

## TPS61085A-Q1 650-kHz and 1.2-MHz, 18.5-V step-up DC/DC converter

### 1 Features

- AEC-Q100 qualified for automotive applications:
  - Device temperature grade 2:  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ,  $T_A$
- 2.3-V to 6-V input voltage range
- 18.5-V boost converter with 2-A switch current
- 650-kHz or 1.2-MHz selectable switching frequency
- Adjustable soft start
- Thermal shutdown
- Undervoltage lockout
- 8-pin VSSOP package

### 2 Applications

- Automotive infotainment cluster
  - Instrument clusters, head units
  - Radios, navigation
  - Audio amplifiers
- Automotive body electronics
  - Body control modules
  - Gateways
- Telematics and emergency call (E-call)
- Advanced driver assistance systems (ADAS)

### 3 Description

The TPS61085A-Q1 device is a high-frequency, high-efficiency, DC/DC boost converter with an integrated 2-A, 0.13- $\Omega$  power switch capable of providing an output voltage up to 18.5 V. The selectable frequency of 650 kHz or 1.2 MHz allows the use of small external inductors and capacitors and provides fast transient response. The external compensation allows optimizing the regulator for application conditions. A capacitor connected to the specific soft-start pin minimizes inrush current at start-up.

## 5 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	COMP	I/O	Compensation pin
2	FB	I	Feedback pin
3	EN	I	Shutdown control input. Connect this pin to logic high level to enable the device.
4	PGND	—	Power ground
5	SW	I	Switch pin
6	IN	PWR	Input supply pin
7	FREQ	I	Frequency select pin. The power switch operates at 650 kHz if FREQ is connected to GND and at 1.2 MHz if FREQ is connected to IN.
8	SS	O	Soft-start control pin. Connect a capacitor to this pin if soft-start required. Open = no soft start

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Input voltage, $V_{IN}$ <sup>(2)</sup>	-0.3	7	V
Voltage on pins EN, FB, SS, FREQ, COMP	-0.3	7	V
Voltage on pin SW	-0.3	20	V
Continuous power dissipation	See <a href="#">Thermal Information</a>		
Lead temperature (soldering, 10 s)		260	°C
Operating junction temperature	-40	150	°C
Storage temperature, $T_{stg}$	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), Classification Level 2 per AEC Q100-002 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), Classification Level C4A per AEC Q100-011	±500	
		Machine model (MM)	±200	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
$V_{IN}$	Input voltage	2.3	6	V
$V_S$	Boost output voltage	$V_{IN} + 0.5$	18.5	V
$T_A$	Operating free-air temperature	-40	105	°C
$T_J$	Operating junction temperature	-40	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS61085A-Q1	UNIT
		DGK (VSSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	189.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	75.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	110	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	13.7	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	108.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the application report, [Semiconductor and IC Package Thermal Metrics](#).

## 6.5 Electrical Characteristics

 $V_{IN} = 3.3\text{ V}$ ,  $EN = IN$ ,  $V_S = 12\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $+105^\circ\text{C}$ , typical values are at  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY</b>						
$V_{IN}$	Input voltage		2.3		6	V
$I_Q$	Operating quiescent current into IN	Device not switching, $V_{FB} = 1.3\text{ V}$		70	100	$\mu\text{A}$
$I_{SDVIN}$	Shutdown current into IN	$EN = \text{GND}$			1	$\mu\text{A}$
UVLO	Undervoltage lockout threshold	$V_{IN}$ falling			2.2	V
		$V_{IN}$ rising			2.3	
$T_{SD}$	Thermal shutdown	Temperature rising, $T_J$		150		$^\circ\text{C}$
$T_{SD(HYS)}$	Thermal shutdown hysteresis			14		$^\circ\text{C}$
<b>LOGIC SIGNALS EN, FREQ</b>						
$V_{IH}$	High level input voltage	$V_{IN} = 2.3\text{ V}$ to $6\text{ V}$	2			V
$V_{IL}$	Low level input voltage	$V_{IN} = 2.3\text{ V}$ to $6\text{ V}$			0.5	V
$I_{lkg}$	Input leakage current	$EN = \text{FREQ} = \text{GND}$			0.1	$\mu\text{A}$
<b>BOOST CONVERTER</b>						
$V_S$	Boost output voltage		$V_{IN} + 0.5$		18.5	V
$V_{FB}$	Feedback regulation voltage		1.230	1.238	1.246	V
gm	Transconductance error amplifier			107		$\mu\text{A/V}$
$I_{FB}$	Feedback input bias current	$V_{FB} = 1.238\text{ V}$			0.1	$\mu\text{A}$
$R_{DS(on)}$	N-channel MOSFET ON-resistance	$V_{IN} = V_{GS} = 5\text{ V}$ , $I_{SW} = \text{current limit}$		0.13	0.2	$\Omega$
		$V_{IN} = V_{GS} = 3.3\text{ V}$ , $I_{SW} = \text{current limit}$		0.15	0.24	
$I_{lkg}$	SW leakage current	$EN = \text{GND}$ , $V_{SW} = 6\text{ V}$			2	$\mu\text{A}$
$I_{LIM}$	N-channel MOSFET current limit		2	2.6	3.2	A
$I_{SS}$	Soft-start current	$V_{SS} = 1.238\text{ V}$	7	10	13	$\mu\text{A}$
$f_{osc}$	Oscillator frequency	FREQ = high	0.9	1.2	1.5	MHz
		FREQ = low	480	650	820	kHz
	Line regulation	$V_{IN} = 2.3\text{ V}$ to $6\text{ V}$ , $I_{OUT} = 10\text{ mA}$		0.0002		%/V
	Load regulation	$V_{IN} = 3.3\text{ V}$ , $I_{OUT} = 1\text{ mA}$ to $400\text{ mA}$		0.11		%/A

## 6.6 Typical Characteristics

The typical characteristics are measured with the 3.3- $\mu\text{H}$  inductor for high-frequency (part number-7447789003) or 6.8- $\mu\text{H}$  inductor for low frequency (part number-B82464G4) and the rectifier diode with part number SL22.

## 7 Detailed Description

### 7.1 Overview

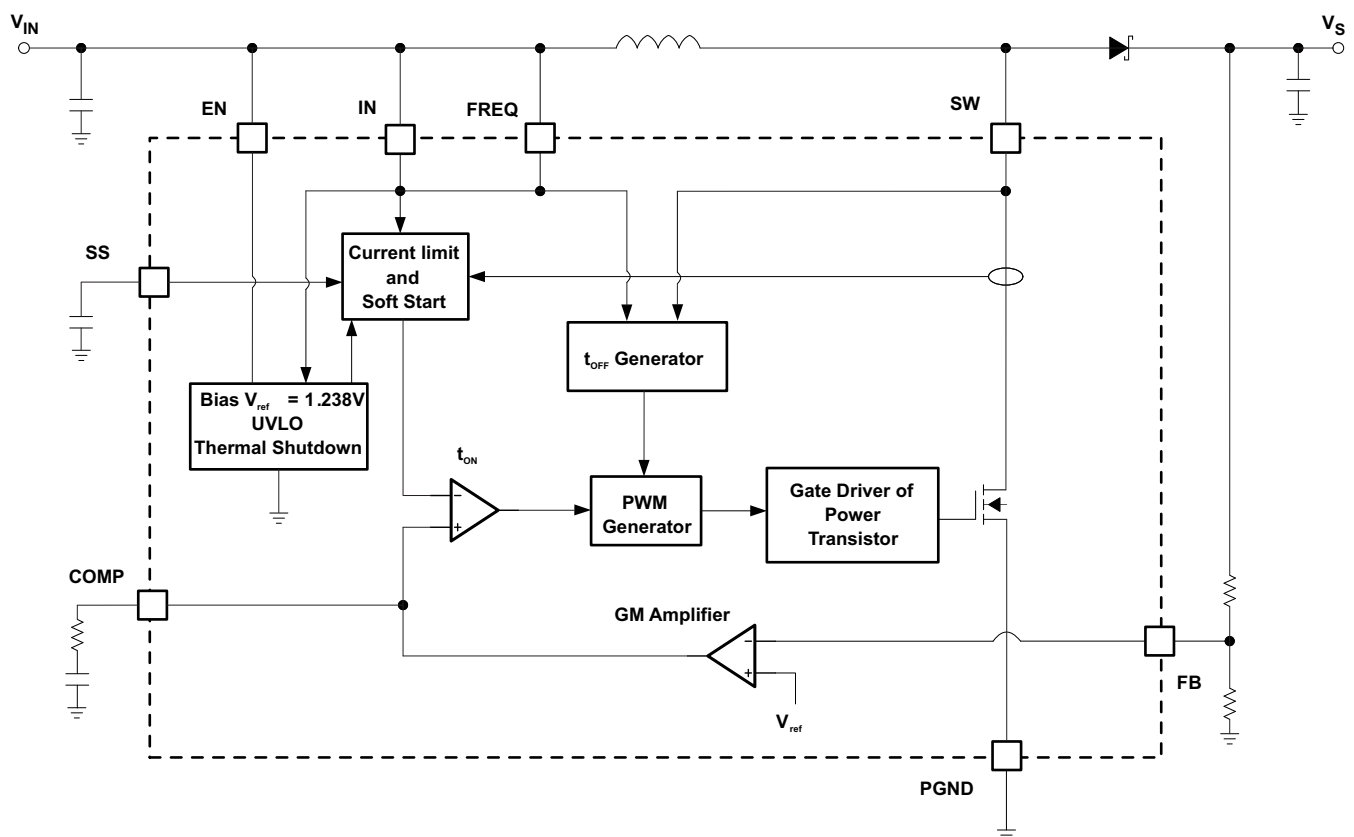

The TPS61085A-Q1 boost converter is designed for output voltages up to 18.5 V with a switch-peak current limit of 2 A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz or 1.2 MHz and the minimum input voltage is 2.3 V. To control the inrush current at start-up, a soft-start pin is available.

The novel topology of the TPS61085A-Q1 boost converter uses adaptive OFF-time to provide superior load and line transient responses. The device also operates over a wider range of applications than conventional converters.

The selectable switching frequency offers the possibility to optimize the design either for the use of small sized components (1.2 MHz) or for higher system efficiency (650 kHz). However, the frequency changes slightly because the voltage drop across the  $R_{DS(on)}$  has some influence on the current and voltage measurement and thus on the ON-time (the OFF-time remains constant).

Depending on the load current, the converter operates in continuous conduction mode (CCM), discontinuous conduction mode (DCM), or pulse skip mode to maintain the output voltage.

## 7.3 Feature Description

### 7.3.1 Soft Start

The boost converter has an adjustable soft start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor connected to the soft-start pin SS is used to slowly ramp up the internal current limit of the boost converter when charged with a constant current. When the EN pin is pulled high, the soft-start capacitor ( $C_{SS}$ ) is immediately charged to 0.3 V. The capacitor is then charged at a constant current of 10  $\mu$ A typically until the output of the boost converter  $V_S$  has reached its power good threshold (90% of  $V_S$  nominal value). During this time, the SS voltage directly controls the peak inductor current, starting with 0 A at  $V_{SS} = 0.3$  V up to the full current limit at  $V_{SS} \approx 800$  mV. The maximum load current is available after the soft start is completed. The larger the capacitor the slower the ramp of the current limit and the longer the soft-start time. A 100-nF capacitor is usually sufficient for most of the applications. When the EN pin is pulled low, the soft-start capacitor is discharged to ground.

### 7.3.2 Frequency Select Pin (FREQ)

The frequency select pin FREQ allows to set the switching frequency of the device to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but reduces slightly the efficiency. The other benefits of higher switching frequency are a lower output ripple voltage and smaller inductor size. Usually, TI recommends using 1.2-MHz switching frequency unless light-load efficiency is a major concern.

### 7.3.3 Undervoltage Lockout (UVLO)

To avoid misoperation of the device at low input voltages an undervoltage lockout is included that disables the device, if the input voltage falls below 2.2 V.

### 7.3.4 Thermal Shutdown

A thermal shutdown is implemented to prevent damages due to excessive heat and power dissipation. Typically the thermal shutdown threshold is at  $T_J = 150^\circ\text{C}$ . When the thermal shutdown is triggered the device stops switching until the temperature falls below typically  $T_J = 136^\circ\text{C}$ . Then the device starts switching again.

### 7.3.5 Overvoltage Prevention

If overvoltage is detected on the FB pin (typically 3% above the nominal value of 1.238 V) the part stops switching immediately until the voltage on this pin drops to its nominal value. This prevents overvoltage on the output and secures the circuits connected to the output from excessive overvoltage.

## 7.4 Device Functional Modes

The converter operates in continuous conduction mode (CCM) as soon as the input current increases above half the ripple current in the inductor. For lower load currents it switches into discontinuous conduction mode (DCM). If the load is further reduced, the part starts to skip pulses to maintain the output voltage.

## 8 Application and Implementation

### NOTE

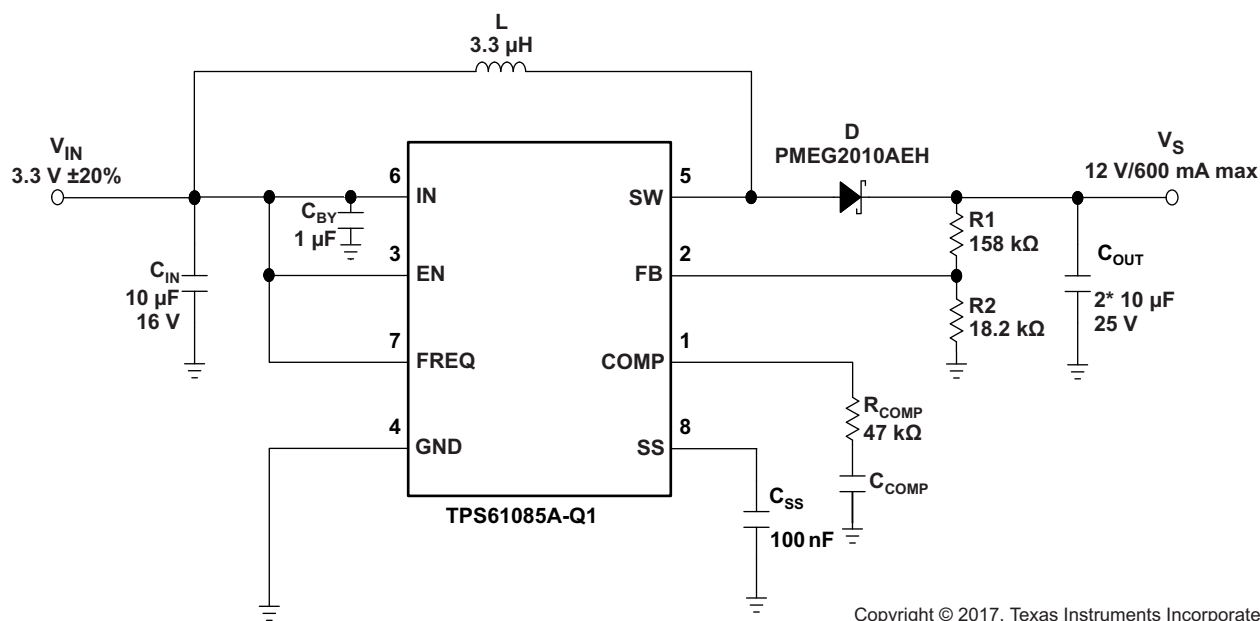

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

With the TPS61085A-Q1 device, a boost regulator with an output voltage of up to 18.5 V can be designed with input voltage ranging from 2.3 V to 6 V. The TPS61085A-Q1 device has a peak switch current limit of 2 A minimum. The device, which operates in a current mode scheme and uses simple external compensation scheme for maximum flexibility and stability. Selectable switching frequency allows the regulator to be optimized either for smaller size (1.2 MHz) or for higher system efficiency (650 KHz). A dedicated soft-start (SS) pin allows the designer to control the inrush current at start-up.

The following section provides a step-by-step design approach for configuring the TPS61085A-Q1 as a voltage regulating boost converter.

### 8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

**Figure 8. Typical Application, 3.3 V to 12 V ( $f_{sw} = 1.2$  MHz)**

#### 8.2.1 Design Requirements

Table 2 lists the design parameters for this application example.

**Table 2. TPS61085A-Q1 Output Design Requirements**

PARAMETER	VALUE
Input voltage	3.3 V $\pm$ 20%
Output voltage	12 V
Output current	600 mA
Switching frequency	1.2 MHz

## 8.2.2 Detailed Design Procedure

The first step in the design procedure is to verify that the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst-case assumption for the expected efficiency, for example, 90%.

1. Duty cycle:

$$D = 1 - \frac{V_{IN} \times \eta}{V_S} \quad (1)$$

2. Maximum output current:

$$I_{out} = \left( I_{swpeak} - \frac{\Delta I_L}{2} \right) \times (1 - D) \quad (2)$$

3. Peak switch current:

$$I_{swpeak} = \frac{\Delta I_L}{2} + \frac{I_{out}}{1 - D}$$

where

$$\Delta I_L = \frac{V_{IN} \times D}{f_s \times L}$$

- 
- $I_{swpeak}$  = converter switch current (minimum switch current limit = 2 A)
- $f_s$  = Converter switching frequency (typically 1.2 MHz)
- $L$  = Selected inductor value
- $\eta$  = Estimated converter efficiency (please use the number from the efficiency plots or 90% as an estimation)
- $\Delta I_L$  = Inductor peak-to-peak ripple current (3)

The peak switch current is the steady-state peak switch current that the integrated switch, inductor, and external Schottky diode must be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is the highest.

### 8.2.2.1 Inductor Selection

The TPS61085A-Q1 is designed to work with a wide range of inductors. The main parameter for the inductor selection is the saturation current of the inductor which must be higher than the peak switch current as calculated in [Detailed Design Procedure](#) with additional margin to cover for heavy load transients. An alternative, more conservative option is to choose an inductor with a saturation current at least as high as the maximum switch current limit of 3.2 A. The other important parameter is the inductor DC resistance. Usually, the lower the DC resistance the higher the efficiency. It is important to note that the inductor DC resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching frequencies of 1.2-MHz inductor core losses, proximity effects and skin effects become more important. Usually, an inductor with a larger form factor gives higher efficiency. The efficiency difference between different inductors can vary between 2% to 10%. For the TPS61085A-Q1, inductor values between 3  $\mu$ H and 6  $\mu$ H are a good choice with a switching frequency of 1.2 MHz, typically 3.3  $\mu$ H. At 650 kHz, TI recommends inductors between 6  $\mu$ H and 13  $\mu$ H, typically 6.8  $\mu$ H. [Table 3](#) shows a few inductors. Customers must verify and validate these components for suitability with their application before using them.

Typically, TI recommends the inductor current ripple is below 20% of the average inductor current. Calculate the inductor value using [Equation 4](#).

$$L = \left( \frac{V_{IN}}{V_S} \right)^2 \times \left( \frac{V_S - V_{IN}}{I_{out\_max} \times f} \right) \times \left( \frac{\eta}{0.35} \right)$$

where

- L is the inductor value
- $V_{IN}$  is input voltage
- $V_S$  is boost output voltage
- $\eta$  is efficiency
- $I_{out\_max}$  is the maximum output current
- f is frequency

(4)

**Table 3. Inductor Selection**

L ( $\mu$ H)	SUPPLIER <sup>(1)</sup>	COMPONENT CODE	SIZE (L×W×H mm)	DCR TYP (m $\Omega$ )	I <sub>sat</sub> (A)

6.8	Sumida	CDRH6D26HP	7 × 7 × 2.8	52	2.9

(1) See [Third-party Products Disclaimer](#)

### 8.2.2.2 Rectifier Diode Selection

To achieve high efficiency, a Schottky type must be used for the rectifier diode. The reverse voltage rating must be higher than the maximum output voltage of the converter. The averaged rectified forward current  $I_{avg}$ , the Schottky diode requirement is rated for, is equal to the output current  $I_{out}$ :

$$I_{avg} = I_{out} \tag{5}$$

Usually a Schottky diode with 2-A maximum average rectified forward current rating is sufficient for most applications. The Schottky rectifier can be selected with lower forward current capability depending on the output current  $I_{out}$  but must be able to dissipate the power. The dissipated power is the average rectified forward current times the diode forward voltage.

$$P_D = I_{avg} \times V_{forward} \tag{6}$$

Typically the diode must be able to dissipate around 500 mW depending on the load current and forward voltage. See [Table 4](#) for few diode options. Customers must verify and validate these components for suitability with their application before using them.

**Table 4. Rectifier Diode Selection**

CURRENT RATING (Iavg)	Vr	V <sub>forward</sub> / Iavg	SUPPLIER <sup>(1)</sup>	COMPONENT CODE	PACKAGE TYPE
750 mA	20 V	0.425 V / 750 mA	Fairchild Semiconductor	FYV0704S	SOT-23
1 A	20 V	0.39 V / 1 A	NXP	PMEG2010AEH	SOD-123
1 A	20 V	0.52 V / 1 A	Vishay Semiconductor	B120	SMA
1 A	20 V	0.5 V / 1 A	Vishay Semiconductor	SS12	SMA
1 A	20 V	0.44 V / 1 A	Vishay Semiconductor	MSS1P2L	μ-SMP (Low Profile)

(1) See [Third-party Products Disclaimer](#)

### 8.2.2.3 Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of 50 μA flowing through the feedback divider gives good accuracy and noise covering. A standard low-side resistor of 18 kΩ is typically selected. The resistors are then calculated as:

$$R2 = \frac{V_{ref}}{70\mu A} \approx 18k\Omega \quad R1 = R2 \times \left( \frac{V_s}{V_{ref}} - 1 \right) \quad (7)$$

### 8.2.2.4 Compensation (COMP)

The regulator loop must be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. Standard values of  $R_{COMP} = 13 \text{ k}\Omega$  and  $C_{COMP} = 3.3 \text{ nF}$  works for the majority of the applications.

See [Table 5](#) for dedicated compensation networks giving an improved load transient response. [Equation 8](#) can be used to calculate  $R_{COMP}$  and  $C_{COMP}$ :

$$R_{COMP} = \frac{110 \cdot V_{IN} \cdot V_s \cdot C_{OUT}}{L \cdot I_{OUT}} \quad C_{COMP} = \frac{V_s \cdot C_{OUT}}{7.5 \cdot I_{OUT} \cdot R_{COMP}} \quad (8)$$

**Table 5. Recommended Compensation Network Values at High/Low Frequency**

FREQUENCY	L	V <sub>s</sub>	V <sub>IN</sub> ±20%	R <sub>COMP</sub>	C <sub>COMP</sub>
High (1.2 MHz)	3.3 μH	15 V	5 V	82 kΩ	1.1 nF
			3.3 V	75 kΩ	1.6 nF
		12 V	5 V	51 kΩ	1.1 nF
			3.3 V	47 kΩ	1.6 nF
		9 V	5 V	30 kΩ	1.1 nF
			3.3 V	27 kΩ	1.6 nF
Low (650 kHz)	6.8 μH	15 V	5 V	43 kΩ	2.2 nF
			3.3 V	39 kΩ	3.3 nF
		12 V	5 V	27 kΩ	2.2 nF
			3.3 V	24 kΩ	3.3 nF
		9 V	5 V	15 kΩ	2.2 nF
			3.3 V	13 kΩ	3.3 nF

Table 5 gives conservatives  $R_{COMP}$  and  $C_{COMP}$  values for certain inductors, input and output voltages providing a very stable system. For a faster response time, a higher  $R_{COMP}$  value can be used to enlarge the bandwidth, as well as a slightly lower value of  $C_{COMP}$  to keep enough phase margin. These adjustments must be performed in parallel with the load transient response monitoring of TPS61085A-Q1.

### 8.2.2.5 Input Capacitor Selection

For good input voltage filtering, TI recommends low-ESR ceramic capacitors. TPS61085A-Q1 has an analog input (IN). Therefore, TI highly recommends placing a 1- $\mu$ F bypass capacitor as close as possible to the IC from IN to GND.

One 10- $\mu$ F ceramic input capacitor is sufficient for most of the applications. For better input voltage, filtering this value can be increased. Refer to Table 6 and typical applications for input capacitor recommendations. Customers must verify and validate these components for suitability with their application before using them.

### 8.2.2.6 Output Capacitor Selection

For best output voltage filtering, TI recommends a low ESR output capacitor like ceramic capacitor. Two 10- $\mu$ F ceramic output capacitors (or one 22- $\mu$ F) work for most of the applications. Higher capacitor values can be used to improve the load transient response.

Pay attention to the derating of capacitor value with the DC voltage.

**Table 6. Rectifier Input and Output Capacitor Selection**

	CAPACITOR	VOLTAGE RATING	SUPPLIER <sup>(1)</sup>	COMPONENT CODE
$C_{IN}$	10 $\mu$ F/1206	16 V	Taiyo Yuden	EMK212 BJ 106KG

### 8.3 System Examples

Figure 14 to Figure 21 show application circuit examples using the TPS61085A-Q1 device. These circuits must be fully validated and tested by customers before using these circuits in their designs. TI does not warrant the accuracy or completeness of these circuits, nor does TI accept any responsibility for them.

**Figure 14. Typical Application, 3.3 V to 12 V ( $f_{sw} = 650$  kHz)**

**Figure 15. Typical Application, 3.3 V to 9 V ( $f_{sw} = 1.2$  MHz)**

9 Power Supply Recommendations

The TPS61085A-Q1 is designed to operate from an input voltage supply range from 2.3 V to 6 V. The required power supply for the TPS61085A-Q1 must have a current rating according to the output voltage and output current of the TPS61085A-Q1.

## 10 Layout

### 10.1 Layout Guidelines

For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems.

*Layout Example* provides an example of layout design with the TPS61085A-Q1 device.

- Use wide and short traces for the main current path and for the power ground tracks.
- The input capacitor, output capacitor, and the inductor must be placed as close as possible to the IC.
- Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at the GND terminal of the IC.
- The most critical current path for all boost converters is from the switching FET, through the rectifier diode, then the output capacitors, and back to ground of the switching FET. Therefore, the output capacitors and their traces must be placed on the same board layer as the IC and as close as possible between the SW pin and the GND terminal of the IC.

### 10.2 Layout Example

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 11.4 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

#### 11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

#### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">TPS61085ATDGKRQ1</a>	Active	Production	VSSOP (DGK)   8	2000   LARGE T&R	Yes	Call TI   Nipdauag	Level-3-260C-168 HR	-40 to 125	1EGV
TPS61085ATDGKRQ1.B	Active	Production	VSSOP (DGK)   8	2000   LARGE T&R	Yes	Call TI	Level-3-260C-168 HR	-40 to 125	1EGV
<a href="#">TPS61085ATDGKTQ1</a>	Active	Production	VSSOP (DGK)   8	250   SMALL T&R	Yes	Call TI   Nipdauag   Nipdau	Level-3-260C-168 HR	-40 to 125	1EGV

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
