Topology: Inverting Buck-Boost (dual outputs negative and positive).
Device: TPS54340
Unless otherwise mentioned all measurements were done with 12V input voltage and 0.7A output current on each output
1 Startup

The startup waveform is shown in the Figure 1. The input voltage was set at 12V, with 0.7A load at the output on each output. Power supply was connected.

Figure 1

- Ch1=> input voltage 5V/div
- Ch2=> output voltage 10V/div (-VOUT)
- Ch3=> output voltage 10V/div (+VOUT)
- 2ms/div
## 2 Shutdown

The shutdown waveform is shown in the Figure 2. The input voltage was set at 12V, with 0.7A load on each output. Power supply was disconnected.

![Figure 2](image-url)

**Ch1** => input voltage 5V/div  
**Ch2** => output voltage 10V/div (VOUT+)  
**Ch3** => output voltage 10V/div (VOUT-)  
200µs/div
3 Efficiency

The efficiency is shown in the Figure 3 below. The input voltage was set to 12V. The output currents were changed together (-IOUT = +IOUT). The discontinuity in the curve reflects the transition from discontinuous to continuous mode.

Figure 3
4 Load Regulation

The load regulation of the output is shown in the Figure 4 below.

![Figure 4](image-url)
5 Line Regulation

Line regulation at 0.7A output current is shown in Figure 5

![Line Regulation Graph](image)
With the same measurement the full load efficiencies across input voltage were calculated.
6 Cross Regulation

The output currents were changed separately (0A, 0.2A, 0.4A, 0.7A)

Figure 7 shows the effects on the positive output voltage, if the negative output current is varied. The different curves represent the positive output current settings.

Figure 7

Figure 8 shows the effects on the negative output voltage, if the positive output current is varied. The different curves represent the negative output current settings.

Figure 8
7 Ripple Voltage

7.1 Positive Output

The output ripple voltage is shown in Figure 9. The image was taken with a 0.7A and 12V at the input.

Positive output voltage ripple is at full load is <1%
7.2 Negative Output

The negative output ripple voltage is shown in Figure 10. The image was taken with a 0.7A load 12V at the input.

Negative output voltage ripple at full load is <1%
7.3 Input Voltage

The input ripple voltage is shown in Figure 11.

Figure 11
8 Control Loop Frequency Response

Figure 12 shows the loop response with 0.7A load and 12V input.

![Diagram](image)

Table 1 summarizes the results.

9 Load Transients

9.1 Transient applied at negative VOUT (-VOUT)

The Figure 13 shows the response to load transients. The load is switching from 0.35A to 0.7A (50 Hz). Negative VOUT was measured.

![Figure 13]

The Figure 14 shows the response to load transients. The load is switching from 0.35A to 0.7A (50 Hz). Positive VOUT was measured.

![Figure 14]
9.2 Transient applied at positive VOUT (+VOUT)

The Figure 13 shows the response to load transients. The load is switching from 0.34A to 0.86A (load precision !) (50 Hz). Negative VOUT was measured.

The Figure 14 shows the response to load transients. The load is switching from 0.34A to 0.86A (50 Hz). Positive VOUT was measured.

For better transient response just increase output capacitance.
10 Miscellaneous Waveforms

Switch node ("SW" to -VOUT)) waveform shown in Figure 17

![Graph showing waveforms with CH1 => 5 V/div and 1 µs/div](image1)

![Graph showing waveforms with CH1 => 5 V/div and 20 ns/div](image2)

Figure 17
Switchnode ("SW" to GND measured at the inductor pads) results in the waveform shown in Figure 18.
“Secondary” switchnode (measured at the inductor pads): the waveform is shown in Figure 19.

Figure 19
Secondary switchnode (SW2 to +VOUT) the waveform is shown in Figure 20.

Figure 20
11 Thermal Image
Thermal image is shown in Figure 21. Input voltage was set to 12V and output current 0.5A on each channel, thermal pic taken after 1hr operation, dT = 40K at U1:
