

**TPS65235-1** SLVSDP1F - JANUARY 2017 - REVISED MAY 2023

# TPS65235-1 LNB Voltage Regulator With I<sup>2</sup>C Interface

#### 1 Features

- Complete integrated solution for LNB and I<sup>2</sup>C interface
- DiSEqC 2.x, and DiSEqC 1.x compatible
- Supports 5-V, 12-V, and 15-V power rail
- Up to 1000-mA accurate output current limit adjustable by external resistor
- Boost switch peak current limit proportional to LDO current limit
- Boost converter with 140-m $\Omega$  low  $R_{ds(on)}$  internal power switch
- Boost switching frequency 1-MHz or 500-kHz selectable
- Audible noise avoided at force PWM mode
- Dedicated enable pin for non-I<sup>2</sup>C application
- Low-dropout (LDO) regulator with push-pull output stage for VLNB output
- Built-in accurate 22-kHz tone generator and external tone input support
- Supports both external 44-kHz and 22-kHz tone
- Adjustable soft start and 13-V to 18-V voltage transition time
- 650-mV to 750-mV 22-kHz tone amplitude selection
- I<sup>2</sup>C registers accessible with EN low
- Short circuit dynamic protection
- Diagnostics for output voltage level, DiSEqC tone input and output, current level, and cable connection
- Thermal protection available
- 20-pin WQFN 3-mm × 3-mm (RUK) package

# 2 Applications

- Set top box satellite receiver
- TV satellite receiver
- PC card satellite receiver
- Satellite TV

## 3 Description

Designed for analog and digital satellite receivers, the TPS65235-1 is a monolithic voltage regulator with I<sup>2</sup>C interface; specifically to provide the 13-V to 18-V power supply and the 22-kHz tone signal to the LNB down converter in the antenna dish or to the multi-switch box. The device offers a complete solution with minimum component count, low power dissipation together with simple design and I<sup>2</sup>C standard interface.

The TPS65235-1 features high power efficiency. The boost converter integrates a 140-mΩ power MOSFET running at 1-MHz or 500-kHz selectable switching frequency. Drop out voltage at the linear regulator is 0.8 V to minimize power loss. The TPS65235-1 provides multiple ways to generate the 22-kHz signal. Integrated linear regulator with push-pull output stage generates 22-kHz tone signal superimposed at the output even at zero loading. Current limit of linear regulator can be programmed by external resistor with ±10% accuracy. Full range of diagnostic read by I<sup>2</sup>C is available for system monitoring.

The TPS65235-1 has a special design at FCCM mode to avoid the audible noise especially when VIN is higher or closer to the VLNB output.

The TPS65235-1 supports advanced DiSEqC 2.x standard with 22-kHz tone detection circuit and output interface.

#### Package Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)	
TPS65235-1	RUK (WQFN, 20)	3.00 mm × 3.00 mm	

For all available packages, see the orderable addendum at the end of the data sheet.

# **5 Pin Configuration and Functions**

Figure 5-1. RUK Package 20-Pin WQFN With Exposed Thermal Pad Top View

**Table 5-1. Pin Functions** 

PIN		TYPE <sup>(1)</sup>	DESCRIPTION		
NO. NAME		ITPE			
1	LX	I	Switching node of the boost converter		
2	VIN	S	Input of internal linear regulator		
3	VCC	0	Internal 6.3-V power supply. Connect a 1- $\mu$ F ceramic capacitor from this pin to ground. When V <sub>IN</sub> is 5 V connect the VCC pin to the VIN pin.		
4	AGND	S	Analog ground. Connect all ground pins and power pad together.		
5	TCAP	0	Connect a capacitor to this pin to set the rise time of the LNB output.		
6	ISET	0	Connect a resistor to this pin to set the LNB output current limit.		
7	EN	I	Enable this pin to enable the VLNB output. pull this pin to ground to disable the output. The output is then pulled to ground, and, when the EN pin is low, the I <sup>2</sup> C interface can be accessed.		
8	FAULT	0	Open drain output pin, it goes low if any fault flag is set.		
9	ADDR	I	Connect a different resistor to this pin to set different I <sup>2</sup> C addresses (see the Table 7-4 table).		
10	VCTRL	I	Voltage level at this pin to set the output voltage (see the Table 7-3).		
11	SDA	I/O	I <sup>2</sup> C compatible bidirectional data		
12	SCL	I	I <sup>2</sup> C compatible clock input		
13	EXTM	I	External modulation logic input pin that activates the 22-kHz tone output. The feeding signal can be 22-kHz tone or logic high or low.		
14	DOUT	0	Tone detection output		
15	DIN	I	Tone detection input		
16	VLNB	0	Output of the power supply connected to satellite receiver or switch		
17	VCP	0	Gate drive supply voltage and output of charge pump. Connect a capacitor between this pin and the VLNB pin.		
18	BOOST	0	Output of the boost regulator and Input voltage of the internal linear regulator		
19	GDR	0	Control the gate of the external MOSFET for DiSEqc 2.x support		
20	PGND	S	Power ground for the boost converter		
_	Thermal Pad	_	The thermal pad must be soldered to the printed circuit board (PCB) for optimal thermal performance. Use thermal vias on the PCB to enhance power dissipation.		

(1) I = input, O = output, I/O = input and output, S = power supply

## **6 Specifications**

## 7 Detailed Description

## 7.1 Overview

The TPS65235-1 device is the power management IC (PMIC) that integrates a boost converter, an LDO regulator, and a 22-kHz tone generator to serve as a LNB power supply. This solution compiles the DiSEqC 2.x standard with or without  $I^2C$  interface. An external resistor allows for precise programming of the output current limit. The 22-kHz tone signal can be generated in one of two ways, either with or without  $I^2C$ . The integrated boost features low  $R_{ds(on)}$  MOSFET and internal compensation. A selectable switching frequency of 1 MHz or 500 kHz is designed to reduce the size of passive components and be flexible for design.

The TPS65235-1 device can support the 44-kHz tone output. When the EXTM pin has a 44-kHz tone input, and the EXTM TONE bit in the *Control Register 1* is set to 1b, the LNB tone output is 44 kHz. By default, the TPS65235-1 device has a typical 22-kHz tone output.

## 7.2 Functional Block Diagram

### 7.3 Feature Description

## 7.3.1 Boost Converter

The TPS65235-1 device has an internal compensated boost converter and low-dropout (LDO) linear regulator. The boost converter tracks the LNB output voltage within 800 mV even at loading 1000 mA, which minimizes power loss.

The boost converter operates at 1 MHz by default. The TPS65235-1 device has internal cycle-by-cycle peak current limit in the boost converter and DC current limit in the LNB output to help protect the device from short

circuits and over loading. When the LNB output is shorted to ground, the LNB output current is clamped at the LDO current limit. The LDO current limit is set by the external resistor at the ISET pin. The current limit of the boost switch is proportional to the LDO current limit. If an overcurrent condition occurs for more than 4 ms, the boost converter enters hiccup mode and retries startup in 128 ms. This hiccup mode ON time and OFF time are selectable through the I<sup>2</sup>C control register (address 0x01) to be either 4 ms and 128 ms or 8 ms and 256 ms, respectively. At extremely light loads, the boost converter automatically operates in a pulse-skipping mode.

The boost converter is stable with either ceramic capacitor or electrolytic capacitor.

If two or more set-top box LNB outputs are connected together, one output voltage can be set higher than others. The output with the lower set voltage is then effectively turned off. When the voltage drops to the set level, the LNB output with the lower set output voltage returns to normal conditions.

#### 7.3.2 Linear Regulator and Current Limit

The linear regulator is used to generate the 22-kHz tone signal by changing the LDO reference voltage. The linear regulator features low-dropout voltage to minimize power loss while maintaining enough head room for the 22-kHz tone with 650-mV amplitude. The linear regulator also implements a tight current limit for overcurrent protection. The current limit is set by an external resistor connected to ISET pin. Figure 7-1 shows the relationship between the current limit threshold and the resistor value.

Figure 7-1. Linear Regulator Current Limit Vs Resistor

$$R_{SET}(k\Omega) = 117.08 \times I_{SET}^{-1.267}(A)$$
 (1)

A 200-k $\Omega$  resistor sets the current to 0.65 A, and 110-k $\Omega$  resistor sets the current to approximately 1 A.

#### 7.3.3 Boost Converter Current Limit

The boost converter has the cycle-by-cycle peak current limit on the internal Power MOSFET switch to serve as the secondary protection when LNB output is hard short. With ISW bit default setting 0b on  $I^2C$  control register 0x01, the switch current limit  $I_{SW}$  is proportional as LDO current limit  $I_{(OCP)}$  set by ISET pin resistor, and the relationship can be expressed as:

$$I_{SW} = 3 \times I_{(OCP)} + 0.8 A$$
 (2)

For the 5 V  $V_{IN}$ , if LNB current load is up to 1 A, the ISW bit must be written as 1b, the switch current limit  $I_{SW}$  for the internal Power MOSFET is:

$$I_{SW} = 5 \times I_{(OCP)} + 0.8 A$$
 (3)

While due to the high power loss at 5 V, V<sub>IN</sub>, it has a chance to trigger the thermal shutdown before the loading is up to 1 A, especially the VLNB output is high.

#### 7.3.4 Charge Pump

The charge pump circuitry generates a voltage to drive the NMOS of the linear regulator. The voltage across the charge pump capacitor between VLNB and VCP is about 5.4 V, so the absolute value of the VCP voltage will be VLNB + 5.4 V.

#### 7.3.5 Slew Rate Control

When LNB output voltage transits from 13.4 V to 18.2 V or 18.2 V to 13.4 V, the cap at pin TCAP controls the transition time. This transition time makes sure the boost converter output to follow LNB output change. Usually boost converter has low bandwidth and can't response fast. The voltage at TCAP acts as the reference voltage of the linear regulator. The boost converter's reference is also based on TCAP with additional fixed voltage to generate a 0.8 V above the LNB output.

The charging and discharging current is 10 µA, thus the transition time can be estimated as:

$$t_{TCAP} (ms) = 0.8 \times \frac{C_{SS} (nF)}{I_{SS} (\mu A)}$$
 (4)

A 22-nF capacitor generates about 2 ms transition time.

In light load conditions, when LNB output voltage is set from 18.2 V to 13.4 V, the voltage drops very slow, which causes wrong VOUT\_GOOD (Bit 0 at status register 0x02) logic for LNB output voltage detection. TPS65235-1 has integrated a pull down circuit to pull down the output during the transition. This ensures the voltage change can follow the voltage at TCAP. When the 22-kHz tone signal is superimposing on the LNB output voltage, the pull down current can also provide square wave instead of a distorted waveforms.

#### 7.3.6 Short-Circuit Protection, Hiccup, and Overtemperature Protection

The LNB output current limit can be set by an external resistor. When short circuit conditions occur or current limit is triggered, the output current is clamped at the current limit for 4 ms with LDO on. If the condition retains, the converter will shut down for 128 ms and then restart. This hiccup behavior prevents IC from being overheat. The hiccup ON/OFF time can be set by I<sup>2</sup>C register. Refer to *Control Register 1* for detail.

The low side MOSFET of the boost converter has a peak current limit threshold which serves as the secondary protection. If boost converter's peak current limit is triggered, the peak current will be clamped as high as 3.8 A when setting I<sub>SW</sub> default and LNB current limit up to 1 A. If loading current continues to increase, output voltage starts to drop and output power drops.

Thermal shutdown prevents the chip from operating at exceedingly high temperatures. When the junction temperature exceeds 160°C, the output shuts down. When the die temperature drops below its lower threshold typically 140°C, the output is enabled.

www.ti.com

When the chip is in overcurrent protection or thermal shutdown, the I<sup>2</sup>C interface and logic are still active. The FAULT pin is pulled down to signal the processor. The FAULT pin signal remains low unless the following action

- 1. If I<sup>2</sup>C interface is not used to control, EN pin must be recycled to pull the FAULT pin back to high.
- 2. If I<sup>2</sup>C interface is used, the I<sup>2</sup>C controller must read the status *Control Register 2*, then the FAULT pin is back

#### 7.3.7 Tone Generation

A 22-kHz tone signal is implemented at the LNB output voltage as a carrier for DiSEqC command. This tone signal can be generated by feeding an external 22-kHz clock at the EXTM pin, and it can also be generated with its internal tone generator controlled by EXTM pin. If EXTM pin is toggled to high, the internal tone signal will be superimposed at the LNB output, if EXTM pin is low, there will be no tone superimposed at the output stage of the regulator facilitates a push-pull circuit, so even at zero loading; the 22-kHz tone at the output is still clean without distortion.

There are two ways to generate the 22-kHz tone signal at the output.

For option1, if the EXTM has 44-kHz tone input, and the bit EXTM TONE of the Control Register 1 is set to 1b, the LNB tone output is 44 kHz.

Option 1. Use external tone, gated by EXTM logic pulse

Option 2. Use internal tone, gated by EXTM logic envelop

Figure 7-2. Two Ways to Generate 22-kHz tone

## 7.3.8 Tone Detection

A 22-kHz tone detector is implemented in the TPS65235-1 solution. The detector extracts the AC-coupled tone signal from the DIN input and provides it as an open-drain signal on the DOUT pin. When the DOUTMODE bit in the Control Register 2 is set to the default setting, if a tone is present, the DOUT output is logic low. If a tone is not present, the internal output FET is off. If a pullup resistor is connected to the DOUT pin, the output is logic high. The maximum tone out delay with respect to the input is one and a half of the tone cycle.

The DOUTMODE bit in the Control Register 2 is reserved and must not be used.

### 7.3.9 Audio Noise Rejection

When the TPS65235-1 operates in PSM mode, locating the switching frequency at the range of audio frequency is possible. Which causes audible noise, especially when the VLNB voltage is lower or closer to the VIN voltage, and the current load is light.

When audible noise occurs, TI recommends setting the TPS65235-1 device to operate in force PWM mode. In force PWM mode, a special design is implemented to avoid the audible noise.

#### 7.3.10 Disable and Enable

The TPS65235-1 device has a dedicated EN pin to disable and enable the LNB output. In a non-I<sup>2</sup>C application, when the EN pin is pulled high, the LNB output is enabled. When the EN pin is pulled low, the LNB output is disabled. In an I<sup>2</sup>C application, when the EN pin is either low or high, the I<sup>2</sup>C registers can be accessed, which allows users to change the default LNB output at system power-up. When the I2C\_CON bit in the *Control Register 1* is set to 1b, the LNB output enable or disable is controlled by the EN bit in the *Control Register 2*. By default, the I2C\_CON bit of the control register is set to 0b, which makes the LNB output is controlled by the EN pin. Figure 7-3 and Figure 7-4 shows the detailed control behavior.

## 7.3.11 Component Selection

#### 7.3.11.1 Boost Inductor

TI recommends the TPS65235-1 device to operate with a boost inductor value of 4.7  $\mu$ H or 10  $\mu$ H. The boost inductor must be able to support the peak current requirement to maintain the maximum LNB output current without saturation. Use Equation 5 to estimate the peak current of the boost inductor ( $I_{peak}$ ).

$$I_{\text{peak}} = \frac{I_{\text{OUT}}}{1 - D} + \frac{1}{2} \times \frac{V_{\text{IN}} \times D}{L \times f_{\text{S}}}$$
 (5)

where

$$D = 1 - \frac{V_{IN}}{VLNB + 0.8}$$

With a different inductance, the system has different gain and phase margins. Figure 7-5 shows a Bode plot of boost loop with 2 × 10  $\mu$ F / 35 V of boost capacitor and 4.7  $\mu$ H, 5.6  $\mu$ H, 6.8  $\mu$ H, 8.2  $\mu$ H, and 10  $\mu$ H of boost inductance. As the boost inductance increases, the 0-dB crossover frequency keeps relatively constant while reducing the phase and gain margins. With a 4.7- $\mu$ H boost inductance, the phase margin is 66.96° and with a 10- $\mu$ H inductance, the phase margin is 39.63°.

Figure 7-5. Gain and Phase Margin of the Boost Loop with Different Inductance ( $V_{IN}$  = 12 V,  $V_{OUT}$  = 18.2 V,  $I_{LOAD}$  = 1 A,  $f_{SW}$  = 1 MHz, 5  $\mu$ F, Typical Bode Plot)

### 7.3.11.2 Capacitor Selection

The TPS65235-1 device has a 1-MHz nonsynchronous boost converter integrated and the boost converter features the internal compensation network. The TPS65235-1 device works well with both ceramic capacitor and electrolytic capacitor.

The recommended ceramic capacitors for the TPS65235-1 application are, at the minimum, rated as X7R/X5R, with a 35-V rating, and a 1206 size for the achieving lower LNB output ripple. Table 7-1 lists the recommended ceramic capacitors list for both  $4.7-\mu H$  and  $10-\mu H$  boost inductors.

If more cost-effictive design is needed, use a 100- $\mu$ F electrolytic (low ESR) and a 10- $\mu$ F or 35-V ceramic capacitor.

**Table 7-1. Boost Inductor and Capacitor Selections** 

BOOST INDUCTOR	CAPACITORS	TOLERANCE (%)	RATING (V)	SIZE
10 μH	2 × 22 μF	±10	35	1206
το μιτ	2 × 10 μF	±10	35	1206
	2 × 22 µF	±10	35	1206
4.7 µH	2 × 10 μF	±10	35	1206
	22 µF	±10	35	1206

Figure 7-6 and Figure 7-7 show a bode plot of boost loop with 4.7- $\mu$ H and 10- $\mu$ H inductance and 4  $\mu$ F, 5  $\mu$ F, 7.5  $\mu$ F, 10  $\mu$ F, 15  $\mu$ F, and 20  $\mu$ F of boost capacitance after degrading. As the boost capacitance increases, the phase margin increases.

Figure 7-6. Gain and Phase Margin of the Boost Loop With Different Boost Capacitance ( $V_{IN}$  = 12 V,  $V_{OUT}$  = 18.2 V,  $I_{LOAD}$  = 1 A,  $f_{SW}$  = 1 MHz, 4.7  $\mu$ H, Typical Bode Plot)

Figure 7-7. Gain and Phase Margin of the Boost Loop With Different Boost Capacitance ( $V_{IN}$  = 12 V,  $V_{OUT}$  = 18.2 V,  $I_{LOAD}$  = 1 A,  $f_{SW}$  = 1 MHz, 10  $\mu$ H, Typical Bode Plot)

## 7.3.11.3 Surge Components

If a surge test is required for the application, the D0 and D2 diodes must be added as the external protection components. If no surge test is required, remove the D0 and D2 diodes. Table 7-2 lists the recommended surge components.

**Table 7-2. Surge Components** 

DESIGNATOR	DESCRIPTION	PART NUMBER	MANUFACTURER (1)
D0	Diode, TVS, Uni, 28 V, 1500 W, SMC	SMCJ28A	Fairchild Semiconductor
D2	Diode, Schottky, 40 V, 2 A, SMA	B240A-13-F	Diodes Inc.

#### (1) See Third-party Products Disclaimer

Figure 7-8. Surge Components Selection

## 7.3.11.4 Consideration for Boost Filtering and LNB Noise

Smaller capacitance on the BOOST pin reduces the cost of the system. However, when the inductor in system is the same, the smaller capacitance on the boost and the larger ripple on the LNB output.

Submit Document Feedback

### 7.4 Device Functional Modes

Table 7-3 is the logic table for the device.

Table 7-3. Logic table

EN	I2C_CON <sup>(1)</sup> (2) (3)	SCL	VCTRL	VLNB <sup>(4)</sup>
Н	0	Н	Н	19.4 V
Н	0	Н	L	14.6 V
Н	0	L	Н	18.2 V
Н	0	L	L	13.4 V
Х	1	X	×	Controlled by VSET[3:0] bits at 0x01 register <sup>(5)</sup>
L	0	Х	X	0 V

- $I2C\_CON$  is the bit7 of the  $I^2C$  control register 0x01, which is used to set the VLNB output controlled by the  $I^2C$  register or not. When  $I^2C$  interface is used in design, all the  $I^2C$  registers are accessible even if the  $I^2C\_CON$  bit is 0b. (1)
- (2)
- When I2C\_CON is 1b, the VLNB output is controlled by the I<sup>2</sup>C control register even if the EN pin is low. (3)
- When I<sup>2</sup>C interface is used in design, TI recommends to set the I2C\_CON with 1b, if not, the LNB output will be variable because the SCL is toggled by the I<sup>2</sup>C register access as the clock signal.
- Bit EN of the control register2 is used to disable or enable the LNB output, by default, the bit EN is 1b which enable the LNB output

## 7.5 Programming

### 7.5.1 Serial Interface Description

I<sup>2</sup>C is a 2-wire serial interface developed by Philips Semiconductor (see I<sup>2</sup>C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high external. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open drain I/O pins, SDA and SCL. A controller device, usually a microcontroller (MCU) or a digital signal processor (DSP), controls the bus. The controller device is responsible for generating the SCL signal and device addresses. The controller device also generates specific conditions that indicate the START and STOP of data transfer. A target device receives, transmits data, or both on the bus under control of the controller device.

The TPS65235-1 device works as a target and supports the following data transfer modes, as defined in the I<sup>2</sup>CBus Specification: standard mode (100 kbps), and fast mode (400 kbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as supply voltage remains above 4.5 V (typical).

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as F/S-mode in this document. The TPS65235-1 device supports 7-bit addressing; 10-bit addressing and general call address are not supported.

The TPS65235-1 device has a 7-bit address set by ADDR pin. Table 7-4 shows how to set the I<sup>2</sup>C address.

Table 7-4. I<sup>2</sup>C Address Selection

ADDR PIN	I <sup>2</sup> C ADDRESS	ADDRESS FORMAT (A6 ≥ A0)
Connect to VCC	0x08	000 1000Ь
Floating	0x09	000 1001b
Connected to GND	0x10	001 0000Ь
Resistor divider to make ADDR pin voltage in 3.7 V - 5.9 V	0x11	001 0001b

Figure 7-9. I<sup>2</sup>C Interface Timing Diagram

## 7.5.2 TPS65235-1 I<sup>2</sup>C Update Sequence

The TPS65235-1 requires a start condition, a valid I<sup>2</sup>C address, a register address byte, and a data byte for a single update. After the receipt of each byte, TPS65235-1 device acknowledges by pulling the SDA line low during the high period of a single clock pulse. TPS65235-1 performs an update on the falling edge of the LSB byte.

When the TPS65235-1 is disabled (EN pin tied to ground) the device cannot be updated via the I<sup>2</sup>C interface.

The TPS65235-1 has full range of diagnostic flags for operation and debug. Processor can read the status register to check the error conditions. After the error happens, the flags are changed, once the errors are gone, the flags are set back without I<sup>2</sup>C access.

If the TSD and OCP flags are triggered, FAULT pin will be pulled low, so FAULT pin can be the interrupt signal to processor. After TSD and OCP are set to 1b, the FAULT pin logic is latched to low, processor must read this status register to release the fault conditions.

## 8 Application and Implementation

#### **Note**

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers must validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

The TPS65235 supports both DisEqc1.x and DisEqc2.x application. When the input voltage VIN is greater than the expected output voltage VLNB, the linear regulator drops the voltage difference between VIN and VLNB, which causes the lower efficiency and the higher power loss on the internal linear regulator if the current loading is high. For care must be taken to ensure that the safe operating temperature range of the TPS65235-1 is not exceeded. TI recommends operating the device in force PWM mode when  $V_{\text{IN}} > V_{\text{OUT}}$  to reduce output ripple.

## 8.2 Typical Application

## 8.2.1 DiSEqc1.x Support

TPS65235-1 can operate in  $I^2C$  and non- $I^2C$  interface mode. Figure 8-1 shows the application with the device in  $I^2C$  interface mode to support DiSEqC 1.x application. In non- $I^2C$  mode, the SCL, SDA, and ADDR pins can be floating.

Figure 8-1. Application for DiSEqc1.x Support

### 8.2.1.1 Design Requirements

For this design example, use the parameters in Table 8-1.

**Table 8-1. Design Parameters** 

PARAMETER	VALUE
Input voltage range, V <sub>IN</sub>	4.5 V to 20 V
Output voltage range V <sub>LNB</sub>	11 V to 20 V
Output current range	0 A to 1 A

#### 8.2.1.2 Detailed Design Procedure

To begin the design process, the following component values must be selected:

- Inductor
  - Choose the appropriate value of the inductor based on application cost requirements, ripple requirements, and Section 7.3.11.
- BOOST capacitor
  - Choose the appropriate BOOST capacitor value based on application cost requirements, ripple requirements, and Section 7.3.11.
- Diodes
  - The D0 and D2 diodes are used to help meet the surge-protection requirement of the application. If the
    application does not require surge protection, remove these diodes. For diode component selection, refer
    to Section 7.3.11.3.
  - The D1 diode is used for the boost loop. TI recommends a Schottky diode for D1. The application requirements, which include input power range, output power range, and the current requirement, determine the current and voltage capability of the D1 diode.
  - The D3 diode is to help with the output protection for the VLNB voltage. TI recommends a Schottky diode for D3. The application requirements determine the current and voltage capability of the D3 diode.

Figure 8-17. No Load, 44-kHz Tone Delay from EXTM 22-kHz Input Turns Low to Output Tone Off

## 8.2.2 DiSEqc2.x Support

The TPS65235-1 can support both DiSEqC 1.x application and DiSEqC 2.x application. Figure 8-18 shows the application for supporting DiSEqC 2.x application.

Figure 8-18. Application Schematic for DiSEqc2.x Support

## 8.2.2.1 Design Requirements

Refer to the Section 8.2.1 section for design requirements.

## 8.2.2.2 Detailed Design Procedure

Refer to the Section 8.2.1 section for detailed design procedures.

#### 8.2.2.3 Application Curve

Refer to the Section 8.2.1 section for typical application curves. Figure 8-19 is the unique tone-detection curve for the DiSEqC 2.x application.

Figure 8-19. DOUT Tone Detection Output

# 8.3 Power Supply Recommendations

The device is designed to operate from an input supply ranging from 4.5 V to 20 V. The input supply must be well regulated. If the input supply is located more than a few inches from the converter, an additional bulk capacitance, typically with a value  $100 \mu F$ , can be required in addition to the ceramic bypass capacitors.

#### 8.4 Layout

#### 8.4.1 Layout Guidelines

The TPS65235-1 is designed to layout in 2-layer PCB. To ensure reliability of the device, TI recommends following common printed-circuit board layout guidelines.

- Make sure the ground of input capacitor, output capacitor, and the boost converter are connected at one point at same layer.
- The PGND and AGND pins are located in different regions. Connect these grounds to the thermal pad. Other components are connected the AGND pin.
- · Put the BOOST capacitors as close as possible.
- The loop from the VIN inductor to the LX pin must be as short as possible.
- The loop from the VIN inductor to D1 Schottky diode to the BOOST must be as short as possible.
- The loop for boost capacitors to the PGND pin must be within the loop from the LX pin to D1 Schottky diode to the BOOST pin.

### 8.4.2 Layout Example

#### 9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

<sup>(2)</sup> Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

<sup>(4)</sup> Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

## TAPE AND REEL INFORMATION

A0	Dimension designed to accommodate the component width
В0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

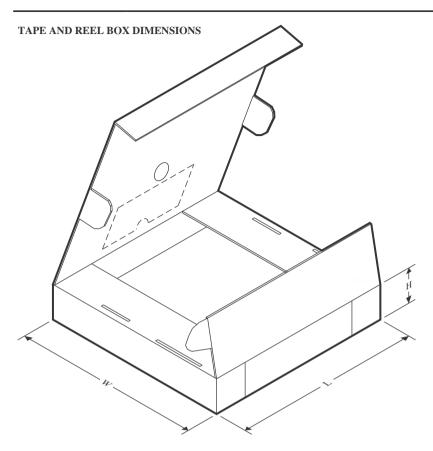

## QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

#### \*All dimensions are nominal

Device	Package Type	Package Drawing		SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

INSTRUMENTS www.ti.com

PLASTIC QUAD FLATPACK - NO LEAD

#### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

  2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

### IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
