO160 to 168)

Reading this register reflects the current state of the GPIO pin regardless of which mode the GPIO is in. Writing to this register will set the GPIO pin high or low if the pin is enabled for GPIO output mode. If the GPIO is not in output mode the value written is latched but will not be reflected on the GPIO pin or reads of the GPxDAT register. The written value latched will become active when the GPIO is put into GPIO Output mode. A system reset will clear all bits and latched values to zero.

NOTE: Bit-wise read-modify-write operations should not be performed on this register. For bit-wise operations the GPxSET, GPxCLEAR, or GPxTOGGLE registers should be used instead. If direct writes to GPxDAT are necessary, the entire register should be written at one time.

The crossbars (referred to as X-BAR throughout this chapter) provide flexibility to connect device inputs, outputs, and internal resources in a variety of configurations.

The device contains a total of four X-BARs:

- Input X-BAR
- Output X-BAR
- CLB X-BAR
- ePWM X-BAR

Each of the X-BARs is named according to where the X-BAR takes signals. For example, the Input X-BAR brings external signals “in” to the device. The Output X-BAR takes internal signals “out” of the device to a GPIO. The CLB X-BAR and ePWM X-BAR take signals to the CLB and ePWM modules, respectively.

<b>8.1 Input X-BAR</b> .....	<a href="#">1104</a>
<b>8.2 ePWM, CLB, and GPIO Output X-BAR</b> .....	<a href="#">1107</a>
<b>8.3 XBAR Registers</b> .....	<a href="#">1115</a>

## 8.1 Input X-BAR

On this device, the Input X-BAR is used to route signals from a GPIO to many different IP blocks such as the ADC, eCAP, ePWM, and external interrupts. The input of each Input X-BAR instance (INPUTx) can be any GPIO, while the output of each instance connects to various IP blocks in the device. The digital input of AIOs are also available as inputs to the Input X-BAR. This flexibility relieves some of the constraints on peripheral muxing by allowing the user to connect any GPIO to the specified outputs of each Input X-BAR instance. Note that the GPIO selected by the Input X-BAR can be configured as either an input or an output. The Input X-BAR simply connects the signal on the input buffer to the output of the selected Input X-BAR instance. Therefore, you can do things such as route the output of an ePWM to the eCAP module for a frequency test).

The Input X-BAR is configured by way of the INPUTxSELECT registers. The destinations for each INPUTx are shown in [Table 8-1](#). For additional details on how each Input X-BAR connects to other IP blocks throughout the device, look for references to Input X-BAR in the chapter associated with that IP. Note that the destinations of each INPUTx are fixed and are not user-configurable. For more information on configuring the Input X-BAR, see the INPUT\_XBAR\_REGS register definitions in the *XBAR Registers* section.

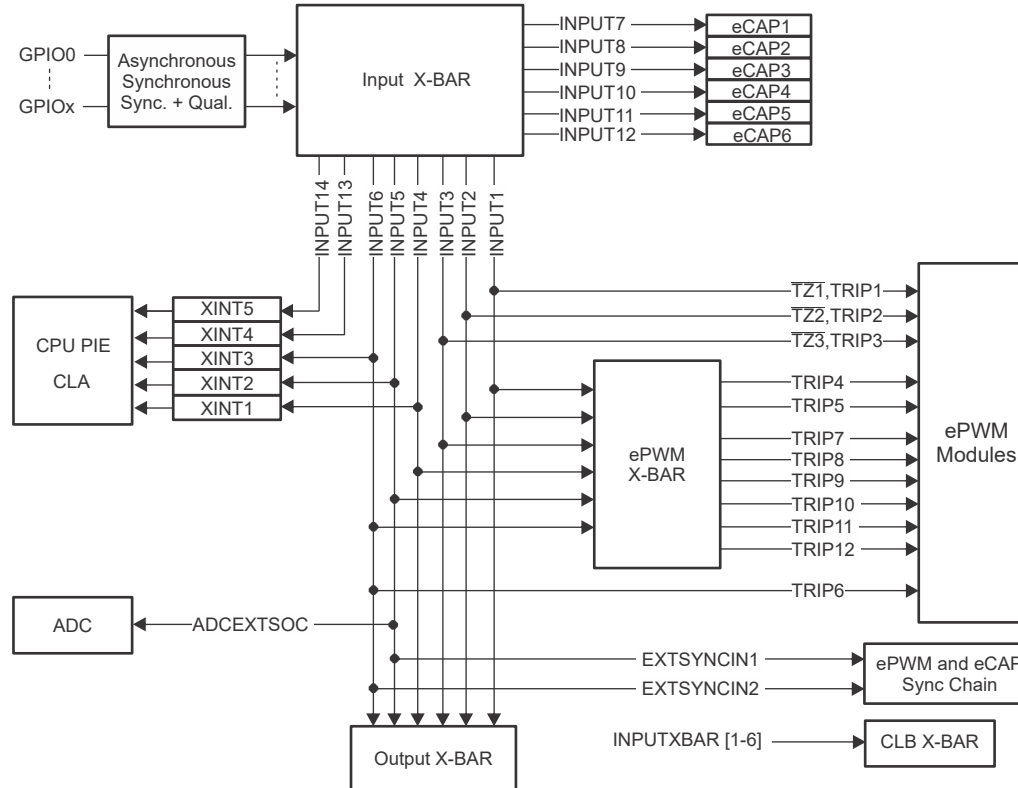

Figure 8-1. Input X-BAR

**Note**

INPUTXBARx, INPUTXBAR\_INPUTx, and INPUTx (when referenced in the context of Input X-BAR) are equivalent in all C2000 software and documentation.

**Table 8-1. Input X-BAR Destinations**

## 8.2 ePWM, CLB, and GPIO Output X-BAR

This section describes the ePWM, CLB, and GPIO Output X-BAR.

### 8.2.1 ePWM X-BAR

The ePWM X-BAR brings signals to the ePWM modules. Specifically, the ePWM X-BAR is connected to the Digital Compare (DC) submodule of each ePWM module for actions such as tripzones and syncing. Refer to the *Enhanced Pulse Width Modulator (ePWM)* chapter for more information on additional ways the DC submodule can be used. Figure 8-2 shows the architecture of the ePWM X-BAR. Note that the architecture of the ePWM X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

#### 8.2.1.1 ePWM X-BAR Architecture

The ePWM X-BAR has eight outputs that are routed to each ePWM module. Figure 8-2 represents the architecture of a single output, but this output is identical to the architecture of all of the other outputs.

First, determine the signals that can be passed to the ePWM by referencing Table 8-2. Select up to one signal per mux for each TRIPx output. Select the inputs to ePWM X-BAR using the TRIPxMUX0TO15CFG and TRIPxMUX16TO31CFG registers. To pass any signal through to the ePWM, enable it via the TRIPxMUXENABLE register. All signals that are enabled are logically ORed before being passed on to the respective TRIPx signal on the ePWM. To optionally invert the signal, use the TRIPxOUTINV register.

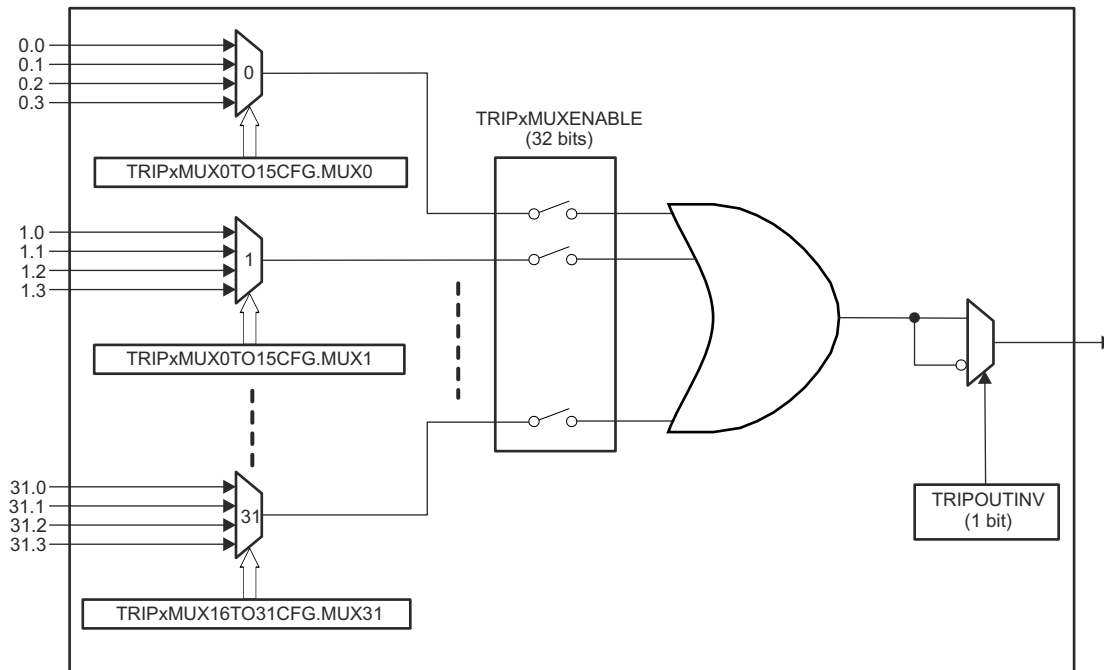

Figure 8-2. ePWM X-BAR Architecture - Single Output

**Note**

Do not use "Reserved" signals in your application.

**Table 8-2. EPWM X-BAR Mux Configuration Table**

## 8.2.2 CLB X-BAR

The CLB X-BAR brings signals to the CLB modules. Figure 8-3 shows the architecture of the CLB X-BAR. Note that the architecture of the CLB X-BAR is identical to the architecture of the GPIO Output X-BAR (with the exception of the output latch).

### 8.2.2.1 CLB X-BAR Architecture

The CLB X-BAR has eight outputs that are routed to each CLB module. Figure 8-3 represents the architecture of a single output, but the output is identical to the architecture of all of the other outputs.

First, determine the signals that can be passed to the CLB by referencing Table 8-3. Select up to one signal per mux (31 total muxes) for each AUXSIGx output. Select the inputs to each mux using the AUXSIGxMUX0TO15CFG and AUXSIGxMUX16TO31CFG registers. To pass any signal through to the CLB, enable the mux in the AUXSIGxMUXENABLE register. All muxes that are enabled are logically ORed before being passed on to the respective AUXSIGx signal on the CLB. To optionally invert the signal, use the AUXSIGOUTINV register.

Figure 8-3. CLB X-BAR Architecture - Single Output

### 8.2.3 GPIO Output X-BAR

The GPIO Output X-BAR takes signals from inside the device and brings them out to a GPIO. Figure 8-5 shows the architecture of the GPIO Output X-BAR. The X-BAR contains eight outputs and each contains at least one position on the GPIO mux, denoted as OUTPUTXBARx. The X-BAR allows the selection of a single signal or a logical-OR of up to 32 signals.

#### 8.2.3.1 GPIO Output X-BAR Architecture

The GPIO Output X-BAR has eight outputs that are routed to the GPIO module. Figure 8-5 represents the architecture of a single output, but this output is identical to the architecture of all of the other outputs. Note that the architecture of the Output X-BAR (with the exception of the output latch) is similar to the architecture of the ePWM X-BAR.

First, determine the signals that can be passed to the GPIO by referencing Table 8-4. Select up to one signal per mux (32 total muxes) for each OUTPUTXBARx output. Select the inputs to each mux using the OUTPUTxMUX0TO15CFG and OUTPUTxMUX16TO31CFG registers. To pass any signal through to the GPIO, enable the mux in the OUTPUTxMUXENABLE register. All muxes that are enabled are logically ORed before being passed on to the respective OUTPUTx signal on the GPIO module. To optionally invert the signal, use the OUTPUTINV register. The signal is only recognized on the GPIO, if the proper OUTPUTx muxing options are selected using the GpioCtrlRegs.GPxMUX and GpioCtrlRegs.GPxGMUX registers.

**Figure 8-5. GPIO Output X-BAR Architecture**

#### Note

Do not use "Reserved" signals in your application.

The ADCSOCAO and ADCSOCBO signals are active-high when routed through the X-BAR. The signal can be inverted by the respective OUTPUTINV bit depending on the application.

**Table 8-4. Output X-BAR Mux Configuration Table**

G31	SD2FLT4_COMPL	Reserved	Reserved	Reserved

### 8.2.4 X-BAR Flags

With the exception of the CMPSS signals, the ePWM X-BAR and the Output X-BAR have all of the same input signals. Due to the inputs being similar between the ePWM X-BAR, CLB X-BAR, and Output X-BAR, all X-BAR modules leverage a single set of input flags to indicate which input signals have been triggered. This allows software to check the input flags when an event occurs. See Figure 8-6 for more information. There is a bit allocated for each input signal in one of the XBARFLGx registers. The flag remains set until cleared through the appropriate XBARCLR<sub>x</sub> register.

**Note**

Not all input sources are routed to all X-BAR modules. Refer to the X-BAR specific configuration tables for exact connections.

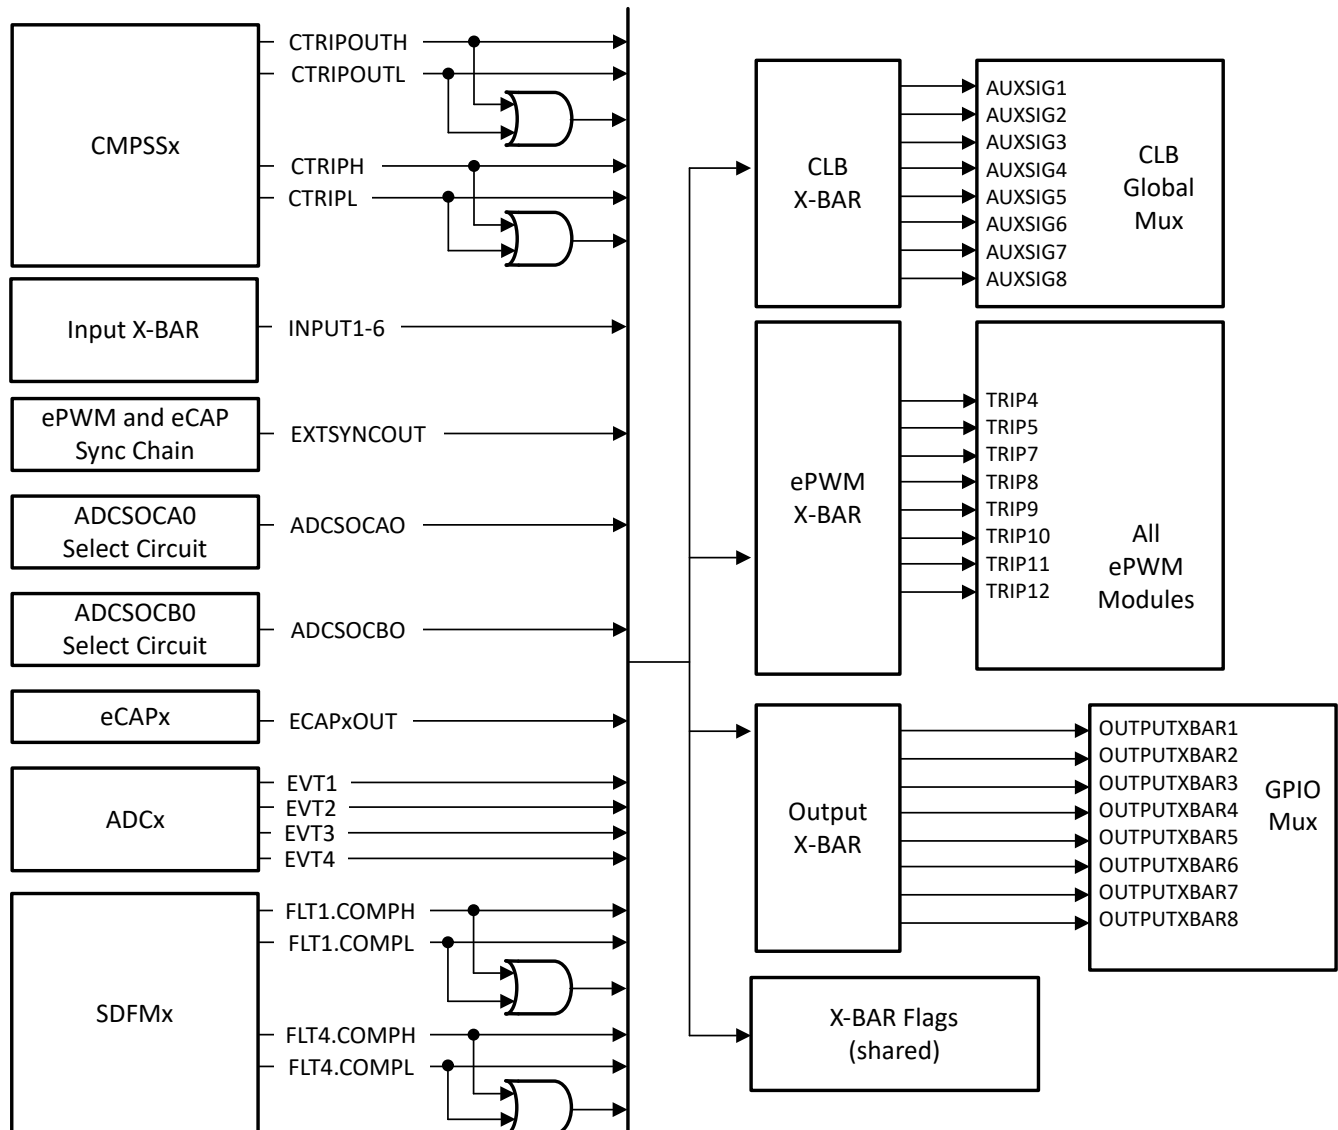

Figure 8-6. X-BAR Input Sources

## 8.3 XBAR Registers

This section describes the Crossbar registers.

### 8.3.1 XBAR Base Addresses

**Table 8-5. XBAR Base Address Table**

Device Registers	Register Name	Start Address	End Address

### 8.3.2 INPUT\_XBAR\_REGS Registers

Table 8-6 lists the memory-mapped registers for the INPUT\_XBAR\_REGS registers. All register offset addresses not listed in Table 8-6 should be considered as reserved locations and the register contents should not be modified.

**Table 8-6. INPUT\_XBAR\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	INPUT1SELECT	INPUT1 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
1h	INPUT2SELECT	INPUT2 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
2h	INPUT3SELECT	INPUT3 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
3h	INPUT4SELECT	INPUT4 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
4h	INPUT5SELECT	INPUT5 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
5h	INPUT6SELECT	INPUT6 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
6h	INPUT7SELECT	INPUT7 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
7h	INPUT8SELECT	INPUT8 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
8h	INPUT9SELECT	INPUT9 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
9h	INPUT10SELECT	INPUT10 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
Ah	INPUT11SELECT	INPUT11 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
Bh	INPUT12SELECT	INPUT12 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
Ch	INPUT13SELECT	INPUT13 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
Dh	INPUT14SELECT	INPUT14 Input Select Register (GPIO0 to x)	EALLOW	<a href="#">Go</a>
1Eh	INPUTSELECTLOCK	Input Select Lock Register	EALLOW	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 8-7 shows the codes that are used for access types in this section.

**Table 8-7. INPUT\_XBAR\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 8.3.2.1 INPUT1SELECT Register (Offset = 0h) [Reset = 0000h]

INPUT1SELECT is shown in [Figure 8-7](#) and described in [Table 8-8](#).

Return to the [Summary Table](#).

INPUT1 Input Select Register (GPIO0 to x)

**Figure 8-7. INPUT1SELECT Register**

### 8.3.3 XBAR\_REGS Registers

Table 8-23 lists the memory-mapped registers for the XBAR\_REGS registers. All register offset addresses not listed in Table 8-23 should be considered as reserved locations and the register contents should not be modified.

**Table 8-23. XBAR\_REGS Registers**

Offset	Acronym	Register Name	Write Protection	Section
0h	XBARFLG1	X-Bar Input Flag Register 1		<a href="#">Go</a>
2h	XBARFLG2	X-Bar Input Flag Register 2		<a href="#">Go</a>
4h	XBARFLG3	X-Bar Input Flag Register 3		<a href="#">Go</a>
8h	XBARCLR1	X-Bar Input Flag Clear Register 1		<a href="#">Go</a>
Ah	XBARCLR2	X-Bar Input Flag Clear Register 2		<a href="#">Go</a>
Ch	XBARCLR3	X-Bar Input Flag Clear Register 3		<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 8-24 shows the codes that are used for access types in this section.

**Table 8-24. XBAR\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 8.3.3.1 XBARFLG1 Register (Offset = 0h) [Reset = 0000000h]

XBARFLG1 is shown in [Figure 8-22](#) and described in [Table 8-25](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

### 8.3.3.2 XBARFLG2 Register (Offset = 2h) [Reset = 0000000h]

XBARFLG2 is shown in [Figure 8-23](#) and described in [Table 8-26](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

1: Corresponding Input was triggered

0: Corresponding Input was not triggered

### 8.3.3.6 XBARCLR3 Register (Offset = Ch) [Reset = 0000000h]

XBARCLR3 is shown in [Figure 8-27](#) and described in [Table 8-30](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG3 register.

1: Clears the corresponding bit in the XBARFLG3 register.

0: Writing 0 has no effect

Complex bit access types are encoded to fit into small table cells. Table 8-32 shows the codes that are used for access types in this section.

**Table 8-32. EPWM\_XBAR\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

**Table 8-32. EPWM\_XBAR\_REGS Access Type Codes (continued)**

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 8.3.4.1 TRIP4MUX0TO15CFG Register (Offset = 0h) [Reset = 0000000h]

TRIP4MUX0TO15CFG is shown in [Figure 8-28](#) and described in [Table 8-33](#).

Return to the [Summary Table](#).

**Table 8-49. TRIP4MUXENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-49. TRIP4MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-49. TRIP4MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-49. TRIP4MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-49. TRIP4MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of Mux0 to drive TRIP4 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP4 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP4 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.18 TRIP5MUXENABLE Register (Offset = 22h) [Reset = 0000000h]

TRIP5MUXENABLE is shown in [Figure 8-45](#) and described in [Table 8-50](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP5

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-50. TRIP5MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-50. TRIP5MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-50. TRIP5MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-50. TRIP5MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP5 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP5 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP5 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.19 TRIP7MUXENABLE Register (Offset = 24h) [Reset = 0000000h]

TRIP7MUXENABLE is shown in [Figure 8-46](#) and described in [Table 8-51](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP7

**Table 8-51. TRIP7MUXENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-51. TRIP7MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-51. TRIP7MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-51. TRIP7MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-51. TRIP7MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP7 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP7 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP7 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.20 TRIP8MUXENABLE Register (Offset = 26h) [Reset = 0000000h]

TRIP8MUXENABLE is shown in [Figure 8-47](#) and described in [Table 8-52](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP8

**Figure 8-47. TRIP8MUXENABLE Register**

**Table 8-52. TRIP8MUXENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-52. TRIP8MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-52. TRIP8MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-52. TRIP8MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-52. TRIP8MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP8 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP8 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP8 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.21 TRIP9MUXENABLE Register (Offset = 28h) [Reset = 0000000h]

TRIP9MUXENABLE is shown in [Figure 8-48](#) and described in [Table 8-53](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP9

**Figure 8-48. TRIP9MUXENABLE Register**

**Table 8-53. TRIP9MUXENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-53. TRIP9MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-53. TRIP9MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-53. TRIP9MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-53. TRIP9MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP9 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP9 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP9 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.22 TRIP10MUXENABLE Register (Offset = 2Ah) [Reset = 0000000h]

TRIP10MUXENABLE is shown in [Figure 8-49](#) and described in [Table 8-54](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP10

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-54. TRIP10MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-54. TRIP10MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-54. TRIP10MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-54. TRIP10MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	MUX3	R/W	0h	Selects the output of Mux3 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux3 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux3 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
2	MUX2	R/W	0h	Selects the output of Mux2 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux2 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux2 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
1	MUX1	R/W	0h	Selects the output of Mux1 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux1 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux1 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
0	MUX0	R/W	0h	Selects the output of mux0 to drive TRIP10 of EPWM-XBAR 0: Respective output of Mux0 is disabled to drive the TRIP10 of EPWM-XBAR 1: Respective output of Mux0 is enabled to drive the TRIP10 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

### 8.3.4.23 TRIP11MUXENABLE Register (Offset = 2Ch) [Reset = 0000000h]

TRIP11MUXENABLE is shown in [Figure 8-50](#) and described in [Table 8-55](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP11

**Table 8-55. TRIP11MUXENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	MUX31	R/W	0h	Selects the output of Mux31 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux31 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux31 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
30	MUX30	R/W	0h	Selects the output of Mux30 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux30 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux30 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29	MUX29	R/W	0h	Selects the output of Mux29 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux29 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux29 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
28	MUX28	R/W	0h	Selects the output of Mux28 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux28 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux28 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-55. TRIP11MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
27	MUX27	R/W	0h	Selects the output of Mux27 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux27 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux27 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
26	MUX26	R/W	0h	Selects the output of Mux26 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux26 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux26 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25	MUX25	R/W	0h	Selects the output of Mux25 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux25 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux25 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
24	MUX24	R/W	0h	Selects the output of Mux24 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux24 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux24 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23	MUX23	R/W	0h	Selects the output of Mux23 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux23 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux23 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
22	MUX22	R/W	0h	Selects the output of Mux22 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux22 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux22 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
21	MUX21	R/W	0h	Selects the output of Mux21 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux21 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux21 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
20	MUX20	R/W	0h	Selects the output of Mux20 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux20 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux20 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-55. TRIP11MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	MUX19	R/W	0h	Selects the output of Mux19 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux19 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux19 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
18	MUX18	R/W	0h	Selects the output of Mux18 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux18 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux18 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
17	MUX17	R/W	0h	Selects the output of Mux17 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux17 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux17 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
16	MUX16	R/W	0h	Selects the output of Mux16 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux16 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux16 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
15	MUX15	R/W	0h	Selects the output of Mux15 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux15 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux15 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
14	MUX14	R/W	0h	Selects the output of Mux14 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux14 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux14 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
13	MUX13	R/W	0h	Selects the output of Mux13 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux13 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux13 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
12	MUX12	R/W	0h	Selects the output of Mux12 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux12 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux12 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-55. TRIP11MUXENABLE Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
11	MUX11	R/W	0h	Selects the output of Mux11 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux11 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux11 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
10	MUX10	R/W	0h	Selects the output of Mux10 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux10 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux10 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
9	MUX9	R/W	0h	Selects the output of Mux9 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux9 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux9 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
8	MUX8	R/W	0h	Selects the output of Mux8 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux8 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux8 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
7	MUX7	R/W	0h	Selects the output of Mux7 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux7 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux7 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
6	MUX6	R/W	0h	Selects the output of Mux6 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux6 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux6 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
5	MUX5	R/W	0h	Selects the output of Mux5 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux5 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux5 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
4	MUX4	R/W	0h	Selects the output of Mux4 to drive TRIP11 of EPWM-XBAR 0: Respective output of Mux4 is disabled to drive the TRIP11 of EPWM-XBAR 1: Respective output of Mux4 is enabled to drive the TRIP11 of EPWM-XBAR Refer to the EPWM X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn

**Table 8-55. TRIP11MUXENABLE Register Field Descriptions (continued)**

Complex bit access types are encoded to fit into small table cells. Table 8-60 shows the codes that are used for access types in this section.

**Table 8-60. CLB\_XBAR\_REGS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R-0	Read Returns 0s
Write Type		
W	W	Write
WOnce	W Once	Write Set once
Reset or Default Value		
-n		Value after reset or the default value

**Table 8-60. CLB\_XBAR\_REGS Access Type Codes (continued)**

Access Type	Code	Description
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 8.3.5.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [Reset = 0000000h]

AUXSIG0MUX0TO15CFG is shown in [Figure 8-54](#) and described in [Table 8-61](#).

Return to the [Summary Table](#).

**Table 8-69. AUXSIG4MUX0TO15CFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	MUX15	R/W	0h	Group Select Bits for MUX15: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX15 01 : Select .1 input for MUX15 10 : Select .2 input for MUX15 11 : Select .3 input for MUX15 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
29-28	MUX14	R/W	0h	Group Select Bits for MUX14: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX14 01 : Select .1 input for MUX14 10 : Select .2 input for MUX14 11 : Select .3 input for MUX14 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
27-26	MUX13	R/W	0h	Group Select Bits for MUX13: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX13 01 : Select .1 input for MUX13 10 : Select .2 input for MUX13 11 : Select .3 input for MUX13 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
25-24	MUX12	R/W	0h	Group Select Bits for MUX12: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX12 01 : Select .1 input for MUX12 10 : Select .2 input for MUX12 11 : Select .3 input for MUX12 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
23-22	MUX11	R/W	0h	Group Select Bits for MUX11: Selects 4X1 group output for AUXSIG4 of CLB-XBAR 00 : Select .0 input for MUX11 01 : Select .1 input for MUX11 10 : Select .2 input for MUX11 11 : Select .3 input for MUX11 Refer to the CLB X-BAR section of this chapter for more details. Reset type: CPU1.SYSRSn
