Table 3-1369. ADC_R_CFG_ADCPPB2CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 2 Compare Source Select. This field determines whether ADCPPB2RESULT, ADCPPB2PSUM, or ADCPPB2SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB2RESULT is used for compare logic 01 = ADCPPB2PSUM is used for compare logic 10 = ADCPPB2SUM is used for compare logic 11 = Reserved Note: when ADCPPB2PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB2LIMIT equals ADCPPB2COUNT] the ADCPPB2PSUM register will be cleared and the final sum will be loaded into ADCPPB2SUM. For this sample, the final sum, ADCPPB2SUM will be used for the compariosn instead of ADCPPB2PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 2 Interrupt Source Select. OSINT2 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT2 in addition to a PCOUNT = LIMIT event. 0 = OSINT2 will be generated from PCOUNT = LIMIT only 1 = OSTIN2 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 2 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.
10	RESERVED_1	R	0h	Reserved
9:4	SYNCINSEL	R/W	0h	PPB 2 sync. input select. On a sync. event, all partial registers transfer to the final registers and are then reset. Refer to SOC spec for details

Bit	Field	Type	Reset	Description
31:24	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 23.
23:0	PSUM	R	0h	Post Processing Block 3 Oversampling Partial Sum. Each time a new result propagates through the PPB signal chain and latches into ADCPPB3RESULT the result is subsequently accumulated into this register. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB3 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB3RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC. In the case of multiple PPBs associated with the same SOC, the lowest numbered PPB's result will be availble 2 SYSCLK cycle after the associated ADCRESULT and subsequent results [in order from lowest numbered PPB to highest] will each become available every 2-3 SYSCLK cycles [refer to the TRM for detailed timing information].

SYNCINSEL				SHIFT			
R/W				R/W			
0h				0h			

Table 3-1405. ADC_R_CFG_ADCPPB4CONFIG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15:14	COMPSEL	R/W	0h	Post Processing Block 4 Compare Source Select. This field determines whether ADCPPB4RESULT, ADCPPB4PSUM, or ADCPPB4SUM is used for the zero-crossing detect logic and threshold compare. 00 = ADCPPB4RESULT is used for compare logic 01 = ADCPPB4PSUM is used for compare logic 10 = ADCPPB4SUM is used for compare logic 11 = Reserved Note: when ADCPPB4PSUM is selected as the compare source and when a LIMIT match occurs [ADCPPB4LIMIT equals ADCPPB4COUNT] the ADCPPB4PSUM register will be cleared and the final sum will be loaded into ADCPPB4SUM. For this sample, the final sum, ADCPPB4SUM will be used for the compariosn instead of ADCPPB4PSUM.
13	RESERVED_2	R	0h	Reserved
12	OSINTSEL	R/W	0h	Post Processing Block 4 Interrupt Source Select. OSINT4 can be used to trigger an ADC interrupt [ADCINT1 through ADCINT4] via selection in the ADCINT1N2 or ADCINT3N4. This selection determines if a sync. event can trigger OSINT4 in addition to a PCOUNT = LIMIT event. 0 = OSINT4 will be generated from PCOUNT = LIMIT only 1 = OSTIN4 will be generated form PCOUNT = LIMIT or a sync. event. Note: If a SYNC event would cause an OSINT one cycle after OSINT would have been cause by PCOUNT = LIMIT match, then the second OSINT is ignored.
11	SWSYNC	R/W1TS	0h	PPB 4 software force sync. On a sync. event, all partial registers transfer to the final registers and are then reset. Note: In the case where the software force occurs at the same time that a new sample is added to the PSUM and the PSUM is being used for a high or low limit compare, then the comparison will not occur.
10	RESERVED_1	R	0h	Reserved
9:4	SYNCINSEL	R/W	0h	PPB 4 sync. input select. On a sync. event, all partial registers transfer to the final registers and are then reset. Refer to SOC spec for details

9:0	PMINI	R	0h	Post Processing Block 4 Oversampling Partial Index of Min. Each time a new result propagates through the PPB signal chain and latches into ADCPPB4RESULT if the result replaces PMIN this register is loaded with the current value of PCOUNT. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB4 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB4RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB4RESULT timing information].

Table 3-1457. ADC_R_RESULTS_ADCPPB4RESULT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 16. NOTE: If the conversion associated with this Post Processing Block is a 12-bit conversion, the SIGN bits extend down to bit 12, and all reflect the same value as bit 12.
15:0	PPBRESULT	R	0h	ADC Post Processing Block Result 4 The result of the offset/reference subtraction post conversion processing is stored in this register. This result is available 1 SYSCLK cycle after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC. In the case of multiple PPBs associated with the same SOC, the lowest numbered PPB's result will be availble 1 SYSCLK cycle after the associated ADCRESULT and subsequent results [in order from lowest numbered PPB to highest] will each become available every 2-3 SYSCLK cycles [refer to the TRM for more detailed timing information]. If ADCINTFLG is polled to determine when to read the PPBRESULT, it may be necessary to add one or more NOP instructions to ensure that the updated post conversion processing result has posted to the register. NOTE: If the conversion associated with this Post Processing Block is a 12-bit conversion, the PPBRESULT bits are limited to bits 12:0.

Table 3-1487. ADC_R_RESULTS_ADCPPB2MIN Register Field Descriptions

Bit	Field	Type	Reset	Description
31:17	SIGN	R	0h	Sign Extended Bits. These bits reflect the same value as bit 16.
16:0	MIN	R	0h	Post Processing Block 2 Oversampling Final Min. When either a count-match event occurs [PCOUNT = LIMIT] or PPB2 receives a sync. event, the value of PMIN is loaded into this register. In the case of a count-match event, the max loaded into this register includes the value from the most recent conversion. This result is available 1 SYSCLK cycle after the associated ADCPPB2RESULT is available [only in case of a count-match event]. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB2RESULT timing information].

3.22.2.2 SDFM_SDIFLGCLR Register

3.22.2.2.1 SDFM_SDIFLGCLR Register (Offset = 4h) [reset = 0h]

SD Module Interrupt Flag Clear Bits:
Writing a "1" will clear the respective flag bit in the SDIFLG register.
Writes of "0" are ignored.
Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	This identifies the scheme revision ID register type implemented for this module
29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

31:16	RESERVED_2	R	0h	Reserved
15:4	RESERVED_1	R	0h	Reserved
3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

3:0	TESTEN	R/W	0h	1010: Parity test feature is enabled All other values: Parity test feature is disabled Note: When the parity test feature is enabled, acutal registers are not accessible in the memory map. Instead, the parity values are accessible. Parity is computed for every byte and the correponding parity value is available at the bit-0 of every byte. Value of '1' written to the parity bit after enabling the parity test feature can be used to inject the error by inverting the stored parity value.

Table 4-371. VIM0_INTTYPE_M Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level [default] or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event [see 3.4 Interrupt Handling]. The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level [default] 1 Pulse

Table 4-375. VIM0_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-417. VIM1_INTTYPE_M Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	VAL	R/W	0h	This field is used to indicate whether the source of an interrupt is a level [default] or a pulse for event group M. This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event [see 3.4 Interrupt Handling]. The value has no effect on how the VIM hardware functions. The input interrupts are agnostic as to whether they are pulse or level. Each bit corresponds to event Q where Q = Mx32+Bit 0 Level [default] 1 Pulse

Table 4-421. VIM1_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	EOI_WR	R/W1TS	0h	EOI Register Write of 1 to this register indicates that software has acknowledged the pending interrupt and the next interrupt can be sent to the host. The bit is self clearing and will be read as a zero.

Table 4-507. ECC_AGG_CORE1_AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	RESERVED	NONE	0h	Reserved
3:2	TIMEOUT	R/WI	0h	Interrupt status set for svbus timeout errors. 2-bit saturating counter of the number of timeout errors that have occurred since last cleared. 0x0: No timeout errors have occurred 0x1: 1 timeout erro has occurred 0x2: 2 timeout error has occurred 0x3: 3 or more timeout errors have occurred A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 to non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

Table 4-509. ECC_AGG_CORE1_AGGR_STATUS_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	RESERVED	NONE	0h	Reserved
3:2	TIMEOUT	R/WD	0h	Interrupt status clear for svbus timeout errors. 0x0: No timeout errors have occurred 0x1: 1 timeout error has occurred 0x2: 2 timeout error has occurred 0x3: 3 or more timeout error have occurred A write of a non-zero value to this register decrements that many from the timeout fields. If the resulting written value is non zero, then the pending level interrupt stays asserted. A new pulse interrupt will not be asserted, you must write the eoi register for that to occur. If you write a value more than the counter value the result will be zero.
1:0	PARITY	R/WD	0h	Interrupt status clear for parity errors. 0x0: No parity errors have occurred 0x1: 1 parity error has occurred 0x2: 2 parity error has occurred 0x3: 3 or more parity error have occurred A write of a non-zero value to this register decrements that many from the parity fields. If the resulting written value is non zero, then the pending level interrupt stays asserted. A new pulse interrupt will not be asserted, you must write the eoi register for that to occur. If you write a value more than the counter value the result will be zero.

Table 4-541. STC_STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	INTCOUNT_B16	R/W	1h	Number of intervals of the self test run [RWP - Read, Priviledge Mode Write only] Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out complete indication once it runs all of the intervals programmed in this field. INTCOUNT_B16=0 is an invalid configuration for a selftest.
15:11	NU0	R	0h	Reserved bits
10:8	CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only] Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7:5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	1h	Idle cycles before and after capture clock [RWP - Read, Priviledge Mode Write only]. *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock [scan_en going high to func_clk_en generation] and misr_log_clk [scan_en going high to misr_log_en generation] generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4:2	NU1	NU1	0h	Reserved bits

Table 4-541. STC_STCGCR0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	RS_CNT_B1	R/W	0h	Restart/Continue or preload [RWP - Read, Priviledge Mode Write only] This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run. 00 = Continue NSTC run from previous interval 01 = Restart NSTC run from ROM address 0 1X = Start from segment number specified in STC_SEGPLR register

Bit	Field	Type	Reset	Description
31:0	TO_PRELOAD	R/W	FFFFFFFFh	Self test time out preload [RWP - Read, Priviledge Mode Write only] This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value [preload count value] gets loaded into the self test timeout down counter whenever a self test run is initiated [ST_ENA is enabled]. and gets disabled on completion of a self test run.

Table 4-569. STC_SEG3_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	NU16	R	0h	Reserved bits
19:0	SEG_START_ADDR	R/W	0h	Segment 3 Start Address [RWP - Read, Priviledge Mode Write only] This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to [1x] PRELOAD option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 3.

Bit	Field	Type	Reset	Description
31:0	C2MISR5	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

Table 4-671. STC_CORE2_CURMISR_22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	C2MISR22	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

31:30	SCHEME	R	1h	This identifies the scheme revision ID register type implemented for this module
29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

Table 4-853. TMU_EXT_CORE1_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	This identifies the scheme revision ID register type implemented for this module
29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.
