Table 3-38. ADC_RESULTS_ADCPPB1RESULT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 16. NOTE: If the conversion associated with this Post Processing Block is a 12-bit conversion, the SIGN bits extend down to bit 12, and all reflect the same value as bit 12.
15:0	PPBRESULT	R	0h	ADC Post Processing Block Result 1 The result of the offset/reference subtraction post conversion processing is stored in this register. This result is available 1 SYSCLK cycle after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC. In the case of multiple PPBs associated with the same SOC, the lowest numbered PPB's result will be availble 1 SYSCLK cycle after the associated ADCRESULT and subsequent results [in order from lowest numbered PPB to highest] will each become available every 2-3 SYSCLK cycles [refer to the TRM for more detailed timing information]. If ADCINTFLG is polled to determine when to read the PPBRESULT, it may be necessary to add one or more NOP instructions to ensure that the updated post conversion processing result has posted to the register. NOTE: If the conversion associated with this Post Processing Block is a 12-bit conversion, the PPBRESULT bits are limited to bits 12:0.

Table 3-54. ADC_RESULTS_ADCPPB3SUM Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 23.
23:0	SUM	R	0h	Post Processing Block 3 Oversampling Final Sum. When either a count-match event occurs [PCOUNT = LIMIT] or PPB3 receives a sync. event, the value of PSUM is loaded into this register. In the case of a count-match event, the sum loaded into this register includes the value from the most recent conversion. The value from PSUM will be right shifted by the amount specified in the SHIFT register before being loaded into the final SUM result register. This result is available 1 SYSCLK cycle after the associated ADCPPB3RESULT is available [only in case of a count-match event]. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB3RESULT timing information].

Table 3-82. ADC_RESULTS_ADCPPB3MIN Register Field Descriptions

Bit	Field	Type	Reset	Description
31:17	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 16.
16:0	MIN	R	0h	Post Processing Block 3 Oversampling Final Min. When either a count-match event occurs [PCOUNT = LIMIT] or PPB3 receives a sync. event, the value of PMIN is loaded into this register. In the case of a count-match event, the max loaded into this register includes the value from the most recent conversion. This result is available 1 SYSCLK cycle after the associated ADCPPB3RESULT is available [only in case of a count-match event]. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB3RESULT timing information].

Table 3-94. ADC_CFG_ADCCTL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	TDMAEN	R/W	0h	Enable Alternate DMA Timings. This bit controls when the DMA is triggered. 0 DMA is triggered at the same time as the CPU interrupt 1 DMA is always triggered at tDMA regardless or whether the ADC is in early interrupt mode or late interrupt mode
14	EXTMUXPRESELECTEN	R/W	0h	If th the ADC SOC sequence is deterministic, the ADCEXTMUX pins can be set earlier: at the end of the S+H window of the previous conversion instead of the beginning of the S+H window of the current conversion. This allows some of the external mux settling time to be pipelined with the previous conversion's conversion time. However, this will not work in the case where high-priority SOCs can arrive asynchronously. 0 ADCEXTMUX pins only change at beginning of S+H window 1 ADCEXTMUX pins are set after the end of S+H window based on pending SOCs
13	ADCBSY	R	0h	ADC Busy. Set when ADC SOC is generated, cleared by hardware four ADC clocks after negative edge of S/H pulse. Used by the ADC state machine to determine if ADC is available to sample. 0 ADC is available to sample next channel 1 ADC is busy and cannot sample another channel
12	RESERVED_3	R	0h	Reserved

Table 3-100. ADC_CFG_ADCINTFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	ADCINT2RESULT	R	0h	ADC Interrupt 2 Results Ready Flag. This flag is set when the conversions results associated with ADCINT2 latch into the corresponding results register. 0 Conversion results have not latched 1 Conversion results have latched This flag can be used in an ISR that is entered in early interrupt mode to ensure that the corresponding results are ready before proceeding to read the result register. This flag can be cleared via the ACK bit in the ADCINTFLGCLR that also clears the ADCINT2 flag. In case results latch and this flag is already set, the corresponding flag in ADCINTOVF is NOT set. This flag does NOT have to be cleared in order for ADCINT ISRs to propagate to the PIE. In case the associated SOC is associated with a PPB or PPBs, the flag will not be set until all associated PPB results latch.
4	ADCINT1RESULT	R	0h	ADC Interrupt 1 Results Ready Flag. This flag is set when the conversions results associated with ADCINT1 latch into the corresponding results register. 0 Conversion results have not latched 1 Conversion results have latched This flag can be used in an ISR that is entered in early interrupt mode to ensure that the corresponding results are ready before proceeding to read the result register. This flag can be cleared via the ACK bit in the ADCINTFLGCLR that also clears the ADCINT1 flag. In case results latch and this flag is already set, the corresponding flag in ADCINTOVF is NOT set. This flag does NOT have to be cleared in order for ADCINT ISRs to propagate to the PIE. In case the associated SOC is associated with a PPB or PPBs, the flag will not be set until all associated PPB results latch.
3	ADCINT4	R	0h	ADC Interrupt 4 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.
2	ADCINT3	R	0h	ADC Interrupt 3 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINTFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.
1	ADCINT2	R	0h	ADC Interrupt 2 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINTFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.

Table 3-116. ADC_CFG_ADCINTSOCSEL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	SOC15	R/W	0h	SOC15 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC15. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC15. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC15. 10 ADCINT2 will trigger SOC15. 11 Invalid selection.
13:12	SOC14	R/W	0h	SOC14 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC14. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC14. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC14. 10 ADCINT2 will trigger SOC14. 11 Invalid selection.
11:10	SOC13	R/W	0h	SOC13 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC13. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC13. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC13. 10 ADCINT2 will trigger SOC13. 11 Invalid selection.
9:8	SOC12	R/W	0h	SOC12 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC12. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC12. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC12. 10 ADCINT2 will trigger SOC12. 11 Invalid selection.

Bit	Field	Type	Reset	Description
7:6	SOC11	R/W	0h	SOC11 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC11. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC11. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC11. 10 ADCINT2 will trigger SOC11. 11 Invalid selection.
5:4	SOC10	R/W	0h	SOC10 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC10. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC10. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC10. 10 ADCINT2 will trigger SOC10. 11 Invalid selection.
3:2	SOC9	R/W	0h	SOC9 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC9. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC9. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC9. 10 ADCINT2 will trigger SOC9. 11 Invalid selection.
1:0	SOC8	R/W	0h	SOC8 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC8. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC8. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC8. 10 ADCINT2 will trigger SOC8. 11 Invalid selection.

Table 3-118. ADC_CFG_ADCSOCFLG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Flag. Indicates the state of SOC15 conversions. 0 No sample pending for SOC15. 1 Trigger has been received and sample is pending for SOC15. This bit will be automatically cleared when the SOC15 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
14	SOC14	R	0h	SOC14 Start of Conversion Flag. Indicates the state of SOC14 conversions. 0 No sample pending for SOC14. 1 Trigger has been received and sample is pending for SOC14. This bit will be automatically cleared when the SOC14 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
13	SOC13	R	0h	SOC13 Start of Conversion Flag. Indicates the state of SOC13 conversions. 0 No sample pending for SOC13. 1 Trigger has been received and sample is pending for SOC13. This bit will be automatically cleared when the SOC13 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-118. ADC_CFG_ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SOC12	R	0h	SOC12 Start of Conversion Flag. Indicates the state of SOC12 conversions. 0 No sample pending for SOC12. 1 Trigger has been received and sample is pending for SOC12. This bit will be automatically cleared when the SOC12 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
11	SOC11	R	0h	SOC11 Start of Conversion Flag. Indicates the state of SOC11 conversions. 0 No sample pending for SOC11. 1 Trigger has been received and sample is pending for SOC11. This bit will be automatically cleared when the SOC11 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
10	SOC10	R	0h	SOC10 Start of Conversion Flag. Indicates the state of SOC10 conversions. 0 No sample pending for SOC10. 1 Trigger has been received and sample is pending for SOC10. This bit will be automatically cleared when the SOC10 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
9	SOC9	R	0h	SOC9 Start of Conversion Flag. Indicates the state of SOC9 conversions. 0 No sample pending for SOC9. 1 Trigger has been received and sample is pending for SOC9. This bit will be automatically cleared when the SOC9 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
8	SOC8	R	0h	SOC8 Start of Conversion Flag. Indicates the state of SOC8 conversions. 0 No sample pending for SOC8. 1 Trigger has been received and sample is pending for SOC8. This bit will be automatically cleared when the SOC8 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-118. ADC_CFG_ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SOC7	R	0h	SOC7 Start of Conversion Flag. Indicates the state of SOC7 conversions. 0 No sample pending for SOC7. 1 Trigger has been received and sample is pending for SOC7. This bit will be automatically cleared when the SOC7 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
6	SOC6	R	0h	SOC6 Start of Conversion Flag. Indicates the state of SOC6 conversions. 0 No sample pending for SOC6. 1 Trigger has been received and sample is pending for SOC6. This bit will be automatically cleared when the SOC6 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
5	SOC5	R	0h	SOC5 Start of Conversion Flag. Indicates the state of SOC5 conversions. 0 No sample pending for SOC5. 1 Trigger has been received and sample is pending for SOC5. This bit will be automatically cleared when the SOC5 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
4	SOC4	R	0h	SOC4 Start of Conversion Flag. Indicates the state of SOC4 conversions. 0 No sample pending for SOC4. 1 Trigger has been received and sample is pending for SOC4. This bit will be automatically cleared when the SOC4 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
3	SOC3	R	0h	SOC3 Start of Conversion Flag. Indicates the state of SOC3 conversions. 0 No sample pending for SOC3. 1 Trigger has been received and sample is pending for SOC3. This bit will be automatically cleared when the SOC3 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Bit	Field	Type	Reset	Description
2	SOC2	R	0h	SOC2 Start of Conversion Flag. Indicates the state of SOC2 conversions. 0 No sample pending for SOC2. 1 Trigger has been received and sample is pending for SOC2. This bit will be automatically cleared when the SOC2 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
1	SOC1	R	0h	SOC1 Start of Conversion Flag. Indicates the state of SOC1 conversions. 0 No sample pending for SOC1. 1 Trigger has been received and sample is pending for SOC1. This bit will be automatically cleared when the SOC1 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
0	SOC0	R	0h	SOC0 Start of Conversion Flag. Indicates the state of SOC0 conversions. 0 No sample pending for SOC0. 1 Trigger has been received and sample is pending for SOC0. This bit will be automatically cleared when the SOC0 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-120. ADC_CFG_ADCSOCFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R/W1TS	0h	SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
14	SOC14	R/W1TS	0h	SOC14 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC14 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC14 flag bit to 1. This will cause a conversion to start once priority is given to SOC14. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC14 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-120. ADC_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	SOC13	R/W1TS	0h	SOC13 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC13 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC13 flag bit to 1. This will cause a conversion to start once priority is given to SOC13. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC13 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
12	SOC12	R/W1TS	0h	SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
11	SOC11	R/W1TS	0h	SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
10	SOC10	R/W1TS	0h	SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
9	SOC9	R/W1TS	0h	SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-120. ADC_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SOC8	R/W1TS	0h	SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
7	SOC7	R/W1TS	0h	SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
6	SOC6	R/W1TS	0h	SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
5	SOC5	R/W1TS	0h	SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
4	SOC4	R/W1TS	0h	SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-120. ADC_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SOC3	R/W1TS	0h	SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
2	SOC2	R/W1TS	0h	SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
1	SOC1	R/W1TS	0h	SOC1 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC1 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC1 flag bit to 1. This will cause a conversion to start once priority is given to SOC1. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC1 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
0	SOC0	R/W1TS	0h	SOC0 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC0 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-122. ADC_CFG_ADCSOCOVF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Overflow Flag. Indicates an SOC15 event was generated in hardware while an existing SOC15 event was already pending. 0 No SOC15 event overflow. 1 SOC15 event overflow. An overflow condition does not stop SOC15 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
14	SOC14	R	0h	SOC14 Start of Conversion Overflow Flag. Indicates an SOC14 event was generated in hardware while an existing SOC14 event was already pending. 0 No SOC14 event overflow. 1 SOC14 event overflow. An overflow condition does not stop SOC14 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
13	SOC13	R	0h	SOC13 Start of Conversion Overflow Flag. Indicates an SOC13 event was generated in hardware while an existing SOC13 event was already pending. 0 No SOC13 event overflow. 1 SOC13 event overflow. An overflow condition does not stop SOC13 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
12	SOC12	R	0h	SOC12 Start of Conversion Overflow Flag. Indicates an SOC12 event was generated in hardware while an existing SOC12 event was already pending. 0 No SOC12 event overflow. 1 SOC12 event overflow. An overflow condition does not stop SOC12 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.

Table 3-122. ADC_CFG_ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R	0h	SOC11 Start of Conversion Overflow Flag. Indicates an SOC11 event was generated in hardware while an existing SOC11 event was already pending. 0 No SOC11 event overflow. 1 SOC11 event overflow. An overflow condition does not stop SOC11 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
10	SOC10	R	0h	SOC10 Start of Conversion Overflow Flag. Indicates an SOC10 event was generated in hardware while an existing SOC10 event was already pending. 0 No SOC10 event overflow. 1 SOC10 event overflow. An overflow condition does not stop SOC10 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
9	SOC9	R	0h	SOC9 Start of Conversion Overflow Flag. Indicates an SOC9 event was generated in hardware while an existing SOC9 event was already pending. 0 No SOC9 event overflow. 1 SOC9 event overflow. An overflow condition does not stop SOC9 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
8	SOC8	R	0h	SOC8 Start of Conversion Overflow Flag. Indicates an SOC8 event was generated in hardware while an existing SOC8 event was already pending. 0 No SOC8 event overflow. 1 SOC8 event overflow. An overflow condition does not stop SOC8 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
7	SOC7	R	0h	SOC7 Start of Conversion Overflow Flag. Indicates an SOC7 event was generated in hardware while an existing SOC7 event was already pending. 0 No SOC7 event overflow. 1 SOC7 event overflow. An overflow condition does not stop SOC7 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
6	SOC6	R	0h	SOC6 Start of Conversion Overflow Flag. Indicates an SOC6 event was generated in hardware while an existing SOC6 event was already pending. 0 No SOC6 event overflow. 1 SOC6 event overflow. An overflow condition does not stop SOC6 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
5	SOC5	R	0h	SOC5 Start of Conversion Overflow Flag. Indicates an SOC5 event was generated in hardware while an existing SOC5 event was already pending. 0 No SOC5 event overflow. 1 SOC5 event overflow. An overflow condition does not stop SOC5 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
4	SOC4	R	0h	SOC4 Start of Conversion Overflow Flag. Indicates an SOC4 event was generated in hardware while an existing SOC4 event was already pending. 0 No SOC4 event overflow. 1 SOC4 event overflow. An overflow condition does not stop SOC4 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.

Table 3-122. ADC_CFG_ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SOC3	R	0h	SOC3 Start of Conversion Overflow Flag. Indicates an SOC3 event was generated in hardware while an existing SOC3 event was already pending. 0 No SOC3 event overflow. 1 SOC3 event overflow. An overflow condition does not stop SOC3 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
2	SOC2	R	0h	SOC2 Start of Conversion Overflow Flag. Indicates an SOC2 event was generated in hardware while an existing SOC2 event was already pending. 0 No SOC2 event overflow. 1 SOC2 event overflow. An overflow condition does not stop SOC2 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
1	SOC1	R	0h	SOC1 Start of Conversion Overflow Flag. Indicates an SOC1 event was generated in hardware while an existing SOC1 event was already pending. 0 No SOC1 event overflow. 1 SOC1 event overflow. An overflow condition does not stop SOC1 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
0	SOC0	R	0h	SOC0 Start of Conversion Overflow Flag. Indicates an SOC0 event was generated in hardware while an existing SOC0 event was already pending. 0 No SOC0 event overflow. 1 SOC0 event overflow. An overflow condition does not stop SOC0 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.

Table 3-124. ADC_CFG_ADCSOCOVFCLR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R/W1TS	0h	SOC15 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC15 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC15 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
14	SOC14	R/W1TS	0h	SOC14 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC14 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC14 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
13	SOC13	R/W1TS	0h	SOC13 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC13 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC13 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
12	SOC12	R/W1TS	0h	SOC12 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC12 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC12 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..

Table 3-158. ADC_CFG_ADCEVTSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED_4	R	0h	Reserved
14	PPB4ZERO	R	0h	Post Processing Block 4 Zero Crossing Flag. When set indicates the ADCPPB4RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
13	PPB4TRIPLO	R	0h	Post Processing Block 4 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
12	PPB4TRIPHI	R	0h	Post Processing Block 4 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. 7	TRIGGEROVF	R/W1TC	0h	ADC Trigger Repeater 1 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers [NCOUNT was not 0 or SOCs associated with Repeater 1 were still pending]. Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0; if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
6	PHASEOVF	R/W1TC	0h	ADC Trigger Repeater 1 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger [PHASECOUNT was not 0]. Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
5	RESERVED_2	R	0h	Reserved

Copyright © 2025 Texas Instruments Incorporated

Table 3-226. ADC_CFG_REP1CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOCBUSY	R	0h	ADC Trigger Repeater 1 Associated SOCs Busy indicator. In oversampling mode: 0 = no SOCs associated with this repeater are pending 1 = SOCs associated with this repeater are still pending The next repeated trigger to the ADC in oversampling mode will not occur until SPREADCOUNT is 0 [minimum time is complete] and REP1CTL.BUSY = 0 [SOCs associated with trigger repeater 1 are no longer pending]. Note: If the ADC is in burstmode and the BURSTTRIG is Repeater 1, then all round-robin SOCs are considered associated with this repeater and the repeater will not re-trigger until there are no pending round-robin SOCs [in addition to any associated pending high-priority SOCs].
3	MODULEBUSY	R	0h	ADC Trigger Repeater 1 Module Busy indicator. In oversampling mode: 0 = Repeater 1 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 1 still has repeated triggers remaining [NCOUNT ' 0] or associated SOCs are still pending [SOCBUSY is 1] If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored.
2	RESERVED_1	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling
0	MODE	R/W	0h	ADC trigger repeater 1 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP1CTL.TRIGSEL is received, the repeater will repeat the trigger REP1N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP1CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP1N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling

7	TRIGGEROVF	R/W1TC	0h	ADC Trigger Repeater 2 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers [NCOUNT was not 0 or SOCs associated with Repeater 2 were still pending]. Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0; if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
6	PHASEOVF	R/W1TC	0h	ADC Trigger Repeater 2 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger [PHASECOUNT was not 0]. Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
5	RESERVED_2	R	0h	Reserved

Copyright © 2025 Texas Instruments Incorporated

Table 3-236. ADC_CFG_REP2CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOCBUSY	R	0h	ADC Trigger Repeater 2 Associated SOCs Busy indicator. In oversampling mode: 0 = no SOCs associated with this repeater are pending 1 = SOCs associated with this repeater are still pending The next repeated trigger to the ADC in oversampling mode will not occur until SPREADCOUNT is 0 [minimum time is complete] and REP2CTL.BUSY = 0 [SOCs associated with trigger repeater 2 are no longer pending]. Note: If the ADC is in burstmode and the BURSTTRIG is Repeater 2, then all round-robin SOCs are considered associated with this repeater and the repeater will not re-trigger until there are no pending round-robin SOCs [in addition to any associated pending high-priority SOCs].
3	MODULEBUSY	R	0h	ADC Trigger Repeater 2 Module Busy indicator. In oversampling mode: 0 = Repeater 2 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 2 still has repeated triggers remaining [NCOUNT ' 0] or associated SOCs are still pending [SOCBUSY is 1] If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored.
2	RESERVED_1	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling
0	MODE	R/W	0h	ADC trigger repeater 2 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP2CTL.TRIGSEL is received, the repeater will repeat the trigger REP2N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP2CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP2N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling

Table 3-250. ADC_CFG_ADCPPB1CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 1 Compare Source Select. This field determines whether ADCPPB1RESULT, ADCPPB1PSUM, or ADCPPB1SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB1RESULT is used for compare logic 01 = ADCPPB1PSUM is used for compare logic 10 = ADCPPB1SUM is used for compare logic 11 = Reserved Note: when ADCPPB1PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB1LIMIT equals ADCPPB1COUNT] the ADCPPB1PSUM register will be cleared and the final sum will be loaded into ADCPPB1SUM. For this sample, the final sum, ADCPPB1SUM will be used for the compariosn instead of ADCPPB1PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 1 Interrupt Source Select. OSINT1 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT1 in addition to a PCOUNT = LIMIT event. 0 = OSINT1 will be generated from PCOUNT = LIMIT only 1 = OSTIN1 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 1 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.

SYNCINSEL				SHIFT			
R/W				R/W			
0h				0h			

Table 3-286. ADC_CFG_ADCPPB3CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 3 Compare Source Select. This field determines whether ADCPPB3RESULT, ADCPPB3PSUM, or ADCPPB3SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB3RESULT is used for compare logic 01 = ADCPPB3PSUM is used for compare logic 10 = ADCPPB3SUM is used for compare logic 11 = Reserved Note: when ADCPPB3PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB3LIMIT equals ADCPPB3COUNT] the ADCPPB3PSUM register will be cleared and the final sum will be loaded into ADCPPB3SUM. For this sample, the final sum, ADCPPB3SUM will be used for the compariosn instead of ADCPPB3PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 3 Interrupt Source Select. OSINT3 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT3 in addition to a PCOUNT = LIMIT event. 0 = OSINT3 will be generated from PCOUNT = LIMIT only 1 = OSTIN3 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 3 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.

Each time a new result propagates through the PPB signal chain and latches into ADCPPB3RESULT if the result replaces PMIN this register is loaded with the current value of PCOUNT. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB3 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB3RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB3RESULT timing information].

SYNCINSEL				SHIFT			
R/W				R/W			
0h				0h			

Table 3-304. ADC_CFG_ADCPPB4CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 4 Compare Source Select. This field determines whether ADCPPB4RESULT, ADCPPB4PSUM, or ADCPPB4SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB4RESULT is used for compare logic 01 = ADCPPB4PSUM is used for compare logic 10 = ADCPPB4SUM is used for compare logic 11 = Reserved Note: when ADCPPB4PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB4LIMIT equals ADCPPB4COUNT] the ADCPPB4PSUM register will be cleared and the final sum will be loaded into ADCPPB4SUM. For this sample, the final sum, ADCPPB4SUM will be used for the compariosn instead of ADCPPB4PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 4 Interrupt Source Select. OSINT4 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT4 in addition to a PCOUNT = LIMIT event. 0 = OSINT4 will be generated from PCOUNT = LIMIT only 1 = OSTIN4 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 4 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.

31:12	RESERVED_1	R	0h	Reserved
11	OOT12	R/W1TS	0h	ADC results safety checker 12 out-of-tolerance flag clear. Used to clear OOT status from CHECK12. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
10	OOT11	R/W1TS	0h	ADC results safety checker 11 out-of-tolerance flag clear. Used to clear OOT status from CHECK11. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
9	OOT10	R/W1TS	0h	ADC results safety checker 10 out-of-tolerance flag clear. Used to clear OOT status from CHECK10. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.

Table 3-339. ADC_SAFETY_AGGR_OOTFLGCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	OOT9	R/W1TS	0h	ADC results safety checker 9 out-of-tolerance flag clear. Used to clear OOT status from CHECK9. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
7	OOT8	R/W1TS	0h	ADC results safety checker 8 out-of-tolerance flag clear. Used to clear OOT status from CHECK8. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
6	OOT7	R/W1TS	0h	ADC results safety checker 7 out-of-tolerance flag clear. Used to clear OOT status from CHECK7. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
5	OOT6	R/W1TS	0h	ADC results safety checker 6 out-of-tolerance flag clear. Used to clear OOT status from CHECK6. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
4	OOT5	R/W1TS	0h	ADC results safety checker 5 out-of-tolerance flag clear. Used to clear OOT status from CHECK5. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
3	OOT4	R/W1TS	0h	ADC results safety checker 4 out-of-tolerance flag clear. Used to clear OOT status from CHECK4. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
2	OOT3	R/W1TS	0h	ADC results safety checker 3 out-of-tolerance flag clear. Used to clear OOT status from CHECK3. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
1	OOT2	R/W1TS	0h	ADC results safety checker 2 out-of-tolerance flag clear. Used to clear OOT status from CHECK2. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
0	OOT1	R/W1TS	0h	ADC results safety checker 1 out-of-tolerance flag clear. Used to clear OOT status from CHECK1. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.

Bit	Field	Type	Reset	Description
8	RES1OVF9	R/W1TS	0h	ADC results safety checker 9 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK9. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
7	RES1OVF8	R/W1TS	0h	ADC results safety checker 8 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK8. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
6	RES1OVF7	R/W1TS	0h	ADC results safety checker 7 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK7. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
5	RES1OVF6	R/W1TS	0h	ADC results safety checker 6 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK6. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
4	RES1OVF5	R/W1TS	0h	ADC results safety checker 5 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK5. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
3	RES1OVF4	R/W1TS	0h	ADC results safety checker 4 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK4. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
2	RES1OVF3	R/W1TS	0h	ADC results safety checker 3 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK3. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
1	RES1OVF2	R/W1TS	0h	ADC results safety checker 2 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK2. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
0	RES1OVF1	R/W1TS	0h	ADC results safety checker 1 result 1 overflow flag clear. Used to clear RES1OVF status from CHECK1. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.

In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
10	RES2OVF11	R/W1TS	0h	ADC results safety checker 11 result overflow flag clear. Used to clear OVF status from CHECK11. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
9	RES2OVF10	R/W1TS	0h	ADC results safety checker 10 result overflow flag clear. Used to clear OVF status from CHECK10. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.

Table 3-347. ADC_SAFETY_AGGR_RES2OVFCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	RES2OVF9	R/W1TS	0h	ADC results safety checker 9 result overflow flag clear. Used to clear OVF status from CHECK9. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
7	RES2OVF8	R/W1TS	0h	ADC results safety checker 8 result overflow flag clear. Used to clear OVF status from CHECK8. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
6	RES2OVF7	R/W1TS	0h	ADC results safety checker 7 result overflow flag clear. Used to clear OVF status from CHECK7. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
5	RES2OVF6	R/W1TS	0h	ADC results safety checker 6 result overflow flag clear. Used to clear OVF status from CHECK6. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
4	RES2OVF5	R/W1TS	0h	ADC results safety checker 5 result overflow flag clear. Used to clear OVF status from CHECK5. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
3	RES2OVF4	R/W1TS	0h	ADC results safety checker 4 result overflow flag clear. Used to clear OVF status from CHECK4. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
2	RES2OVF3	R/W1TS	0h	ADC results safety checker 3 result overflow flag clear. Used to clear OVF status from CHECK3. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
1	RES2OVF2	R/W1TS	0h	ADC results safety checker 2 result overflow flag clear. Used to clear OVF status from CHECK2. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHECKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.
0	RES2OVF1	R/W1TS	0h	ADC results safety checker 1 result overflow flag clear. Used to clear OVF status from CHECK1. In the case of a safety checker interrupt, clear all serviced OOT or OVF flags first, then clear the global interrupt flag [in the CHECKINTFLG register] using the CHKINTFLGCLR register. In the case of a safety checker X-bar event, clear all associated OOT or OVF flags to clear the event.

Table 3-349. ADC_SAFETY_AGGR_CHECKINTFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
15:1	RESERVED_1	R	0h	Reserved
0	CHECKINT	R	0h	ADC results safety checker subsytem interrupt flag. Indicates that one or more configured OOT or OVF conditions have occurred in the individual safety checker modules. In the ISR, clear all serviced OOT or OVF flags first [using the OOTFLGCLR and OVFFLGCLR registers], then clear this flag using the CHKINTFLGCLR register. The CHECKINTSEL1 and CHECKINTSEL2 registers are used to select which OOT and OVF flags from the individual checker modules can trigger this interrupt.

Table 3-524. ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	CTRFILTRESET	R/W1TC	0h	Reset Bit 0h[R] = No effect 1h[W] = Resets event filter, counter, modulo counter and CEVT[1,2,3,4] and CNTOVF , HRERROR flags Note: This provides an ability start capture module from known state in case spurious inputs are captured while ECAP is configured.
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. 0 Output is active high (Compare value defines high time) 1 Output is active low (Compare value defines low time)
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select 0 ECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input 1 ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary) - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output
8	SWSYNC	R/W1TS	0h	Software-forced Counter [TSCTR] Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event. 0 Writing a zero has no effect. Reading always returns a zero 1 Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful.
7:6	SYNCO_SEL	R/W	0h	Sync-Out Select 0 sync out signal is SWSYNC 1 Select CTR = PRD event to be the sync-out signal 3 Disable sync out signal
5	SYNCI_EN	R/W	0h	Counter [TSCTR] Sync-In select mode 0 Disable sync-in option 1 Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a S/W force event.
4	TSCTRSTOP	R/W	0h	Time Stamp [TSCTR] Counter Stop [freeze] Control 0 TSCTR stopped 1 TSCTR free-running
3	REARM	R/W1TS	0h	Re-Arming Control. Note: The re-arm function is valid in one shot or continuous mode 0 Has no effect (reading always returns a 0) 1 Arms the one-shot sequence as follows: (1) Resets the Mod4 counter to zero (2) Unfreezes the Mod4 counter (3) Enables capture register loads

Copyright © 2025 Texas Instruments Incorporated

Table 3-524. ECAP_ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:1	STOP_WRAP	R/W	3h	Stop value for one-shot mode. This is the number [between 1-4] of captures allowed to occur before the CAP[1-4] registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number [between 1-4] of the capture register in which the circular buffer wraps around and starts again. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, 2 actions occur: - Mod4 counter is stopped [frozen] - Capture register loads are inhibited In one-shot mode, further interrupt events are blocked until re-armed. 0 Stop after Capture Event 1 in one-shot mode Wrap after Capture Event 1 in continuous mode. 1 Stop after Capture Event 2 in one-shot mode Wrap after Capture Event 2 in continuous mode. 2 Stop after Capture Event 3 in one-shot mode Wrap after Capture Event 3 in continuous mode. 3 Stop after Capture Event 4 in one-shot mode Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control [applicable only in capture mode] 0 Operate in continuous mode 1 Operate in one-Shot mode

3.7.2.10 ECAP_ECEINT Register

3.7.2.10.1 ECAP_ECEINT Register (Offset = 2Ch) [reset = 0h]

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers.
The proper procedure for configuring peripheral modes and interrupts is as follows:
- Disable global interrupts
- Stop eCAP counter
- Disable eCAP interrupts
- Configure peripheral registers
- Clear spurious eCAP interrupt flags
- Enable eCAP interrupts
- Start eCAP counter
- Enable global interrupts.

R/W	R/W1TS	R		R/W	R/W	R/W	
1h	0h	0h		0h	0h	3h	

Table 3-614. EPWM_TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the EPWM time-base counter during emulation events 00:Stop after the next time-base counter increment or decrement 01:Stop when counter completes a whole cycle: - Up-count mode: stop when the time-base counter = period [TBCTR = TBPRD] - Down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] - Up-down-count mode: stop when the time-base counter = 0x00 [TBCTR = 0x00] 1x: Free run
13	PHSDIR	R/W	0h	Phase Direction Bit This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter [TBCTR] will count after a synchronization event occurs and a new phase value is loaded from the phase [TBPHS] register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0:Count down after the synchronization event. 1:Count up after the synchronization event.
12:10	CLKDIV	R/W	0h	Time Base Clock Pre-Scale Bits These bits select the time base clock pre-scale value [TBCLK = EPWMCLK/[HSPCLKDIV * CLKDIV]: 000:/1 [default on reset] 001:/2 010:/4 011:/8 100:/16 101:/32 110:/64 111:/128

Copyright © 2025 Texas Instruments Incorporated

Table 3-614. EPWM_TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9:7	HSPCLKDIV	R/W	1h	High Speed Time Base Clock Pre-Scale Bits These bits determine part of the time-base clock prescale value. TBCLK = EPWMCLK / [HSPCLKDIV x CLKDIV]. This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager [EV] peripheral. 000:/1 001:/2 [default on reset] 010:/4 011:/6 100:/8 101:/10 110:/12 111:/14
6	SWFSYNC	R/W1TS	0h	Software Forced Sync Pulse 0:Writing a 0 has no effect and reads always return a 0. 1:Writing a 1 forces a one-time synchronization pulse to be generated. SWFSYNC can be enabled to effect EPWMxSYNCO by setting the EPWMSYNCOUTEN.SWEN bit.
5:4	RESERVED_1	R	0h	Reserved
3	PRDLD	R/W	0h	Active Period Reg Load from Shadow Select 0:The period register [TBPRD] is loaded from its shadow register when the time-base counter, TBCTR, is equal to zero and/or a sync event as determined by the TBCTL2[PRDLDSYNC] bit. A write/read to the TBPRD register accesses the shadow register. 1: Immediate Mode [Shadow register bypassed]: A write or read to the TBPRD register accesses the active register.
2	PHSEN	R/W	0h	Counter Reg Load from Phase Reg Enable 0:Do not load the time-base counter [TBCTR] from the time-base phase register [TBPHS]. 1:Allow Counter to be loaded from the Phase register [TBPHS] and shadow to active load events when an EPWMxSYNCI input signal occurs or a software-forced sync signal, see bit 6.
1:0	CTRMODE	R/W	3h	Counter Mode The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 00:Up-count mode 01:Down-count mode 10:Up-down count mode 11:Freeze counter operation [default on reset]

7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
LOADREDMODE		IN_MODE		POLSEL		OUT_MODE	
R/W		R/W		R/W		R/W	
0h		0h		0h		0h	

Table 3-623. EPWM_DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit 0:Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1:Half cycle clocking enabled. The dead-band counters are clocked at TBCLK*2.
14	DEDB_MODE	R/W	0h	Dead Band Dual-Edge B Mode Control [S8 switch] 0:Rising edge delay applied to InA/InB as selected by S4 switch [IN-MODE bits] on A signal path only. Falling edge delay applied to InA/InB as selected by S5 switch [INMODE bits] on B signal path only. 1:Rising edge delay and falling edge delay applied to source selected by S4 switch [INMODE bits] and output to B signal path only. Note: When this bit is set to 1, user should always either set OUT_MODE bits such that Apath = InA OR OUTSWAP bits such that OutA=Bpath otherwise, OutA will be invalid.
13:12	OUTSWAP	R/W	0h	Dead Band Output Swap Control Bit 13 controls the S6 switch and bit 12 controls the S7 switch. 00:OutA and OutB signals are as defined by OUT-MODE bits. 01:OutA = A-path as defined by OUT-MODE bits. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path]. 10:OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = B-path as defined by OUT-MODE bits. 11:OutA = B-path as defined by OUT-MODE bits [falling edge delay or delay-bypassed B signal path]. OutB = A-path as defined by OUT-MODE bits [rising edge delay or delay-bypassed A signal path].
11	SHDWDBFEDMODE	R/W	0h	FED Dead-Band Load Mode 0:Immediate mode. Only the active DBFED register is used. All writes/reads via the CPU directly access the active register for immediate "FED dead-band action." 1:Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy].

Copyright © 2025 Texas Instruments Incorporated

Table 3-623. EPWM_DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	SHDWDBREDMODE	R/W	0h	RED Dead-Band Load Mode 0:Immediate mode. Only the active DBRED register is used. All writes/reads via the CPU directly access the active register for immediate "RED dead-band action." 1:Shadow mode. Operates as a double buffer. All writes via the CPU access Shadow register. Default at Reset is Immediate mode [for compatibility with legacy].
9:8	LOADFEDMODE	R/W	0h	Active DBFED Load from Shadow Select Mode 00:Load on Counter = 0 [CNT_eq] 01:Load on Counter = Period [PRD_eq] 10:Load on either Counter = 0, or Counter = Period 11:Freeze [no loads possible] Note: has no effect in Immediate mode.
7:6	LOADREDMODE	R/W	0h	Active DBRED Load from Shadow Select Mode 00:Load on Counter = 0 [CNT_eq] 01:Load on Counter = Period [PRD_eq] 10:Load on either Counter = 0, or Counter = Period 11:Freeze [no loads possible] Note: has no effect in Immediate mode.
5:4	IN_MODE	R/W	0h	Dead-Band Input Mode Control Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 00:EPWMxA In [from the action-qualifier] is the source for both falling-edge and rising-edge delay. 01:EPWMxB In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxA In [from the action-qualifier] is the source for falling-edge delayed signal. 10:EPWMxA In [from the action-qualifier] is the source for rising-edge delayed signal. EPWMxB In [from the action-qualifier] is the source for falling-edge delayed signal. 11:EPWMxB In [from the action-qualifier] is the source for both rising-edge delay and falling-edge delayed signal.
3:2	POLSEL	R/W	0h	Polarity Select Control Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 2'b11 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes. 00:Active high [AH] mode. Neither EPWMxA nor EPWMxB is inverted [default]. 01:Active low complementary [ALC] mode. EPWMxA is inverted. 10:Active high complementary [AHC]. EPWMxB is inverted. 11:Active low [AL] mode. Both EPWMxA and EPWMxB are inverted.
1:0	OUT_MODE	R/W	0h	Dead-Band Output Mode Control Bit 1 controls the S1 switch and bit 0 controls the S0 switch. 00:DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect. 01:Apath = InA [delay is by-passed for A signal path] Bpath = FED [Falling Edge Delay in B signal path] 10:Apath = RED [Rising Edge Delay in A signal path] Bpath = InB [delay is by-passed for B signal path] 11:DBM is fully enabled [i.e. both RED and FED active]

Table 3-630. EPWM_HRCNFG Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	LINESEL	R/W	0h	Delay Line Selection Bits: Selects which of the 4 delay lines for a particular EPWM/EPWM module to send to CALIN for calibration.
13	RESERVED_1	R	0h	Reserved
12:11	HRLOADB	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPBHR shadow value into the active register. 00:Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01:Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10:Load on either CTR = Zero or CTR = PRD 11:Load on CMPB_EQ [Translator Event CMPB-3]
10	CTLMODEB	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0:CMPBHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1:TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode].
9:8	EDGMODEB	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00:HRPWM capability is disabled [default on reset] 01:MEP control of rising edge [CMPBHR] 10:MEP control of falling edge [CMPBHR] 11:MEP control of both edges [TBPHSHR or TBPRDHR]
7	SWAPAB	R/W	0h	Swap EPWM A & B Output Signals This bit enables the swapping of the A & B signal outputs. The selection is as follows: 0:EPWMxA and EPWMxB outputs are unchanged. 1:EPWMxA signal appears on EPWMxB output and EPWMxB signal appears on EPWMxA output.

Copyright © 2025 Texas Instruments Incorporated

Table 3-630. EPWM_HRCNFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	AUTOCONV	R/W	0h	Auto Convert Delay Line Value Selects whether the fractional duty cycle/period/phase in the CMPAHR/TBPRDHR/TBPHSHR register is automatically scaled by the MEP scale factor in the HRMSTEP register or manually scaled by calculations in application software. The SFO library function automatically updates the HRMSTEP register with the appropriate MEP scale factor. 0:Automatic HRMSTEP scaling is disabled. 1:Automatic HRMSTEP scaling is enabled. If application software is manually scaling the fractional duty cycle, or phase [i.e. software sets CMPAHR = [fraction[PWMduty * PWMperiod] * MEP Scale Factor]<<8 + 0x080 for duty cycle], then this mode must be disabled.
5	SELOUTB	R/W	0h	EPWMxB Output Select Bit This bit selects which signal is output on the EPWMxB channel output. The inversion will take the high resolution mode into account and the inverted signal will contain any high resolution modification. The inversion takes place as the last step in modifying the EPWMxB signal. 0:EPWMxB output is normal. 1:EPWMxB output is inverted version of EPWMxA signal.
4:3	HRLOAD	R/W	0h	Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. 00:Load on CTR = Zero: Time-base counter equal to zero [TBCTR = 0x0000] 01:Load on CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 10:Load on either CTR = Zero or CTR = PRD 11:Load on CMPA_EQ [Translator Event CMPA-3]
2	CTLMODE	R/W	0h	Control Mode Bits Selects the register [CMP/TBPRD or TBPHS] that controls the MEP: 0:CMPAHR[8] or TBPRDHR[8] Register controls the edge position [i.e., this is duty or period control mode]. [Default on Reset] 1:TBPHSHR[8] Register controls the edge position [i.e., this is phase control mode].
1:0	EDGMODE	R/W	0h	Edge Mode Bits Selects the edge of the PWM that is controlled by the micro-edge position [MEP] logic: 00:HRPWM capability is disabled [default on reset] 01:MEP control of rising edge [CMPAHR] 10:MEP control of falling edge [CMPAHR] 11:MEP control of both edges [TBPHSHR or TBPRDHR]

Table 3-632. EPWM_HRPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:7	RESERVED_1	R	0h	Reserved
6:4	PWMSYNCSELX	R/W	0h	Extended selection bits for EPWMSYNCPER 000:EPWMSYNCPER is defined by PWMSYNCSEL - > default condition [compatible with previous EPWM versions] 001:Reserved 010:Reserved 011:Reserved 100:CTR = CMPC, Count direction Up 101:CTR = CMPC, Count direction Down 110:CTR = CMPD, Count direction Up 111:CTR = CMPD, Count direction Down
3	HRPSYNCE	R/W	0h	SYNC Enable Bit [TRSYNCE]/High Resolution Period SYNC Enable Bit [HRPSYNCE]
2	TBPHSHRLOADE	R/W	0h	TBPHSHR Load Enable This bit allows you to synchronize EPWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple EPWM modules operating at the same frequency to be phase aligned with high-resolution. 0:Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event: 1:Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled.
1	PWMSYNCSEL	R/W	0h	PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC: 0 CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD] 1 CTR = zero: Time-base counter equal to zero [TBCTR = 0x00]

3.8.2.23 EPWM_EPWMXLINK Register

3.8.2.23.1 EPWM_EPWMXLINK Register (Offset = 70h) [reset = 0h]

EPWMx Link Register
This register controls which EPWMs are linked to other EPWM modules. The default reset value will vary for each module. The reset value will link each EPWM module to itself to prevent unintentional linking of modules.

Return to Summary Table

Table 3-651. EPWM_TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	TBPHS	R/W	0h	Phase Offset Register These bits set time-base counter phase of the selected EPWM relative to the time-base that is supplying the synchronization input signal. - If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. - If TBCTL[PHSEN] = 1, then the time-base counter [TBCTR] will be loaded with the phase [TBPHS] when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal [EPWMxSYNCI] or by a software forced synchronization.
15:0	TBPHSHR	R/W	0h	Phase Offset [High Resolution] Register. TBPHSHR must not be used. Instead TRREM [HRPWM remainder register] must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero

Table 3-655. EPWM_CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	CMPA	R/W	0h	Compare A Register The value in the active CMPA register is continuously compared to the time-base counter [TBCTR]. When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: - Do nothing the event is ignored. - Clear: Pull the EPWMxA and/or EPWMxB signal low - Set: Pull the EPWMxA and/or EPWMxB signal high - Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. - If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. - Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. - If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. - In either mode, the active and shadow registers share the same memory map address.

Table 3-659. EPWM_GLDCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:2	RESERVED_1	R	0h	Reserved
1	GFRCLD	R/W1TS	0h	Force Load Event in One Shot Mode 0:Writing of 0 will be ignored. Always reads back a 0. 1:Force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode.
0	OSHTLD	R/W1TS	0h	Enable Reload Event in One Shot Mode 0:Writing of 0 will be ignored. Always reads back a 0. 1:Turns the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing 1 to this bit would allow one load strobe event to pass through and block further strobe events.

15:8	RESERVED_1	R	0h	Reserved
7	CAPEVT	R	0h	Latched Status Flag for Capture Event 0:Indicates no trip event has occurred on CAPEVT 1:Indicates a trip event has occurred for the event defined for CAPEVT
6	DCBEVT2	R	0h	Latched Status Flag for Digital Compare Output B Event 2 0:Indicates no trip event has occurred on DCBEVT2 1:Indicates a trip event has occurred for the event defined for DCBEVT2
5	DCBEVT1	R	0h	Latched Status Flag for Digital Compare Output B Event 1 0:Indicates no trip event has occurred on DCBEVT1 1:Indicates a trip event has occurred for the event defined for DCBEVT1
4	DCAEVT2	R	0h	Latched Status Flag for Digital Compare Output A Event 2 0:Indicates no trip event has occurred on DCAEVT2 1:Indicates a trip event has occurred for the event defined for DCAEVT2
3	DCAEVT1	R	0h	Latched Status Flag for Digital Compare Output A Event 1 0:Indicates no trip event has occurred on DCAEVT1 1:Indicates a trip event has occurred for the event defined for DCAEVT1
2	OST	R	0h	Latched Status Flag for A One-Shot Trip Event 0:No one-shot trip event has occurred. 1:Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by Writing the appropriate value to the TZCLR register.

Copyright © 2025 Texas Instruments Incorporated

Table 3-669. EPWM_TZFLG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CBC	R	0h	Latched Status Flag for Cycle-By-Cycle Trip Event 0:No cycle-by-cycle trip event has occurred. 1:Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the EPWM time-base counter reaches zero [TBCTR = 0x00] if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared. This bit is cleared by Writing the appropriate value to the TZCLR register.
0	INT	R	0h	Latched Trip Interrupt Status Flag 0:Indicates no interrupt has been generated. 1:Indicates an EPWMx_TZINT VIM interrupt was generated because of a trip condition. No further EPWMx_TZINT VIM interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by Writing the appropriate value to the TZCLR register.

Table 3-678. EPWM_ETPS Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	SOCBCNT	R	0h	EPWM ADC Start-of-Conversion B Event [EPWMxSOCB] Counter Register These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.
13:12	SOCBPRD	R/W	0h	EPWM ADC Start-of-Conversion B Event [EPWMxSOCB] Period Select These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled [ETSEL[SOCBEN] = 1]. The SOCB pulse will be generated even if the status flag is set from a previous start of conversion [ETFLG[SOCB] = 1]. Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 00:Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 01:Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 2'b01 10:Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 2'b10 11:Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 2'b11
11:10	SOCACNT	R	0h	EPWM ADC Start-of-Conversion A Event [EPWMxSOCA] Counter Register These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.

Table 3-678. EPWM_ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9:8	SOCAPRD	R/W	0h	EPWM ADC Start-of-Conversion A Event [EPWMxSOCA] Period Select These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled [ETSEL[SOCAEN] = 1]. The SOCA pulse will be generated even if the status flag is set from a previous start of conversion [ETFLG[SOCA] = 1]. Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 00:Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 01:Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 2'b01 10:Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 2'b10 11:Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 2'b11
7:6	RESERVED_1	R	0h	Reserved
5	SOCPSSEL	R/W	0h	EPWMxSOC A/B Pre-Scale Selection Bits 0:Selects ETPS [SOCACNT/SOCBCNT] and [SOCAPRD/SOCBPRD] registers to determine frequency of events [interrupt once every 0-3 events]. 1:Selects ETSOCPS [SOCACNT2/SOCBCNT2] and [SOCAPRD2/SOCBPRD2] registers to determine frequency of events [interrupt once every 0-15 events].
4	INTPSSEL	R/W	0h	EPWMxINTn Pre-Scale Selection Bits 0:Selects ETPS [INTCNT, and INTPRD] registers to determine frequency of events [interrupt once every 0-3 events]. 1:Selects ETINTPS [INTCNT2, and INTPRD2] registers to determine frequency of events [interrupt once every 0-15 events].
3:2	INTCNT	R	0h	EPWM Interrupt Event [EPWMx_INT] Counter Register These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 00:No events have occurred. 01:1 event has occurred. 10:2 events have occurred. 11:3 events have occurred.
1:0	INTPRD	R/W	0h	EPWM Interrupt [EPWMx_INT] Period Select These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled [ETSEL[INT] = 1]. If the interrupt status flag is set from a previous interrupt [ETFLG[INT] = 1] then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 00:Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored. 01:Generate an interrupt on the first event INTCNT = 01 [first event] 10:Generate interrupt on ETPS[INTCNT] = 2'b10 [second event] 11:Generate interrupt on ETPS[INTCNT] = 2'b11 [third event]

RESERVED_1						SHDWMODE	CAPE
R						R/W	R/W
0h						0h	0h

Table 3-693. EPWM_DCCAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CAPMODE	R/W	0h	Counter Capture Mode 0:When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs, further trip [capture] events are ignored until the next PRD_eq or CNT_zero event [as selected by the PULSESEL bit in the DCFCTL register] re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCC0PCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCC0PCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event [whichever is selected by PULSESEL bit in DCFCTL register]. CPU reads of this register will return the shadow register value. 1:When a DCEVTFILT occurs and the counter capture is enabled, then the current TBCNT value is captured in the active register. When the respective trip event occurs - it will set the CAPSTS flag and further trip [capture] events are ignored until this bit is cleared. CAPSTS can be cleared by writing to CAPCLR bit in DCC0PCTL register and it re-triggers the capture mechanism. If active mode is enabled, via SHDWMODE bit in DCC0PCTL register, CPU reads of this register will return the active register value. If shadow mode is enabled, via SHDWMODE bit in DCC0PCTL register, the active register is copied to the shadow register on the PRD_eq or CNT_zero event [whichever is selected by PULSESEL bit in DCFCTL register]. CPU reads of this register will return the shadow register value.
14	CAPCLR	R/W1TS	0h	DC Capture Latched Status Clear Flag 0:Writing a 0 has no effect. 1:Writing a 1 will clear this CAPSTS [set] condition.
13	CAPSTS	R	0h	Latched Status Flag for Capture Event 0:No DC capture event occurred. 1:A DC capture event has occurred.
12:2	RESERVED_1	R	0h	Reserved

Table 3-694. EPWM_DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	DCFOFFSET	R/W	0h	Blanking Window Offset These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

Table 3-700. EPWM_DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15:0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture To enable time-base counter capture, set the DCC0PCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter [TBCTR] on the low to high edge transition of a filtered [DCEVTFLT] event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCC0P is enabled and disabled by the DCC0PCTL[SHDWMODE] bit. By default this register is shadowed. - If DCC0PCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. - If DCC0PCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.

Table 3-714. EPWM_XLOAD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED_1	R	0h	Reserved
1	FRCLD	R/W1TS	0h	Force reload event in one shot mode : Writing a 1 to this bit turn force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode. Writing of 0 will be ignored. Always reads back a 0.
0	STARTLD	R/W1TS	0h	Enable reload event : Writing a 1 to this bit turn the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing "1" to this bit would allow load strobe event to pass through and block further strobe events. Writing of 0 will be ignored. Always reads back a 0.

Bit	Field	Type	Reset	Description
31:16	RESERVED_1	R	0h	Reserved
15:0	CNT	R	0h	An 16-bit counter which monitors the frequency of diode mode trip events. When TripHorTripL is active: Increment CNT [increment INCSTEP on every EPWMxSYNC] When TripHorTripL is in-active: Decrement CNT [decrement DECSTEP on every EPWMxSYNC] If[CNT > THRESHOLD] then generate DETRIP and clear the counter. If[[CNT - DECSTEP] < 0] then CNT = 0 If[[CNT + INCSTEP] >= 0xFFFF] then CNT = 0xFFFF Note : CNT is cleared when DECTL.ENABLE is 0 Note: DEMONTHRES == 0x0 should not generate trip as the DEMONTHRES and DEMONCNT registers have reset value of 0x0

Table 3-794. EQEP_QPOSCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register [QPOSCNT] during initialization, i.e. when the eQEP position counter is disabled [QPEN bit of QEPCTL is zero]. Once the position counter is enabled [QPEN bit is one], Writing to the eQEP position counter register [QPOSCNT] may cause unexpected results.

Table 3-818. EQEP_QEPCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11:10	SEI	R/W	0h	Strobe event initialization of position counter 0 Does nothing (action disabled) 1 Does nothing (action disabled) 2 Initializes the position counter on rising edge of the QEPS signal 3 Clockwise Direction: Initializes the position counter on the rising edge of QEPS strobe Counter Clockwise Direction: Initializes the position counter on the falling edge of QEPS strobe
9:8	IEI	R/W	0h	Index event init of position count 0 Do nothing (action disabled) 1 Do nothing (action disabled) 2 Initializes the position counter on the rising edge of the QEPI signal (QPOSCNT = QPOSINIT) 3 Initializes the position counter on the falling edge of QEPI signal (QPOSCNT = QPOSINIT)
7	SWI	R/W	0h	Software init position counter 0 Do nothing (action disabled) 1 Initialize position counter (QPOSCNT=QPOSINIT). This bit is not cleared automatically
6	SEL	R/W	0h	Strobe event latch of position counter 0 The position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the QDECCTL register 1 Clockwise Direction: Position counter is latched on rising edge of QEPS strobe Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe
5:4	IEL	R/W	0h	Index event latch of position counter [software index marker] 0 Reserved 1 Latches position counter on rising edge of the index signal 2 Latches position counter on falling edge of the index signal 3 Software index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the QPOSILAT register and the direction flag is latched in the QEPSTS[QDLF] bit. This mode is useful for software index marking.
3	QPEN	R/W	0h	Quadrature position counter enable/software reset 0 Reset the eQEP peripheral internal operating flags/read-only registers. Control/configuration registers are not disturbed by a software reset. When QPEN is disabled, some flags in the QFLG register do not get reset or cleared and show the actual state of that flag. 1 eQEP position counter is enabled

Table 3-850. FSI_RX_CFG_RX_MASTER_CTRL_ALTC Register Field Descriptions

Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after Writing, so it must be written again for every change to this register.
7:5	RESERVED_1	R	0h	Reserved
4	DATA_FILTER_EN	R/W	0h	Data Filter Enable Bit. 0h[R/W] = Data filtering is disabled. 1h[R/W] = Data filtering is enabled.
3	INPUT_ISOLATE	R/W	0h	When set to 1, the FSI RX inputs [RXCLK, RXD0 and RXD1] will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not effect the RX module itself.
2	SPI_PAIRING	R/W	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only [RX_OPER_CTRL.SPI_MODE = 1] 0h[R/W] = SPI clock pairing is not enabled. 1h[R/W] = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Table 3-850. FSI_RX_CFG_RX_MASTER_CTRL_ALTC Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	INT_LOOPBACK	R/W	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h[R/W] = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h[R/W] = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
0	CORE_RST	R/W	0h	Receiver Controller Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h[R/W] = Receiver core is not in reset and can receive frames. 1h[R/W] = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Table 3-852. FSI_RX_CFG_RX_OPER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED_1	R	0h	Reserved
8	PING_WD_RST_MODE	R/W	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h[R/W] = The ping watchdog counter will reset and restart only by ping frames. 1h[R/W] = The ping watchdog counter will reset and restart by any received frame.
7	ECC_SEL	R/W	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h[R/W] = 32-bit ECC is used. 1h[R/W] = 16-bit ECC is used.
6:3	N_WORDS	R/W	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h[R/W] = 1 data word frame [16-bit data]. 1h[R/W] = 2 data word frame [32-bit data]. .. Fh [R/W] = 16 data word frame [256-bit data].
2	SPI_MODE	R/W	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h[R/W] = FSI is in normal mode of operation. 1h[R/W] = FSI is operating in SPI compatibility mode.

Bit	Field	Type	Reset	Description
15:4	RESERVED_1	R	0h	Reserved
3:0	FRAME_TYPE	R	0h	Received Frame Type This field indicates the type of frame that was successfully received last. 0000b[R/W] = A ping frame was received 0100b[R/W] = A DATA_1_WORD frame was received [16-bit data]. 0101b[R/W] = A DATA_2_WORD frame was received [32-bit data]. 0110b[R/W] = A DATA_4_WORD frame was received [64-bit data]. 0111b[R/W] = A DATA_6_WORD frame was received [96-bit data]. 0011b[R/W] = A DATA_N_WORD frame was received. The N_WORD field will determine the number of words [1 to 16] to be sent. The number of words received must equal the value programmed in RX_OPER_CTRL.N_WORDS. 1111b[R/W] = An error frame was received. This frame can be used during error conditions or any condition where the transmitter wants to signal the receiver for attention. However, the user software is at liberty to use this for any purpose. 0001b 0010b and 1000bthrough 1110bare Reserved and should not be used.

Bit	Field	Type	Reset	Description
15	RESERVED_1	R	0h	Reserved
14	ERROR_TAG_MATCH	R	0h	Error Tag Match Flag This bit indicates that an error frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched error frame received. 1h[R] = A tag-matched error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
13	DATA_TAG_MATCH	R	0h	Data Tag Match Flag This bit indicates that a dataframe was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched data frame received. 1h[R] = A tag-matched data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
12	PING_TAG_MATCH	R	0h	Ping Tag Match Flag This bit indicates that a ping frame was received with a tag comparison matching the masked tag reference. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No tag-matched ping frame received. 1h[R] = A tag-matched ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Copyright © 2025 Texas Instruments Incorporated

Table 3-860. FSI_RX_CFG_RX_EVT_STS_ALT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	DATA_FRAME	R	0h	Data Frame Received Flag This bit indicates that an data frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No data frame has been received. 1h[R] = A data frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
10	FRAME_OVERRUN	R	0h	Frame Overrun Flag This bit indicates that a frame overrun condition has occured. This bit gets set to 1 when a new DATA/ERROR frame is received and the corresponding DATA_FRAME_RCVD/ERROR_FRAME_RCVD flag is still set to 1. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Frame overrun has not ocurred. 1h[R] = Frame overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
9	PING_FRAME	R	0h	Ping Frame Received Flag This bit indicates that an ping frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No ping frame has been received. 1h[R] = A ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
8	ERR_FRAME	R	0h	Error Frame Received Flag This bit indicates that an error frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No error frame has been received. 1h[R] = An error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
7	BUF_UNDERRUN	R	0h	Receive Buffer Underrun Flag This bit indicates that a buffer underrun condition has occured in the receive buffer. This will happen when software reads the buffer which is empty and has no valid data. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Receive Buffer Underrun has not ocurred. 1h[R] = Receive Buffer Underrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
6	FRAME_DONE	R	0h	Frame Done Flag This bit indicates that a frame has been successfully received without error. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No frame has been successfully received. 1h[R] = A frame has been successfully received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
5	BUF_OVERRUN	R	0h	Receive Buffer Overrun Flag This bit indicates that a buffer overrun condition has occured in the receive buffer. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Receive buffer overrun has not ocurred. 1h[R] = Receive buffer overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Table 3-860. FSI_RX_CFG_RX_EVT_STS_ALT1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	EOF_ERR	R	0h	End-of-Frame Error Flag This bit indicates that an invalid end-of-frame bit pattern has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Invalid end-of-frame has not been received. 1h[R] = Invalid end-of-frame has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
3	TYPE_ERR	R	0h	Frame Type Error Flag This bit inditcates that an invalid frame type has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Invalid frame type has not been received. 1h[R] = Invalid frame type has been received To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
2	CRC_ERR	R	0h	CRC Error Flag This bit indicates that a CRC error has occured. A CRC error will be generated on a data frame where the received CRC and the computed CRC do not match. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = CRC error has not occured. 1h[R] = CRC error has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
1	FRAME_WD_TO	R	0h	Frame Watchdog Timeout Flag This bit indicates that the frame watchdog timer has timed out. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Frame watchdog timeout has not occured. 1h[R] = Frame watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
0	PING_WD_TO	R	0h	Ping Watchdog Timeout Flag This bit indicates that the ping watchdog timer has timed out. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Ping watchdog timeout has not occured. 1h[R] = Ping watchdog timeout has occured. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

Table 3-880. FSI_RX_CFG_RX_PING_TAG Register Field Descriptions

Bit	Field	Type	Reset	Description
15:5	RESERVED_1	R	0h	Reserved
4:1	PING_TAG	R	0h	Received Ping Frame Tag This field contains the 4-bit frame tag from the last successfully received ping frame. This is intentionally shifted into bits 4:1 so that the register can be used as a 32-bit address index based on the received tag.
0	ZERO	R	0h	Zero bit This bit will always read as 0. This is intentionally provided to create a 32-bit offset if required. Using the PING_TAG and ZERO bits of this register [bits 4:0], application software can directly index into an array of 32-bit data.

Bit	Field	Type	Reset	Description
15:2	RESERVED_1	R	0h	Reserved
1	MBE	R	1h	Multiple Bit Errors Detected This bit indicates the occurrence of multiple bit errors.The data is corrupted and cannot be corrected. If this bit is set, the data present in RX_ECC_SEC_DATA is invalid and should not be used. 0h[R] Multiple Bit Errors were not detected. Check the SBE bit for single bit errors. 1h[R] Multiple Bit Errors were detected. The data is not able to be corrected. The value present in RX_ECC_SEC_DATA is invalid and should not be used.
0	SBE	R	1h	Single Bit Error Detected This bit indicates the occurrence of a single bit error in the data. The data is autocorrected and placed into the RX_ECC_SEC_DATA register. This bit is valid only if MBE is 0. 0h[R] No bit errors were detected. The value in RX_ECC_SEC_DATA is correct. 1h[R] A single bit error was detected and corrected. The corrected data is present in RX_ECC_SEC_DATA.

Bit	Field	Type	Reset	Description
31:4	RESERVED_2	R	0h	Reserved
3	RX_CORE_STS	R	0h	Receiver Core Status bit This bit indicates the status of the receiver core. If this bit is set, the receiver should undergo a reset and subsequent resynchronization with the transmitter. This bit will be always be set when the receiver has detected and end of frame error or a frame type error. This bit can also be set if the receiver becomes corrupted due to noise on the signal lines. If the receiver has experienced a ping watchdog or frame watchdog timeout, this bit should be read to determine if the cause was due to a corrupt transaction, thus putting the receiver core into an unrecoverable state. Only a soft reset will reset the recevier core and thus reset this bit. 0h[R] The receiver core is operating normally. 1h[R] The receiver core has entered into an error state and should be reset.

Table 3-924. FSI_TX_CFG_TX_MASTER_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key In order to write to any bit in this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after Writing, so it must be written again for every change to this register.
7:2	RESERVED_1	R	0h	Reserved
1	FLUSH	R/W	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h[R/W] = Clear this bit. 1h[R/W] = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0.
0	CORE_RST	R/W	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h[R/W] = Transmitter core is not in reset and can transmit frames. 1h[R/W] = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Bit	Field	Type	Reset	Description
15:11	RESERVED_1	R	0h	Reserved
10	SEL_TDM_IN	R/W	0h	Input TDM port Select bit This bit selects the input port for the transmitter core between the TDM input pins or the RX module. When this bit is '0', the inputs selected for TDM are from the TDM input pins. When this bit is '1', then inputs selected for TDM are from the RX module.
9	TDM_ENABLE	R/W	0h	Transmit TDM Mode Enable bit. This bit enables the TDM Mode for multi-target TDM operation. 0h[R/W] Transmit TDM Mode is not enabled. 1h[R/W] Transmit TDM Mode is enabled.
8	SEL_PLLCLK	R/W	0h	Input Clock Select bit This bit selects the input clock source for the transmitter core. 0h[R/W] = SYSCLK is the source of the transmitter clock into the clock prescaler. 1h[R/W] = PLLRAWCLK is the source of the transmitter core clock into the clock prescaler.
7	PING_TO_MODE	R/W	0h	Ping Counter Reset Mode Select bit This bit selects when the ping counter will reset. 0h[R/W] = The ping counter will reset and restart only on hardware initiated ping frames, when ping counter has timed out. 1h[R/W] = The ping counter will reset and restart on any software initiated frame as well as a ping counter timeout
6	SW_CRC	R/W	0h	CRC Source Select bit This bit selects the source of the CRC value that is transmitted. 0h[R/W] = The transmitted CRC value is computed by hardware. 1h[R/W] = The transmitted CRC value is sourced from the value programmed in the TX_USER_CRC register.

Table 3-928. FSI_TX_CFG_TX_OPER_CTRL_LO_ALT2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:3	START_MODE	R/W	0h	Transmission Start Mode Select bit These bits select the method by which a new frame transmission is started. 0h[R/W] = Only a software write to TX_FRAME_CTRL.START initiate a new transmission. 1h[R/W] = The configured external trigger will initiate a new transmission. 2h[R/W] = Either Writing to TX_FRAME_CTRL.START or the TX_FRAME_TAG_UDATA register will initiate a new transmission. All other combinations of bits are illegal and reserved for future use.
2	SPI_MODE	R/W	0h	SPI Mode Select bit This bit enables and disables SPI compatibility mode. 0h[R/W] = FSI is in normal mode of operation. 1h[R/W] = FSI is operating in SPI compatibility mode.
1:0	DATA_WIDTH	R/W	0h	Transmit Data Width Select bits These bits define the number of data lines used by the transmitter. 0h[R/W] = Data will be transmitted on one data line [TXD0] 1h[R/W] = Data will be transmitted on two data lines [TXD0 and TXD1]. The format of the data is described in the FSI_TX TRM chapter. 2h 3h[R/W] = Reserved

Bit	Field	Type	Reset	Description
15:13	RESERVED_2	R	0h	Reserved
12:7	EXT_TRIG_SEL	R/W	0h	External Trigger Select bit These bits define which of the 64 external inputs will be used as the source for the external input trigger. 00h[R/W] = Trigger 1 is the source. 01h[R/W] = Trigger 2 is the source. 02h[R/W] = Trigger 3 is the source. ... 3Fh [R/W] = Trigger 64 is the source.
6	ECC_SEL	R/W	0h	ECC Data Width Select bit This bit selects between 16-bit and 32-bit ECC computation. 0h[R/W] = 32-bit ECC is used. 1h[R/W] = 16-bit ECC is used.
5	FORCE_ERR	R/W	0h	Error Frame Force bit This bit will force the the CRC value of the transmitted data frame to 0 whenever there is a buffer overrun or underrun condition. This can be used to force a corrupted CRC as the data is not guaranteed to be reliable. The receiver will treat the data as invalid and can handle this as needed. Note: DO NOT use FORCE_ERR if using the SW CRC mode [FSI Transmit]. 0h[R/W] = The CRC will not be forced to 0. 1h[R/W] = The CRC will be forced to 0 in a buffer overrun or underrun condition.

Table 3-932. FSI_TX_CFG_TX_FRAME_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:0	FRAME_TYPE	R/W	0h	Transmit Frame Type This field determines the type of frame that will be transmitted next. 0000b[R/W] = Ping Frame. This frame can be sent either by software or automatically by hardware. 0100b[R/W] = DATA_1_WORD Frame. One word data frame [16-bit data]. 0101b[R/W] = DATA_2_WORD Frame. Two word data frame [32-bit data]. 0110b[R/W] = DATA_4_WORD Frame. Four word data frame [64-bit data]. 0111b[R/W] = DATA_6_WORD Frame. Six word data frame [96-bit data]. 0011b[R/W] = DATA_N_WORD Frame. The N_WORDS field will determine the number of words [1 to 16] to be sent. Both the transmitter and receiver must have the same value programmed. 1111b[R/W] = Error Frame. This frame can be used during error conditions or any condition where the transmitter wants to notify the receiver of a high priorty status. However, the user software is at liberty to use this for any purpose. 0001b 0010b and 1000bthrough 1110bare Reserved and should not be used.

R/W					R/W	R/W	R/W
0h					0h	0h	0h

Table 3-940. FSI_TX_CFG_TX_PING_CTRL_ALT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:9	RESERVED_1	R	0h	Reserved
8:3	EXT_TRIG_SEL	R/W	0h	External Trigger Select bits This bitfield will select one of the 64 external trigger inputs to as the source to generate a ping frame. A ping frame will only be generated if the EXT_TRIG_EN bit is set. 0h[R/W] = Trigger 1 will be used to generate a ping frame. 1h[R/W] = Trigger 2 will be used to generate a ping frame. .. 3Fh [R/W] = Trigger 64 will be used to generate a ping frame.
2	EXT_TRIG_EN	R/W	0h	External Trigger Enable bit This bit will allow the external trigger logic to generate a ping frame. 0h[R/W] = External triggers will not be used to generate ping frames. 1h[R/W] = The selected external trigger [selected by EXT_TRIG_SEL bits] will be able to generate a ping frame. The ping timer will be ignored if this bit is set.
1	TIMER_EN	R/W	0h	Ping Timer Enable bit This bit will enable the ping timer for generating periodic ping frames. 0h[R/W] = The ping timer is disabled and will not generate ping frames. 1h[R/W] = The ping timer is enabled and can be used to generate ping frames.Once the timer count reaches the value set by the TX_PING_TO_REF register, it will initiate a ping frame transmission. Note: If the ping timer is used, EXT_TRIG_EN should not be set as it will override this function.
0	CNT_RST	R/W	0h	Ping Counter Reset bit Writing a 1 to this bit will reset the ping counter to 0. The counter will stay in reset as long as this bit is set to 1. This bit needs to be cleared to 0 to use the counter. 0h[R/W] = Clear the CNT_RST. 1h[R/W] = The ping counter will be reset to 0.

Bit	Field	Type	Reset	Description
31:16	DATA_HIGH	R/W	0h	Upper 16 bits of ECC Data Writing to this bitfield will cause the ECC logic to compute the ECC[SEC-DED] the entire 32-bit register and update TX_ECC_VAL register with the results. Software should write to these 16 bits of the register in a 32-bit write when needing to compute ECC for 32-bits for the full TX_ECC_DATA register.
15:0	DATA_LOW	R/W	0h	Lower 16 bits of ECC Data Writing to this bitfield will cause the ECC logic to compute the ECC[SEC-DED] for these 16 bits and update the TX_ECC_VAL register with the results. Software should write to these register bits as a 16-bit write when needing to compute ECC for 16-bits.

RESOLVER

3.13.1 RESOLVER Summaries

RESOLVER Summaries

Note

1. Resolver registers with names suffixed with "_0" refers to register space for Resolver to Digital Convertor 0 (RDC0).

   The register space for RDC0 is from 502C B030h to 502C B110h
2. Resolver registers with names suffixed with "_1" refers to register space for Resolver to Digital Convertor 1 (RDC1)

   The register space for RDC1 is from 502C B200h to 502C B2E0h
3. Resolver registers without 0/1 suffix are common registers for both RDC0 and RDC1.

Table 3-1195. ADC_R_CFG_ADCCTL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	TDMAEN	R/W	0h	Enable Alternate DMA Timings. This bit controls when the DMA is triggered. 0 DMA is triggered at the same time as the CPU interrupt 1 DMA is always triggered at tDMA regardless or whether the ADC is in early interrupt mode or late interrupt mode
14	EXTMUXPRESELECTEN	R/W	0h	If th the ADC SOC sequence is deterministic, the ADCEXTMUX pins can be set earlier: at the end of the S+H window of the previous conversion instead of the beginning of the S+H window of the current conversion. This allows some of the external mux settling time to be pipelined with the previous conversion's conversion time. However, this will not work in the case where high-priority SOCs can arrive asynchronously. 0 ADCEXTMUX pins only change at beginning of S+H window 1 ADCEXTMUX pins are set after the end of S+H window based on pending SOCs
13	ADCBSY	R	0h	ADC Busy. Set when ADC SOC is generated, cleared by hardware four ADC clocks after negative edge of S/H pulse. Used by the ADC state machine to determine if ADC is available to sample. 0 ADC is available to sample next channel 1 ADC is busy and cannot sample another channel
12	RESERVED_3	R	0h	Reserved

Bit	Field	Type	Reset	Description
5	ADCINT2RESULT	R	0h	ADC Interrupt 2 Results Ready Flag. This flag is set when the conversions results associated with ADCINT2 latch into the corresponding results register. 0 Conversion results have not latched 1 Conversion results have latched This flag can be used in an ISR that is entered in early interrupt mode to ensure that the corresponding results are ready before proceeding to read the result register. This flag can be cleared via the ACK bit in the ADCINTFLGCLR that also clears the ADCINT2 flag. In case results latch and this flag is already set, the corresponding flag in ADCINTOVF is NOT set. This flag does NOT have to be cleared in order for ADCINT ISRs to propagate to the PIE. In case the associated SOC is associated with a PPB or PPBs, the flag will not be set until all associated PPB results latch.
4	ADCINT1RESULT	R	0h	ADC Interrupt 1 Results Ready Flag. This flag is set when the conversions results associated with ADCINT1 latch into the corresponding results register. 0 Conversion results have not latched 1 Conversion results have latched This flag can be used in an ISR that is entered in early interrupt mode to ensure that the corresponding results are ready before proceeding to read the result register. This flag can be cleared via the ACK bit in the ADCINTFLGCLR that also clears the ADCINT1 flag. In case results latch and this flag is already set, the corresponding flag in ADCINTOVF is NOT set. This flag does NOT have to be cleared in order for ADCINT ISRs to propagate to the PIE. In case the associated SOC is associated with a PPB or PPBs, the flag will not be set until all associated PPB results latch.
3	ADCINT4	R	0h	ADC Interrupt 4 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.
2	ADCINT3	R	0h	ADC Interrupt 3 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINTFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.
1	ADCINT2	R	0h	ADC Interrupt 2 Flag. Reading these flags indicates if the associated ADCINT pulse was generated since the last clear. 0 No ADC interrupt pulse generated 1 ADC interrupt pulse generated If the ADC interrupt is placed in continue to interrupt mode [INTSELxNy register] then further interrupt pulses are generated whenever a selected EOC event occurs even if the flag bit is set. If the continuous mode is not enabled, then no further interrupt pulses are generated until the user clears this flag bit using the ADCINTFLGCLR register. Rather, an ADC interrupt overflow event occurs in the ADCINTOVF register.

The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC10. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC10. 10 ADCINT2 will trigger SOC10. 11 Invalid selection.
3:2	SOC9	R/W	0h	SOC9 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC9. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC9. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC9. 10 ADCINT2 will trigger SOC9. 11 Invalid selection.
1:0	SOC8	R/W	0h	SOC8 ADC Interrupt Trigger Select. Selects which, if any, ADCINT triggers SOC8. The trigger selected in this field is in addition to the TRIGSEL field in the ADCSOCxCTL register. 00 No ADCINT will trigger SOC8. TRIGSEL field alone determines SOC0 trigger. 01 ADCINT1 will trigger SOC8. 10 ADCINT2 will trigger SOC8. 11 Invalid selection.

Table 3-1219. ADC_R_CFG_ADCSOCFLG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R	0h	SOC15 Start of Conversion Flag. Indicates the state of SOC15 conversions. 0 No sample pending for SOC15. 1 Trigger has been received and sample is pending for SOC15. This bit will be automatically cleared when the SOC15 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
14	SOC14	R	0h	SOC14 Start of Conversion Flag. Indicates the state of SOC14 conversions. 0 No sample pending for SOC14. 1 Trigger has been received and sample is pending for SOC14. This bit will be automatically cleared when the SOC14 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
13	SOC13	R	0h	SOC13 Start of Conversion Flag. Indicates the state of SOC13 conversions. 0 No sample pending for SOC13. 1 Trigger has been received and sample is pending for SOC13. This bit will be automatically cleared when the SOC13 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-1219. ADC_R_CFG_ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	SOC12	R	0h	SOC12 Start of Conversion Flag. Indicates the state of SOC12 conversions. 0 No sample pending for SOC12. 1 Trigger has been received and sample is pending for SOC12. This bit will be automatically cleared when the SOC12 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
11	SOC11	R	0h	SOC11 Start of Conversion Flag. Indicates the state of SOC11 conversions. 0 No sample pending for SOC11. 1 Trigger has been received and sample is pending for SOC11. This bit will be automatically cleared when the SOC11 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
10	SOC10	R	0h	SOC10 Start of Conversion Flag. Indicates the state of SOC10 conversions. 0 No sample pending for SOC10. 1 Trigger has been received and sample is pending for SOC10. This bit will be automatically cleared when the SOC10 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
9	SOC9	R	0h	SOC9 Start of Conversion Flag. Indicates the state of SOC9 conversions. 0 No sample pending for SOC9. 1 Trigger has been received and sample is pending for SOC9. This bit will be automatically cleared when the SOC9 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
8	SOC8	R	0h	SOC8 Start of Conversion Flag. Indicates the state of SOC8 conversions. 0 No sample pending for SOC8. 1 Trigger has been received and sample is pending for SOC8. This bit will be automatically cleared when the SOC8 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-1219. ADC_R_CFG_ADCSOCFLG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	SOC7	R	0h	SOC7 Start of Conversion Flag. Indicates the state of SOC7 conversions. 0 No sample pending for SOC7. 1 Trigger has been received and sample is pending for SOC7. This bit will be automatically cleared when the SOC7 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
6	SOC6	R	0h	SOC6 Start of Conversion Flag. Indicates the state of SOC6 conversions. 0 No sample pending for SOC6. 1 Trigger has been received and sample is pending for SOC6. This bit will be automatically cleared when the SOC6 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
5	SOC5	R	0h	SOC5 Start of Conversion Flag. Indicates the state of SOC5 conversions. 0 No sample pending for SOC5. 1 Trigger has been received and sample is pending for SOC5. This bit will be automatically cleared when the SOC5 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
4	SOC4	R	0h	SOC4 Start of Conversion Flag. Indicates the state of SOC4 conversions. 0 No sample pending for SOC4. 1 Trigger has been received and sample is pending for SOC4. This bit will be automatically cleared when the SOC4 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
3	SOC3	R	0h	SOC3 Start of Conversion Flag. Indicates the state of SOC3 conversions. 0 No sample pending for SOC3. 1 Trigger has been received and sample is pending for SOC3. This bit will be automatically cleared when the SOC3 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Bit	Field	Type	Reset	Description
2	SOC2	R	0h	SOC2 Start of Conversion Flag. Indicates the state of SOC2 conversions. 0 No sample pending for SOC2. 1 Trigger has been received and sample is pending for SOC2. This bit will be automatically cleared when the SOC2 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
1	SOC1	R	0h	SOC1 Start of Conversion Flag. Indicates the state of SOC1 conversions. 0 No sample pending for SOC1. 1 Trigger has been received and sample is pending for SOC1. This bit will be automatically cleared when the SOC1 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.
0	SOC0	R	0h	SOC0 Start of Conversion Flag. Indicates the state of SOC0 conversions. 0 No sample pending for SOC0. 1 Trigger has been received and sample is pending for SOC0. This bit will be automatically cleared when the SOC0 conversion is started. If contention exists where this bit receives both a request to set and a request to clear on the same cycle, regardless of the source of either, this bit will be set and the request to clear will be ignored. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether this bit was previously set or not.

Table 3-1221. ADC_R_CFG_ADCSOCFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R/W1TS	0h	SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
14	SOC14	R/W1TS	0h	SOC14 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC14 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC14 flag bit to 1. This will cause a conversion to start once priority is given to SOC14. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC14 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-1221. ADC_R_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	SOC13	R/W1TS	0h	SOC13 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC13 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC13 flag bit to 1. This will cause a conversion to start once priority is given to SOC13. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC13 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
12	SOC12	R/W1TS	0h	SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
11	SOC11	R/W1TS	0h	SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
10	SOC10	R/W1TS	0h	SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
9	SOC9	R/W1TS	0h	SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-1221. ADC_R_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SOC8	R/W1TS	0h	SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
7	SOC7	R/W1TS	0h	SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
6	SOC6	R/W1TS	0h	SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
5	SOC5	R/W1TS	0h	SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
4	SOC4	R/W1TS	0h	SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-1221. ADC_R_CFG_ADCSOCFRC1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SOC3	R/W1TS	0h	SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
2	SOC2	R/W1TS	0h	SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
1	SOC1	R/W1TS	0h	SOC1 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC1 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC1 flag bit to 1. This will cause a conversion to start once priority is given to SOC1. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC1 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.
0	SOC0	R/W1TS	0h	SOC0 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC0 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0. 0 No action. 1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0. If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.

Table 3-1223. ADC_R_CFG_ADCSOCOVF1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	SOC11	R	0h	SOC11 Start of Conversion Overflow Flag. Indicates an SOC11 event was generated in hardware while an existing SOC11 event was already pending. 0 No SOC11 event overflow. 1 SOC11 event overflow. An overflow condition does not stop SOC11 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
10	SOC10	R	0h	SOC10 Start of Conversion Overflow Flag. Indicates an SOC10 event was generated in hardware while an existing SOC10 event was already pending. 0 No SOC10 event overflow. 1 SOC10 event overflow. An overflow condition does not stop SOC10 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
9	SOC9	R	0h	SOC9 Start of Conversion Overflow Flag. Indicates an SOC9 event was generated in hardware while an existing SOC9 event was already pending. 0 No SOC9 event overflow. 1 SOC9 event overflow. An overflow condition does not stop SOC9 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
8	SOC8	R	0h	SOC8 Start of Conversion Overflow Flag. Indicates an SOC8 event was generated in hardware while an existing SOC8 event was already pending. 0 No SOC8 event overflow. 1 SOC8 event overflow. An overflow condition does not stop SOC8 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
7	SOC7	R	0h	SOC7 Start of Conversion Overflow Flag. Indicates an SOC7 event was generated in hardware while an existing SOC7 event was already pending. 0 No SOC7 event overflow. 1 SOC7 event overflow. An overflow condition does not stop SOC7 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
6	SOC6	R	0h	SOC6 Start of Conversion Overflow Flag. Indicates an SOC6 event was generated in hardware while an existing SOC6 event was already pending. 0 No SOC6 event overflow. 1 SOC6 event overflow. An overflow condition does not stop SOC6 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
5	SOC5	R	0h	SOC5 Start of Conversion Overflow Flag. Indicates an SOC5 event was generated in hardware while an existing SOC5 event was already pending. 0 No SOC5 event overflow. 1 SOC5 event overflow. An overflow condition does not stop SOC5 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
4	SOC4	R	0h	SOC4 Start of Conversion Overflow Flag. Indicates an SOC4 event was generated in hardware while an existing SOC4 event was already pending. 0 No SOC4 event overflow. 1 SOC4 event overflow. An overflow condition does not stop SOC4 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.

Bit	Field	Type	Reset	Description
3	SOC3	R	0h	SOC3 Start of Conversion Overflow Flag. Indicates an SOC3 event was generated in hardware while an existing SOC3 event was already pending. 0 No SOC3 event overflow. 1 SOC3 event overflow. An overflow condition does not stop SOC3 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
2	SOC2	R	0h	SOC2 Start of Conversion Overflow Flag. Indicates an SOC2 event was generated in hardware while an existing SOC2 event was already pending. 0 No SOC2 event overflow. 1 SOC2 event overflow. An overflow condition does not stop SOC2 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
1	SOC1	R	0h	SOC1 Start of Conversion Overflow Flag. Indicates an SOC1 event was generated in hardware while an existing SOC1 event was already pending. 0 No SOC1 event overflow. 1 SOC1 event overflow. An overflow condition does not stop SOC1 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.
0	SOC0	R	0h	SOC0 Start of Conversion Overflow Flag. Indicates an SOC0 event was generated in hardware while an existing SOC0 event was already pending. 0 No SOC0 event overflow. 1 SOC0 event overflow. An overflow condition does not stop SOC0 events from being processed. It simply is an indication that a hardware trigger was missed. A write to the ADCSOCFRC1 register does not effect this bit.

Table 3-1225. ADC_R_CFG_ADCSOCOVFCLR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
15	SOC15	R/W1TS	0h	SOC15 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC15 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC15 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
14	SOC14	R/W1TS	0h	SOC14 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC14 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC14 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
13	SOC13	R/W1TS	0h	SOC13 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC13 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC13 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..
12	SOC12	R/W1TS	0h	SOC12 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC12 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0. 0 No action. 1 Clear SOC12 overflow flag. If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set..

Table 3-1259. ADC_R_CFG_ADCEVTSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
15	RESERVED_4	R	0h	Reserved
14	PPB4ZERO	R	0h	Post Processing Block 4 Zero Crossing Flag. When set indicates the ADCPPB4RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
13	PPB4TRIPLO	R	0h	Post Processing Block 4 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
12	PPB4TRIPHI	R	0h	Post Processing Block 4 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
11	RESERVED_3	R	0h	Reserved
10	PPB3ZERO	R	0h	Post Processing Block 3 Zero Crossing Flag. When set indicates the ADCPPB3RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority

Table 3-1259. ADC_R_CFG_ADCEVTSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	PPB3TRIPLO	R	0h	Post Processing Block 3 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
8	PPB3TRIPHI	R	0h	Post Processing Block 3 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
7	RESERVED_2	R	0h	Reserved
6	PPB2ZERO	R	0h	Post Processing Block 2 Zero Crossing Flag. When set indicates the ADCPPB2RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
5	PPB2TRIPLO	R	0h	Post Processing Block 2 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
4	PPB2TRIPHI	R	0h	Post Processing Block 2 Trip High Flag. When set indicates a digital compare trip high event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
3	RESERVED_1	R	0h	Reserved
2	PPB1ZERO	R	0h	Post Processing Block 1 Zero Crossing Flag. When set indicates the ADCPPB1RESULT register has changed sign. This bit is gated by EOC signal. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority
1	PPB1TRIPLO	R	0h	Post Processing Block 1 Trip Low Flag. When set indicates a digital compare trip low event has occurred. Note: these bits are set even when the corresponding enable in ADCEVTINTSEL is not set. Because of this, an ISR may need to examine both the ADCEVTSTAT and ADCEVTINTSEL registers to determine the source of the interrupt. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority

7	TRIGGEROVF	R/W1TC	0h	ADC Trigger Repeater 1 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers [NCOUNT was not 0 or SOCs associated with Repeater 1 were still pending]. Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0; if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
6	PHASEOVF	R/W1TC	0h	ADC Trigger Repeater 1 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger [PHASECOUNT was not 0]. Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
5	RESERVED_2	R	0h	Reserved

Copyright © 2025 Texas Instruments Incorporated

Table 3-1327. ADC_R_CFG_REP1CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOCBUSY	R	0h	ADC Trigger Repeater 1 Associated SOCs Busy indicator. In oversampling mode: 0 = no SOCs associated with this repeater are pending 1 = SOCs associated with this repeater are still pending The next repeated trigger to the ADC in oversampling mode will not occur until SPREADCOUNT is 0 [minimum time is complete] and REP1CTL.BUSY = 0 [SOCs associated with trigger repeater 1 are no longer pending]. Note: If the ADC is in burstmode and the BURSTTRIG is Repeater 1, then all round-robin SOCs are considered associated with this repeater and the repeater will not re-trigger until there are no pending round-robin SOCs [in addition to any associated pending high-priority SOCs].
3	MODULEBUSY	R	0h	ADC Trigger Repeater 1 Module Busy indicator. In oversampling mode: 0 = Repeater 1 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 1 still has repeated triggers remaining [NCOUNT ' 0] or associated SOCs are still pending [SOCBUSY is 1] If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored.
2	RESERVED_1	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling
0	MODE	R/W	0h	ADC trigger repeater 1 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP1CTL.TRIGSEL is received, the repeater will repeat the trigger REP1N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP1CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP1N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling

7	TRIGGEROVF	R/W1TC	0h	ADC Trigger Repeater 2 Oversampled Trigger Overflow. Indicates that a trigger was dropped because a trigger arrived while the repeater was still generating repeated oversampled triggers [NCOUNT was not 0 or SOCs associated with Repeater 2 were still pending]. Writing a 1 will clear this flag. Note: This flag won't be set in undersampling mode or when NSEL = 0; if a trigger arrives before the previous SOCs have completed, the trigger will be passed and the overflow flags of the SOCs that were still pending will be set. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
6	PHASEOVF	R/W1TC	0h	ADC Trigger Repeater 2 Phase Delay Overflow. Indicates that a trigger was dropped because a trigger arrived when the phase delay logic was still waiting to send the delayed trigger [PHASECOUNT was not 0]. Writing a 1 will clear this flag. Note: If software sets the clear bit on the same cycle that hardware is trying to set the flag bit, then hardware has priority and the overflow bit will not be set
5	RESERVED_2	R	0h	Reserved

Table 3-1337. ADC_R_CFG_REP2CTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SOCBUSY	R	0h	ADC Trigger Repeater 2 Associated SOCs Busy indicator. In oversampling mode: 0 = no SOCs associated with this repeater are pending 1 = SOCs associated with this repeater are still pending The next repeated trigger to the ADC in oversampling mode will not occur until SPREADCOUNT is 0 [minimum time is complete] and REP2CTL.BUSY = 0 [SOCs associated with trigger repeater 2 are no longer pending]. Note: If the ADC is in burstmode and the BURSTTRIG is Repeater 2, then all round-robin SOCs are considered associated with this repeater and the repeater will not re-trigger until there are no pending round-robin SOCs [in addition to any associated pending high-priority SOCs].
3	MODULEBUSY	R	0h	ADC Trigger Repeater 2 Module Busy indicator. In oversampling mode: 0 = Repeater 2 is idle and can accept a new repeated trigger in oversampling mode 1 = Repeater 2 still has repeated triggers remaining [NCOUNT ' 0] or associated SOCs are still pending [SOCBUSY is 1] If a new oversampled trigger is received while the module is still busy, the TRIGGEROVF bit will be set and the trigger will be ignored.
2	RESERVED_1	R	0h	Reserved
1	ACTIVEMODE	R	0h	When a trigger is recived in oversampling or undersampling mode the value of MODE is copied to ACTIVEMODE. ACTIVEMODE determines if the repeater will repeat of filter triggers. Changes to MODE while the repeater is working therefore won't cause any changes in functionality until the module becomes idle and then a new trigger is received. 0 = module is oversampling 1 = module is undersampling
0	MODE	R/W	0h	ADC trigger repeater 2 mode selection. Select either oversampling or undersampling mode. In oversampling mode, when the trigger selected by REP2CTL.TRIGSEL is received, the repeater will repeat the trigger REP2N.NSEL + 1 times. In undersampling mode, when the trigger selected by REP2CTL.TRIGSEL is received the first time, the repeater will pass the trigger through. The next REP2N.NSEL triggers will be ignored. 0 = oversampling 1 = undersampling

SYNCINSEL				SHIFT			
R/W				R/W			
0h				0h			

Table 3-1351. ADC_R_CFG_ADCPPB1CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 1 Compare Source Select. This field determines whether ADCPPB1RESULT, ADCPPB1PSUM, or ADCPPB1SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB1RESULT is used for compare logic 01 = ADCPPB1PSUM is used for compare logic 10 = ADCPPB1SUM is used for compare logic 11 = Reserved Note: when ADCPPB1PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB1LIMIT equals ADCPPB1COUNT] the ADCPPB1PSUM register will be cleared and the final sum will be loaded into ADCPPB1SUM. For this sample, the final sum, ADCPPB1SUM will be used for the compariosn instead of ADCPPB1PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 1 Interrupt Source Select. OSINT1 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT1 in addition to a PCOUNT = LIMIT event. 0 = OSINT1 will be generated from PCOUNT = LIMIT only 1 = OSTIN1 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 1 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.
10	RESERVED_1	R	0h	Reserved
9:4	SYNCINSEL	R/W	0h	PPB 1 sync. input select. On a sync. event, all partial registers transfer to the final registers and are then reset. Refer to SOC spec for details
