AC7 ADSL Infrastructure Chipset

The 16-port AC7 Infrastructure chipset from Texas Instruments (TI) supports all new ADSL standards and establishes a new baseline of integration that enables a much lower system cost—two key considerations for next-generation DSLAMs, IP-DSLAMs, mini-DSLAMs, and BBDLCs.

At 750 mW per port for all modem functions including memory, AC7 offers the industry’s lowest power per port. This power level is up to 25 percent less than competitive solutions, which translates into

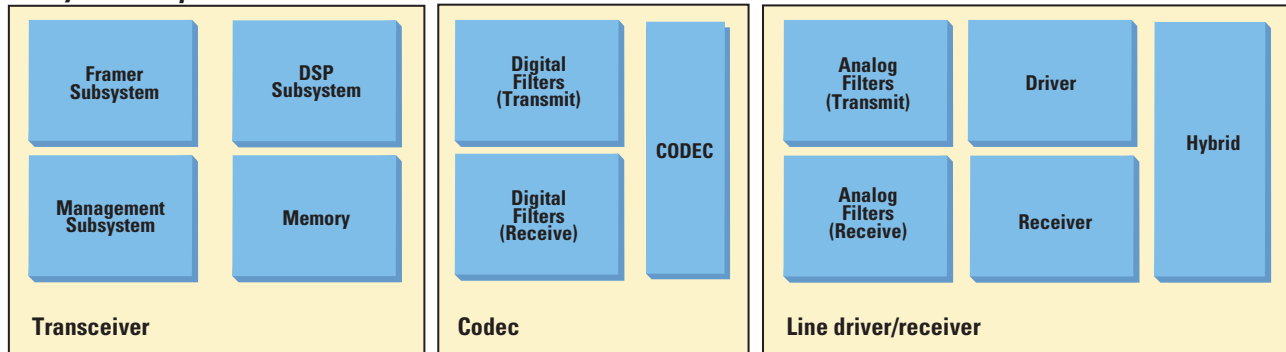

significantly improved cabinet-level power consumption and dissipation, overall system quality reliability, and network level electricity usage.

Through complete ownership of the DSL signal chain, Texas Instruments has established a new system architecture that offers distinct cost advantages versus current three-chip solutions. By integrating the traditional codec functionality, partially into the digital transceiver device and partially into the line transceiver device, the AC7 is the industry’s first true two-

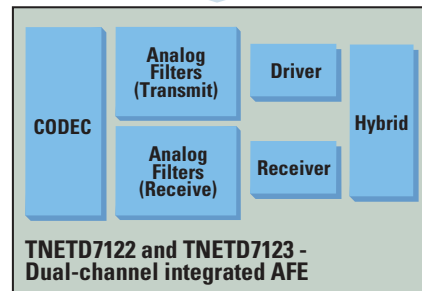

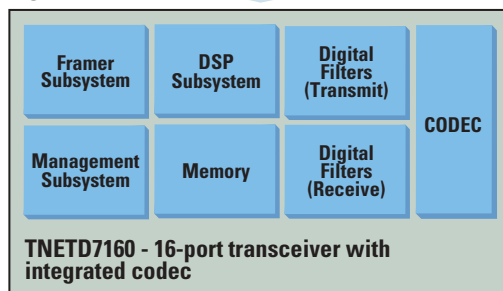

Key Features

- 16-port, two-chip design significantly reduces component count, streamlining layout and manufacturing
- “Any Service/Any Port” architecture protects existing ADSL installed base with support of current standards while also supporting the latest ADSL2, ADSL2+, enhanced upstream and extended reach standards
- “True” two-chip solution integrates all intra-chipset analog signal traces to reduce PCB costs and simplify board layout
- Industry’s lowest power per port, 750 mW, reduces ADSL power by up to 25 percent versus competitive solutions
- AC7 reduces bill of materials (BOM) costs by eliminating the number of devices needed by up to 50 percent when compared to competitive solutions

Today's CO Chipset Architecture

AC7

chip solution. By eliminating all cumbersome and noise prone analog signal traces between chipset devices, AC7 simplifies board designs and layouts and reduces overall PCB costs.

Further, to enable lower cost aggregation solutions, the AC7 has an optional built-in high-speed serial LVDS interface to aggregation solutions, which lowers PCB costs by reducing the cost of board-level aggregation solutions as well as PCB costs.

Unmatched Interoperability

Since the beginning of the ADSL market, TI has built a solid reputation for industry leading interoperability performance. The significant

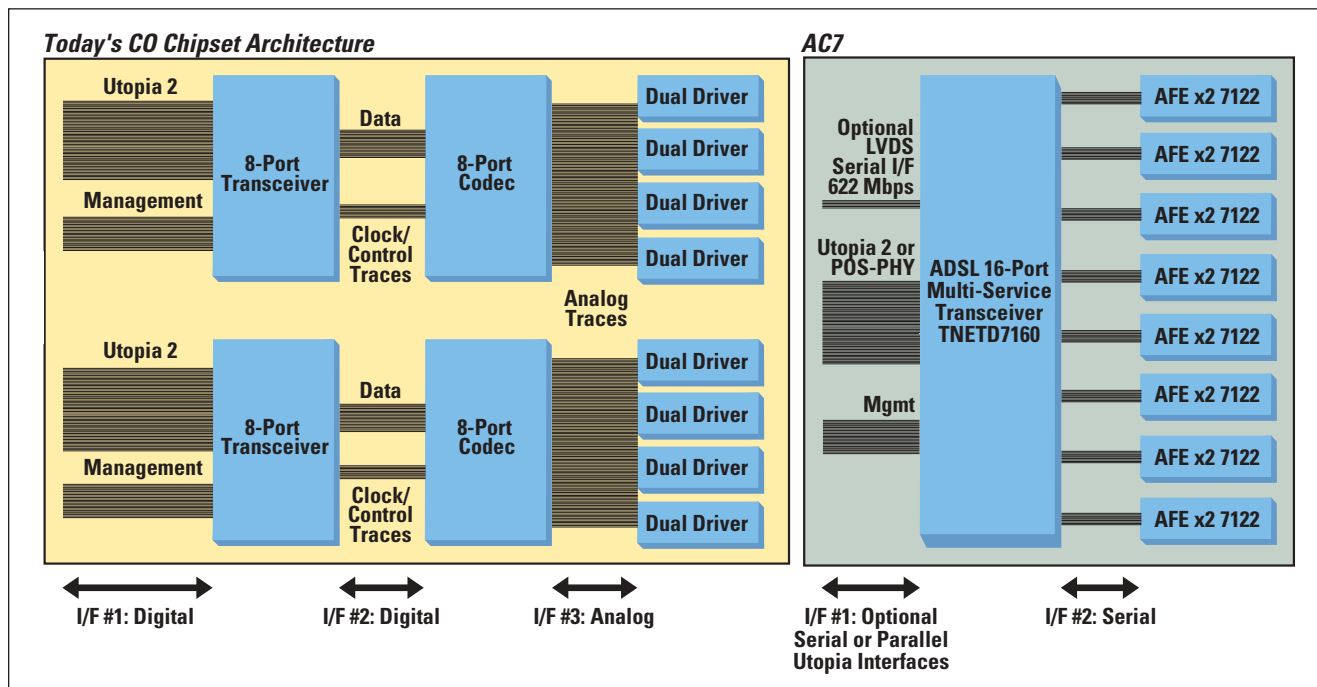

investments TI has made in the capital equipment needed to establish a leading interoperability lab and the extensive man-hours devoted to testing and pre-qualification of its chipsets helps manufacturers achieve the best possible interoperability performance, enhancing network qualification success.

The cumulative effect of the many years that TI has devoted to ADSL interoperability issues is an extensive database of knowledge and human expertise that is readily applied to new generations of ADSL infrastructure technology. As such, the AC7 leverages this expertise as well as the experience gained from shipping over 30 million ports worldwide.

Development Support

The support provided with the AC7 accelerates the development process and shortens a new system's time-to-market. The full package of support includes an evaluation board, reference design, a hardware design kit (HDK) and a software design kit (SDK).

TI also offers a full range of brick and discrete board-level power solutions that are specifically matched to support the AC7 chipset in typical configurations. This reduces the development time for customers to bring a complete board to market.

AC7 Hardware Design Kit

- Design manual
- Application notes
- Datasheets
- Schematics in OrCAD™ and PDF files
- Layout example in PowerPCB™, Gerber and PDF files
- Example splitter design for Annexes A and B
- Full bill of materials
- Evaluation module (EVM) motherboard reference schematics
- Boundary scan (JTAG) diagnostics files for Annexes A and B

AC7 Software Design Kit

- Management access users guide
- Management presentation
- Management port interface example code
- Description and example code source files
- OAM code module
- Software release notes
- Modem diagnostic code module
- Modem datapump code

Devices in the AC7 Chipset

TNETD7160 ADSL Transceiver

The TNETD7160 embeds an ARM7 processor for all real-time modem operation and maintenance (OAM) control, extensively uses TI programmable DSP capability for transceiver training and steady-state functions, and includes all necessary program, data, interleaver memory, and interprocessor communications paths to reduce bill-of-materials costs. Each modem port can be configured dynamically to support ADSL, ADSL2, ADSL2+ (up to 24 Mbps), extended reach and enhanced upstream (up to 3.5 Mbps) with the same software load.

- Single chip integrates all digital functions for 16 Asymmetric Digital Subscriber Line (ADSL) ATU-C modems including digital section of the codec function
- Supports:
 - 16 ADSL modems
 - ANSI T1.413, Issue 2
 - ITU-T G.992.1 G.dmt (with s=1/2)
 - ITU-T G.992.2 G.lite
 - ITU-T G.992.3 G.dmt.bis (ADSL2–Annexes A, B, C)
 - ITU-T G.992.3 (Annex I, J) Enhanced Upstream
 - ITU-T G.992.3 (Annex L) Extended Reach
 - ITU-T G.992.4 G.lite.bis
- ITU-T G.992.5 (ADSL2+ –Annexes A, B, C)
- ITU-T G.992.5 (Annex L) Enhanced Upstream
- ITU-T G.994.1 G.hs
- ITU-T G.997.1 G.ploam
- ADSL2 Packet transfer mode (PTM)
- Data interfaces include:
 - UTOPIA 2
 - Packet over Sonet (POS-PHY)
 - High-Speed Serial Data Distribution Port (LVDS)
- Optional in-band management eliminates need for local microcontroller
- Glueless interface to TNETD7122 and TNETD7123 dual channel AFE line interface
- On chip:
 - ARM processor and memory
 - Interleaving memory compliant to all ANSI and ITU standards
 - Two bit error rate tester (BERT) modules
- OAM register interface compatible with AC5 and AC6 for easy software migration
- Operating free-air temperature range -40°C to 85°C
- Packaged in a 480-terminal ball grid array with 1-mm Pitch for easy mounting

TNETD7122 and TNETD7123 Dual Channel Analog Front End (AFE)

The TNETD7122, used in plain old telephone service (POTS), and TNETD7123, used in integrated services digital network (ISDN) implementations, are dual low-power differential ADSL central-office (CO) front ends containing line driver/receiver, codec, analog filters and hybrid used in conjunction with the TNETD7160. These devices feature active-termination drivers that eliminate the matching resistors required with traditional ADSL line drivers. The transmitter and receiver have full-bandwidth access, allowing for SELT/DELT capability and line characterization. The selectable integrated hybrid optimizes performance over different loop impedances.

- Designed for use with TNETD7160
- Integrates codec functionality to reduce chip count
- 750-mW power for normal operating conditions
- Low-power dual-channel zero-overhead Class-G design
- ±5-V power rails
- Active termination differential driver/receiver
- Bypassable filters allow full bandwidth access for SELT/DELT
- Programmable integrated hybrid for enhanced upstream performance
- Multiple power-saving modes to support L0–L3 ITU specifications
- 64-terminal PowerPAD™ Plastic Quad Flatpack (PAP)
