Description

This reference design automatically provides a back-up voltage during a power interruption. It manages the charging of supercaps and provides reverse blocking protection. The maximum supercap charging current and voltage can be adjusted. When the input voltage fails a buck-boost converter (TPS63802) takes over and generates a constant backup voltage. The supercap capacitance and voltage define the energy which is available for the backup. The PMP30693 provides a stable backup output of 3.7 V at 300 mA for more than 100 s until the output voltage drops.

A supercap discharge resistor R\textsubscript{discharge} was assembled for this measurement. The resistor was connected between the supercap voltage (V\_SC (2x) and ground. It forces a discharge of the supercaps.
