About This Register Addendum

This Register Addendum (RA) provides detailed register references for each peripheral and subsystem in the device including:

- Register Address
- Register Name
- Register Types
- Register Reset Values
- Register Descriptions
- Bit-field Descriptions

Register Access Type Codes

Table 1-1. Access Type Codes

Access Type	Description
R	Read
R/W	Read / Write
R/W1TC	Read/Write 1 To Clear
R/W1TS	Read/Write 1 To Set
W	Write

This Register Addendum has been created in order to make the Technical Reference Manual a more effective and size-efficient collateral document.

Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

Trademarks

TI E2E™ is a trademark of Texas Instruments.

Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

Note on Register Names

Sub section headers and figure titles show different naming conventions for the registers, but the header and figure are referring to the same register. The different naming conventions help legacy users search for registers. A future revision of this document can align the registers names

Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

1 Memory Map

This chapter summarizes the memory map address regions for the device.

Copyright © 2025 Texas Instruments Incorporated

1.1 Device Memory Map

This section describes the device memory map.

Note

The memory locations not shown are either unallocated or reserved and not used.

Accesses to these locations are not recommended and must be avoided.

1. See core-specific tables for the internal memory map.
2. In Lockstep mode, the R5FSS*x*_CORE**1** memory region is not accessible.
3. The size of these memories changes based on Dual-Core vs Lockstep operation.
   For more information about Dual-Core and Lockstep modes, see the *R5FSS* chapter.
   For more information about ATCM and BTCM, see the *Tightly-Coupled Memories (TCM)* section within the *R5FSS* chapter.
4. This memory region is used by each CPU core to access the TCM/Cache memory space of other CPU cores.
5. Each R5FSS contains 16 KB i-cache and 16 KB d-cache. However, the system interconnect sees an 8 MB address range at ICACHE/DCACHE. Any core attempting to access more than 16 KB results in a wrap around and accessing the same cache multiple times.

2 Control Module (CTRLMMR) Registers

The Control module is the main controller for top-level device behavior in various states. Module contains registers for configuration, bootstrap (SOP) signals, I/O terminal pad multiplexing, clock selection, and many others. There are various Control or (CTRLMMR) modules defined in this device:

General SoC Control Modules

- *TOP_CTRL Registers* (CTRLMMR0): SoC-level configuration registers
- *MSS_CTRL Registers* (CTRLMMR1): SoC and Peripheral-level configuration registers
- *CONTROLSS_GLOBAL_CTRL Registers* (CTRLMMR2): CONTROLSS-level configuration registers including general control, reset, and clocking-related functions for the real time control subsystem (CONTROLSS))

Pad Configuration Control Modules

- *MSS_IOMUX Registers* (PADCFG_CTRLMMR0): SoC-level terminal configuration control registers

Reset and Clocking Control Modules

- *MSS_TOPRCM Registers* (RCM_CTRLMMR0): SoC-level Clock and Reset control registers
- *MSS_RCM Registers* (RCM_CTRLMMR1): SoC and Peripheral-level Clock and Reset control registers

2.1 LOCK_KICK Protection Register Unlock Values

All Control Module MMR have a protection mechanism which prevents spurious writes from changing register values. LOCK0_KICK0 and LOCK0_KICK1 registers are used for this purpose. The sequence to unlock these MMR is as follows:

1. Write exact unlock value (Table 2-1) to <Control Module>LOCK0_KICK0:KEY field
2. Write exact unlock value (Table 2-1) to <Control Module>LOCK0_KICK1:KEY field

The sequence to lock the MMR is as follows:

1. Write zero (or another value other than the unlock value) (Table 2-1) to <Control Module>LOCK0_KICK1:KEY field
2. Write zero (or another value other than the unlock value) (Table 2-1) to <Control Module>LOCK0_KICK0:KEY field

- **Note**

  If the above sequence for locking the IOMUX is not followed, an AHB_WRITE_ERROR interrupt will occur (if enabled).

For example, to unlock Control Module MSS_CTRL the sequence is as below:
1. Write 0x01234567 to MSS_CTRL.LOCK0_KICK0:KEY
2. Write 0xFEDCBA8 to MSS_CTRL.LOCK0_KICK1:KEY

To lock the Control Module MSS_CTRL the sequence is as below:
1. Write 0x0 to MSS_CTRL.LOCK0_KICK1:KEY
2. Write 0x0 to MSS_CTRL.LOCK0_KICK0:KEY

Any writes to locked memory region will result in assertion of the MMR_ACCESS_ERR_WR event by the respective control modules. This assertion can be enabled or disabled by writing the appropriate value to <Control Module>.INTR_ENABLE.KICK_ERR_EN field.

The table below shows the values that must be written to the LOCK0_KICK0 and LOCK0_KICK1 registers to unlock the various Control modules' MMR.

Table 2-1. Kick Protection Register Unlock Values

Protected Register	LockKick Register	Unlock Value
TOP_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
MSS_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
CONTROLSS_CTRL	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
TOP_RCM	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
MSS_RCM	LOCK0_KICK0	0x01234567
	LOCK0_KICK1	0xFEDCBA8
IOMUX	LOCK0_KICK0	0x83E70B13
	LOCK0_KICK1	0x95A4F1E0

Note

To ensure that all registers from a given partition are write protected, software must always re-lock the protection mechanism after completing the register writes.

Copyright © 2025 Texas Instruments Incorporated

The kick protection registers described in this section are an exception and are not write protected by the protection mechanism.

Table 2-177. MSS_CTRL_R5SS0_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:27	RESERVED	NONE	0h	Reserved
26:24	R5SS0_CONTROL_ROM_WAIT_STATE	R/W	0h	Writing 3'b111 enables a single cycle wait state with respect to CR5A_clk for rom access. This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. [because it is a timing issue in this scenario]
23:19	RESERVED	NONE	0h	Reserved
18:16	R5SS0_CONTROL_RESET_FSM_TRIGGER	R/W	0h	Write pulse bit field: Writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
15:11	RESERVED	NONE	0h	Reserved
10:8	R5SS0_CONTROL_LOCK_STEP_SWITCH_WAIT	R/W	7h	Writing 3'b111 ensures switch happens only after R5SS reset. Orelse it will be a immediate switch.
7:3	RESERVED	NONE	0h	Reserved
2:0	R5SS0_CONTROL_LOCK_STEP	R/W	7h	Writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if corresponding R5SS_CONTROL_LOCK_STEP_SWITCH_WAIT is set. Or else the switching to Dual-core happens on the fly.

23	PLL_CORE_CLKCTRL_IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low powe

Copyright © 2025 Texas Instruments Incorporated

Table 2-690. TOP_RCM_PLL_CORE_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	PLL_CORE_CLKCTRL_BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	PLL_CORE_CLKCTRL_STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	PLL_CORE_CLKCTRL_CLKOUTEN	R/W	0h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	PLL_CORE_CLKCTRL_CLKOUTLDOEN	R/W	1h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	PLL_CORE_CLKCTRL_ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/[N2+1] 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	PLL_CORE_CLKCTRL_CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	PLL_CORE_CLKCTRL_M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	NONE	0h	Reserved
14	PLL_CORE_CLKCTRL_STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	NONE	0h	Reserved
12:10	PLL_CORE_CLKCTRL_SELFREQDCO	R/W	4h	DCO Clock [DCOCLK = CLKINP * [M/[N+1]]] frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000MHz to 2000MHz 0x5: Reserved
9	RESERVED	NONE	0h	Reserved
8	PLL_CORE_CLKCTRL_RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%
7:2	RESERVED	NONE	0h	Reserved
1	PLL_CORE_CLKCTRL_SSCTYPE	R/W	0h	SSC Type - This should be configured as 1'b0. The module supports spread spectrum clocking [SSC] on its output clocks.
0	PLL_CORE_CLKCTRL_TINTZ	R/W	0h	PLL core soft reset. TINITZ activation [Low] gives softreset to ADPLLLJ. TINITZ does not reset the entire digital control logic; it forces the FSM into RESET State so that ADPLLLJ could restart.

Table 2-742. TOP_RCM_PLL_PER_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PLL_PER_CLKCTRL_CYCLESLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK. Cycleslip could be caused if loop is not able to track input clock. Default = 1'b0 recommended
30	PLL_PER_CLKCTRL_ENSSC	R/W	0h	Controls Clock SpReading. SSC is not supported. Should be set to 0x0 to disable clock spReading.
29	PLL_PER_CLKCTRL_CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28:24	RESERVED	NONE	0h	Reserved
23	PLL_PER_CLKCTRL_IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low powe

Table 2-742. TOP_RCM_PLL_PER_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	PLL_PER_CLKCTRL_BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	PLL_PER_CLKCTRL_STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	PLL_PER_CLKCTRL_CLKOUTEN	R/W	0h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	PLL_PER_CLKCTRL_CLKOUTLDOEN	R/W	1h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	PLL_PER_CLKCTRL_ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/[N2+1] 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	PLL_PER_CLKCTRL_CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	PLL_PER_CLKCTRL_M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	NONE	0h	Reserved
14	PLL_PER_CLKCTRL_STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	NONE	0h	Reserved
12:10	PLL_PER_CLKCTRL_SELFREQDCO	R/W	4h	DCO Clock [DCOCLK = CLKINP * [M/[N+1]]] frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000MHz to 2000MHz 0x5: Reserved
9	RESERVED	NONE	0h	Reserved
8	PLL_PER_CLKCTRL_RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%
7:2	RESERVED	NONE	0h	Reserved
1	PLL_PER_CLKCTRL_SSCTYPE	R/W	0h	SSC Type - This should be configured as 1'b0. The module supports spread spectrum clocking [SSC] on its output clocks.
0	PLL_PER_CLKCTRL_TINTZ	R/W	0h	PLL core soft reset. TINITZ activation [Low] gives softreset to ADPLLLJ. TINITZ does not reset the entire digital control logic; it forces the FSM into RESET State so that ADPLLLJ could restart.

Bit	Field	Type	Reset	Description
31:0	EPWM_CLKSYNC_BIT	R/W	0h	EPWM clock sync for each EPWM instance. Set the bit corresponding to the instance number to enable that EPWM instance. When set, all enabled EPWM module clocks are started with the first rising edge of TBCLK aligned.Refer to TRM for more details. Writing 1'b1 will allow to enable corresponding EPWM instance Writing 1'b0 will disable corresponding EPWM instance.

3 Real-time Control Subsystem (CONTROLSS) Registers

The Real-time Control Subsystem (CONTROLSS) registers are described in the following sections.

3.1 CONTROLSS 16-bit Register Access Note

Note

8-bit wide register access is **not allowed** for ADC, EPWM, DAC, CMPSS, EQEP, SDFM, and FSI MMR regions. 16-bit access must be used instead.
