If You Need Assistance

If you have any feedback or questions, support for the C2000™ devices and the C2000 Gang Programmer is provided by the Texas Instruments Product Information Center (PIC) and the TI E2E Forum (http://e2e.ti.com/support/microcontrollers/c2000/default.aspx). Contact information for the PIC can be found on the TI web site at support.ti.com. Additional device-specific information is on the C2000 web site at www.ti.com/c2000.

Related Documentation from Texas Instruments

The primary sources of C2000 information are the device-specific data sheets and user’s guides. The most current information is on the C2000 web site at www.ti.com/c2000.

Information specific to the C2000 Gang Programmer is at www.ti.com/c2000-gang.
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
(1) this device may not cause harmful interference and
(2) this device must accept any interference received, including interference that may cause undesired operation.

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital devices, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of more of the following measures:
* Reorient or relocate the receiving antenna
* Increase the separation between the equipment and receiver
* Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
* Consult the dealer or an experienced radio/TV technician for help.

Warning: Changes or modifications not expressly approved by Texas Instruments Inc. could void the user’s authority to operate the equipment.

This Class B digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numerique de la classe B respecte toutes les exigences du Reglement sur le material brouilleur du Canada.
The C2000 Gang Programmer is a C2000 device programmer that can program up to eight identical C2000 devices at the same time. The C2000 Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process. A top-level view of the C2000 Gang Programmer can be seen in Figure 1-1.

The C2000 Gang Programmer is not a gang programmer in the traditional sense, in that there are not eight sockets provided to program target devices. Instead, the C2000 Gang Programmer is designed to connect to target devices in-circuit (that is, target devices are mounted in the final circuit or system). The C2000 Gang Programmer accesses target devices using connectors that use JTAG signals.

The C2000 Gang Programmer is provided with an expansion board, called the Gang Splitter, that implements the interconnections between the C2000 Gang Programmer and multiple target devices. Eight cables are provided that connect the expansion board to eight target devices (via JTAG connectors).

Chapter 2 describes in detail how to use the C2000 Gang Programmer to program target devices. Various modes of operation are described, and they allow the user to choose the most convenient method of programming. In addition, this chapter describes the various windows that are used to configure the programming procedure for a specific target device.

Chapter 3 describes firmware commands that can be used to control the programming process at fine granularity. Firmware commands can be received over an RS-232 or USB port and correspond to specific actions that the programmer can perform. Take great care in using these commands, because they must often be used in groups for proper behavior, and the order in which they are executed affects the result.

Chapter 5 contains an I/O schematic that shows how signals from the C2000 Gang Programmer can be brought out to each of the target devices via a C2000-standard JTAG connector. The user can easily modify the circuit to connect the signals to the target device pins directly (via a socket) if a traditional gang programmer setup is desired.
1.1 Software Installation

TI recommends that you use the latest software version, which can be downloaded from the C2000 website at www.ti.com/tool/c2000-gang.

To install C2000 Gang Programmer software:
1. Download C2000-GANG software from TI website - see link above. Unzip file and run setup.exe file.
2. Follow the instructions in the installation process.
3. When the setup program is complete, C2000 Gang Programmer icons are available in the selected folder. Click the C2000 Gang Programmer Read Me First icon to obtain important information about the C2000 Gang Programmer.
4. The setup program also adds a program group and icons to the Windows desktop.
5. To start the C2000 Gang Programmer software, click the newly created icon.
1.2 **Driver Installation**

To install the required drivers:

1. Connect the C2000 Gang Programmer to a USB port on the PC. When the Windows Wizard starts, follow instructions provided by wizard. When the wizard asks for the USB driver location, browse to the CD-ROM drive. Drivers are located in the main CD-ROM directory location and also in the following directory:

   C:\Program Files\Texas Instruments\C2000-GANG\Driver

2. If the RS-232 interface is used for communication with C2000 Gang Programmer, then the additional driver is not required. Check the Device Manager for the COM port number to use with communication via RS-232.

1.3 **Hardware Installation**

To install the C2000 Gang Programmer hardware:

1. Attach the expansion board (Gang Splitter) to the 100-pin connector on the C2000 Gang Programmer. The expansion board provides connectivity for up to eight targets using the included 14-pin cables. The target C2000 flash devices can be in standalone sockets or can be on an application’s PCB. These devices can be accessed by JTAG signals.

   **NOTE:** The C2000-GANG Programmer rev 1.04 should use software rev. 1.5 or higher and splitter rev.1, while lower revisions of C2000-GANG Programmer can use any software revision, but should continue to use the older C2000-GANG Splitter rev.0

2. Connect the C2000 Gang Programmer hardware to a computer's USB port using a USB A-B cable. The C2000 Gang Programmer's internals can be supplied from the computer's USB port (5 V, 0.5 A), but an external power supply is needed for programming target devices. Target devices can be powered independently or from the C2000 Gang Programmer's 6-10V power supply connector. In this case the external power supply must provide a voltage between 6 V and 10 V DC and must be capable of providing a minimum current of 1.5 A. The center post of the power supply connector on the C2000 Gang Programmer is the positive-voltage terminal. The programmer indicates the status of the power supply connection by using system LEDs and the LCD back light. The programmer can also be connected to a serial port (COM1 to COM255) using a 9-pin Sub-D connector, if the computer does not have a USB port.

3. An external power supply is required to power the C2000 Gang Programmer if it is not connected via USB port.

   **NOTE:** Maximum Signal Path Length: 50 cm

   The maximum length of a signal path between the 14-pin JTAG connector on the Gang Splitter and the target device is 50 cm.

4. The C2000 Gang Programmer can supply power at 3.3 V, 160mA to each target device separately (pin 5 on each 14-pin JTAG cable), provided that the external power supply is attached to the C2000 Gang Programmer. The C2000 Gang Programmer consumes 150 mA by itself.

5. The C2000 Gang Programmer can be supplied from an external power supply connected to the dc connector or via a gang splitter (not populated J10 connector). Because the J10 and dc connectors are connected in parallel, make sure that only one connector provides an external power supply to the C2000 Gang Programmer.
This chapter describes how to use the C2000 Gang Programmer to program target devices. Various modes of operation, which allow the user to choose the most convenient method of programming, are described. In addition, this chapter describes the various windows that are used to configure the programming procedure for a specific target device. The explanations in this chapter assume that the user has properly installed the C2000 Gang Programmer hardware and software as described in Chapter 1.

2.1 Programming C2000 Flash Devices Using the C2000 Gang Programmer

The C2000 Gang Programmer is capable of quickly and reliably programming C2000 flash devices using an RS-232 or USB interface. There are four ways to use the programmer to achieve this task and these include:

- Interactive
- From Image
- From Script
- Standalone

The Interactive mode is selected by default, and is the easiest to get started with, because it requires the least amount of preparation. After the user has mastered the Interactive mode it can be used to create images and script files, which can then be used with the From Image and From Script modes, respectively. Images and scripts are ready-to-go setups than can run with minimal user input. They are very useful for repetitive programming, for example in a production environment, because they ensure consistency (because of the re-use of images or scripts, we highly encourage the user to thoroughly test their images or scripts for correctness before committing them to production). The C2000 Gang Programmer can also be run in Standalone mode to program target devices without a PC. To do this, first create an image to use for programming, and then save it to internal memory of the C2000 Gang Programmer. Creating images is described in Section 2.1.6.

The following sections describe how to use these modes of operation.
2.1.1 Programming Using Interactive Mode

Use the following sequence to start the C2000 Gang Programmer GUI and program C2000 Flash Devices using the Interactive Mode:

1. Click on the C2000 Gang Programmer icon located in the program group that was specified during installation. Figure 2-1 shows the C2000 Gang Programmer GUI in the Interactive Mode (see the Mode group in the top left corner). This window is used to select the target microcontroller, code file used for programming, power supply options, communication interface, and more. This window also shows the result of programming and any errors, if they occur.

![Figure 2-1. Main C2000 Gang Programmer Dialog GUI, Interactive Mode](image)

2. Select a target device using the MCU Type menu (select MCU group and then desired MCU type).

3. Select the code file to be programmed into the devices using the Open Code File button or pulldown menu: File→Open Code File. The formats supported for the code file are TI (.txt), Intel (.hex) and Motorola (.s19, .s28, .s37). Code size and checksum appear on the right side (for details on how the checksum is calculated, see Section 2.1.10).

4. MCUs provide a method of disabling JTAG by programming a password to flash memory. The password should be specified as data to be programmed to MCU. The code file must contain password contents if you intend to lock JTAG using the password feature after programming. If the MCU is already locked using a previously programmed code file, then you must provide the password section (or entire old code file) using the Open Password File button if and only if the password section is different. Functionally, if the MCU is locked by password, the code file’s password section is first used.
to attempt to unlock the MCU. If that fails, then the password file’s contents are used to attempt to unlock the MCU. If both attempts fail, the MCU remains locked and JTAG access fails. Password file contents are not used to program the MCU.

5. In the Target power group, select if the target is supplied from the C2000 Gang Programmer or from an external power supply. The voltage or current is not customizable because of strict requirements for flash programming.

6. In the Results group, select desired target devices to be programmed. After programming has concluded, a green checkmark or lights appear for successful operations for each target.

7. In the Interface selector, choose the desired communication speed for JTAG (fast, medium or slow).

8. In the Memory Options dialog (pulldown menu: Setup→Memory options) shown in Figure 2-2, select desired memory space to be programmed. By default, the selected option is OTP and Flash Memory and it is correct for most programming tasks (Section 2.1.5 describes how to use the memory configuration window).

---

**Figure 2-2. Memory Options**
9. In the Reset Options dialog (pulldown menu: Setup→Device Reset) shown in Figure 2-3, select the duration of the reset pulse and the delay after reset. By default it is 10 ms, but other options are available if required by the hardware.

![Figure 2-3. Reset Options](image)

**NOTE:** This window lets the user specify the duration of the reset pulse coming from the C2000 Gang Programmer to the target device. Depending on the hardware implementation, a longer reset pulse might be required.

10. If selecting dual-core MCUs (that is, Concerto™, Delfino™), select Core 1 and Core 2 (press Core 1 or Core 2 button) separately to choose configuration options and code file for each core. To enable programming of both cores using the GO procedure, check-in the Program all Cores enable (GO button) checkbox.

Following these steps creates a working setup that can program target devices using the C2000 Gang Programmer. Click the Save Project As button to save this configuration settings. These settings can be loaded again later and modified, if necessary (one project holds one configuration). After saving the project, use the buttons described in the following sections to perform the desired actions.

### 2.1.1 GO

Click the GO button in the Main Dialog GUI (or F9 key on the keyboard) to start programming. The progress and completion of the operation are displayed in the Results group. The result is shown as one of the following:

- **Idle status**
- **Test in progress.** For power on or off, dc voltage is correct.
- **Access enabled**
- **Access denied** (for example, the fuse is blown)
- **Device action has been finished successfully**
- **Device action has been finished, but result failed**

### 2.1.2 Erase

Click the Erase button in the Main Dialog GUI to erase a segment of memory (sets each word to 0xFFFF). Use the Memory Options configuration screen shown in Figure 2-2 to specify which addresses should be erased (Section 2.1.5 describes in detail how to use the memory configuration window). This action succeeds after the programmer has attempted to erase the specified memory segment. Use the Blank Check function to verify that this segment has been properly erased.
2.1.1.3 Blank Check

Click the Blank Check button in the Main Dialog GUI to check that the contents of specified memory have been properly erased. This function is best used after erasing the same segment of memory using the button described in Section 2.1.1.2. Use the same Memory Options configuration screen shown in Figure 2-2 to specify which addresses should be erased (Section 2.1.5 describes in detail how to use the memory configuration window). This function succeeds when the specified memory segments are set to 0xFFFF, and fails otherwise.

2.1.1.4 Program

Click the Program button in the Main Dialog GUI to write the contents of a code files to flash memory on the target device. Addresses specified in the code files are used to determine where the program is written. Make sure that the regions of memory corresponding to the addresses in the code file are enabled for writing in the Memory Options configuration screen shown in Figure 2-2 (Section 2.1.5 describes in detail how to use the memory configuration window).

Configuration conflicts may arise during programming. It is possible that the code the user has chosen is too big to fit in the flash memory of the target MCU, or the appropriate memory segments have not been enabled in the Memory Options configuration screen. If this is the case, a warning message appears to notify the user of insufficient memory; however, the user is still allowed to proceed. If the user proceeds despite the warning, only the portion of code that fits within the MCU's enabled flash memory is written. This function succeeds after the programmer has attempted to write code to the specified memory addresses. Use the Verify function to ensure that the code has been correctly copied to flash on the target MCU.

2.1.1.5 Verify

Click the Verify button in the Main Dialog GUI to verify that the contents of the target MCU's flash memory have been properly programmed. This function is best used after programming the same segment of memory, as performed using the button described above. Make sure that the same memory segments are enabled in the Memory Options configuration window shown in Figure 2-2, as during programming described above, to ensure all programmed segments are verified (Section 2.1.5 describes in detail how to use the memory configuration window).

If configuration conflicts arose during programming that indicated that the MCU did not contain sufficient memory for the code to be programmed (either enabled segments or total memory was too small), then the Verify function verifies only the code that was programmed and ignores the code that could not fit in memory. This function succeeds if the code in flash matches the code file, and fail otherwise.

2.1.1.6 Read

Click the Read button in the Main Dialog GUI to read the contents of the target MCU's flash memory. Use the Memory Options configuration screen shown in Figure 2-2 to specify which addresses should be read (Section 2.1.5 describes in detail how to use the memory configuration window).

Once used, data is displayed in the Flash Memory Data window as shown in Figure 2-4. This window can be selected in the View→Flash Memory Data pulldown menu. The Flash Memory Data viewer, shown in Figure 2-4, displays the code address on the left side, data in hex format in the central column, and the same data in ASCII format in the right column. The contents of the code viewer can be converted to TI (*.txt) or Intel (*.hex) file format by clicking on the “TI hex” or “INTEL” button.
2.1.2 Programming >From Image

A programming configuration like the one created in Section 2.1.1 can be stored in the form of an image. The advantage of an image is that it contains both the configuration options necessary for programming as well as the code files that are flashed to target devices. Moreover, only images can be saved to internal C2000 Gang Programmer memory and used in Standalone mode, in which the programmer can operate without being connected to a PC. Using the From Image mode allows the user to test images with full GUI support before committing them to production.

After an image has been created, it can be used to greatly simplify programming by using the procedure described in Section 2.1.6. Figure 2-5 shows the main dialog GUI where the From Image option is selected for programming (top left corner). Here the user can load an image from C2000 Gang Programmer internal memory. An image can be created in Interactive Mode and saved to the programmer. One of 16 different images can be selected from internal memory, or one image from each external SD-Card can be used.
NOTE: C2000 Gang Programmer internal memory and SD-Card are mutually exclusive.

To avoid confusion during programming, connecting an SD-Card to the C2000 Gang Programmer disables its internal memory used for other images. Therefore, when an SD-Card is connected to the programmer only the image on the SD-Card is usable or accessible. If the SD-Card is empty, or contains a corrupted image, then it must be disconnected before C2000 Gang Programmer internal memory can be used.

Figure 2-5. Main C2000 Gang Programmer Dialog GUI, From Image Mode
Figure 2-5 highlights several parts of the GUI. The dropdown menu in the Programmer's Internal Image Memory group (top right) is used to select which image is used for programming, because up to 16 different images might be available. In the same group, the Config. from Image option is enabled, meaning that all configurations options, such as which devices are enabled or power options are being taken from the image.

Sometimes it is useful to use the basic files from an image, such as the MCU type and code files, but also make a few minor modifications to test a different configuration. Figure 2-6 shows the additional configuration options available when the Config. from Image button is disabled. These are highlighted in red and include which devices are enabled for programming, target \(V_{CC}\), interface, communication, and security. However, these changes cannot be committed to the image. If the user wishes to change the current image's configuration or code files then the image needs to be recreated using the original project file and procedure described in Section 2.1.6.
NOTE: This figure shows the From Image Mem. mode (top left corner). The Config. from Image option is disabled in this example, allowing the user to change various but not all configuration settings from the image. The configuration options that can be changed are highlighted in red. One of the options that cannot be changed, for example, is the target processor type.

Figure 2-6. Main C2000 Gang Programmer Dialog GUI, From Image Mode and Custom Configuration Enabled

2.1.3 Programming From Script

Use this option to create a script file to automate more complicated programming procedures. Scripts can create functions that open message boxes, target devices, change code files, and any other sequences of reconfigurations up to a total of 1000 commands. Repeated series of instructions can be encompassed into functions for easier programming. The stack supports a call depth of up to 50 CALLs (CALL inside CALL inside CALL, and so on), which is sufficient for most nonrecursive programs.
Figure 2-7 shows the main dialog GUI where the From Script option is selected for programming (top left corner). A script file is selected using the Open Script File button and it specifies all configuration options, and the code files to be used for programming. A script can be created using any text editor and saved in a simple text file. Follow these guidelines to create a script.

NOTE: This figure shows the From Script mode (see the Mode section near the top left corner). A script file is selected using the Open Script File button and it specifies all configuration options, and the code files to be used for programming. In addition, the script can call individual functions, such as Program or Verify, in the order specified by the programmer.

**Figure 2-7. Main C2000 Gang Programmer Dialog GUI, From Script**

### 2.1.3.1 Script Limitations

- Up to a total of 1000 command lines can be used. Empty lines and comments are ignored.
- The stack supports a call depth of up to 50 CALLs (CALL inside CALL inside CALL, and so on).
2.1.3.2 Command Syntax

• White spaces before instructions, labels, and comments are ignored.
• ; – Start of a comment. All characters in the same line after the start of a comment are ignored.

NOTE: A comment cannot be placed after a filename.
For example, when specifying a config file to be loaded, a path to a file must be given. This filename cannot be followed by a comment.

• > – Start of a label. Place the label name after the character with no spaces in between.

NOTE: A line with a label cannot also contain a command or another label.
For example, this would be illegal:
>START VCCOFF

2.1.3.3 Instructions

MESSAGE – Message declaration. Contents must be placed between quotes below a message declaration. Maximum of 50 content lines. Example:

MESSAGE
"Hello."
"This is my script."

GUIMSGBOX setting – Enable or disable pop-up message boxes in the GUI (warning and errors). Setting can be either ENABLE or DISABLE.

IFGUIMSGBOXPRESS option – Apply the option when a message box created by GUI is generated. Option can be OK or CANCEL.

MESSAGEBOX type – Create a pop-up message box with buttons. Contents must be placed between quotes below message declaration. Maximum of 50 content lines. Message box types are:
• OK – One button: OK.
• OKCANCEL – Two buttons: OK and CANCEL
• YESNO – Two buttons: YES and NO
• YESNOCANCEL – Three buttons: YES, NO, and CANCEL

Example:

MESSAGE YESNOCANCEL
"You have three choices:"
"Press yes, no, or cancel."

GOTO label – Jump to instruction immediately following the label.

SLEEP number – Pause a number of milliseconds, between 1 and 100000.

F_FROMIMAGEMODE – Switch to Image mode.

CALL label – Call procedure starting at the instruction immediately following the label. Stack saves return address.

RETURN – Return from CALL.
IF condition operation – Test condition and if true then perform operation. The condition can be one of the following:

- BUTTONOK – OK button is pressed in the message box.
- BUTTONYES – YES button is pressed in the message box.
- BUTTONNO – NO button is pressed in the message box.
- BUTTONCANCEL – CANCEL button is pressed in the message box.
- DONE – Previous process (for example, GO or Read File) finished successfully.
- FAILED – Previous process (for example, GO or Read File) failed.

The operation can be one of the following:

- GOTO label
- CALL label SLEEP number – Pause a number of milliseconds, between 1 and 100000.

F_LOADCFGFILE filename – Load configuration file. Provide a full path and filename.
F_LOADCODEFILE filename – Load code file. Provide a full path and filename.
F_APPENDCODEFILE filename – Append code file. Provide a full path and file name.
F_VCCOFF – Turn Vcc OFF from programming adapter to target device.
F_VCCON – Turn Vcc ON from programming adapter to target device.

NOTE: Vcc from FPA must be enabled first using configuration file.

F_RESET – Perform RESET function from main dialogue screen.
F_GO – Perform GO function from main dialogue screen.
F_ERASEFLASH – Perform ERASE FLASH function from main dialogue screen.
F_BLANKCHECK – Perform BLANK CHECK function from main dialogue screen.
F_WRITEFLASH – Perform WRITE FLASH function from main dialogue screen.
F_VERIFYFLASH – Perform VERIFY FLASH function from main dialogue screen.
F_SECURE – Perform Secure Device function from main dialogue screen.

NOTE: Blows fuse regardless of enable option.
If the F_SECURE command is used, then security is enabled even if the Write CSM enable option is disabled.

F_SETIMAGENUMBER number – Choose image number between 1 and 16 from C2000 Gang Programmer internal memory.
F_INTERACTIVEMODE – Switch to Interactive mode.

F_NEWRESULTFILENAME – Provide a full path and name of the result file.

F_APPENDRESULTFILENAME – Provide a full path and name of the file where the result should be appended.

F_COMMENTTOFILE – Add a comment at the beginning of the result stream.

F_RESULTTOFILE – Save result to the result file specified by F_NEWRESULTFILENAME or F_APPENDRESULTFILENAME. The following data is saved:

- Finished task mask: HHHH (16 bits task mask)
- Cumulative target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Requested target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Connected target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Erased target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Blank Check target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Programmed target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Verified target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Secured target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- error_no: error number
- VTIO in mV: VTio in mV
- Vcc
- Vcc Cumulative Err mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- JTAG Init target mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Already Secured mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)
- Wrong MCU ID mask: HH (8 bits target mask - 0x01-target-1,.. 0x80-target-8)

TRACEOFF – Disable tracing.

TRACEON – Enable tracing and log to the Trace-Scr.txt file in the current working directory. This option is useful for debugging. The trace file contains the sequence of all executed commands from the script file annotated with line numbers. Line numbers are counted without empty lines and without lines containing only comments.

END – End of script.
The following example script executes this sequence of commands:

1. Label START is created.
2. $V_{CC}$ from programmer to target device is turned OFF.
3. Message box notifies the user of $V_{CC}$ setting and asks for permission to proceed with buttons OK and CANCEL. The program halts here until a button is pressed.
4. If CANCEL was pressed then GOTO finish label (ends the script).
5. If CANCEL was not pressed (in this case this implies that OK was pressed) then load configuration file test-A.c2000cfg to the C2000 Gang Programmer. Configuration file test-A.c2000cfg should be prepared before running this script using Interactive mode.
6. Message box asks the user to proceed. The program halts until OK is pressed.
7. The C2000 Gang Programmer programs the target device using the GO function.
8. Message box asks the user if the test succeeded giving a YES or NO choice.
9. If NO was pressed then GOTO START label (start of script).
10. If NO was not pressed (in this case this implies that YES was pressed) then load configuration file finalcode.c2000cfg to the C2000 Gang Programmer.
12. Script jumps to the beginning using GOTO START. This can be used to wait for the next target device to be connected.
13. Label finish is created.

;==============================================================================
; Script file - demo program
;==============================================================================
>START
VCCOFF
MESSAGEBOX OKCANCEL
"VCC if OFF now. Connect the test board."
"When ready press the button:"

"OK - to test the board"
"CANCEL - to exit from program"
IF BUTTONCANCEL GOTO finish
F_LOADCFGFILE C:\Elprotronic\Project\Cpp-Net\C2000\test-A.c2000cfg
MESSAGEBOX OK
"Press OK to download the test program."
F_GO
MESSAGEBOX YESNO
"Press YES when the test finished successfully."
"Press NO when the test failed."
IF BUTTONNO GOTO START
F_LOADCFGFILE C:\Elprotronic\Project\Cpp-Net\C2000\finalcode.c2000cfg
F_GO
GOTO START
>finish
END
;==============================================================================
2.1.3.4 Commands Combined With the Executable File

Programming executable file can be opened with the following commands:

- **prj** project file with file name or full path and name.

- **sf** script file with file name or full path and name.

For example:

- `C2000-GANG.exe -sf test.c2000gangsf`
  
  or
  
- `C2000-GANG.exe -prj test1.c2000gangproj`
  
  or
  
- `C2000-GANG.exe -prj test1.c2000gangproj -sf test.c2000gangsf`
2.1.4 Programming in Standalone Mode

The C2000 Gang Programmer supports a Standalone mode of programming target devices. In this mode the C2000 Gang Programmer can only use images for programming because they contain a complete configuration and code files necessary for the procedure. If the user has not already created an image then follow the procedure outlined in Section 2.1.6. When viewed from the GUI, Figure 2-8 shows that all GUI options are disabled and the C2000 Gang Programmer hardware buttons have to be used for programming.

![Figure 2-8. Main C2000 Gang Programmer Dialog GUI, Standalone Mode](image)

NOTE: This figure uses the Standalone mode (see the Mode section near the top-left corner). All GUI options are disabled; the C2000 Gang Programmer can only be operated using physical controls on the programmer itself. Standalone mode allows the user to program a target device using an image either from internal memory (up to 16 different images), or an external SD-Card, without the use of a desktop or laptop computer.

After images have been downloaded to the internal memory or after an SD card with a valid image is connected to the C2000 Gang Programmer, proceed with programming in Standalone mode. In Standalone mode, control the programmer using the arrows and buttons on the actual C2000 Gang programmer, not the GUI on the PC. Use the arrow buttons (up and down) and the enter button to select a desired image for programming. A description of the selected image is displayed on the bottom line, and it is the same description that was created in the GUI when the Save Image button was pressed (see Figure 2-9).
After the desired image has been selected, press the GO button on the C2000 Gang Programmer hardware to start programming. This button operates the same way as the GO button on the GUI. Progress of the operation in Standalone mode is indicated by a flashing yellow LED and displayed on the LCD display. The result status is represented by green and red LEDs on the C2000 Gang Programmer and details are displayed on the LCD display. If a green LED is ON only, then all targets have been programmed successfully. If only the red LED is displaying, that all results failed. If red and green LEDs are on, then result details should be checked on top of the LCD display. The LCD display shows target numbers 1 to 8 and marks to indicate failure or success: X for failure and V for success. When an error is reported, the bottom line repeatedly displays an error number followed by a short description with time intervals of approximately two seconds.

The selected image contains all necessary configuration options and code files required for programming; however, the user can change the number of target devices being programmed using onboard buttons. On the main display of the C2000 Gang Programmer (see Figure 2-10), use the up or down arrow buttons to find the Target En/Dis option. Press the OK button to enter this menu. A sliding cursor appears below the numbers representing each device at the top of the main display. Use the arrow buttons to underline the device to enable or disable. Press OK to toggle the devices; press Esc to exit to the main menu. Press GO to use the selected image to program the selected devices. If another image is selected or the current image is selected again, the Enable and Disable options reset to what has been configured in the image.

Figure 2-9. Image Option
In addition to these options that control programming, the contrast of the LCD display can be changed. Select the Contrast option in the main menu, and press OK. Then use the up and down arrow buttons to adjust the screen contrast. Changes to contrast reset after power down, unless the contrast setting has been set via the GUI on the host computer.
2.1.5 Memory Setup for GO, Erase, Program, Verify, and Read

The GO, Erase, Program, Verify, and Read operations shown in Figure 2-1 use addresses specified in the Memory Options dialog screen shown in Figure 2-2. The memory setup used by these operations has five main options:

1. **Update only** – When this option is selected, the GO operation does not erase memory contents. Instead, contents of code data taken from the code file are downloaded to flash memory. This option is useful if a relatively small amount of data, such as calibration data, needs to be added to flash memory. Other address ranges should not be included in the code file, meaning that the code file should contain ONLY the data which is to be programmed to flash memory. For example, if the code file contains data as shown in TI format:

   @3F0000
   25CA 8040 39E3 F802
   @3F4000
   4835 5972 ACB8

   Then four words of data are written starting at location 0x3F0000 and three words of data starting at location 0x3F4000. The specified addresses should be blank before writing (contain a value of 0xFF). Before the writing operation is actually performed, the C2000 Gang Programmer automatically verifies if this part of memory is blank and proceeds to program the device only if verification is successful.

2. **OTP and Flash Memory** – This is the most frequently used option during programming. All flash memory is erased before programming, and all contents from the code file are downloaded to the target microcontroller's flash memory. When the microcontroller contains an OTP (One-Time Programmable) segment (for example TMS320F2801, address range 0x3D7800 to 0x3F7BFF), then OTP is modified if data for it was provided in the code file. If the code file does not contain data addressed to the OPT segment, then OTP memory is not modified. Once programmed, OTP memory cannot be erased. Flash memory can be reprogrammed as long as the MCU is not locked.

3. **Flash Memory only** – Only Flash memory is programmed, OTP segments are not touched. Contents of OTP memory from the code file are ignored.

4. **OTP Memory only** – Only OTP segments are programmed, Flash memory is not touched. Contents of Flash memory from the code file are ignored.

5. **Used by Code File** – This option allows main memory segments and OTP memory segments to be modified when specified by the code file. Other flash memory segments are not touched. This option is useful if only some data, like calibration data, needs to be replaced.

6. **User defined** – This option is functionally similar to options described before, but memory segments are explicitly chosen by the user. When this option is selected, then on the right side of the memory group, the OTP Memory and Flash Memory dialog screens are enabled. The check boxes allow the user to select OTP and flash memory segments to be enabled (erased (not OTP), programmed, verified). Edit lines allow the user to specify the address range (start and stop addresses) for each type of memory. The start address should specify the first word in the segment, and the stop address should specify the last word in the segment (last word is programmed). Depending on the segment size in the chosen MCU, for example 0x1000, the start address should be a multiple of 0x1000; for example, 0x3F0000 or 0x3F1000. The stop address should specify the last word of the segment to be written. Therefore, it should be greater than the start address and point to a word that immediately precedes a memory segment boundary; for example, 0x3F0FFF or 0x3F1FFF.

2.1.6 Creating and Using Images

An image contains the code files and the configuration options necessary for programming of a target device. Images can be stored as a binary file (".c2000gangbin") in internal C2000 Gang Programmer memory (or SD card), or as an image file (".c2000gangimage") on disk for redistribution. Image files intended for redistribution can be encrypted with additional security features described later in this section.

Creating an image is done in Interactive Mode by following the same steps described in Section 2.1.4 followed by pressing the "Save Image File As..." or "Save to Image" buttons. The first button saves the code files and configuration options as a binary file and image file locally on disk, and the second button saves this information directly to the C2000 Gang Programmer internal memory. Note that to use the C2000 Gang Programmer in Standalone mode, you need to program at least one image to internal memory or read a binary file from an SD card (via the SD card connector on the C2000 Gang...
Programming C2000 Flash Devices Using the C2000 Gang Programmer

If you intend to modify the contents of an image at a later date, it is advisable to save the configuration options as a project. Because an image is read-only, reading a project file is the only way to recreate images easily without reentering the configuration options from scratch. After the project is loaded, a change can be made and a new image with the same name can be created to overwrite the previous one.

In total, 16 different images can be saved internally in the C2000 Gang Programmer or one image can be saved on an SD card. Each image can be selected at any time to program the target devices. The C2000 Gang Programmer also allows the image to be saved in a file, either to be saved on an SD card or to be sent to a customer. In order for the image file to be usable from the SD card, copy only the binary file (".spgangbin") to the SD card and preserve the proper extension (Note that binary files are not encrypted). For redistribution to a customer, the image file can be sent and encrypted with additional security features.

When a new image is saved to a file or to a C2000 Gang Programmer internal memory, an image configuration screen appears (see Figure 2-11). Enter any name up to 16 characters. This name is displayed in the GUI image selector (see Figure 2-1) on the bottom line of the C2000 Gang Programmer LCD screen when the corresponding image is selected. Press OK when the name is entered.

After you have created a programming setup using the steps mentioned above, it is useful to store it in the form of an image. The advantage of an image is that it contains both the configuration options necessary for programming as well as the code files that are flashed to target devices. Moreover, only images can be saved to internal C2000 Gang Programmer memory and used in Standalone mode, where the programmer can operate without being connected to a PC.

Before the user proceeds to making images; however, it is advisable to save the C2000 Gang Programmer setup as a project first. This is recommended because images cannot be modified after they are created; they can only be overwritten. Therefore, if the user wants to change an image that has already been created without recreating the whole configuration from scratch, then it is necessary to load the corresponding project file. After the project is loaded, a change can be made, and a new image with the same name can be created to overwrite the old one.

Images can be saved to the programmer's internal memory or on an external SD-Card. A total of 16 different images can be saved internally, or one image can be saved on an SD-Card. Each image can be selected at any time to program the target devices. The C2000 Gang Programmer also allows the image to be saved in a file, either to be saved on an SD-Card or to be sent to a customer. When the code file and configuration are ready to be saved, press the Save Image button to save to C2000 Gang Programmer internal memory, or the Save Image to file button to save to a file.

Whether the new image being created is saved to a file or to C2000 Gang Programmer internal memory, an image configuration screen appears (see Figure 2-11). Enter any name up to 16 characters. This name is displayed in the GUI image selector (see Figure 2-1), and it is displayed on the bottom line of the C2000 Gang Programmer LCD screen when the corresponding image is selected. Press OK after entering the name.
NOTE: The image name is limited to 16 characters. This name is shown on the LCD display of the C2000 Gang Programmer and Image pulldown menu in the GUI.

Figure 2-11. Image Name Configuration Screen

The screen shown in Figure 2-12 allows the user configure what type of security is used to protect the image file. Three options are available; however, for all three options, the contents of the code file are always encrypted and cannot be read.
NOTE: During project creation, the user can select to protect project information using various methods.

**Figure 2-12. Image File Security Options**

1. **Any PC** – Configuration can be opened on any computer using C2000 Gang Programmer software. It can be used for programming only.

2. **Any PC - Password protected** – Configuration can be opened on any computer using the C2000 Gang Programmer software, but only after the desired password has been entered.

3. **Selected PC - Hardware Fingerprint number** – Image can be opened only on the dedicated computer with the same hardware fingerprint number as the number entered in the edited line above. **Figure 2-13** shows a window with the hardware fingerprint number. An example usage scenario would involve calling an intended user to provide the hardware fingerprint number of their computer and entering it within this configuration window. This restricts opening this image to only the dedicated computer running C2000 Gang Programmer software.
NOTE: The fingerprint can be used to secure the project where, for example, only a computer with a matching hardware fingerprint can be used to view and edit the project.

Figure 2-13. Hardware Fingerprint of Computer in Use

The image file can be copied to internal C2000 Gang Programmer memory and used for programming target devices. Select the desired image number in the GUI and press the Load Image from File button (see Figure 2-1). This selected image is subsequently be used for programming target devices.

2.1.7 Programming >From Image File

An image file can be used to program target devices from a self-contained read-only file that has all the necessary configuration options and code files already included. By selecting the "From Image File" Mode, you can use an image file created using the steps described in Section 2.1.6. If the image is password protected, you are prompted to enter the password before you can use the image. Alternatively, if the image is restricted to be used on a specific PC, you are unable to use the image unless your PC matches the hardware fingerprint (for instructions on how to use images from C2000 Gang Programmer internal memory see Section 2.1.2).
Figure 2-14. Programming From Image File

Figure 2-15. Password for Image File
2.1.8 Programming > From SD Card

The C2000 Gang Programmer can program target devices with an image loaded from an external SD card. To program from an external SD card, copy a binary file (".c2000gangbin") created using steps described in Section 2.1.6 to the root directory of the SD card (preserve the original extension ".c2000gangbin"). If multiple binary files are present in the root directory of the SD card, the first one found is used (the first one found is not necessarily the first one alphabetically). To ensure that the desired binary file is used, verify that only one binary file with the proper extension .c2000gangbin is present in the root directory. The name of the selected file is displayed on the LCD screen of the C2000 Gang Programmer.

When the SD card is connected to the C2000 Gang Programmer, internal memory is disabled, and an image can only be read from the SD card. This mechanism has been deliberately implemented to aid in production, because inserting an SD card to the C2000 Gang Programmer leaves the user with only one option for programming a target device and, therefore, less possibility for misconfiguration errors.

2.1.9 File Extensions

C2000 Gang Programmer software accepts the following file extensions:

Code hex files

*.txt Texas Instruments
*.s19/*.s28/*.s37 Motorola
*.hex Intel

Image files

*.c2000gangbin binary file, used for saving data in SD card
*.c2000gangimage image file, can be password protected for distribution

Script files

*.c2000gangsf script file

Project configuration files

*.c2000gangproj keep all configuration, file names and data for used project

2.1.10 Checksum Calculation

The checksum (CS) that is displayed on the side of the code file name is used for internal verification. The CS is calculated as the 32-bit arithmetic sum of the 16-bit unsigned words in the code file, without considering the flash memory size or location.

The following formula is used.

```
DWORD CS;
DWORD XL, XH;

CS = 0;
for( addr = 0; addr < ADDR_MAX; addr = addr + 2 )
{
    if(( valid_code[ addr ] ) || ( valid_code[ addr+1 ]))
    {
        if( valid_code[ addr ] )
            XL = (DWORD) code[ addr ];
        else
            XL = 0xFF;
```
if( valid_code[ addr+1 ] )
    XH = ((DWORD) code[ addr+1 ])<<8;
else
    XH = 0xFF00;

    CS = CS + XH + XL;
}
}

As an example, refer to the code file below, which is in the TI hex file (*.txt format).

----------------------------------------
@3E8000
40F2

@3E8090
0228 9268 3BDB 8038 0005 FF58
q
----------------------------------------

The CS is calculated as shown below:

CS = 0x40F2 + 0x0228 + 0x9268 + 0x3BDB + 0x8038 + 0x0005 + 0xFF58 = 0x000290F2

2.2 Data Viewers

Data from code files and from flash memory can be viewed and compared in data viewers. Contents of the selected file can be viewed by selecting the View→Code File Data option from the dropdown menu. The Code data viewer, shown in Figure 2-16, displays the code address on the left side, data in hex format in the central column, the same data in ASCII format in the right column. Data in hex format is displayed from 0x0000 to 0xFFFF for addresses corresponding to the code file. Data from other addresses is displayed as double dots (..). If code size exceeds flash memory size in the selected microcontroller, this warning message is displayed first.

Data out of the Flash Memory Space of the selected C2000.
NOTE: The selected option on the bottom ignores all words that have the value of 0xFFFF, which represents empty words.

Figure 2-16. Code File Data

The contents of the code viewer can be converted to TI (*.txt) or Intel (*.hex) file format by clicking on the TI hex or INTEL button.

Contents of flash memory data can be viewed by selecting the View—Flash Memory Data option from the dropdown menu. To be able to see flash memory contents, the Read button must be used first (as described in Section 2.1.1). The Flash Memory Data viewer displays the memory addresses, data in hex and ASCII format in the same way as the Code data viewer shown in Figure 2-16.

Contents of the code file and flash memory can be compared and differences can be displayed in a the viewer by selecting the View—Compare Code & Flash Data options from the dropdown menu. Only data that are not the same in the code file and the flash memory are displayed. The first line displays code file data, and the second line displays flash memory data as shown in Figure 2-17.
The Compare location presented in the code file only option is chosen by default. This option allows the user to view differences between Code file data and corresponding flash contents (compared by address). Additional data in the flash like DCO calibration and personal data is not compared but can be displayed if desired. If all the aforementioned data are identical, then a "No difference found" message is displayed on the screen.

**NOTE:** Only words that differ are shown. The selected option on the bottom of the figure specifies that only memory segments corresponding to the code file should be compared. The second option, if selected, performs the comparison and shows any remaining contents of flash memory that do not correspond to the code file.

**Figure 2-17. Comparison of Code and Flash Memory Data of the Target Microcontroller**
2.3 Status Messages

The current status is always displayed at the bottom of the progress bar, as shown in Figure 2-1, and previous status and error messages are shown in the history window in the bottom left corner. are displayed in the report window.

All procedures in the C2000 Gang Programmer are divided into small tasks to be executed in series. When first task is finished successfully, then the next task is started. Each task has its own consecutive number assigned by the task manager when the image is created. The tasks are listed below:

- Open Target Device
- Close Target Device
- Erase
  - Segment
  - Main memory
  - OTP memory
- Blank check
- Program
- Gang Program (program unique data to each target)
- Write RAM
- Write GANG RAM (write unique data to each target)
- Verify
- Read memory
- Secure device
- Unlock Target
- Download Firmware
- Start Firmware
- Start DSP Firmware
- Set PLL Frequency
- Get PLL Frequency Status
- Get Initialization Data
- Reset
- Toggle Vcc
- Display Results
- Read Retain Data
- Restore Retain Data
- Finish

For example, the operations Erase, Program, and Verify execute the following tasks:

- Open Target Device
- Erase
- Blank check
- Program
- Verify
- Close Target Device
- Finish

These tasks execute the easiest programming process in small MCU devices. The aforementioned tasks can be divided into smaller tasks that only erase one segment, or erase one block of the main memory. For that reason, many more tasks are displayed in the report window than are described above. For example, when programming the C2000 F28035 the following information would be displayed in the report window:
Executing Main Process...

--- F28035 Test ---

.............

2 : init target
3 : unlock CSM
4 : Download FW
5 : Start API
6 : Set PLL freq.
7 : Get Init Data
8 : Get PLL status
9 : Erase-3E8000
10 : Erase-3EA000
11 : Erase-3EC000
12 : Erase-3EE000
13 : Erase-3F0000
14 : Erase-3F2000
15 : Erase-3F4000
16 : Erase-3F6000
17 : Blank-3E8000
18 : Blank-3EA000
19 : Blank-3EC000
20 : Blank-3EE000
21 : Blank-3F0000
22 : Blank-3F2000
23 : Blank-3F4000
24 : Blank-3F6000
25 : Write-3F4000
26 : Verify-3F4000
27 : closing target
28 : Done
29 : Finished

Done

This report indicates that the main memory block has been erased (tasks 9 to 16), blank checked (tasks 17 to 24), programmed (task 25), and verified (task 26). Finally, access to target devices is closed, and the programming process is finished. Length of task description (including consecutive task number) is limited to 16 characters to be able display this information on the third line of the C2000 Gang Programmer LCD display.

The C2000 Gang Programmer can process up to 1000 tasks per one image saved in internal memory. Having that number of available tasks and one or more code files saved in internal memory (total memory footprint of up to 512 kbytes (256 kwords) in one image), the C2000 Gang Programmer gives the user significant flexibility to perform custom programming procedures. If for any reason the code files and task scripts require more than 512 kbytes of memory, then the next image memory can be combined with the first one for one larger image block (1Mbyte or more). The C2000 Gang Programmer has internal flash memory of 8Mbyte that can, if desired, all be used to form one image with a memory footprint of 8Mbytes.

Error messages are displayed similarly to status messages; however, programming is terminated if the error is related to all target devices. Subsequently, if the problem is resolved or the faulty target device is disabled, then the programming procedure can be restarted to complete the programming process. The result for all devices is reported in the results section (green or red icons). When the global status is reported as FAIL, see the result section for details. Similarly, the C2000 Gang Programmer uses red and green LEDs to indicate the result of its operations (red indicates failure) and details are displayed on the LCD display. Below is the list of errors reported in the C2000 Gang Programmer.

ERR_NONE,             "Operation successful.",

The C2000 Gang Programmer Self Test program allows to test most of the hardware for correctness. Connect the programmer to a computer running C2000 Gang Programmer software. The Gang Splitter must be connected to the C2000 Gang Programmer. Disconnect all target devices, because any connected devices can modify the test results and make them invalid.

Activate the Self Test by choosing the Tools→Self Test option from the dropdown menu. Press the Start Self Test button, as shown in Figure 2-18, to begin. If the Self Test reports any problems, then it is advisable to send the test report to TI technical support for assistance.
NOTE: Use the C2000 Gang Programmer selftest capability to check the integrity of the hardware. Before beginning the test, make sure that no target MCUs are connected to the C2000 Gang Programmer.

Figure 2-18. Self Test

The following is a typical self test report:

============== Finished =================================
* Test pass - no errors.
2.5 Label

Information and C2000 Gang Programmer software and hardware can be displayed by accessing the About dropdown menu. Select the About→About option to display information similar to that shown in Figure 2-19.

![Figure 2-19. Information About the C2000 Gang Programmer](image-url)
2.6 Benchmarks

This section shows the results of timing benchmarks used on the C2000 Gang Programmer to measure the programming speed. Table 2-1 shows the result of the benchmark when programming with the JTAG interface. Identical programming speed is seen whether one device is programmed or eight devices are programmed simultaneously, because programming each MCU is done in parallel.

2.6.1 Benchmark for C28035

(1) Programming speed and verify speed without startup procedures (initialization takes 1.2 seconds).
3.1 Commands

The C2000 Gang Programmer can be controlled by firmware commands received through USB or its RS-232 serial port. The following firmware commands are supported:

== Commands supported by the BOOT loader ======

- "Hello"
- Boot Commands Disable
- Boot Commands Enable
- Transmit Diagnostics
- Select Baud Rate
- Erase Firmware
- Load Firmware
- Exit Firmware update
- Get Label
- Get Progress Status

== Commands supported by API firmware ======

- Main process
- Interactive process
- Erase Image
- Read Info memory from C2000-GANG
- Write Info memory to C2000-GANG
- Verify Access Key
- Load Image Block
- Verify Image Checksum
- Read Image Header
- Boot update
- Read from Gang Data buffer
- Write to Gang Data buffer
- Disable API Interrupts
- Select Image
- Display Message on the LCD display
- Set temporary configuration
- Get selected status
- Selftest
3.2 Firmware Interface Protocol

The C2000 Gang Programmer supports a UART communication protocol at baud rates from 9.6 to 115.2 kbaud in half duplex mode. The default baud rate at startup is 9.6 kbaud. This allows for communication between the C2000 Gang Programmer and devices that have a lower communication speed than the maximum 115.2 kbaud. It is recommended that after startup, the communication speed be increased to the common maximum for both devices to enable faster communication. If the control device has a USB interface with a virtual COM port, then it is recommended to use USB for communication between the control device and the C2000 Gang Programmer, because USB is several times faster than RS-232. Communication requires one start bit, eight data bits, even parity bit, and one stop bit. A software handshake is performed by a (not) acknowledge character.

3.3 Synchronization Sequence

To synchronize with the C2000 Gang Programmer the host serial handler transmits a SYNC (CR) character (0x0D) to the C2000 Gang Programmer. The C2000 Gang Programmer acknowledges successful reception of the SYNC character by responding with a DATA ACK character (0x90). If the SYNC is not received correctly, no data is sent back. This sequence is required to establish the communication channel and to react immediately to line faults. The synchronization character is not part of the data frame described in Section 3.4.1. When communication is established, the synchronization character is not required any more, but it can be sent at any time for checking the "alive" status, if required.

The synchronization character is not part of the data frame described in Section 3.4.1.

3.4 Command Messages

The C2000 Gang Programmer has a few type of messages with mandatory responses for each received command.

- Short TX messages with one byte only

  "Hello"

  Tx -> 0x0d (CR)
  Rx -> 0x90 (ACK)

- Get Progress Status

  Tx -> 0xA5
  Rx -> 0x80 0x00 <...data...> (without Check Sum)

- Standard TX messages with data frame

  Tx -> 0x3E, CMD, <...data...>, < Check sum >
  Rx -> 0x90 (ACK)
  or 0xA0 (NACK)
  or 0xB0 (In Progress) (use Get Progress Status for monitoring)
  or 0x80, 0x00, <...data...>, < Check sum >

3.4.1 Frame Structure

The data frame format follows the TI C2000 serial standard protocol (SSP) rules, extended with a preceding synchronization sequence (SS), as described in Section 3.3. The C2000 Gang Programmer is considered the receiver in Table 3-1, which details the data frame for firmware commands. The redundancy of some parameters results from the adaptation of the SSP or to save boot ROM space.

The data frame format of the firmware commands is shown in Table 3-1.

- The first eight bytes (HDR through LH) are mandatory ("-" represents dummy data).
- Data bytes D1 to Dn are optional.
- Two bytes (CKL and CKH) for checksum are mandatory
- Response is mandatory by the C2000 Gang Programmer. Response can be an "Acknowledge" or a full data frame depending on the command.
The following abbreviations are used in Table 3-1.

CMD Command identification
R Do not use this command. Used for internal communication.
T Target number (1 to 8)
L1, L2 Number of bytes in AL through Dn. The valid values of these bytes are restricted as follows: L1 = L2, L1 < 255, L1 even.
A1, A2, A3 Block start address or erase (check) address or jump address LO or HI byte. The bytes are combined to generate a 24-bit word as follows: Address = A3 × 0x10000 + A2 × 0x100 + A1
LL, LH Number of pure data bytes (maximum 250) or erase information LO or HI byte or block length of erase check (max is 0xFF).
D1...Dn Data bytes
CKL, CKH 16-bit checksum LO or HI byte
xx Can be any data
– No character (data byte) received or transmitted
ACK The acknowledge character returned by the C2000 Gang Programmer can be either DATA_ACK = 0x90 (frame was received correctly, command was executed successfully) or DATA_NAK = 0xA0 (frame not valid (for example, wrong checksum, L, L2), command is not defined, is not allowed.
PRS DATA_IN_PROGRESS = 0xB0 - Tasks in progress. Use Get Progress Status (0xA5) command to get the status and check when task is finished.

</tbody>
</table>

(1) All numbers are bytes in hexadecimal notation. ACK is sent by the C2000 Gang Programmer.
(2) PROMPT = 0x3E means data frame expected.
(3) Bold bytes represent responses from C2000 Gang Programmer.
3.4.2 Checksum

The 16-bit (2-byte) checksum is calculated over all received or transmitted bytes, B1 to Bn, in the data frame except the checksum bytes themselves. The checksum is calculated by XORing words (two consecutive bytes) and bit-wise inverting (∼) the result, as shown in the following formulas:

\[
\text{CHECKSUM} = \text{INV} \left[ (B_1 + 256 \times B_2) \text{ XOR } (B_3 + 256 \times B_4) \text{ XOR } \ldots \text{ XOR } ((B_{n-1}) + 256 \times B_n) \right] \\
\]

or

\[
\begin{align*}
\text{CKL} &= \text{INV} \left[ B_1 \text{ XOR } B_3 \text{ XOR } \ldots \text{ XOR } B_{n-1} \right] \\
\text{CKH} &= \text{INV} \left[ B_2 \text{ XOR } B_4 \text{ XOR } \ldots \text{ XOR } B_n \right] 
\end{align*}
\]

An example of a frame for the Execute Self Test command with checksum would appear as:

0x3E 0x35 0x06 0x06 0x00 0x00 0x00 0x00 0xC7 0xCC

3.5 Detailed Description of Commands

3.5.1 General

After the prompt byte (0x3E) and the command identification byte CMD, the frame length bytes L1 and L2 (which must be equal) hold the number of bytes following L2, excluding the checksum bytes CKL and CKH. Bytes A1, A2, A3, A4, LL, LH, and D1 to Dn are command specific. However, the checksum bytes CKL (low byte) and CKH (high byte) are mandatory. If the data frame is received correctly and the command execution is successful, the acknowledge byte ACK (0x90), in progress byte (0xB0) or received message with header byte (0x80) as the first one. Incorrectly received data frames, unsuccessful operations, and commands that are not defined are confirmed with a DATA_NACK = 0xA0.

3.5.2 Commands Supported by the BOOT Loader

3.5.2.1 "Hello"

Short TX messages with one byte only

Tx -> 0x0D (CR)  
Rx -> 0x90 (ACK)

A response is sent only when the <CR> (0x0D byte) has been detected and when it is not the byte used as the part of the data frame. This command can be useful for checking communication with the C2000 Gang Programmer. When there is no response, then the baud rate should be changed. After power-up, the USB interface is used for communication with the C2000 Gang Programmer; however, the RS-232 receiver is also active. To reestablish communication between USB and RS232, the "Hello" command must be sent a minimum of three times via RS232. After this, an ACK (0x90) is transmitted via RS232. This sequence also works in reverse, to reestablish communication between RS232 and USB.
3.5.2.2 Boot Commands Disable

Tx -> 3E 2A ... ... CKL CKH
Rx -> 0x90 (ACK)

Do not use this command. This command is used during firmware or information memory update. Use the C2000 Gang Programmer executable GUI software for updating firmware or information memory update if required.

3.5.2.3 Boot Commands Enable

Tx -> 3E 2B ... ... CKL CKH
Rx -> 0x90 (ACK)

Do not use this command. This command is used during firmware or information memory update. Use the C2000 Gang Programmer executable GUI software for updating firmware or information memory update if required.

3.5.2.4 Diagnostic

The Diagnostic command retrieves the result of the preceding gang programming command.

Tx -> 3E 32 04 04 00 00 00 00 CKL CKH
Rx -> 80 00 1E 1E D1 D2 ... D30 CKL CKH

Data bytes D1 to D30 hold the parameters, as follows:

D1-D6: Reserved
D7-D8: Boot revision number: D7 (MSByte), D8 (LSByte)
D9-D10: Hardware version number: D9 (MSByte), D10 (LSByte).
D11 to D12: Firmware version number: D11 (MSByte), D12 (LSByte).
D13 to D20: Character string representing the boot name "C2000BOOT"
D21: Comma (,)
D22 to D30: Zero-terminated application firmware name "C2000-GANG"

When the application is modified or is not present, then bits D11-D12 and D22-D30 are modified and can be used for detection if the application firmware is present, and if present, what type and version of the application firmware is downloaded.

3.5.2.5 Set Baud Rate

Tx -> 3E 38 06 06 BR 00 00 00 00 CKL CKH
Rx -> 0x90 (ACK)

The Set Baud Rate command sets the rate of the serial communications. The default is 9600 baud. Baud rate index 0 to 4, representing the baud rate.

BR → 0 = 9600 baud (default)
BR → 1 = 19200 baud
BR → 2 = 38400 baud
BR → 3 = 57600 baud
BR → 4 = 115200 baud

The Set Baud Rate command takes effect (that is, changes the baud rate) immediately.

3.5.2.6 Erase Firmware

Tx -> 3E 39 ... ... CKL CKH
Rx -> 0x90 (ACK)

Do not use this command. This command is used during firmware or information memory update. Use the C2000 Gang Programmer executable GUI software for updating firmware or information memory update if required.
3.5.2.7 Load Firmware

```
Tx -> 3E 3A ... ... ... CKL CKH
Rx -> 0x90 (ACK)
```

Do not use this command. This command is used during firmware or information memory update. Use the C2000 Gang Programmer executable GUI software for updating firmware or information memory update if required.

3.5.2.8 Exit Firmware Update Command

```
Tx -> 3E 3B ... ... ... CKL CKH
Rx -> 0x90 (ACK)
```

Do not use this command. This command is used during firmware or information memory update. Use the C2000 Gang Programmer executable GUI software for updating firmware or information memory update if required.

3.5.2.9 Get Label

The Get Label command retrieves all hardware and software information.

```
Tx -> 3E 40 04 04 00 00 00 00 CKL CKH
Rx -> 80 00 8C 8C D1 D2 ... D140 CKL CKH
```

Data bytes D1 to D140 hold the parameters, as follows:

- D1, D2: BOOT software ID ("B430")
- D3-D6: BOOT software version (01 00 01 00)
- D7, D8: API software ID ("A430")
- D9-D12: API software version (01 00 01 09)
- D13, D14: Boot revision number: D7 (MSByte), D8 (LSByte)
- D15, D16: Hardware version number: D9 (MSByte), D10 (LSByte)
- D17, D18: Firmware version number: D11 (MSByte), D12 (LSByte)
- D19-D26: Character string representing the boot name "C2000BOOT"
- D27: Comma ','
- D28-D36: Zero-terminated application firmware name "C2000-GANG"
- D37-D44: MCU's Silicon Unique Number
- D45-D76: Zero-terminated string of the Programmer description
- D77-D108: Access keys
- D109-D116: Programmers serial number YYMMnnnn
- D117-D120: MFG ID "ELP"
- D121-D124: Hardware ID "C2000"
- D125-D126: Hardware revision 0x0101 (rev 1.01)
- D127-D140: Spare

3.5.2.10 Get Progress Status

The Get Progress Status command is a low-level command and can be used at any time, even if the C2000 Gang Programmer is busy with other tasks. It replies to the command without interrupting the currently serviced process. Some commands that have long execution times require the Get Progress Status command to monitor the current state.

For example, the Main Process command, which can require a few seconds or more to execute, responds with the character "In Progress 0xB0" as soon as the command has been received and accepted. At this time, the communication link has been released and is ready to use the Get Progress Status command. The current status and progress data can be monitored by polling the Get Progress Status command. The contents of the progress status include the current task number, chunk number, and information about what tasks have been already finished (erase, blank check, program, verify, and more).
In addition, the comment that is displayed on the LCD display is also available in the progress status message. This makes it possible to mirror the progress status on a PC screen so that the status on the PC screen appears the same as it is in the C2000 Gang Programmer LCD display. In the internal firmware, the progress status buffer is always updated when a new task or new chunk is executed. In cases where the LCD is updated frequently, it might not be possible for the PC screen to exactly mirror it. If polling is done more frequently, then messages on the PC can be updated almost in real time. Polling can be fast, but it is not recommended to send the Get Progress Status command within a 20-ms interval.

The C2000 Gang Programmer has internal 8-level FIFO buffer for progress status (8 internal buffers of 50 bytes each). This allows messages to be retrieved even if status has been changed a few times in the 20-ms interval, as long as the next task is bigger and the status is not updated within the next 100 ms.

One of the bytes (byte 6) in the progress status contains information as to whether the process is still in progress or if it is finished. If the process is finished, then the programmer is ready to receive the next command. If the process is in progress, then only the Get Progress Status command can be used. Do not send any other commands. The next command can also be accepted, but the new command bytes would be collected in the RX buffer until the C2000 Gang Programmer is ready to service it. When the first valid byte of the new command has been received (byte prompt ‘>' 0x3E ), then the receiver cannot get the Get Progress Status command, because the 0xA5 byte, instead of the Get Progress Status command, is treated as a data byte in the data frame.

When the Get Progress Status command is detected (single 0xA5 byte if it is not the frame data contents) then the current status (50 bytes) is transmitted from the C2000 Gang Programmer with following data:

<table>
<thead>
<tr>
<th>byte</th>

</tbody>
</table>

Where,

Bytes 8-9 are task mask bits:
3.5.3 Commands Supported by Application Firmware

Commands supported by the application firmware give access to the target device. All of the features that are provided by the C2000 Gang Programmer and available through the GUI and DLL are accessible by these functions. Some of the commands that allow control of the C2000 Gang Programmer are described in the following sections; however, commands that provide data transfer and script information between the C2000 Gang Programmer and DLL are not described here. Users should use the GUI software package (C2000 Gang Programmer executable and DLL) for preparing data for programming, save it in the internal memory or SD card, verify if that works, and then use the commands described in the following sections to control the programming process via RS-232 or USB interface. If it is possible, then it is recommended to use the C2000 Gang Programmer DLL and control the C2000 Gang Programmer via the DLL rather than directly via RS-232 or USB interface using the low-level communication protocol. The C2000 Gang Programmer DLL allows full control of the programmer.

3.5.3.1 Select Image

\[ Tx \rightarrow \quad 3E \ 50 \ 4 \ 4 \ A1 \ 0 \ 0 \ 0 \ CKL \ CKH \]

\[ Rx \rightarrow \quad 90 \ (ACK) \]

The Select Image command sets a number for the current image. After this command, all operations that the C2000 Gang Programmer performs use this image. The C2000 Gang Programmer supports 16 images, 0 through 15. The default image after power on is 0.

A1: holds a number of the image to set (0x00 to 0x0F).

**NOTE:** When the SD card is inserted to SD slot, then the SD card is selected as the default image, and the Select Image command has no effect.
3.5.3.2 Main Process

Tx -> 3E 31 4 4 0 0 0 0 CKL CKH
Rx -> B0 (In Progress)

The Main Process command begins the gang programming cycle, using the operations defined in the SD or internal image memory. The result of the command execution can be determined using the Get Progress Status command described in Section 3.5.2. It should be noted that the Main Progress commands responds as soon as the command is accepted with byte In Progress (0xB0). When the byte In Progress is received, then the Get Progress Status command should be polled to monitor the progress status. As long as the main process is not finished, byte 6 gives a response of In Progress data (0xB0). When the process is finished, byte 6 changes to ACK (0x90) or NACK (0xA0). When ACK is received, then whole process is finished, and all results are available on bytes 8 to 32. See the Get Progress Status command description for details. During the polling process, it is possible to examine all bytes of the progress status and check the current state; for example, what targets are connected or erased. In the comment bytes (34-50) is the current process, and the same message as is displayed on the LCD display.

3.5.3.3 Set Temporary Configuration

Tx -> 3E 56 6 6 A1 0 2 0 DL DH CKL CKH
Rx -> 90 (ACK)

By default the Main Process command takes all configuration and setup from the image memory. It is possible to overwrite some of the configuration parameters and execute the Main Process commands with a modified configuration. The following parameters can be modified: Targets VCC, high or low current, external VCC enable or disable, VCC settle time, communication interface (JTAG), enabled target devices and enable process mask (for example, erase or program verify). The Set Temporary Configuration in C2000 Gang Programmer command allows modification of these parameters.

When the Main Process command is finished, then the temporary setups are erased and the configuration from the image memory is restored. When the modified configuration should be used in the next run, then the temporary configuration should be transferred to C2000 Gang Programmer again before starting the Main Process command.

The Set Temporary Configuration in C2000 Gang Programmer command transfers two data: address index (A1) and one 16-bit data [DL (LSB byte) and DH (MSB byte)].

The following address indexes are defined:

CFG_TMP_CLEAR (2)
Data (DH, DH) is irrelevant.
Remove temporary configuration and take it from the image memory.

CFG_TMP_TASK_MASK (4)
Set the execution mask.
By default execution mask is 0xFFFF (execute all procedures).
Data (DH, DL) can be from 0x0000 up to 0xFFFF.
Currently supported bits in the execution mask:

<table>
<thead>
<tr>
<th>Bit Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECT_TASK_BIT</td>
<td>0x0001</td>
</tr>
<tr>
<td>ERASE_TASK_BIT</td>
<td>0x0002</td>
</tr>
<tr>
<td>BLANKCHECK_TASK_BIT</td>
<td>0x0004</td>
</tr>
<tr>
<td>PROGRAM_TASK_BIT</td>
<td>0x0008</td>
</tr>
<tr>
<td>VERIFY_TASK_BIT</td>
<td>0x0010</td>
</tr>
<tr>
<td>SECURE_TASK_BIT</td>
<td>0x0020</td>
</tr>
<tr>
<td>DCO_CAL_TASK_BIT</td>
<td>0x0040</td>
</tr>
</tbody>
</table>
For example, when the target device must be erased, then only the following data should be send (A1, D).

4, 0x0003

Full command:

```
Tx -> 3E 56 6 6 4 0 2 0 3 0 CKL CKH
```

**CFG_TMP_VCC_VALUE (6)**

Data - VCC value in mV (range from 1800 to 3600)

**CFG_TMP_POWER_VCC_EN (8)**

Data 0 Target devices powered from an external power supply
Data 1 Target devices powered from C2000 Gang Programmer

**CFG_TMP_INTERFACE (10)**

Data JTAG_FAST 0x0004
Data JTAG_MED 0x0005
Data JTAG_SLOW 0x0006
Data SBW_FAST 0x0008
Data SBW_MED 0x0009
Data SBW_SLOW 0x000A

**CFG_TMP_GANG_MASK (12)**

Sum of target bit masks

<table>
<thead>
<tr>
<th>Target</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0x01</td>
</tr>
<tr>
<td>2</td>
<td>0x02</td>
</tr>
<tr>
<td>3</td>
<td>0x04</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>8</td>
<td>0x80</td>
</tr>
</tbody>
</table>

One target only - Target 1  Data = 0x0001
All targets  Data = 0x00FF

**CFG_TMP_VCC_ONOFF (14)**

Immediately turn VCC target on of off

Data 0x0001 ON
Data 0x0000 OFF

**CFG_TMP_ICC_HI_EN (18)**

High (50 mA) current from programmer enable or disable

Data 0x0001 Enable
Data 0x0000 Disable
Detailed Description of Commands

CFG_TMP_IO_INTERFACE (20)
Set interface configuration

Data 0x0000  SBW via TDOI line
Data 0x0001  SBW via RST line

CFG_TMP_RESET (22)
Immediately reset target device

Data 0x0001  Reset target device
Data 0x0000  Release Reset line

CFG_TMP_VCC_SETTLE_TIME (26)

Data 0x0000 to 0x00C8  Settle VCC time in step 20 ms

3.5.3.4 Get Gang Status

Tx -> 3E 58 04 04 A1 0 0 0 0 -- CKL CKH
Rx -> 80 0 n n B0 B1 B2 B3 ... Bn CKL CKH

The Get Gang Status command gets the selected status or results from the C2000 Gang Programmer. The following numbers (A1) are available. See the description of the C2000GANG_GetAPIStatus function (Section 4.1.41) for details of the B0...Bn byte contents.

GET_APP_FLAGS  10
GET_LAST_STATUS  12
GET_LAST_ERROR_NO  14

3.5.3.5 Read Gang Buffer

Tx -> 3E 49 4 4 T 0 0 0 0 -- CKL CKH
Rx -> 80 0 n n D1 D2 D3 D4 D5 D6 D7 D8 ... Dn CKL CKH

The C2000 Gang Programmer contains a temporary data buffer that can be used for writing data to and reading data from each target device. The buffer size is 64 words for each target device - Buffer[8][64];

T = Target device number, 1 to 8
n = Number of words taken from the Buffer[T-1] [..]

3.5.3.6 Write Gang Buffer

Tx -> 3E 4A n+4 n+4 T 0 0 0 0 D1 D2 ... Dn CKL CKH
Rx -> ACK

Write words to selected target’s Buffer -> Buffer[8][64]

T = Target device number, 1 to 8
n = Number of bytes written to Buffer[T-1] [..]
3.5.4 API Firmware Commands That Should Not be Used

3.5.4.1 Interactive Task

Tx -> 3E 46 n n D1 ... Dn CKL CKH
Rx -> 80 0 k k D1 ... Dk CKL CKH

NOTE: Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.2 Erase Image

Tx -> 3E 33 4 4 0 0 0 0 CKL CKH
Rx -> B0 (In Progress)

NOTE: Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.3 Get Info C-D

Tx -> 3E 41 4 4 A1 0 0 0 CKL CKH
Rx -> 80 0 80 80 D1 ... D128 CKL CKH

NOTE: Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.4 Write Info C-D

Tx -> 3E 42 84 84 A1 0 80 0 D1 ... D128 CKL CKH
Rx -> ACK

NOTE: Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.5 Verify Access Key

Tx -> 3E 44 4 4 0 0 0 0 CKL CKH
Rx -> ACK or NACK

NOTE: Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.6 Load Image

Tx -> 3E 43 n n A1 A2 A3 0 n-6 0 D1 ... Dn-6 CKL CKH
Rx -> ACK or NACK

The Load Image command loads the data bytes into the image buffer of the C2000 Gang Programmer. Do not use this function in your application. Use C2000-GANG GUI and C2000-GANG DLL for writing data into the internal image buffer.

3.5.4.7 Verify Image CRC

Tx -> 3E 45 08 08 A1 A2 A3 0 LL LH D1 D2 CKL CKH
Rx -> ACK or NACK

The Verify Image CRC command verifies the image CRC of all written image contents. Do not use this function in your application. Use C2000-GANG GUI and C2000-GANG DLL for writing and verifying data in the internal image buffer.
3.5.4.8 Get Image Header

```
Tx -> 3E 47 6 6 A1 A2 0 0 n 0 CKL CKH
Rx -> 80 0 n n D1 ... Dn CKL CKH
```

**NOTE:**
Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.9 Disable API Interrupts

```
Tx -> 3E 4C 4 4 R R R R CKL CKH
Rx -> ACK
```

**NOTE:**
Do not use this command. This command is used by the API-DLL and GUI only.
3.5.4.10 Display Message

**Detailed Description of Commands**

| Tx  | → 3E 54 n+4 A1 A2 n 0 D1 ... Dn CKL CKH |
| Rx  | → ACK |

**Note:** Do not use this command. This command is used by the API-DLL and GUI only.

3.5.4.11 Set IO State

**Detailed Description of Commands**

| Tx  | → 3E 4E 0C 0C VL VH 08 00 D1 D2 D3 D4 D5 D6 D7 D8 CKL CKH |
| Rx  | → ACK |

Modify static levels on the I/O pins (JTAG lines).

Vcc - \( V_{CC} \) level in mV ( \( V_{CC} = VH \times 256 + VL \))

D1 - Open destination buffer for output and transferred data for each target

- 0 = none
- 1 = TDI (target1 to target8)
- 2 = TDOI (target1 to target8)
- 3 = TMS (target1 to target8)
- 4 = RST (target1 to target8)
- 5 = BSL-RX (target1 to target8)

D2 - Data transferred to the buffer above

- b0 to b7 - target1 to target8

D3 - Output enable bits: 0 = high impedance, 1 = output

- b2 (0x04) - common RST - the same state for all eight targets (Note: if the RST buffer above is selected, then this state is ignored)
- b3 (0x08) - common TEST - the same state for all eight targets
- b4 (0x10) - common TCK - the same state for all eight targets
- b5 (0x20) - common TMS - the same state for all eight targets (Note: if the TMS buffer above is selected, then this state is ignored)

D4 - Output level on all targets: 0 = LOW, 1 = HIGH

- b2 (0x04) - common RST - the same level for all eight targets (Note: if the RST buffer above is selected, then this state is ignored)
- b3 (0x08) - common TEST - the same level for all eight targets
- b4 (0x10) - common TCK - the same level for all eight targets
- b5 (0x20) - common TMS - the same level for all eight targets (Note: if the TMS buffer above is selected, then this state is ignored)

D5 - \( V_{CC} \) enable bits to each target

- b0 to b7 - target1 to target8

D6 - \( I_{CC} \) HI enable: 0 = disable, 1 = enable

D7 - spare

D8 - spare

**Example 1**

Generate a short RST pulse on target 1 only and force RST level LOW on targets 2 to 5 and RST level HIGH on targets 6 and 7. \( V_{CC} \) on targets 1 to 7 is 3.3 V (0x0CE4) and on target 8 is 0 V (disabled).

| Tx  | → 3E 4E 0C 0C E4 0C 08 00 04 60 00 00 7F 00 00 00 CKL CKH |

then

| Tx  | → 3E 4E 0C 0C E4 0C 08 00 04 61 00 00 7F 00 00 00 CKL CKH |
Example 2
Generate a short RST pulse on all targets. $V_{CC}$ on targets 1 to 7 is $3.3 \text{ V (0x0CE4)}$ and on target 8 is $0 \text{ V (disabled)}$.

\begin{verbatim}
Tx -> 3E 4E 0C 0C E4 0C 08 00 00 00 04 00 7F 00 00 00 CKL CKH
then
Tx -> 3E 4E 0C 0C E4 0C 08 00 00 00 04 04 7F 00 00 00 CKL CKH
\end{verbatim}

3.5.4.12 Remote Selftest

\begin{verbatim}
Tx -> 3E 71 n+6 n+6 A1 A2 A3 A4 n 0 D1 D2...Dn CKL CKH
Rx -> 80 0 n n D1 D2 D3 D4 D5 D6 D7 D8...Dn CKL CKH
\end{verbatim}

**NOTE:** Do not use this command. This command is used by the API-DLL and GUI only.
Chapter 4

Dynamic Link Library for C2000 Gang Programmer

4.1 C2000-GANG.dll Description

The C2000-GANG.dll is a Dynamic Link Library (DLL) that provides functions for controlling the C2000 Gang Programmer. The C2000-GANG.dll controls the Gang Programmer via RS 232 or USB (VCP) interface. The C2000-GANG.dll greatly simplifies the control of the C2000 Gang Programmer, because the user is isolated from the complexities of the communication via USB or RS232 interface protocol. Together with the C2000-GANG.dll are provided two more files that should be used during the compilation process.

- C2000-GANG.h: This file is the header file for the C2000-GANG.dll, and provides the function prototypes, typedefs, #defines, and data structures for the functions of the C2000-GANG.dll. This file is normally located in the same directory as the application source file and should be included by the application source files. This file is used during compile time.
- C2000-GANG.lib: This file is the library file for the C2000-GANG.dll and is required to access the DLL functions. This file is normally located in the same directory as the application source file and should be added to the Linker Object, Library Modules list of the application. This file is used during link time.

All C2000 Gang Programmer DLL functions have the same "C2000GANG_" prefix in the function name. It is easy in the application software to determine what functions are used with the C2000-GANG.dll. The following sections describe each function.

Examples of using the new C2000-GANG.dll are provided and can be found in these locations (if the default installation directory was used):

- C:\Program Files\Texas Instruments\C2000-GANG\Examples\C_Applications_C2000_DLL
- C:\Program Files\Texas Instruments\C2000-GANG\Examples\Cpp_Applications_C2000_DLL

These examples show how to configure the C2000 Gang Programmer to the desired target device type, select code, and subsequently program connected devices. In addition, the examples also show how to write a serial number into a custom memory location. To use these examples copy the MSG-Gang.dll into the working directory.
4.1.1 C2000GANG_GetDataBuffers_ptr

C2000GANG_GetDataBuffers_ptr gives access to the internal data buffers that provide code contents, data to be programmed, and buffers of data that was read from each target device with following structure.

```c
typedef struct
{
    WORD SourceCode[DBUFFER_SIZE]; //source code from the file
    WORD UsedCode[DBUFFER_SIZE]; //combined data (source code, serialization etc)
    WORD CommonTx[DBUFFER_SIZE]; //data used to writing - the same data to all targets
    WORD GangTx[DBUFFER_SIZE][GANG_SIZE]; //selective data used to writing
    WORD GangRx[DBUFFER_SIZE][GANG_SIZE]; //data read from all targets
    WORD Tmp[DBUFFER_SIZE];
    WORD CSM_Passsword[NO_OF_CSM_PASSWORDS][CSM_PASSWORD_SIZE];
    BYTE Flag_ScrCode[DBUFFER_SIZE]; //0 - empty 1-valid data in SourceCode[x];
        #define CODE1_FLAG 1
        #define CODE2_FLAG 2
        #define APPEND_CODE_FLAG 4
    BYTE Flag_UsedCode[DBUFFER_SIZE]; //0 - empty 1-valid data in UsedCode[x];
    BYTE Flag_WrEn[DBUFFER_SIZE]; //0 - none 1-write/verify enable in FlashMem[x]
    BYTE Flag_EraseEn[DBUFFER_SIZE]; //0 - none 1-erase enable in FlashMem[x]
    BYTE Flag_RdEn[DBUFFER_SIZE]; //0 - none 1-read enable in FlashMem[x]
    BYTE Flag_Sp1[DBUFFER_SIZE]; //spare
    BYTE Flag_Sp2[DBUFFER_SIZE]; //spare
    BYTE Flag_Sp3[DBUFFER_SIZE]; //spare
    BYTE Flag_CSM_Passw[NO_OF_CSM_PASSWORDS][CSM_PASSWORD_SIZE]; //spare
} DATA_BUFFERS;
```

In the application software, the pointer to the dat buffer can be initialized as follows.

```c
DATA_BUFFERS *DBuf;
void *temp;
C2000GANG_GetDataBuffers_ptr((&temp));
DBuf = (DATA_BUFFERS *)temp;
```

**Syntax**

```
LONG C2000GANG_GetDataBuffers_ptr(void ** x)
```
4.1.2  **C2000GANG_SetGangBuffer, C2000GANG_GetGangBuffer**

The C2000 Gang Programmer contains a temporary data buffer that can be used for writing and reading data to each target device. Buffer size is 64 words for each target device.

Buffer[8][64];

**Syntax**

LONG C2000GANG_SetGangBuffer(BYTE target, BYTE size, WORD *data)
LONG C2000GANG_GetGangBuffer(BYTE target, BYTE size, WORD *data)

**Arguments**

- **BYTE target**  Target number (1 to 8)
- **BYTE size**  Size of data (1 to 64)
- **WORD *data**  Pointer to data buffer from where data is taken or to where the data should be saved

**Result**

LONG  Error code
4.1.3  **C2000GANG_GetDevice**

Reads all specific parameters of a device type from the internal C2000-GANG .DLL table and returns data related to the selected device.

**Syntax**

```c
LONG WINAPI C2000GANG_GetDevice(LPTSTR lpszDeviceName, void **lpData)
```

**Arguments**

- `LPTSTR lpszDeviceName`  
  MCU name. The device name; for example, 'C2000F5438A' for desired MCU or (blank) for currently selected MCU

- `void *lpData`  
  Pointer to internal structure

**Result**

- `LONG`  
  Error code

```c
typedef struct
{
    long Group;
    long RAM_size;
    long OTP_start_addr;
    long OTP_end_addr;
    long MainMem_start_addr;
    long MainMem_end_addr;
    long family_index;
    long InternalOSC_kHz;
    long spare[32];
} DEVICE_INFO;
extern DEVICE_INFO device;

In the application software, the pointer to the device info structure can be initialized as follows.
```

```c
DEVICE_INFO *Device;
void *temp;
C2000GANG_GetDevice(" ", &temp);
Device = (DEVICE_INFO *)temp;
```
4.1.4 C2000GANG_LoadFirmware

Load firmware from C2000-GANG.dll to C2000 Gang Programmer,

**NOTE:** Do not use this command. This command is used by the API-DLL and GUI only.

**Syntax**

LONG C2000GANG_LoadFirmware(void)

4.1.5 C2000GANG_InitCom

C2000GANG_InitCom opens a communications port, sets the baudrate and checks if the C2000 Gang Programmer is present.

**Syntax**

LONG C2000GANG_InitCom(LPTSTR lpszPort, LONG lBaud)

**Arguments**

char * lpszComPort   Name of the port
LONG lBaudRate       Baud rate

**Result**

LONG   Error code

4.1.6 C2000GANG_ReleaseCom

Release communications port

**Syntax**

LONG C2000GANG_ReleaseCom(void)

**Arguments**

None

**Result**

LONG   Error code
4.1.7 **C2000GANG_GetErrorString**

Returns the error string for the selected error number (response from any functions that returns error status).

**Syntax**

```c
LPTSTR C2000GANG_GetErrorString(LONG lErrorNumber)
```

**Arguments**

- **LONG lErrorNumber**
  - Error number

**Result**

- **LPTSTR**
  - Error string

4.1.8 **C2000GANG_SelectBaudrate**

C2000GANG_SelectBaudrate sets the rate of the serial communications. The default is 9600 baud. Baud rate index 0 to 4, representing the baud rate. The Select Baud Rate command takes effect (that is, changes the baud rate) immediately.

**Syntax**

```c
LONG C2000GANG_SelectBaudrate(LONG lBaud)
```

**Arguments**

- **LONG lBaud**
  - Baud rate in bytes per second
  - 0 = 9600 baud (default)
  - 1 = 19200 baud
  - 2 = 38400 baud
  - 3 = 57600 baud
  - 4 = 115200 baud

**Result**

- **LONG**
  - Error code

4.1.9 **C2000GANG_GetDiagnostic**

See the Get Diagnostic command (Section 3.5.2.4) for detailed information about received data contents.

**Syntax**

```c
LONG C2000GANG_GetDiagnostic(void **lpData)
```

**Arguments**

- **void ** lpData**
  - Pointer to data buffer

**Result**

- **LONG**
  - Error code
4.1.10 **C2000GANG_MainProcess**

C2000GANG_MainProcess starts the execution if all function saved inside image memory (or SD card memory). That includes targets initialization, fuse check, memory erase, blank check, program, verification, and more, if selected (for example, DCO calibration).

**Syntax**

```c
LONG C2000GANG_MainProcess(LONG timeout)
```

**Arguments**

- LONG timeout
  - In seconds

**Result**

- LONG
  - Error code

4.1.11 **C2000GANG_InteractiveProcess**

C2000GANG_InteractiveProcess starts the execution if all function provided in the interactive mode, similar to the C2000GANG_MainProcess function; however, data is taken from the PC, not from the image (or SD) memory.

**Syntax**

```c
LONG C2000GANG_InteractiveProcess(LONG timeout)
```

**Arguments**

- LONG timeout
  - In seconds

**Result**

- LONG
  - Error code

4.1.12 **C2000GANG_Interactive_Open_Target_Device**

C2000GANG_Interactive_Open_Target_Device is used in the interactive mode and in initializing access to target devices (setting Vcc, checking fuse, and initializing JTAG communication with target devices). The argument 'name' is displayed on the LCD display. It can contains no more then 16 characters. Extra characters are ignored.

**Syntax**

```c
LONG C2000GANG_Interactive_Open_Target_Device(LPTSTR name)
```

**Arguments**

- LPTSTR name

**Result**

- LONG
  - Error code
4.1.13  C2000GANG_Interactive_Close_Target_Device

C2000GANG_Interactive_Close_Target_Device is used in the interactive mode and in closing access to target devices.

Syntax

LONG C2000GANG_Interactive_Close_Target_Device(void)

Result

LONG Error code

4.1.14  C2000GANG_Interactive_DefReadTargets

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_DefReadTargets reads the contents of the selected target devices (one to eight targets) simultaneously from Start_addr to the End_addr and saves it in the internal data buffer (see DATA_BUFFERS dat; structure for details).

Syntax

LONG C2000GANG_Interactive_DefReadTargets(BYTE mask, BYTE bar_min, BYTE bar_max, LONG Start_addr, LONG End_addr)

Arguments

BYTE mask          Mask of the target devices that data should be read from
BYTE bar_min       Beginning progress bar value displayed on the LCD display (valid values are 0 to 100).
BYTE bar_max       Ending — „„„
LONG Start_addr    Data read from Start_addr location
LONG End_addr      Data read up to the End_addr location

Result

LONG Error code

4.1.15  C2000GANG_Interactive_ReadTargets

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_ReadTargets reads the contents of the selected target devices (one to eight targets) simultaneously from the locations specified in the configuration memory (see configuration setup for details) and saves it in the internal data buffer (see DATA_BUFFERS dat; structure for details).

Syntax

LONG C2000GANG_Interactive_ReadTargets(BYTE mask)

Arguments

BYTE mask          Mask of the target devices that data should be read from

Result

LONG Error code
4.1.16 C2000GANG_Interactive_ReadWords

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_ReadWords reads contents from one selected target device and saves it in the desired data buffer.

Syntax

LONG WINAPI C2000GANG_Interactive_ReadWords( BYTE target_no, LONG addr, LONG size, WORD * data )

Arguments

BYTE target_no Target number (one to eight) of the desired target device
LONG addr Start address from read data
LONG size Number of read words
WORD *data Pointer to buffer where data would be saved

Result

LONG Error code

4.1.17 C2000GANG_Interactive_WriteWord_to_RAM

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_WriteWord_to_RAM writes one word (16 bits) to any RAM or I/O location. The address must be even.

Syntax

LONG C2000GANG_Interactive_WriteWord_to_RAM(LONG addr, LONG data)

Arguments

LONG addr RAM address location
BYTE data Data (16 bits)

Result

LONG Error code
4.1.18  C2000GANG_Interactive_WriteWords_to_RAM

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_WriteWords_to_RAM writes 'size' number of words to any RAM or I/O location. The starting address must be even.

Syntax

LONG C2000GANG_Interactive_WriteWords_to_RAM(LONG addr, LONG size, WORD * data)

Arguments

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LONG addr</td>
<td>RAM address location</td>
</tr>
<tr>
<td>LONG size</td>
<td>Number of words to be written</td>
</tr>
<tr>
<td>WORD * data</td>
<td>Data block</td>
</tr>
</tbody>
</table>

Result

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LONG</td>
<td>Error code</td>
</tr>
</tbody>
</table>
4.1.19  C2000GANG_Interactive_WriteWords_to_FLASH

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_WriteWords_to_FLASH writes ‘size’ number of words to any flash location. The starting address must be even.

Syntax

LONG C2000GANG_Interactive_WriteWords_to_FLASH(LONG addr, LONG size, WORD * data)

Arguments

LONG addr  RAM address location
LONG size  Number of words to be written
WORD * data  Data block

Result

LONG  Error code

4.1.20  C2000GANG_Interactive_Copy_Gang_Buffer_to_RAM

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_Copy_Gang_Buffer_to_RAM writes ‘size’ number of words from the internal Gang_Buffer[8][64] to RAM - simultaneously to all active target devices. Data for each target can be different. Contents from Gang_Buffer[0][n] are written to target 1, contents from Gang_Buffer[1][n] are written to target 2, and contents from Gang_Buffer[7][n] are written to target 8.

Syntax

LONG C2000GANG_Interactive_Copy_GANG_Buffer_to_RAM(LONG addr, LONG size)

Arguments

LONG addr  RAM address location
LONG size  Number of words to be written (up to 64)

Result

LONG  Error code
4.1.21 **C2000GANG_Interactive_Copy_Gang_Buffer_to_FLASH**

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_Copy_Gang_Buffer_to_FLASH writes ‘size’ number of words from the internal Gang_Buffer[8][64] to FLASH, simultaneously to all active target devices. Data for each target can be different (for example, calibration data or serial numbers). Contents from Gang_Buffer[0][n] are written to target 1, contents from Gang_Buffer[1][n] are written to target 2, and contents from Gang_Buffer[7][n] are written to target 8.

**Syntax**

LONG C2000GANG_Interactive_Copy_Gang_Buffer_to_FLASH(LONG addr, LONG size)

**Arguments**

- LONG addr   FLASH address location
- LONG size   Number of words to be written

**Result**

LONG   Error code

4.1.22 **C2000GANG_Interactive_EraseSectors**

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_EraseSectors erases flash sectors starting from the sector with address location StartAddr and ending with the sector with EndAddr location.

**Syntax**

LONG C2000GANG_Interactive_EraseSectors(LONG StartAddr, LONG EndAddr)

**Arguments**

- LONG StartAddr   FLASH address location of the first sector to be erased. Address aligned to the sector size.
- LONG EndAddr   Address of the last sector to be erased. The address is aligned to the sector size.

**Result**

LONG   Error code
4.1.23  C2000GANG_Interactive_BlankCheck

Note: The target device must be opened first if not open yet (see C2000GANG_Interactive_Open_Target_Device, Section 4.1.12).

C2000GANG_Interactive_BlankCheck verifies all flash contents starting from StartAddr and ending with EndAddr are 0xFF.

Syntax

LONG C2000GANG_Interactive_BlankCheck(LONG StartAddr, LONG EndAddr)

Arguments

LONG StartAddr   Blank check (if 0xFF) from StartAddr location to EndAddr location Start Address must be even, End address must be odd.
LONG EndAddr

Result

LONG  0 = blank
      10 = error (not blank or error)
4.1.24 **C2000GANG_SelectImage**

**Syntax**

\[
\text{LONG C2000GANG\_SelectImage(LONG \ lImage)}
\]

**Arguments**

- LONG \ lImage : Image number (0 to 15)

**Result**

- LONG \ : Error code

### 4.1.25 **C2000GANG\_EraseImage**

C2000GANG\_EraseImage clears (presets with 0xFF) active image memory. Use the C2000GANG\_SelectImage function to select desired image memory.

**Syntax**

\[
\text{LONG C2000GANG\_EraseImage(void)}
\]

**Result**

- LONG \ : Error code

### 4.1.26 **C2000GANG\_CreateGangImage**

C2000GANG\_CreateGangImage creates a command script and the data to be written to target devices according to the current C2000 Gang Programmer configuration. After the image data is prepared, then it can be saved in the selected image memory by calling the C2000GANG\_LoadImageBlock function.

**Syntax**

\[
\text{LONG C2000GANG\_CreateGangImage(LPTSTR name)}
\]

**Arguments**

- LPTSTR \ name : Image name; maximum of 16 characters. Image name is displayed on the LCD display.

**Result**

- LONG \ : Error code
4.1.27 **C2000GANG_LoadImageBlock**

C2000GANG_LoadImageBlock saves the previously prepared image contents into the selected image memory. The selected image memory must be erased first. Use the following sequence for preparing and saving an image into image memory:

C2000GANG_CreateGangImage(name);
C2000GANG_SelectImage(lImage);
C2000GANG_EraseImage();
C2000GANG_LoadImageBlock();
C2000GANG_VerifyPSAImageBlock();

**Syntax**

LONG C2000GANG_LoadImageBlock(void)

**Arguments**

None

**Result**

LONG Error code

4.1.28 **C2000GANG_VerifyPSAImageBlock**

C2000GANG_VerifyPSAImageBlock verifies the checksum of all blocks used in the selected image memory. The image memory number should be selected first using C2000GANG_SelectImage function.

**Syntax**

LONG C2000GANG_VerifyPSAImageBlock(void)

**Arguments**

None

**Result**

LONG Error code

4.1.29 **C2000GANG_ReadImageBlock**

C2000GANG_ReadImageBlock reads the header from the selected image memory. A maximum of 127 words can be read. Access to the remaining image memory (up to 512 kBytes (256 kWords)) is blocked.

**Syntax**

LONG C2000GANG_ReadImageBlock(LONG addr, LONG size, void *lpData)

**Arguments**

LONG address
LONG size
void *lpData Pointer to word buffer where the result is saved

**Result**

LONG Error code
4.1.30 **C2000GANG_Read_Code_File**

C2000GANG_Read_Code_File reads or appends a code file or reads a password file and saves it in its internal buffer. By default, the file is treated as the main code file as long as the setup has not redirected the file to ‘Append code’ or ‘Password code’ using the C2000GANG_SetConfig function.

C2000GANG_SetConfig(CFG_OPEN_FILE_TYPE, CODE_FILE_INDEX)
C2000GANG_SetConfig(CFG_OPEN_FILE_TYPE, APPEND_FILE_INDEX)
C2000GANG_SetConfig(CFG_OPEN_FILE_TYPE, PASSW_FILE_INDEX)

When the C2000GANG_Read_Code_File is executed, the flag set by C2000GANG_SetConfig(CFG_OPEN_FILE_TYPE, CODE_FILE_INDEX) is set to the default value of Read Code File.

**Syntax**

LONG C2000GANG_Read_Code_File(LPTSTR FullPath)

**Arguments**

LPTSTR FullPath  Path to the code file (*.hex,.txt or *.s19, *.s28, *.s37)

**Result**

LONG  Error code

4.1.31 **C2000GANG_Save_Config, C2000GANG_Load_Config, C2000GANG_Default_Config**

The current configuration file can be saved using the C2000GANG_Save_Config function and recalled when required using the C2000GANG_Load_Config function. The current configuration can be erased and the default configuration loaded by calling the C2000GANG_Default_Config function. When the new configuration is loaded, some of the parameters can be modified item-by-item using C2000GANG_SetConfig and can be read from the configuration item-by-item using C2000GANG_GetConfig. The C2000 Gang Programmer configuration can also be created using the C2000 Gang Programmer GUI software (C2000-GANG-exe) by setting the desired programmer setup, verifying it, and then saving the configuration using the Save Setup as... option. The setup created using the GUI can be loaded by the DLL when the above mentioned configuration file is selected using the C2000GANG_Load_Config function.

**Syntax**

LONG C2000GANG_Save_Config(LPTSTR filename)
LONG C2000GANG_Load_Config(LPTSTR filename)
LONG C2000GANG_Default_Config(void)

**Arguments**

LPTSTR filename  Path to the configuration file

**Result**

LONG  Error code
4.1.32 C2000GANG_SetConfig, C2000GANG_GetConfig

Syntax
LONG C2000GANG_SetConfig(LONG index, LONG data)

Arguments
LONG index  Configuration index. See list below.
LONG data   Configuration data

Result
LONG       Error code

Syntax
LONG C2000GANG_GetConfig(LONG index)

Arguments
LONG index  Configuration index. See list below.

Result
LONG data   Configuration data

4.1.33 **C2000GANG_GetNameConfig, C2000GANG_SetNameConfig**

Set or Get file names for code file, script file, password file or warning sounds.

**Syntax**

```c
LPTSTR C2000GANG_GetNameConfig(LONG index)
```

**Arguments**

| LONG index | See list of indexes below |

**Result**

| LPTSTR | File name |

**Syntax**

```c
LONG C2000GANG_SetNameConfig(LONG index, LPTSTR name)
```

**Arguments**

| LONG index | See list of indexes below |
| LPTSTR file_name |

**Result**

| LONG | Error code |

```c
#define CODEFILE_INDEX 0
#define SCRIPTFILE_INDEX 1
#define PASSWORDFILE_INDEX 2
#define SOUNDERRFILE_INDEX 3
#define SOUNDOKFILE_INDEX 4
#define SOUNDWARNINGFILE_INDEX 5
```
4.1.34 C2000GANG_SetTmpGANG_Config

See the Set temporary configuration command (Section 3.5.3.3) for details.

Syntax

LONG C2000GANG_SetTmpGANG_Config(LONG no, LONG data)

Arguments

LONG no Index list of indexes below
LONG data

Result

LONG Error code

//----- TMP_CFG_INDEX -----------
#define CFG_TMP_CLEAR 2
#define CFG_TMP_TASK_MASK 4
#define CFG_TMP_VCC_VALUE 6
#define CFG_TMP_POWER_VCC_EN 8

#define CFG_TMP_VCC_SETTLE_TIME 26

4.1.35 C2000GANG_GetLabel

See the Get Label command (Section 3.5.2.9) for detailed LABEL information.

Syntax

LONG C2000GANG_GetLabel(BYTE *Data)

Arguments

BYTE *Data Pointer to data buffer where the label is saved

Result

LONG Error code
4.1.36  **C2000GANG_GetInfoMemory, C2000GANG_SetInfoMemory**

Reads or writes 64 words to the internal Information memory. Information memory contains configuration data such as LCD contrast and USB port configuration, and it is not intended to be modified by the user. Use the GUI software to set the Information memory.

**Syntax**

LONG C2000GANG_GetOTPMemory(BYTE page, WORD *data)
LONG C2000GANG_SetOTPMemory(BYTE page, WORD *data)

**Arguments**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYTE page</td>
<td>Page info 0 or 1</td>
</tr>
<tr>
<td>WORD *data</td>
<td>Pointer to or from data buffer</td>
</tr>
</tbody>
</table>

**Result**

LONG Error code
4.1.37  **C2000GANG_Get_qty_MCU_Family, C2000GANG_Get_MCU_FamilyName, C2000GANG_Check_MCU_Name, C2000GANG_Get_MCU_Name**

Set of functions that allows to get names of all supported MCU's, names of MCU groups and subgroups.

**Syntax**

```c
LONG C2000GANG_Get_qty_MCU_Family(void)
LONG C2000GANG_Get_MCU_FamilyName(LONG index, LPTSTR name)
LONG C2000GANG_Check_MCU_Name(LPTSTR name)
LONG C2000GANG_Get_MCU_Name(LONG group_index, LONG index, LPTSTR name)
```

Use these functions in the following order:

```c
typedef struct
{
  int no;
  char name[24];
} MCU_FAMILY;

MCU_FAMILY MCU_family_list[30];

typedef struct
{
  int index;
  char name[24];
} MCU_NAME;

MCU_NAME MCU_name_list[100];

n = C2000GANG_Get_qty_MCU_Family(); //get no of MCU groups
for(k=0; k<n; k++)
{
  p = C2000GANG_Get_MCU_FamilyName(k, MCU_family_list[k].name);
  if(p == 0) break;
  MCU_family_list[k].no = p;
}
```

Currently following names and numbers should be received using above functions:

```c
{ F28FIXED, " F28xx Fixed-point" },
{ F28PICCOLO, " F28xx Piccolo" },
{ F28DELFINO, " F28xx Delfino" },
```

List of the MCU names in selected group can be taken as follows (as an example - list of the MCUs from the F28xx group (group number F28FIXED, defined in DLL header file)):

```c
for(n = 0; n< 100; n++) MCU_name_list[n].index = 0;
for(n = 0; n< 100; n++)
{
  p = C2000GANG_Get_MCU_Name(50, n, MCU_name_list[n].name);
  if(p == 0) break;
  MCU_name_list[n].index = n;
}
4.1.38  **C2000GANG_Set_MCU_Name**

The C2000GANG_Set_MCU_Name allows to select desired target MCU.

**Syntax**

LONG C2000GANG_Set_MCU_Name(LPTSTR name);

**Arguments**

LPTSTR MCU_name  
MCU name, the same as it is listed in the GUI software

**Result**

LONG  
Error code

4.1.39  **C2000GANG_HW_devices**

The C2000GANG_HW_devices function scanning all available COM ports and saving information about these ports in following structure.

```c
#define MAX_COM_SIZE 60
#define HW_NAME_SIZE 30
typedef union
{
    unsigned char bytes[HW_NAME_SIZE];
    struct
    {
        unsigned short ComNo;
        char ComName[7];
        char description[HW_NAME_SIZE-2-7];
    }x;
}COM_PORTS_DEF;
COM_PORTS_DEF *AvailableComPorts = NULL;
C2000GANG_HW_devices(MAX_COM_SIZE, (void **) &AvailableComPorts);
```

If detected, USB VCP information is placed at the first location.

**Syntax**

LONG C2000GANG_HW_devices(LONG max, void **AvailableComPorts)

**Arguments**

LONG max
void **AvailableComPorts

**Result**

LONG  
Error code
4.1.40 **C2000GANG_GetProgressStatus**

C2000GANG_GetProgressStatus gets progress status from C2000 Gang Programmer. The data received contains a Gang Mask of all processes done in the previous function. Each bit in the Gang mask represents one targeted device:

- bit 0 → Target 1, bit 1 → Target 2, ... bit 7 → Target 8

For example, when `connected_gang_mask` is 0x7A, then targets 2, 4, 5, 6, and 7 are detected, and communication with these targets is established. The cumulative mask contains the final result for all targets.

**Syntax**

```c
LONG C2000GANG_GetProgressStatus(void *lpData)
```

**Arguments**

- `void *lpData` Pointer to structure below

**Result**

- `LONG` Error code

```c
#define SCRIPT_TEXT_SIZE 16
union GANG_PROGRESS_STATUS {
  BYTE bytes[PROGRESS_STATUS_SIZE+4];
  struct {
    BYTE header;
    BYTE ctr;
    WORD task_ctr; //byte offset - 0
    WORD chunk_ctr; //byte offset - 2
    BYTE run; //byte offset - 4
    BYTE ack; //byte offset - 5
    WORD Finished_tasks_mask; //byte offset - 6,7
    //--- task mask bits ----
    // CONNECT_TASK_BIT 0x0001
    // ERASE_TASK_BIT 0x0002
    // BLANKCHECK_TASK_BIT 0x0004
    // PROGRAM_TASK_BIT 0x0008
    // VERIFY_TASK_BIT 0x0010
    // SECURE_TASK_BIT 0x0020
    // FREQ_TEST_TASK_BIT 0x0040
    //spare 0x0080 to 0x4000
    // RST_AND_START_FW_BIT 0x8000
    BYTE cumulative; //byte offset - 8
    //target masks
    // TARGET_1_MASK 0x01
    // TARGET_2_MASK 0x02
    // TARGET_3_MASK 0x04
    // TARGET_4_MASK 0x08
    // TARGET_5_MASK 0x10
    // TARGET_6_MASK 0x20
    // TARGET_7_MASK 0x40
    // TARGET_8_MASK 0x80
    BYTE Rq_gang_mask; //byte offset - 9
    BYTE Connected_gang_mask; //byte offset - 10
    BYTE Erased_gang_mask; //byte offset - 11
    BYTE BlankCheck_gang_mask; //byte offset - 12
    BYTE Programmed_gang_mask; //byte offset - 13
    BYTE Verified_gang_mask; //byte offset - 14
    BYTE Secured_gang_mask; //byte offset - 15
    BYTE spare[6]; //byte offset - 16..21
```
BYTE error_no; // byte offset - 22
BYTE VTIO_32mV; // byte offset - 23
BYTE VccSt_LOW; // byte offset - 24
BYTE VccSt_HI; // byte offset - 25

// VccSt_LOW, VccSt_HI provide 2 bits to each target.
// Bit A for each target and bit B for each target.
// Bits B A
// 0 0 Vcc below 0.7V
// 0 1 Vcc below Vcc min (0.7V < Vcc < Vcc min)
// 1 0 Vcc over Vcc min (OK status)
// 1 1 Vcc over 3.8V
BYTE VccErr; // byte offset - 26

// current Vcc below min
BYTE VccErr_Cumulative; // byte offset - 27
// Cumulative (during programing) Vcc below min
BYTE JTAG_init_err_mask; // byte offset - 28
BYTE JTAG_Fuse_already_blown_mask; // byte offset - 29
BYTE Wrong_MCU_ID_mask; // byte offset - 30
BYTE Progress_bar; // byte offset - 31

// 0...100%
char comment[SCRIPT_TEXT_SIZE]; // byte offset - 32..47
}st;
4.1.41 C2000GANG_GetAPIStatus

C2000GANG_GetAPIStatus gets the selected status or results from the C2000 Gang Programmer. The following numbers (no) are available:

- GET_APP_FLAGS 10
- GET_LAST_STATUS 12
- GET_LAST_ERROR_NO 14

Syntax

LONG C2000GANG_GetAPIStatus (LONG no, BYTE *data)

Arguments

- LONG no: Status type
- BYTE *data: Pointer to status results. See below.

Result

LONG Error code

no = GET_APP_FLAGS (10)
response:
Byte-0
  b0 (LSB) Hardware rev-0
  b1 initialization finished (after power-up)
  b2 access key CRC error
  b3 invalid access key
  b4 running from SD card
  b5 File in SD card found
  b6 target secure device in process
  b7 keypad enabled
Byte-1
  b0 key pressed
  b1..b7 spare
Byte-2 spare
Byte-3 spare

no = GET_LAST_STATUS (12)
response:
Byte-0 Error number in the last execute transaction
Byte-1 targets connection mask
Byte-2 active targets mask
Byte-3 targets error mask
Byte-4..7 spare

no = GET_LAST_ERROR_NO (14)
Byte-0 last error number from C2000 Gang Programmer for any command
  error numbers 1...255 - see error list numbers
4.1.42 C2000GANG_Set_IO_State

The C2000GANG_Set_IO_State modifies the static levels on the I/O pins (JTAG lines). The JTAG lines can be set to the desired level (low or high) or they can be high impedance. The state and the level can be the same on all outputs. The level on one selected line (RST, TDI, TDOI, TMS or BSL-RX) can be different for each target.

Syntax

```
LONG C2000GANG_Set_IO_State(long Vcc_mV, BYTE * data);
```

Arguments

- **Vcc_mV**: Voltage level in mV on the target's VCC
- **data[0]**: Open destination buffer for output and transferred data for each targets.
  - 0 = None
  - 1 = TDI (target1 to target8)
  - 2 = TDOI (target1 to target8)
  - 3 = TMS (target1 to target8)
  - 4 = RST (target1 to target8)
  - 5 = BSL-RX (target1 to target8)
- **data[1]**: Data transferred to the buffer above.
  - b0 to b7 - target1 to target8
- **data[2]**: Output enable bits: 0 = high impedance, 1 = output
  - b2 (0x04) - common RST - the same state for all 8 targets (Note: if the RST buffer above is selected, then this state is ignored)
  - b3 (0x08) - common TEST - the same state for all 8 targets
  - b4 (0x10) - common TCK - the same state for all 8 targets
  - b5 (0x20) - common TMS - the same state for all 8 targets (Note: if the TMS buffer above is selected, then this state is ignored)
- **data[3]**: Output level on all targets: 0 = LOW, 1 = HIGH
  - b2 (0x04) - common RST - the same level for all eight targets (Note: if the RST buffer above is selected, then this state is ignored)
  - b3 (0x08) - common TEST - the same level for all eight targets
  - b4 (0x10) - common TCK - the same level for all eight targets
  - b5 (0x20) - common TMS - the same level for all eight targets (Note: if the TMS buffer above is selected, then this state is ignored)
- **data[4]**: VCC enable bits to each target
  - b0 to b7 - target1 to target8
- **data[5]**: Icc HI enable: 0 = disable, 1 = enable
- **data[6]**: spare
- **data[7]**: spare

Example 1

Generate a short RST pulse on target 1 only and force RST level LOW on targets 2 to 5 and RST level HIGH on targets 6 and 7. VCC on targets 1 to 7 is 3.3 V (0x0CE4) and on target 8 is 0 V (disabled).

```
WORD data[4] = { 0460 0000 7F00 0000 };  
C2000GANG_Set_IO_State( 3300, data );  
then  
data[0] = 0x0461;  
C2000GANG_Set_IO_State( 3300, data );
```
Example 2

Generate a short RST pulse on all targets. $V_{CC}$ on targets 1 to 7 is 3.3 V (0x0CE4) and on target 8 is 0 V (disabled).

```c
WORD data[4] = { 0000 0400 7F00 0000 };  
C2000GANG_Set_IO_State( 3300, data );

then

data[2] = 0x0400;  
C2000GANG_Set_IO_State( 3300, data );
```
The following pages show the schematics for the C2000 Gang Programmer.

## Chapter 6

**Supported MCU List**

### 6.1 F28x Fixed Point MCU

TMS320F2801, TMS320F28015, TMS320F28016, TMS320F2802, TMS320F28044, TMS320F2806, TMS320F2808, TMS320F2809, TMS320F2810, TMS320F2811, TMS320F2812, TMS320F28232, TMS320F28234, TMS320F28235

### 6.2 Piccolo™ F280x

TMS320F28022, TMS320F28023, TMS320F28024, TMS320F28025, TMS320F28026, TMS320F28027, TMS320F28035, TMS320F28032, TMS320F28033, TMS320F28034, TMS320F28030, TMS320F28031, TMS320F28021, TMS320F28020, TMS320F28020, TMS320F28020, TMS320F28062, TMS320F28062U, TMS320F28063, TMS320F28063U, TMS320F28064, TMS320F28064U, TMS320F28065, TMS320F28065U, TMS320F28066, TMS320F28066U, TMS320F28067, TMS320F28067U, TMS320F28068, TMS320F28068U, TMS320F28069, TMS320F28069U, TMS320F28050, TMS320F28051, TMS320F28052, TMS320F28052F, TMS320F28052M, TMS320F28053, TMS320F28054, TMS320F28054F, TMS320F28054M, TMS320F28055, TMS320F280220, TMS320F280230, TMS320F280260, TMS320F280270, TMS320F28075, TMS320F28074

### 6.3 Delfino F283xx

TMS320F28332, TMS320F28334, TMS320F28335, TMS320F28377D, TMS320F28376D, TMS320F28375D, TMS320F28374D, TMS320F28376S, TMS320F28374S

### 6.4 C28x + ARM®

# Revision History

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
