

# DRV8334 Three-Phase Smart Gate Driver with Accurate Current Sensing and Advanced Monitoring

## 1 Features

- Three phase half-bridge gate driver
  - Drives six N-channel MOSFETs (NMOS)
  - 4.5 to 60V wide operating voltage range
  - Bootstrap architecture for high-side gate driver
  - Strong GVDD charge pump to support up to 50mA average gate switching current enables driving 400nC MOSFETs at 20kHz
  - Trickle charge pump to support 100% PWM duty cycle and to generate overdrive supply to drive external protection circuits
- Smart Gate Drive architecture
  - 45-level configurable peak gate drive current up to 1000 / 2000mA (source / sink)
  - Three-step dynamic drive current control
  - Configurable soft shutdown to minimize inductive voltage spikes during overcurrent shutdown
- Low-side Current Sense Amplifier
  - Sub-1mV low input offset across temperature
  - 9-level adjustable gain
- SPI-based detailed configuration and diagnostics
- DRVOFF pin to disable driver independently
- High voltage wake up pin (nSLEEP)
- 6x, 3x, 1x, and Independent PWM Modes
- Supports 3.3V, and 5V Logic Inputs
- Integrated protection features
  - Battery and power supply voltage monitors
  - Phase feedback comparator
  - MOSFET  $V_{DS}$  and  $R_{sense}$  over current monitors
  - MOSFET  $V_{GS}$  gate fault monitors
  - Device thermal warning and shutdown
  - Fault condition indicator pin

## 2 Applications

- Appliances, Cordless Garden and Power Tools, Lawnmowers
- Brushless-DC (BLDC) Motor Modules and PMSM
- Fans, Pumps, and Servo Drives
- E-Bikes, E-Scooters, and E-Mobility
- Cordless Vacuum Cleaners
- Drones, Industrial & Logistics Robots, and RC Toys

## 3 Description

The DRV8334 is an integrated smart gate driver for three-phase BLDC applications. The device provides three half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs.

The DRV8334 generates the correct gate drive voltages using an integrated bootstrap diode and a GVDD charge pump. The Smart Gate Drive architecture supports configurable peak gate drive current from 0.8mA up to 1A source and 2A sink. The DRV8334 can operate from a single power supply with a wide input range of 4.5 to 60V. A trickle charge pump enables 100% PWM duty cycle control, and provides overdrive supply voltage for external switches.

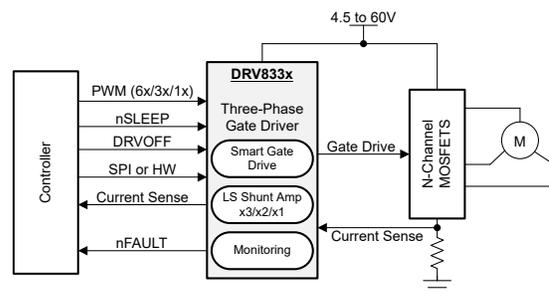

The DRV8334 provides low-side current sense amplifiers to support resistor based low-side current sensing. The low offset of the amplifiers enables the system to obtain precise motor current measurement.

A wide range of diagnostics and protection features integrated in the DRV8334 enable a robust motor drive system design and help eliminate the needs of external components. The highly configurable device response allows the device to be integrated seamlessly into a variety of system designs.

### Package Information

PART NUMBER	PACKAGE (1)	PACKAGE SIZE (2)	BODY SIZE (NOM)
DRV8334	HTQFP (48)	9mm x 9mm	7mm x 7mm
	QFN (48)	7mm x 7mm	7mm x 7mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size includes pins, where applicable.

## 4 Pin Configuration and Functions

### 4.1 Pin Functions 48-Pin DRV8334

**Figure 4-1. DRV8334 Package 48-Pin HTQFP With Exposed Thermal Pad Top View**

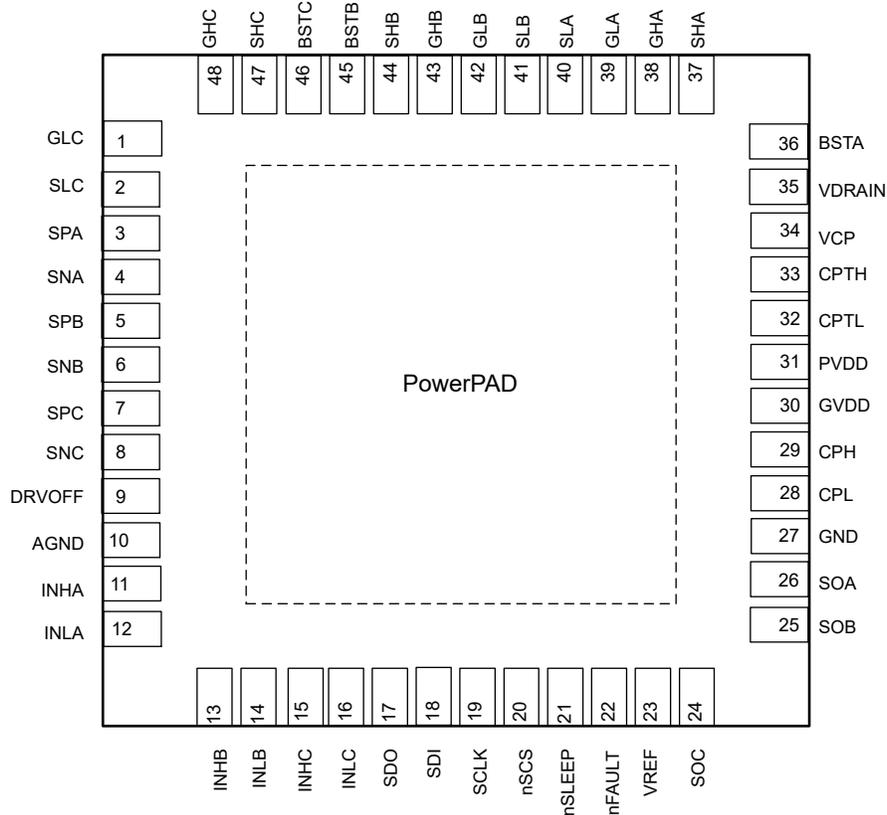

Figure 4-2. DRV8334xRGZ Package 48-Pin QFN (Preview) With Exposed Thermal Pad Top View

Table 4-1. Pin Functions 48-QFP

PIN		I/O <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
GLC	1	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
SLC	2	I	Low-side source sense input. Connect to the low-side power MOSFET source.
SPA	3	I	Low-side current shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
SNA	4	I	Current sense amplifier input. Connect to the low-side of the current shunt resistor.
SPB	5	I	Low-side current shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
SNB	6	I	Current sense amplifier input. Connect to the low-side of the current shunt resistor.
SPC	7	I	Low-side current shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
SNC	8	I	Current sense amplifier input. Connect to the low-side of the current shunt resistor.
DRVOFF	9	I	Active high shutdown input to pull-down gate driver outputs GHx and GLx.
AGND	10	PWR	Device ground.
INHA	11	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INLA	12	I/O	Low-side gate driver control input. This pin controls the output of the low-side gate driver. This pin can be configured to output buffer of phase comparator by SPI register bit PHC_OUTEN.
INHB	13	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INLB	14	I/O	Low-side gate driver control input. This pin controls the output of the low-side gate driver. This pin can be configured to output buffer of phase comparator by SPI register bit PHC_OUTEN.
INHC	15	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.

**Table 4-1. Pin Functions 48-QFP (continued)**

PIN		I/O <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
INLC	16	I/O	Low-side gate driver control input. This pin controls the output of the low-side gate driver. This pin can be configured to output buffer of phase comparator by SPI register bit PHC_OUTEN.
SDO	17	O	Serial data output.
SDI	18	I	Serial data input.
SCLK	19	I	Serial clock input.
nSCS	20	I	Serial chip select.
nSLEEP	21	I	Gate driver nSLEEP. When this pin is logic low the device goes to a low-power sleep mode.
nFAULT	22	OD	Fault indicator output. This pin is pulled logic low during a fault condition and requires an external pullup resistor.
VREF	23	PWR	External voltage reference for current sense amplifiers.
SOC	24	O	Current sense amplifier output.
SOB	25	O	Current sense amplifier output.
SOA	26	O	Current sense amplifier output.
GND	27	PWR	Device ground
CPL	28	PWR	Charge pump switching node. Connect a flying capacitor between the CPH and CPL pins.
CPH	29	PWR	Charge pump switching node. Connect a flying capacitor between the CPH and CPL pins.
GVDD	30	PWR	Gate driver power supply output. Connect a GVDD-rated ceramic between the GVDD and GND pins.
PVDD	31	PWR	Gate driver power supply input. Connect to the bridge power supply. Connect a PVDD-rated ceramic between the PVDD and GND pins.
CPTL	32	PWR	Trickle charge pump switching node. Connect a charge pump flying capacitor between CPTL and CPTH pins.
CPTH	33	PWR	Trickle charge pump switching node. Connect a charge pump flying capacitor between CPTL and CPTH pins.
VCP	34	PWR	Trickle charge pump storage capacitor. Connect a ceramic capacitor between VCP and VDRAIN pins.
VDRAIN	35	PWR	High-side drain sense and charge pump power supply input.
BSTA	36	O	Bootstrap output pin. Connect a bootstrap capacitor between BSTA and SHA
SHA	37	I	High-side source sense input. Connect to the high-side power MOSFET source.
GHA	38	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GLA	39	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
SLA	40	I	Low-side source sense input. Connect to the low-side power MOSFET source.
SLB	41	I	Low-side source sense input. Connect to the low-side power MOSFET source.
GLB	42	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GHB	43	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
SHB	44	I	High-side source sense input. Connect to the high-side power MOSFET source.
BSTB	45	O	Bootstrap output pin. Connect a bootstrap capacitor between BSTB and SHB
BSTC	46	O	Bootstrap output pin. Connect a bootstrap capacitor between BSTC and SHC
SHC	47	I	High-side source sense input. Connect to the high-side power MOSFET source.
GHC	48	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
PAD	N/A	N/A	Exposed pad. Connect to the GND plane with the best heat sinking ability. This pad is not used as an electrical connection to GND for circuit operation.

(1) Signal Types: I = Input, O = Output, I/O = Input or Output., PWR = Power

## 5 Specification

### 5.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Power supply pin voltage	PVDD	-0.3	65	V
High-side MOSFET drain pin voltage	VDRAIN	-0.3	65	V
Voltage difference between ground pins	AGND, GND	-0.3	0.3	V
Charge pump pin voltage	CPH	-0.3	$V_{GVDD} + 0.3$	V
Charge pump pin voltage	CPL	-0.3	$V_{GVDD} + 0.9$ $V_{PVDD} + 0.6$	V
Trickle Charge pump high-side pin voltage	CPTH	-0.3	80	V
Trickle Charge pump low-side pin voltage	CPTL	-0.3	$V_{VDRAIN} + 0.3$	V
Trickle Charge pump output pin voltage	VCP	-0.3	80	V
Gate driver regulator pin voltage $V_{GVDD}$	GVDD	-0.3	18	V
Logic pin voltage	nSLEEP	-0.3	65	V
Logic pin voltage	DRVOFF	-0.3	65	V
Logic pin voltage	INHx, INLx, nFAULT, SCLK, SDO, SDI, nSCS	-0.3	6.5	V
Logic pin voltage	INHx, INLx, nFAULT, SCLK, SDO, SDI, nSCS : Transient	-0.3	7.0	V
Bootstrap pin voltage	BSTx, Continuous	-0.3	80	V
	BSTx with respect to SHx	-0.3	20	V
	BSTx with respect to GHx	-0.3	20	V
Bootstrap pin transient current	BSTx, Transient (500 ns), Assumed external component $R_{BST} = 2\Omega$ and condition $V(R_{BST}) = -7V$ ,		3.5	A
High-side gate drive pin voltage	GHx, Continuous	-8	80	V
High-side gate drive pin voltage	GHx, Transient 1us	-15	80	V
High-side gate drive pin voltage with respect to SHx	GHx - SHx	-0.3	BSTx + 0.3	V
High-side source pin voltage	SHx, Continuous	-8	70	V
High-side source pin voltage	SHx, Transient 1us	-15	72	V
Low-side gate drive pin voltage	GLx with respect to SLx (LSS)	-0.3	20	V
Low-side gate drive pin voltage	GLx with respect to GVDD, $V_{GLx} - V_{GVDD}$ if $V_{GLx} > V_{GVDD}$		0.3	V
Low-side gate drive pin voltage	GLx, Continuous	-8	20	V
Low-side gate drive pin voltage	GLx, Transient 1us	-15	20	V
Low-side source sense pin voltage	SLx, Continuous	-8	$V_{GVDD}$	V
Low-side source sense pin voltage	SLx, Transient 1us	-15	$V_{GVDD}$	V
Gate drive current	GHx, GLx	Internally Limited	Internally Limited	A
Reference input pin voltage	VREF	-0.3	6	V
Shunt amplifier input pin voltage	SNx, SPx, Continuous	-5	5	V
Shunt amplifier input pin voltage	SNx, SPx, Transient 1μs	-15	15	V
Shunt amplifier output pin voltage	SOx	-0.3	$VREF + 0.3$	V
Power supply transient voltage ramp	PVDD, VDRAIN, VREF		3	V/μs
High-side source slew rate	SHx, $V_{BSTx} - V_{SHx} \geq 5.5V$ nSLEEP = High and ENABLE_DRV = 1b		4	V/ns
Ambient temperature, $T_A$	Ambient temperature, $T_A$	-40	125	°C
Junction temperature, $T_J$	Junction temperature, $T_J$	-40	150	°C

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Storage temperature, $T_{stg}$	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime

## 5.2 ESD Ratings DRV8334

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 5.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
$V_{VM}$	Power supply voltage	PVDD Full device functionality. Operation at PVDD = 4.5V only when coming from higher PVDD. Minimum PVDD for startup = 4.85V	4.5		36	V
$V_{VM}$	Power supply voltage for logic operation	PVDD, Logic and SPI functional after battery falling from min PVDD for startup (during battery cranking after coming from full device functionality)	4.0		60	V
$V_{VDRAIN}$	High-side MOSFET Drain voltage	VDRAIN, Full functionality	4.5		60	V
$V_{VDRAIN}$	High-side MOSFET Drain voltage	VDRAIN, Limited functionality (VDS monitor). GVDD, TCP/VCP, BST and Gate drivers are functional.	0		60	V
$V_{BST}$	Bootstrap pin voltage with respect to SHx	nSLEEP = High, PWM switching, Gate Driver functional <sup>(1)</sup>	3.9		20	V
$I_{VCP}$	VCP external load	VCP, PVDD < 8V			3	mA
$I_{VCP}$	VCP external load	VCP, PVDD > 8V			5	mA
$V_{IN}$	Logic input voltage	DRVOFF, INHx, INLx	0		5.5	V
$V_{IN}$	Logic input voltage	nSLEEP,	0		60	V
$V_{IN}$	Logic input voltage	SCLK, SDI, nSCS	0		5.5	V
$V_{OD}$	Open drain pullup voltage	nFAULT			5.5	V
$I_{OD}$	Open drain output pull-up resistor	nFAULT	5			KΩ
$I_{OD}$	Open drain output current	SDO, PHC, DC condition			-1	mA
$I_{GS}$	Total average gate-drive current (Low Side and High Side Combined)	$I_{GHx} \cdot I_{GLx}$			50	mA
$V_{VREF}$	Current sense amplifier reference voltage	VREF	3		5.5	V
$V_{SL}$	DC voltage of SLx	SLx pin, DC condition	-2		2	V
$V_{CM\_CSA}$	Current sense input common mode voltage	SP, SN	-2		2	V
$T_A$	Operating ambient temperature		-40		125	°C

**DRV8334**

SLVSHC7B – DECEMBER 2023 – REVISED SEPTEMBER 2025

over operating temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T <sub>J</sub>	Operating junction temperature	-40		150	°C

- (1) V<sub>BST</sub> needs to be reviewed by users with over / under voltage detection threshold V<sub>BST\_OV</sub>/V<sub>BST\_UV</sub> as well as the requirements of external MOSFET .

## 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV8334	DRV8334	UNIT
		PHP (QFP)	RGZ (QFN)	
		48 PINS	48 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	27.0	23.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	15.6	11.6	°C/W

## 6 Detailed Description

### 6.1 Overview

The DRV8334 is an integrated 4.5V to 60V gate driver for three-phase motor drive applications. The device decreases system component count, cost, and complexity by integrating three independent half-bridge gate drivers, trickle charge pump, and linear regulator for the supply voltages of the high-side and low-side gate drivers. The device also integrates current shunt (or current sense) amplifiers. A standard serial peripheral interface (SPI) provides a simple method for configuring the various device settings and reading fault diagnostic information through an external controller.

The gate driver supports external N-channel high-side and low-side power MOSFETs and can drive up to 1A source, 2A sink peak currents. A bootstrap capacitor generates the supply voltage of the high-side gate drive. The supply voltage of the low-side gate driver is generated using a linear regulator GVDD from the PVDD power supply that regulates to 12V.

A Smart Gate Drive architecture provides the ability to dynamically adjust the strength of the gate drive output current which lets the gate driver control the VDS switching speed of the power MOSFET. This feature lets the user remove the external gate drive resistors and diodes, reducing the component count in the bill of materials (BOM), cost, and area of the printed circuit board (PCB). The architecture also uses an internal state machine to protect against short-circuit events in the gate driver, control the half-bridge dead time, and protect against dV/dt parasitic turn on of the external power MOSFET.

The DRV8334 integrates current sense amplifiers for monitoring current level through all the external half-bridges using a low-side shunt resistor. The gain setting of the current sense amplifier can be adjusted through SPI commands.

In addition to the high level of device integration, the DRV8334 provides a wide range of integrated protection features. These features include power supply under voltage lockout (PVDD UV), regulator under voltage lockout (GVDDUV), VDS over current monitoring (VDS OCP),  $R_{SENSE}$  over current monitoring (SNS\_OCP), and over temperature shutdown (OTW and OTSD). Fault events are indicated by the nFAULT pin.

## 6.2 Functional Block Diagram

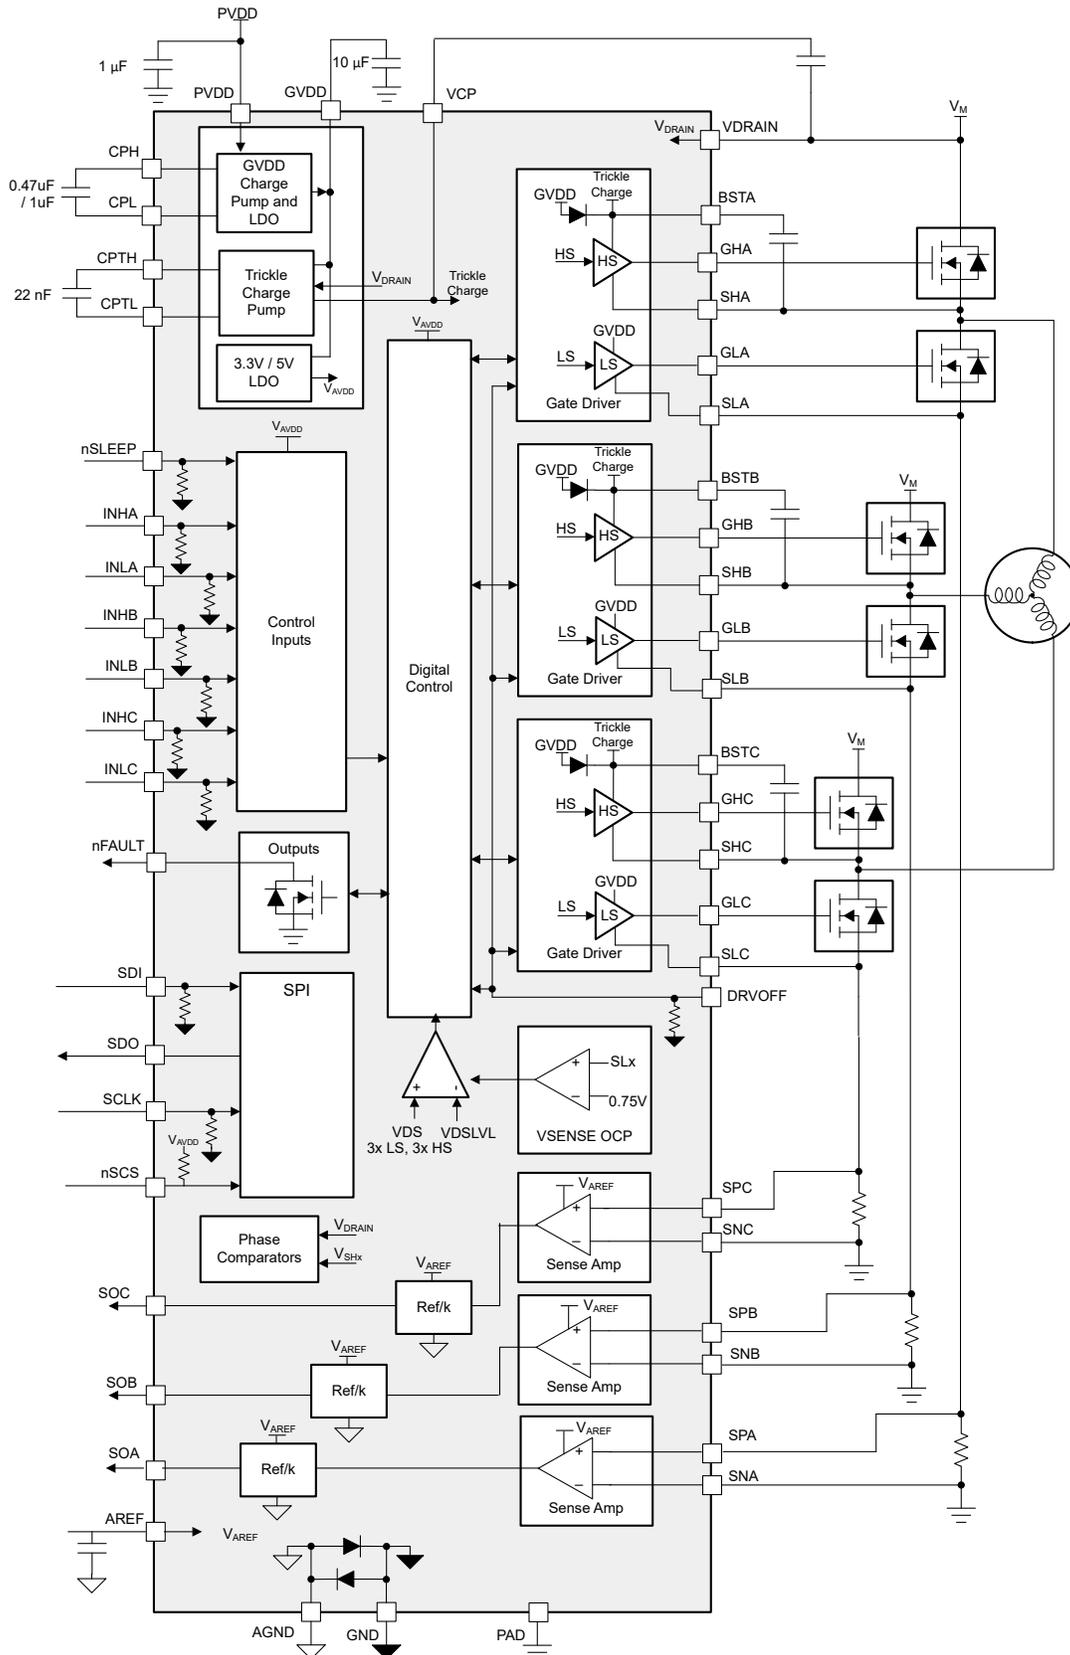

Figure 6-1. Block Diagram of DRV8334

## 6.3 Feature Description

### 6.3.1 Three BLDC Gate Drivers

The DRV8334 integrates three half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs. A charge pump is used to generate the GVDD to supply the correct gate bias voltage across a wide operating voltage range of the PVDD supply input. The low side gate outputs are driven directly from GVDD, while the high side gate outputs are driven using a bootstrap circuit with an integrated diode. An internal trickle charge pump (VCP) provides 100% duty cycle support and an overdrive voltage of external switches. The half-bridge gate drivers can be used in combination to drive a three-phase motor or separately to drive other types of loads.

#### 6.3.1.1 PWM Control Modes

The DRV8334 provides four different PWM control modes to support various commutation and control methods. The PWM control mode is adjustable through PWM\_MODE register bits.

##### 6.3.1.1.1 6x PWM Mode

In 6x PWM mode, the corresponding INHx and INLx signals control the output state as listed in [Table 6-1](#).

**Table 6-1. 6x PWM Mode Truth Table**

INLx	INHx	GLx	GHx	Note
0	0	L	L	
0	1	L	H	
1	0	H	L	
1	1	L	L	Shoot through protection

##### 6.3.1.1.2 3x PWM Mode with INLx enable control

In 3x PWM mode, the INHx pin controls each half-bridge and supports two output states: low or high. The INLx pin is used to put both high-side and low-side gate drive outputs low. If the state is not required, tie all INLx pins to logic high. The corresponding INHx and INLx signals control the output state as listed in [Table 6-2](#).

**Table 6-2. 3x PWM Mode Truth Table**

INLx	INHx	GLx	GHx
0	X	L	L
1	0	H	L
1	1	L	H

##### 6.3.1.1.3 3x PWM Mode with SPI enable control

In 3x PWM mode, the INHx pin controls output states of GHx and GLx. If SPI register bit DRVEN\_x (x=A,B,C) is 0b, GHx and GLx are pulled low. INLx is not used by the device for PWM control. The corresponding INHx signal and DRVEN\_x control the output state as listed in table.

**Table 6-3. 3x PWM Mode (SPI Enable Control) Truth Table**

DRVEN_x	INL	INHx	GLx	GHx
0	X	X	L	L
1	X	0	H	L
1	X	1	L	H

#### Note

SPI register bit DRVEN\_x is valid for any PWM mode settings.

### 6.3.1.1.4 1x PWM Mode

In 1x PWM mode, the device uses 6-step block commutation tables that are stored internally. This feature allows for a three-phase BLDC motor to be controlled using one PWM sourced from a simple controller. The PWM is applied on the INHA pin and determines the output frequency and duty cycle of the half-bridges.

The half-bridge output states are managed by the INLA, INHB, and INLB pins which are used as state logic inputs. The state inputs can be controlled by an external controller or connected directly to the digital outputs of the Hall effect sensor from the motor (INLA = HALL\_A, INHB = HALL\_B, INLB = HALL\_C). The 1x PWM mode usually operates with synchronous rectification (low-side MOSFET recirculation).

The INHC input controls the direction through the 6-step commutation table which is used to change the direction of the motor when Hall effect sensors are directly controlling the state of the INLA, INHB, and INLB inputs. Tie the INHC pin low if this feature is not required.

The INLC input brakes the motor by turning off all high-side MOSFETs and turning on all low-side MOSFETs when the INLC pin is pulled low. This brake is independent of the state of the other input pins. Tie the INLC pin high if this feature is not required.

**Table 6-4. Synchronous 1x PWM Mode (PWM1X\_COM = 0b)**

Figure 6-2 and Figure 6-3 show the different possible configurations in 1x PWM mode.

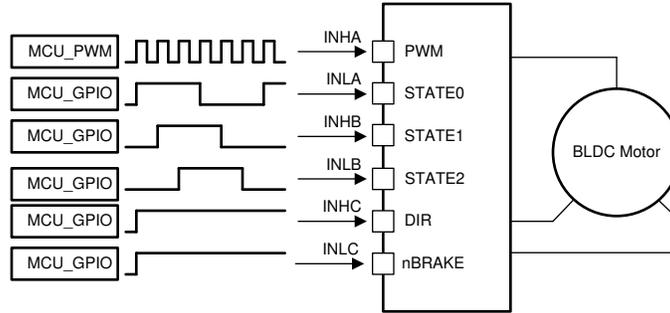

Figure 6-2. 1x PWM—Simple Controller

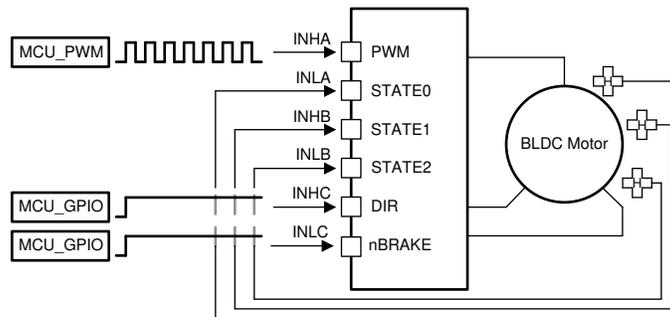

Figure 6-3. 1x PWM—Hall Effect Sensor

#### 6.3.1.1.5 SPI Gate Drive Mode

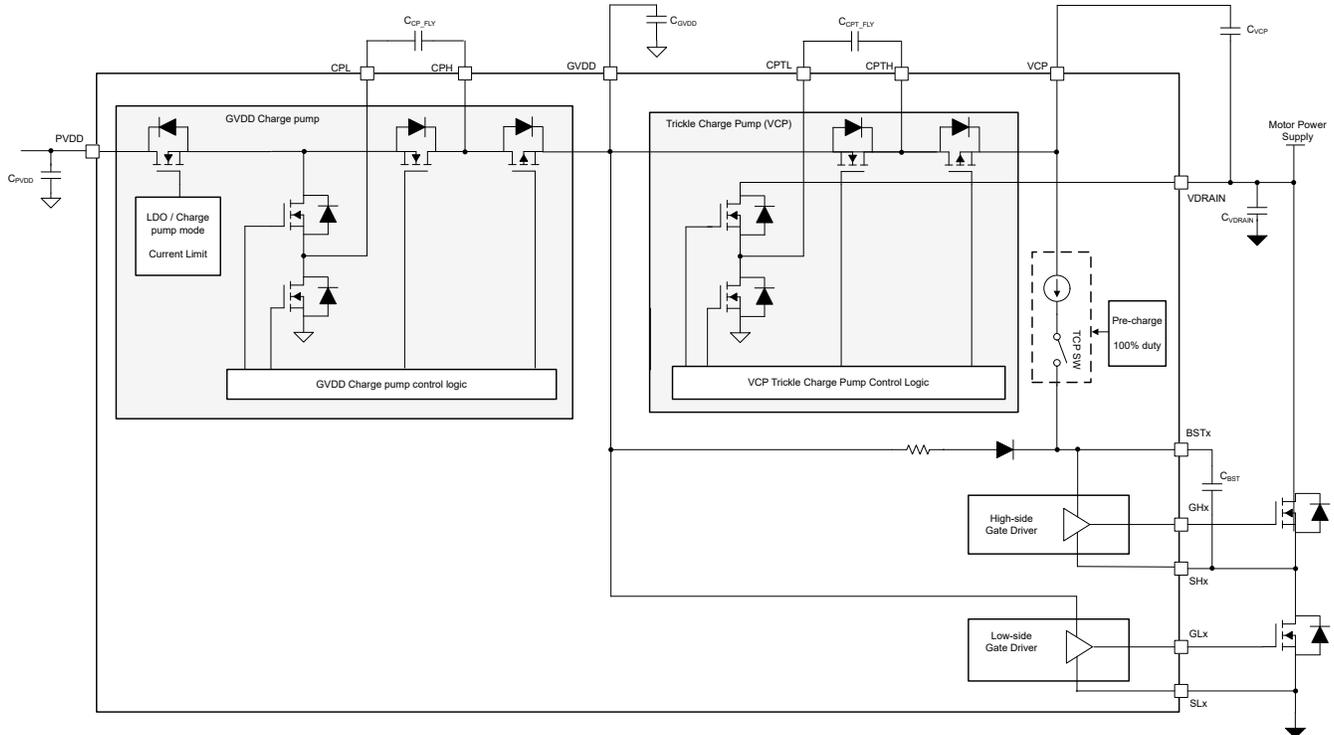

In SPI Gate Drive Mode, the output state of GLx and GHx are controlled by the corresponding DRV\_GLx and DRV\_GHx SPI register bits as listed in Table 6-6.

Table 6-6. SPI Gate Drive Mode Truth Table

SPI DRV_GLx	SPI DRV_GHx	GLx	GHx
0	0	L	L
0	1	L	H
1	0	H	L
1	1	L	L

#### 6.3.1.2 Gate Drive Architecture

The gate driver device use a complimentary, push-pull topology for both the high-side and low-side drivers. This topology allows for both a strong pullup and pulldown of the external MOSFET gates. The low side gate drivers are supplied directly from the GVDD regulator supply. For the high-side gate drivers, a bootstrap diode and capacitor are used to generate the floating high-side gate voltage supply. The bootstrap diode is integrated and an external bootstrap capacitor is used on the BSTx pin. To support 100% duty cycle control, a trickle charge pump is integrated into the device. The trickle charge pump is connected to the BSTx node to prevent bootstrap voltage drop during 100% duty cycle operation due to the leakage currents of the driver and external MOSFET.

**Figure 6-4. DRV8334 Gate Driver Power Supply Architecture**

#### 6.3.1.2.1 Bootstrap diode

The bootstrap diode is necessary to generate the high-side bias and is integrated inside the driver. The diode anode is connected to GVDD through an internal resistor and the cathode is connected to BSTx. With the  $C_{BST}$  capacitor connected to the BSTx and the SHx pins, the  $C_{BST}$  capacitor charge is refreshed every switching cycle when SHx transitions to ground. The capacitor value  $C_{BST}$  is dependent on the gate charge of the high-side MOSFET and must be selected considering PWM control and voltage drop of the MOSFET gate. The boot diode provides fast recovery times, low diode resistance, and voltage rating margin to allow for efficient and reliable operation.

#### 6.3.1.2.2 GVDD Charge pump/LDO

The GVDD charge pump/LDO provides a regulated voltage of approximately 12V on the GVDD pin. GVDD is a power supply source of the bootstrap diode and also the VCP trickle charge pump.

#### Note

TI recommends setting DIS\_GVDD\_SS to 1b after power up. In case DIS\_GVDD\_SS remains 0b, the GVDD output load capability does not meet the test limits of electrical characteristic table when PVDD input voltage is lower than 7.2V.

#### 6.3.1.2.3 VCP Trickle Charge pump

The device has a trickle charge pump that provides current to the  $C_{BST}$  bootstrap capacitors so that the bootstrap capacitor stays charged. This allows the gate driver to operate at 100% duty cycle. The charge pump also supports pre-charge of the  $C_{BST}$  capacitors at power up.

By default, the device monitors INLx pins and charging the bootstrap capacitor by VCP is enabled while INLx are inactive (=low). If TCP\_SW\_MODE register bit is 1b, charging bootstrap capacitor is enabled regardless of INLx pins.

In addition to the support of 100% PWM duty cycle operation, the VCP charge pump is designed to support an overdrive supply for external components. The supply voltage  $V_{VCP}$  is available on VCP pin and the voltage is

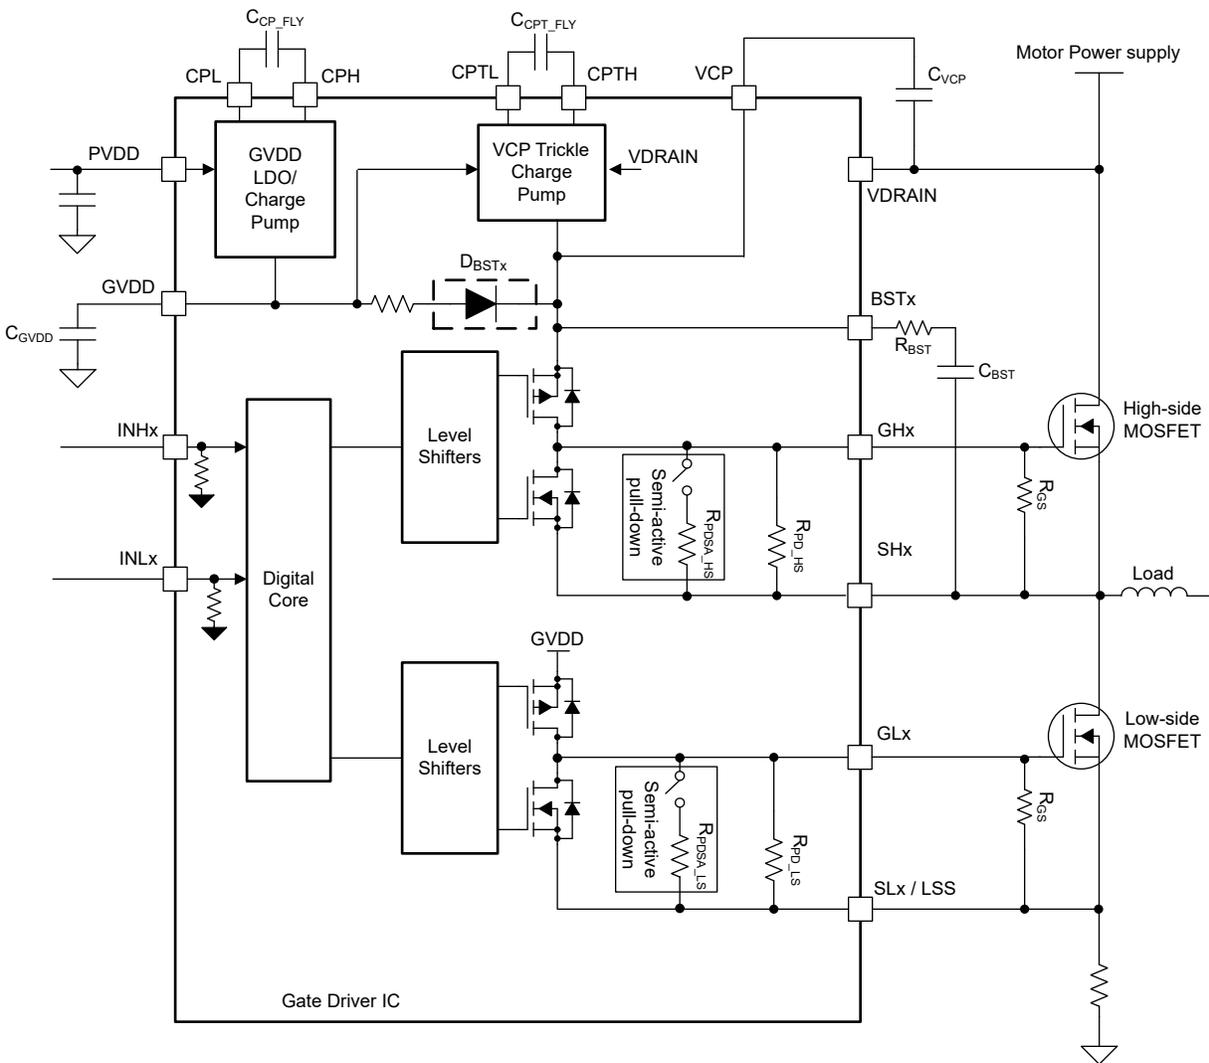

regulated with respect to VDRAIN, where a capacitor is connected between VCP and VDRAIN pins. The VCP voltage may be used for an overdrive supply of external switch control circuits such as battery reverse protection switch, high-side switch, or motor phase isolation switches. While the VCP charge pump is designed to support these external loads, care must be taken to avoid exceeding the total current limit of the overdrive supply.

**Note**

At the device power up, a VCP under voltage flag VCP\_UV is reported and remains latched. The VCP\_UV status flag can be cleared through a SPI write command CLR\_FLT by MCU.

**6.3.1.2.4 Gate Driver Output**

The gate drivers use a Smart Gate Drive architecture to provide switching control of the external power MOSFETs, additional steps to protect the MOSFETs, and optimize tradeoffs between efficiency and robustness. This architecture is implemented through two components called IDRIVE and TDRIVE. The IDRIVE gate drive current and TDRIVE gate drive time are initially selected based on the parameters of the external power MOSFET used in the system and the desired rise and fall times.

**Figure 6-5. Gate Driver Architecture**

### 6.3.1.2.5 Passive and Semi-active pull-down resistor

Each gate driver has a passive pull down between the gate and source to keep the external MOSFETs turned off in unpowered conditions. In addition a semi-active pull down circuit of low-side gate driver reduces the gate impedance during SLEEP mode.

### 6.3.1.2.6 TDRIVE Gate Drive Timing Control

The device integrates TDRIVE gate drive timing control to prevent parasitic dV/dt gate turn on of external MOSFETs. Strong pull-down  $I_{STRONG}$  current is enabled on the opposite MOSFET gate whenever a MOSFET is switching. The strong pulldown lasts for the TDRIVE duration. This feature helps to remove parasitic charge that couples into the MOSFET gate when the half-bridge switch-node voltage slews rapidly.

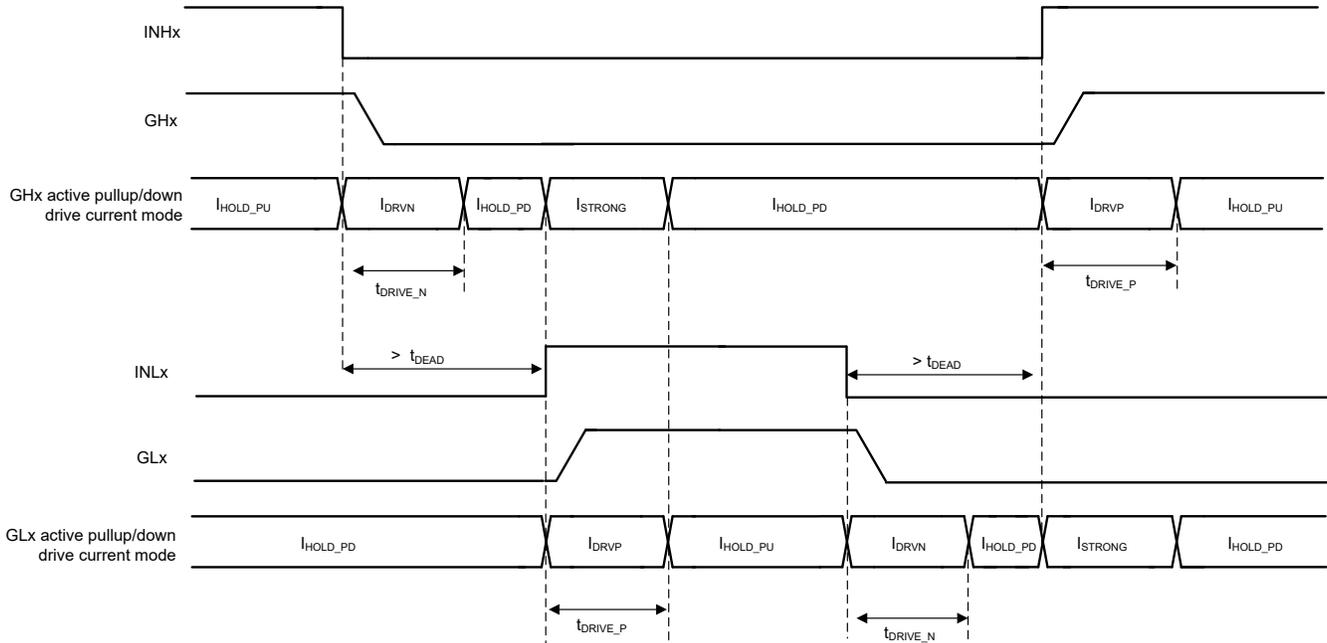

Figure 6-6. TDRIVE Gate Drive Timing Control (DEADT\_MODE = 0b)

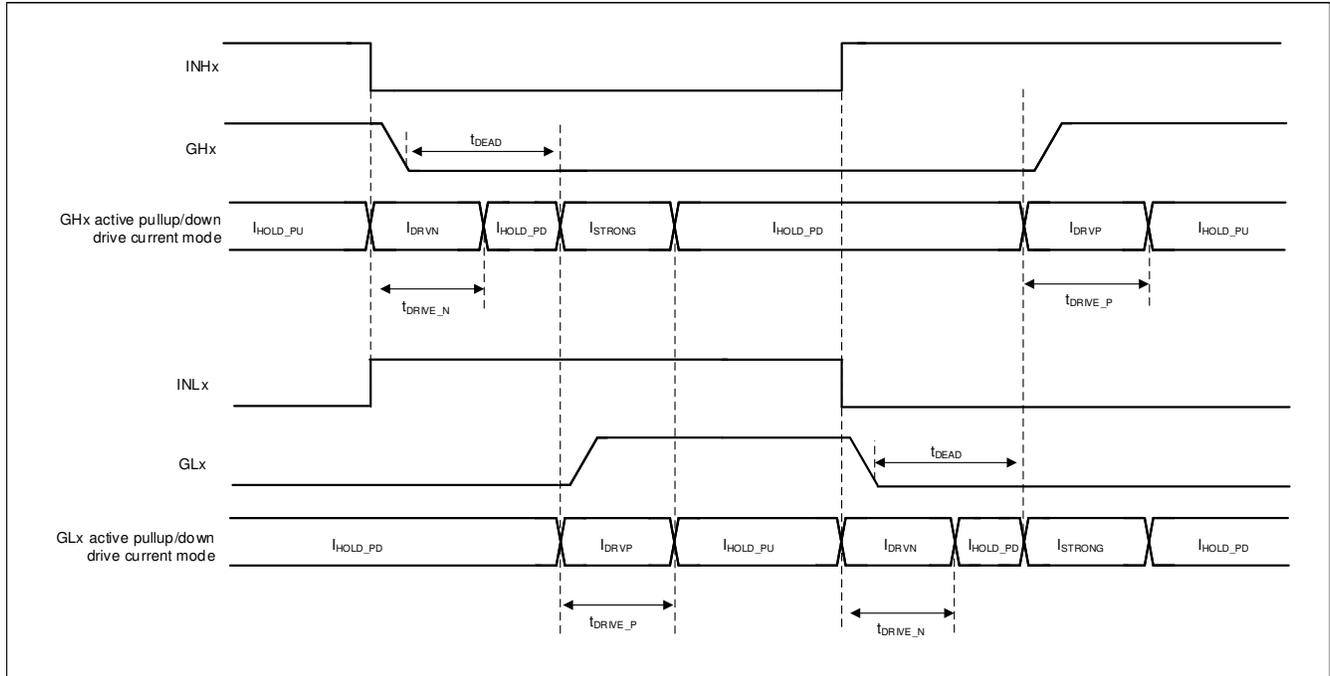

Figure 6-7. TDRIVE Gate Drive Timing Control (DEADT\_MODE = 1b)

### 6.3.1.2.7 Propagation Delay

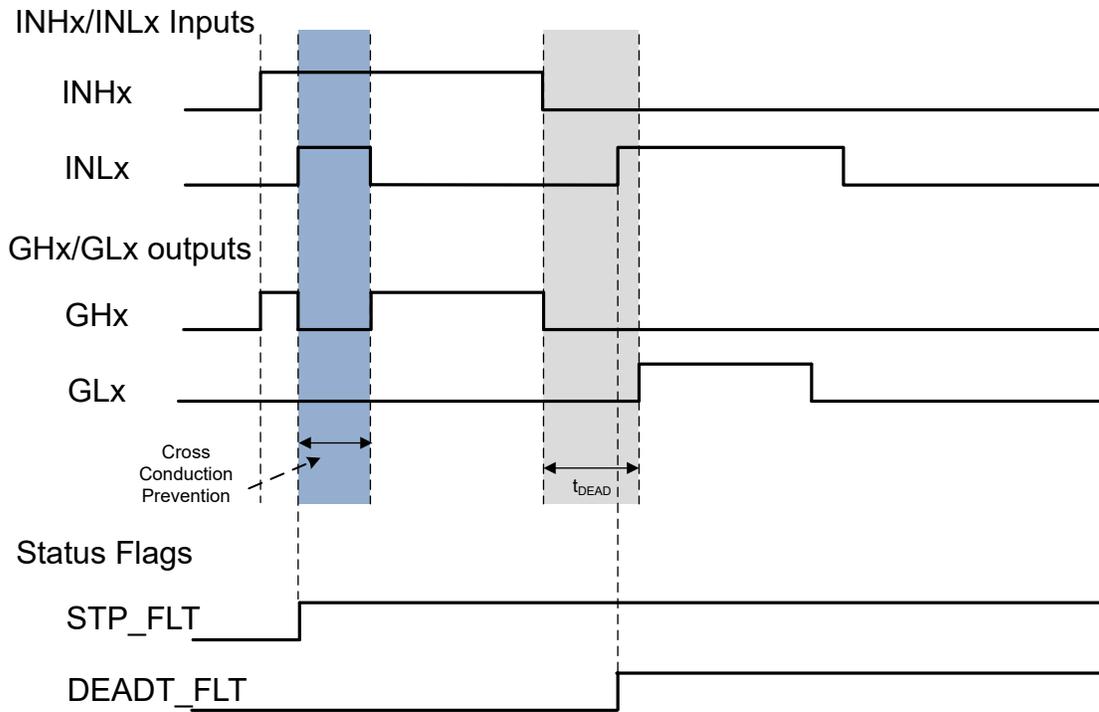

The propagation delay time ( $t_{pd}$ ) is measured as the time between an input logic edge to a detected output change. This time has two parts consisting of the digital propagation delay, and the delay through the analog gate drivers.

To support multiple control modes and dead time insertion, a small digital delay is added as the input command propagates through the device. Lastly, the analog gate drivers have a small delay that contributes to the overall propagation delay of the device.

### 6.3.1.2.8 Deadtime and Cross-Conduction Prevention

In 6xPWM mode of DRV8334, high-side INHx and low-side INLx inputs operate independently, with an exception to prevent cross conduction when the high and low side of the same half-bridge are turned ON at same time. The device pulls high- and low- side gate outputs low to prevent shoot through condition of power stage and a fault STP\_FLT is reported when high- and low-side inputs are logic high at the same time.

In 6xPWM mode, if SPI register bit DEADT\_MODE is 0b and DEADT\_MODE\_6X is 00b, the device monitors INHx and INLx and inserts dead time if the period of INHx=INLx=low is shorter than  $t_{DEAD}$ . Other than 6xPWM mode, dead time is always inserted regardless of the configuration.

**Figure 6-8. Cross Conduction Prevention and Dead time Insertion**

### 6.3.2 Low-Side Current Sense Amplifiers

The DRV8334 devices integrate high-performance low-side current sense amplifier for current measurements using low-side shunt resistors. Low-side current measurements are commonly used to implement overcurrent protection, external torque control, or brushless DC commutation with the external controller. The current sense amplifiers feature nine configurable gain settings between 5 and 40V/V, which can be configured through SPI commands. The CSA output is referenced to the external voltage reference pin (VREF). The CSA output offset can be configured between 1/2 xVREF or 1/8 xVREF to support bidirectional or unidirectional current sensing as needed.

#### Note

By default, CSA output is disabled. CSA output can be enabled in SPI register IC\_CTRL2. After CSA is enabled, the external MCU must wait 100us before sampling CSA output signals.

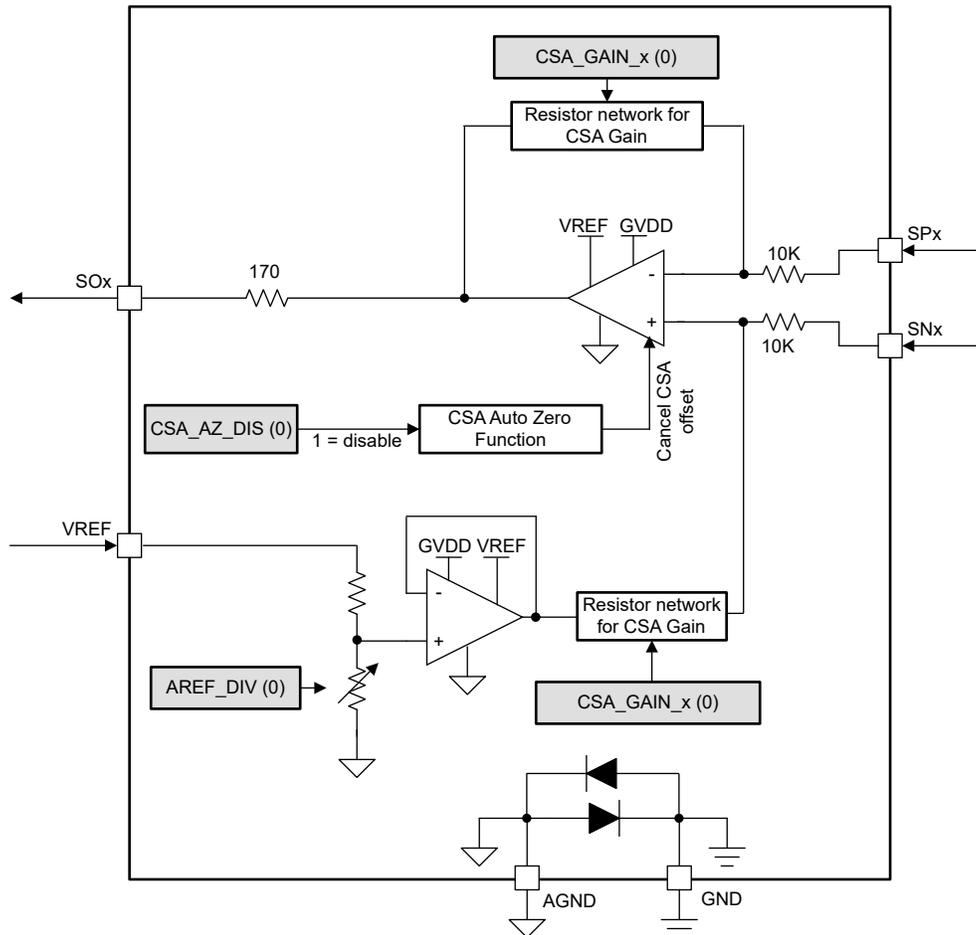

Figure 6-9. Current-Sense Amplifier Diagram

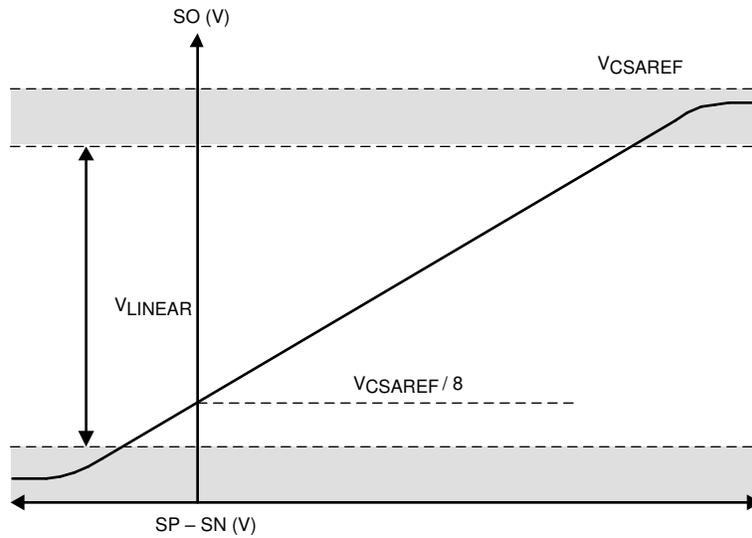

#### 6.3.2.1 Unidirectional Current Sense Operation

The DRV8334 internally generates a common mode voltage of 1/8 x VREF to obtain maximum resolution for current measurement. The current sense amplifier operates in a unidirectional mode and the SO pin outputs an analog voltage equal to the voltage across the SP and SN pins multiplied by the gain setting ( $G_{CSA}$ ).

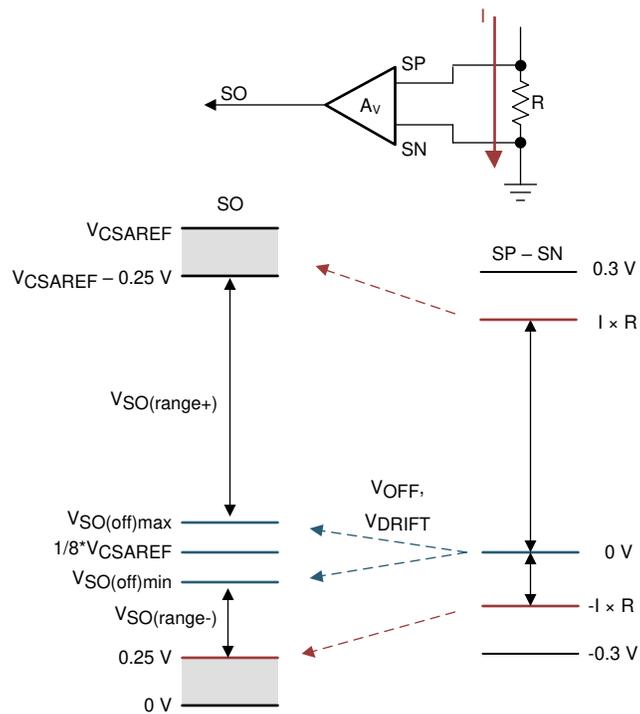

Use Equation 1 to calculate the current through the shunt resistor.

$$I = \frac{V_{SOx} - V_{VREF}/8}{G_{CSA} \times R_{SENSE}}$$

(1)

**Figure 6-10. Unidirectional Current-Sense Output**

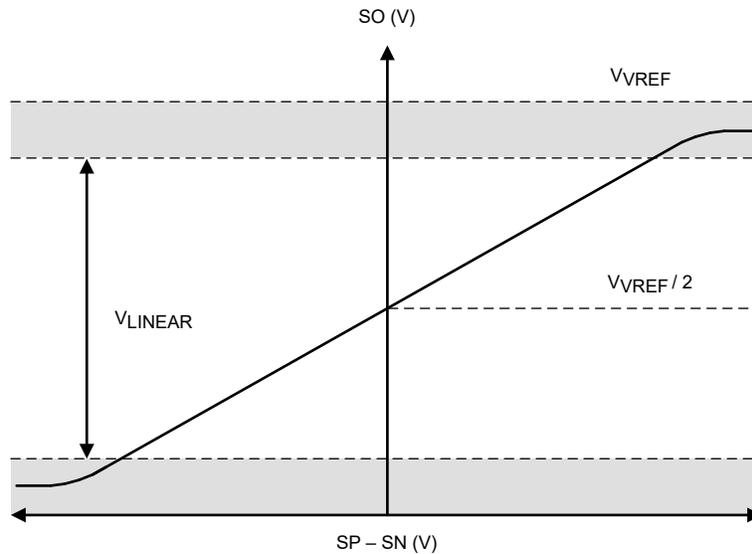

**Figure 6-11. Unidirectional Current-Sense Regions**

### 6.3.2.2 Bidirectional Current Sense Operation

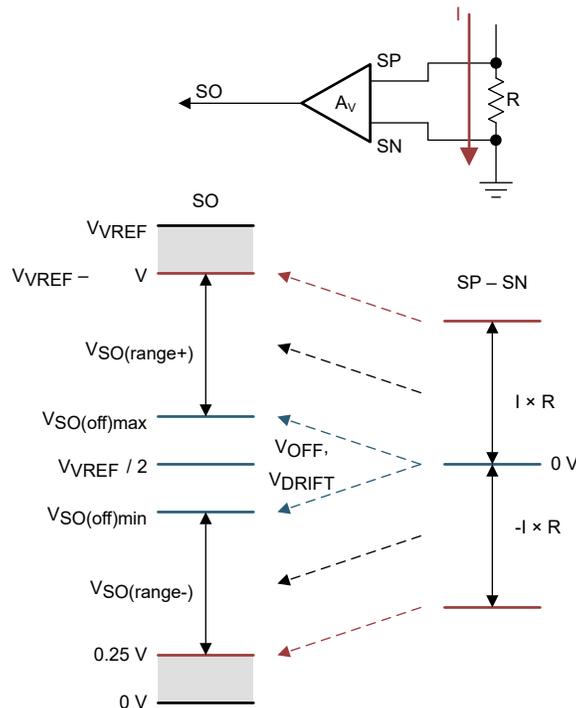

In this mode, DRV8334 internally generates a common mode voltage of  $\frac{1}{2} \times V_{REF}$  to enable bidirectional current measurement. The current sense amplifier operates in a bidirectional mode and the SO pin outputs an analog voltage equal to the voltage across the SP and SN pins multiplied by the gain setting ( $G_{CSA}$ ).

Use Equation 2 to calculate the current through the shunt resistor ( $A_{REF\_DIV} = V_{REF} / 2$  case).

$$I = \frac{V_{SOx} - \frac{V_{VREF}}{2}}{G_{CSA} \times R_{SENSE}} \tag{2}$$

**Figure 6-12. Bidirectional Current Sense Output**

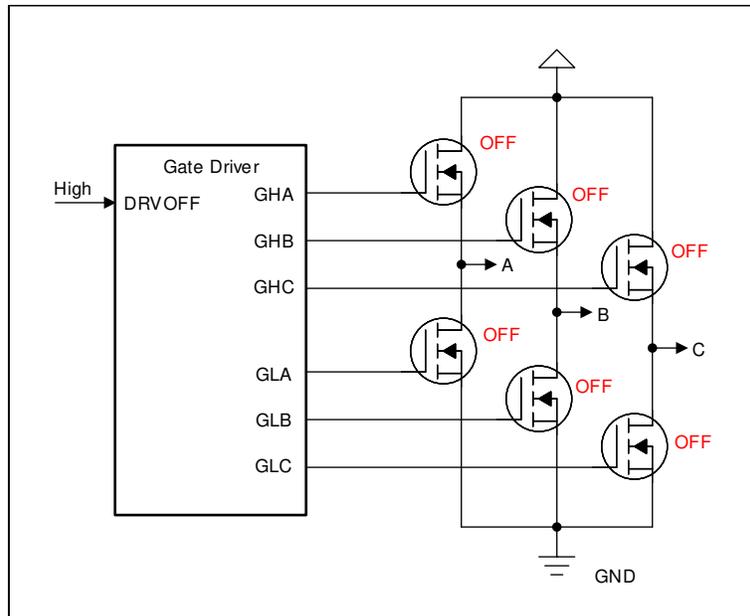

**Figure 6-13. Bidirectional Current Sense Regions**

### 6.3.3 Gate Driver Shutdown

If a fault condition is detected or DRVOFF pin is driven by system, the device takes an action of gate driver shutdown. The high-side and low-side gate driver outputs are pulled down to turn off external MOSFETs.

#### 6.3.3.1 DRVOFF Gate Driver Shutdown

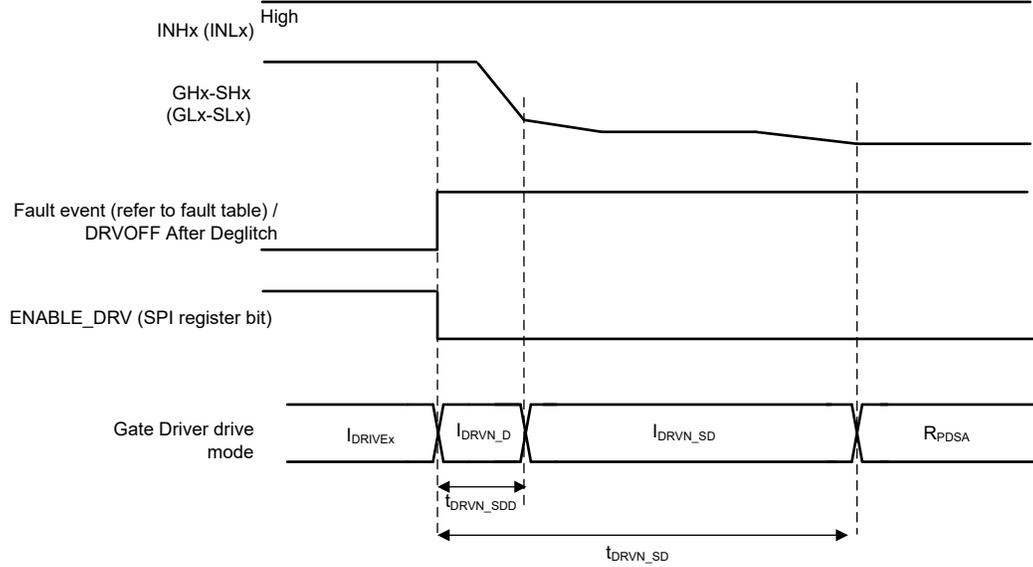

When DRVOFF is driven high, the gate driver goes into shutdown mode, overriding signals on inputs pins INHx and INLx. DRVOFF bypasses the internal digital logic and is connected directly to the predriver. This pin provides a mechanism for externally monitored faults to disable the gate driver directly bypassing the external controller. When the DRVOFF pin is driven high, the device disables the gate driver and triggers the shutdown sequence.

**Figure 6-14. DRVOFF Gate Driver Output State**

#### 6.3.3.2 Gate Driver Shutdown Timing Sequence

The device initiates gate driver shutdown sequence as shown in figure. The shutdown drive current can be programmed with SPI register IDRVN\_SD. The gate driver uses  $I_{DRVN\_SDD}$  for  $t_{DRVN\_SDD}$  time to discharge gate of MOSFET. The shutdown current changes to  $I_{DRVN\_SD}$  current and is hold until end of  $t_{DRVN\_SD}$  time. After completion of shutdown sequence, gate driver outputs are in semi-active pull-down mode.

**Figure 6-15. Gate Drive Shutdown Sequence**

### 6.3.4 Gate Driver Protective Circuits

#### 6.3.4.1 PVDD Supply Undervoltage Warning (PVDD\_UVW)

If at any time the power supply voltage on the PVDD pin falls below the  $V_{PVDD\_UVW}$  threshold for longer than the  $t_{PVDD\_UVW\_DG}$  time, the DRV8334 detects a PVDD undervoltage warning event. After detecting the undervoltage condition, the device asserts a warning in accordance with the WARN\_MODE bit. The  $V_{PVDD\_UVW}$  threshold is adjustable through the SPI register bit PVDD\_UVW\_LVL.

#### 6.3.4.2 PVDD Supply Undervoltage Lockout (PVDD\_UV)

If at any time the power supply voltage on the PVDD pin falls below the  $V_{PVDD\_UV}$  threshold for longer than the  $t_{PVDD\_UV\_DG}$  time, the DRV8334 detects a PVDD undervoltage event. After detecting the undervoltage condition, the gate driver disabled, charge pump disabled and nFAULT pin is driven low. After PVDD\_UV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.3 PVDD Supply Overvoltage Fault (PVDD\_OV)

If at any time the power supply voltage on the PVDD pin exceeds the  $V_{PVDD\_OV}$  threshold for longer than the  $t_{PVDD\_OV\_DG}$  time, the DRV8334 detects a PVDD overvoltage event. After detecting the overvoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After PVDD\_OV condition is cleared, the fault state remains latched and can be cleared through an SPI command. The PVDD\_OV threshold is adjustable through the SPI register field PVDD\_OV\_LVL. The PVDD OV threshold is adjustable through the SPI register field PVDD\_OV\_LVL, with settings available for 28V, 33V, or 50V.

#### 6.3.4.4 GVDD Undervoltage Lockout (GVDD\_UV)

If at any time the voltage on the GVDD pin falls lower than the  $V_{GVDD\_UV}$  threshold voltage for longer than the  $t_{GVDD\_UV\_DG}$  time, the device detects a GVDD undervoltage event. After detecting the GVDD\_UV undervoltage event, the gate driver is disabled, VCP charge pump is disabled and nFAULT pin is driven low if the GVDD\_UV\_MODE bit is 1b. After GVDD\_UV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.5 GVDD Overvoltage Fault (GVDD\_OV)

If at any time the power supply voltage on the GVDD pin exceeds the  $V_{GVDD\_OV}$  threshold for longer than the  $t_{GVDD\_OV\_DG}$  time, the DRV8334 detects a GVDD overvoltage event. After detecting the overvoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After PVDD\_OV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.6 BST Undervoltage Lockout (BST\_UV)

If at any time the voltage across BTSx and SHx pins falls lower than the  $V_{BST\_UV}$  threshold voltage for longer than the  $t_{BST\_UV\_DG}$  time, the device detects a BST undervoltage event. After detecting the BST\_UV undervoltage event, the high-side gate driver is disabled and nFAULT pin is driven low if the BST\_UV\_MODE register bit is 1b. The low-side gate driver remains active during BST\_UV event. After the BST\_UV condition is cleared, the fault state remains latched if BST\_UV\_LATCH register bit is 1b, and the flag can be cleared through an SPI command.

#### 6.3.4.7 BST Overvoltage Fault (BST\_OV)

If at any time the power supply voltage on one of the BSTx pins exceeds the  $V_{BST\_OV}$  threshold for longer than the  $t_{BST\_OV\_DG}$  time, the DRV8334 detects a BST overvoltage event. After detecting the overvoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After BST\_OV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.8 VCP Undervoltage Fault (CP\_OV)

If at any time the voltage between the VCP and VDRAIN pins falls below the  $V_{CP\_UV}$  threshold for longer than the  $t_{CP\_UV\_DG}$  time, the DRV8334 detects a VCP undervoltage event. After detecting the undervoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After the VCP\_UV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.9 VCP Overvoltage Fault (CP\_OV)

If at any time the between the VCP and VDRAIN pins exceeds the  $V_{CP\_OV}$  threshold for longer than the  $t_{CP\_OV\_DG}$  time, the DRV8334 detects a VCP overvoltage event. After detecting the overvoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After VCP\_OV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.10 VDRAIN Undervoltage Fault (VDRAIN\_UV)

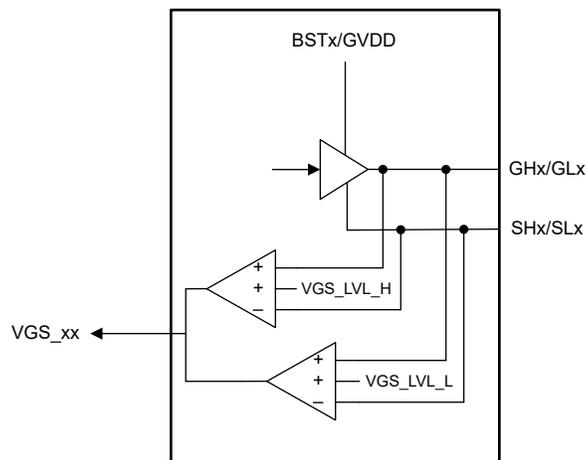

If at any time the supply voltage on the VDRAIN pins falls below the  $V_{DRAIN\_UV}$  threshold for longer than the  $t_{vdrain\_uv\_dg}$  time, the DRV8334 detects a VDRAIN undervoltage event. After detecting the undervoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After the VDRAIN\_UV condition is cleared, the fault state remains latched and can be cleared through an SPI command.

#### 6.3.4.11 VDRAIN Overvoltage Fault (VDRAIN\_OV)

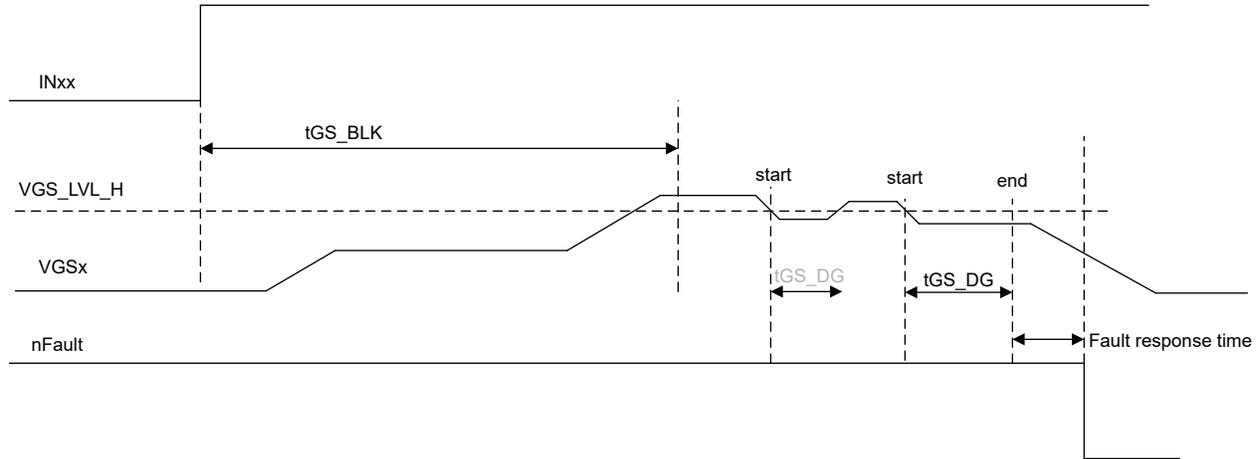

If at any time the power supply voltage on the VDRAIN pin exceeds the  $V_{DRFAIN\_OV}$  threshold for longer than the  $t_{VDRAIN\_OV\_DG}$  time, the DRV8334 detects a VDRAIN overvoltage event. After detecting the overvoltage condition, the gate driver is disabled, charge pump is disabled, and nFAULT pin is driven low. After the VDRAIN\_OV condition is cleared, the fault state remains latched and can be cleared through an SPI command. The VDRAIN\_OV threshold can be adjusted based on expected supply range using the VDRAIN\_OV\_LVL register field.

#### 6.3.4.12 MOSFET VGS Monitoring Protection

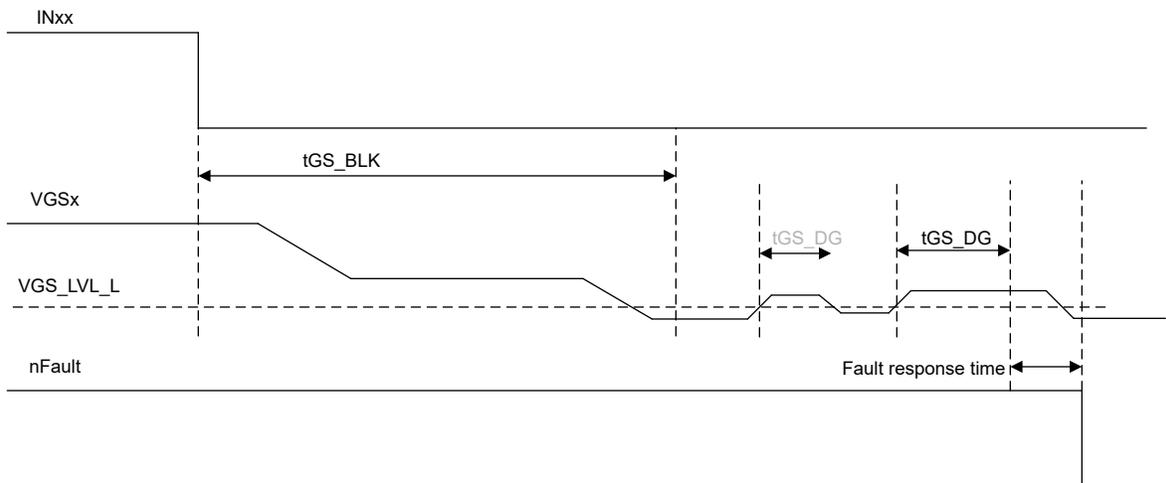

The DRV8334 utilizes integrated gate to source voltage (VGS) monitors to monitor the state of the external MOSFETs. When the output state of the MOSFETs is commanded OFF ( $IN_{xx} = \text{low}$ ), the monitor provides that the output stays turned off. If at any point the VGS voltage exceeds the VGS threshold for a duration longer than  $t_{vgs\_dg}$ , the nFAULT pin is driven low and the VGS\_XX flag is set for the corresponding output channel. When the output state of the MOSFETs is commanded ON ( $IN_{xx} = \text{high}$ ), the monitor verifies that the output turns on and the MOSFETs are driven with sufficient VGS to be strongly enhanced. If at any point the VGS drops below the VGS threshold for a duration longer than  $t_{vgs\_dg}$ , the nFAULT pin is driven low and the VGS\_XX flag is set for the corresponding output channel. The VGS monitor blanking time can be adjusted through the VGS\_BLK register field. TI recommends to set this value based on the expected switching time for the external MOSFETs. The VGS monitor deglitch time can be adjusted through the VGS\_DEG register field. The deglitch timer does not start until after the VGS blanking time has elapsed following a rising/falling PWM signal. TI recommends to set this value based on the system noise level and acceptable fault tolerance timing.

**Figure 6-16. DRV8334 V<sub>GS</sub> Monitors**

**Figure 6-17. DRV8334 V<sub>GS</sub> Monitor Timing (Output High)**

**Figure 6-18. DRV8334 V<sub>GS</sub> Monitor Timing (Output Low)**

### 6.3.4.13 MOSFET V<sub>DS</sub> Overcurrent Protection (VDS\_OCP)

The device has adjustable V<sub>DS</sub> voltage monitors to detect overcurrent or short-circuit conditions on the external power MOSFETs. A MOSFET overcurrent event is sensed by monitoring the V<sub>DS</sub> voltage drop across the external MOSFET R<sub>DS(on)</sub>. The high-side VDS monitors measure between the VDRAIN and SHx pins and the low-side VDS monitors measure between the SHx and SLx pins. If the voltage across external MOSFET exceeds the V<sub>DS\_LVL</sub> threshold for longer than the t<sub>DS\_DG</sub> deglitch time, a VDS\_OCP event is recognized. After detecting the VDS overcurrent event, all of the gate driver outputs are driven low to disable the external MOSFETs and nFAULT pin is driven low. VDS level and deglitch time are programmable.

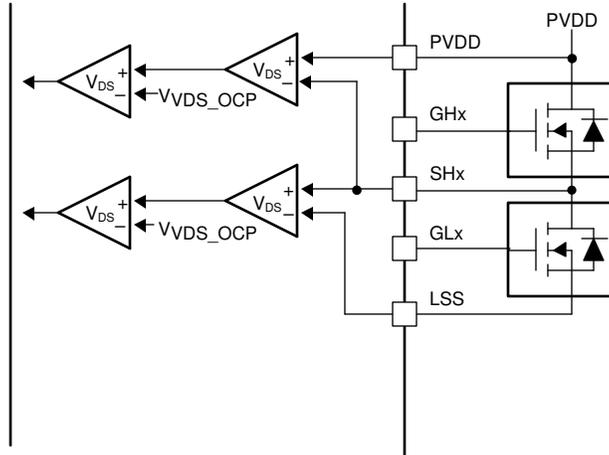

Figure 6-19. DRV8334  $V_{DS}$  Monitors

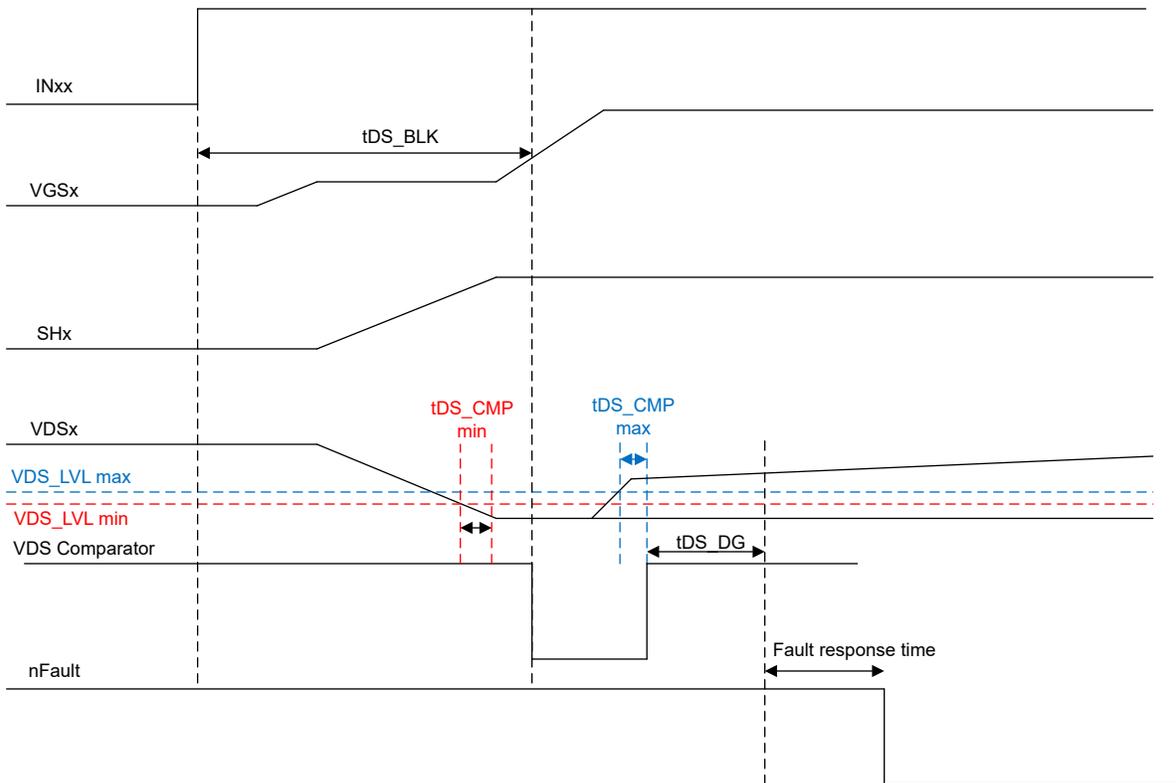

Figure 6-20. DRV8334  $V_{DS}$  Monitor Timing

#### 6.3.4.14 $V_{SENSE}$ Overcurrent Protection (SEN\_OCP)

Overcurrent is also monitored by sensing the voltage drop across the external current sense resistor between SPx and SNx pin. If at any time the difference voltage of SPx-SNx exceeds the  $V_{SEN\_OCP}$  threshold for longer than the  $t_{OCP\_DEG}$  deglitch time, a SEN\_OCP event is recognized. After detecting the SEN\_OCP over current event, all of the gate driver outputs are driven low to disable the external MOSFETs and nFAULT pin is driven low. The  $V_{SENSE}$  threshold and deglitch time are programmable. After SEN\_OCP condition is cleared, the fault state remains latched and can be cleared through SPI command.

#### 6.3.4.15 Phase Comparators

The device has three integrated phase comparators, each of which monitors the voltage at the SHx pin against the voltage on the VDRAIN pin. The phase comparators can be used to monitor the voltage of the SHx pin for motor commutation control, measurement of the time from input to output, or for diagnostics of the drivers, external MOSFETs, and external load.

The phase comparator thresholds are created with a resistor divider between the VDRAIN and GND pins. The threshold voltage is sent to the phase comparator and compared against the SHx voltage with respect to GND.

The device can be configured to enable three push-pull digital outputs on INLA, INLB and INLC pins. The outputs indicate the status of each phase comparator output. When INLx are used for phase comparator outputs, SPI register bit PWM\_MODE must be configured to 010b (3xPWM mode with SPIN enable control) to control low-side gate drivers.

The device integrates a logic to compare the digital inputs INHx and the phase comparator outputs. If a mis-compare is detected, the fault is reported on SPI register bits PHCx\_FLT.

#### 6.3.4.16 Thermal Shutdown (OTSD)

If the die temperature exceeds the trip point of the thermal shutdown limit ( $T_{OTSD}$ ), OTSD event is recognized. After detecting the OTSD overtemperature event, if OTSD\_MODE is Fault mode, all of the gate driver outputs are driven low to disable the external MOSFETs, charge pump and current sense are disabled, and nFAULT pin is driven low. After OTSD condition is cleared, the fault state remains latched and can be cleared through an SPI command (CLR\_FLT). The OTSD\_MODE is Fault mode by default. If OTSD condition is detected during device power up, nFAULT stays low and charge pump and current sense remain disabled until OTSD condition is removed and SPI command (CLR\_FLT) is sent by MCU.

#### 6.3.4.17 Thermal Warning (OTW)

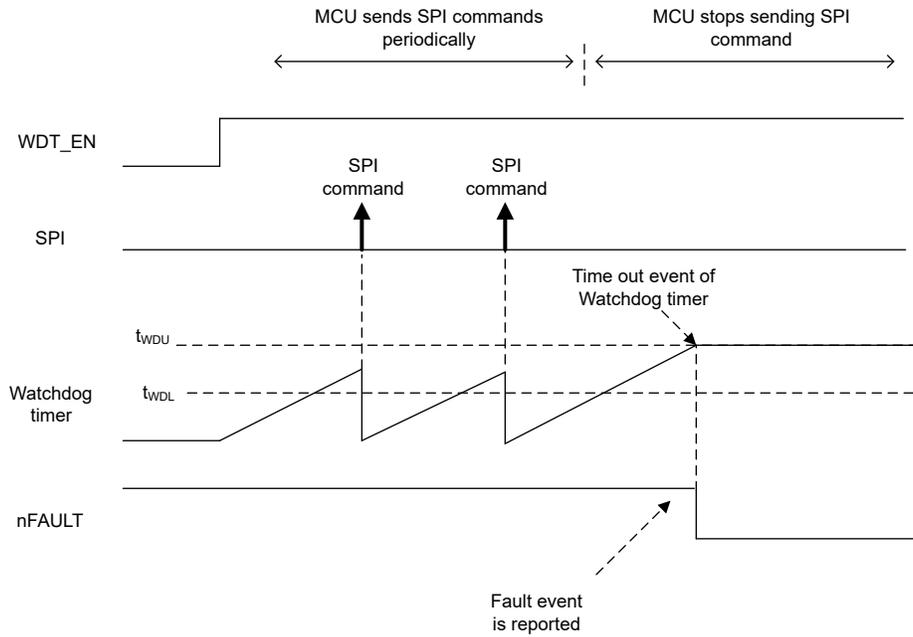

If the die temperature exceeds the trip point of the thermal warning ( $T_{OTW}$ ), the OTW bit is set in the registers of SPI devices. The device performs no additional action and continues to function. After the die temperature falls lower than the hysteresis point of the thermal warning, the OTW bit remains latched and can be cleared through an SPI command CLR\_FLT. If OTW bit is 1b, nFAULT remains high.

#### 6.3.4.18 OTP CRC

After each power up, the device performs an OTP CRC check. If the calculated CRC8 checksum does not match the CRC8 checksum stored in the internal OTP memory, the OTP\_CRC failed flag is set.

#### 6.3.4.19 SPI Watchdog Timer

The device integrates a programmable window-type SPI watchdog timer to verify that the external controller is operating. The SPI watchdog timer can be enabled by writing a 1 to WDT\_EN SPI register bit. The watchdog timer is disabled by default. When the watchdog timer is enabled, an internal timer starts to count up. A valid SPI access resets the timer. This valid SPI access must be issued between the lower window time and the upper window time. If a watchdog timer fault is detected, the WDT\_FLT status bit is set to 1b and nFAULT pin is asserted low.

**Figure 6-21. SPI Watchdog Timer timing diagram**

**6.3.4.20 Phase Diagnostic**

The device integrates a current source and a switch between VDRAIN and SHx device pins and between SHx device pin and the device ground for each channel. The switches can be individually enabled and disabled via SPI register bits PHDEN\_Hx and PHDEN\_Lx. If PHDEN\_Hx is 1b, the source current  $I_{PHD\_SRC}$  of SHx pin is enabled. If PHDEN\_Lx is 1b, the sink current  $I_{PHD\_SNK}$  of SHx pin is enabled. When any of PHDEN\_Hx and PHDEN\_Lx register bits are set to 1, the VDS overcurrent detection flags, VDS\_Hx and VDS\_Lx, change from the fault detection flag to the status flag of VDS comparators. The combination of the integrated current sources and VDS status flags can be used for the phase diagnostics such as an open fault detection of motor load, without activating external MOSFETs.

By default, the gate drivers are disabled when PHDEN\_x register bits are 1b. If PHDEN\_DRV register bit is 1b, the gate driver output can be controlled by INHx and INLx input pins while PHDEN\_x register bits are 1b, and the external MOSFETs can be turned ON during the phase diagnostic.

If PDHEN\_x register bits are 1b, VCP charge pump stays enabled but the charging path from VCP to the bootstrap capacitor is disabled. After phase diagnostic, the bootstrap capacitor needs to be pre-charged before PWM operation.

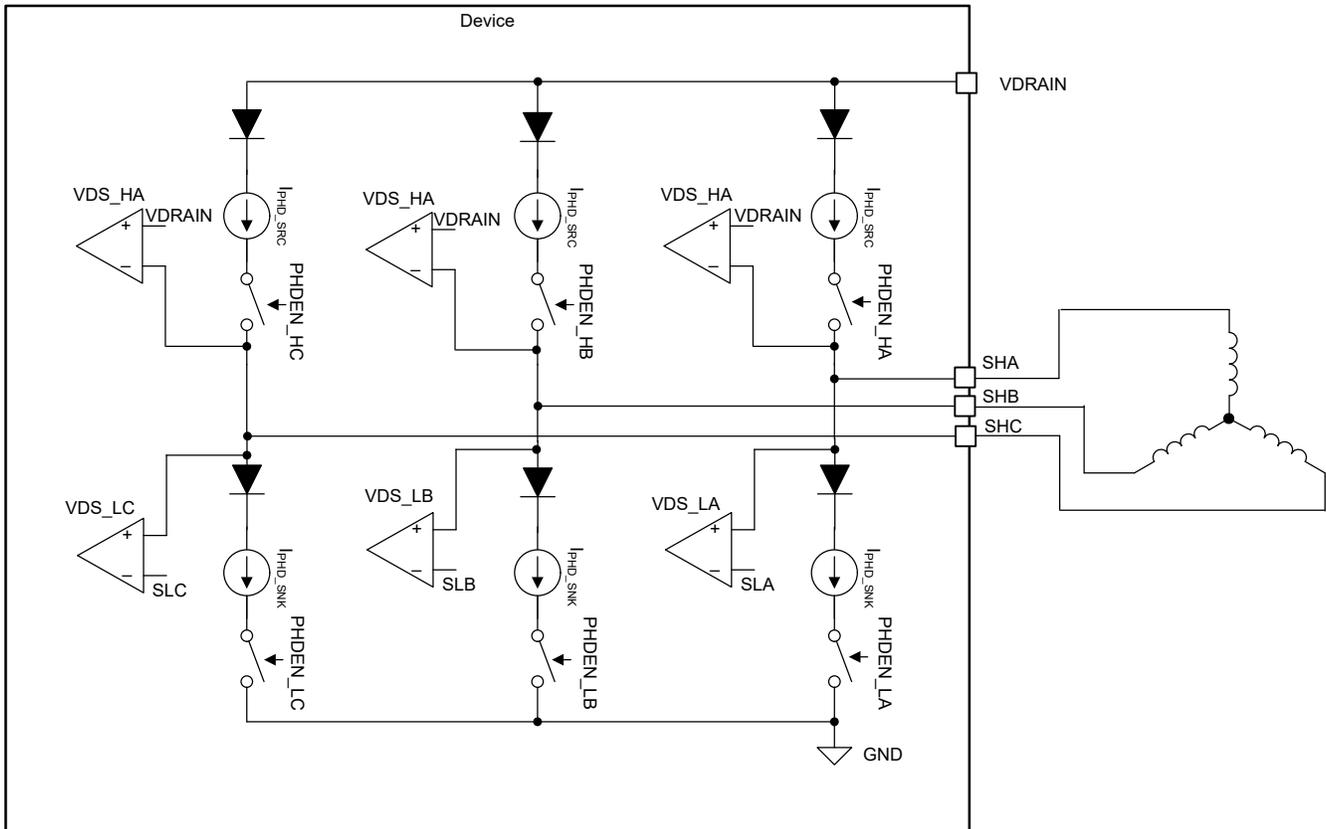

Figure 6-22. Phase Diagnostic (Preview only)

## 6.4 Device Functional Modes

### 6.4.1 Gate Driver Functional Modes

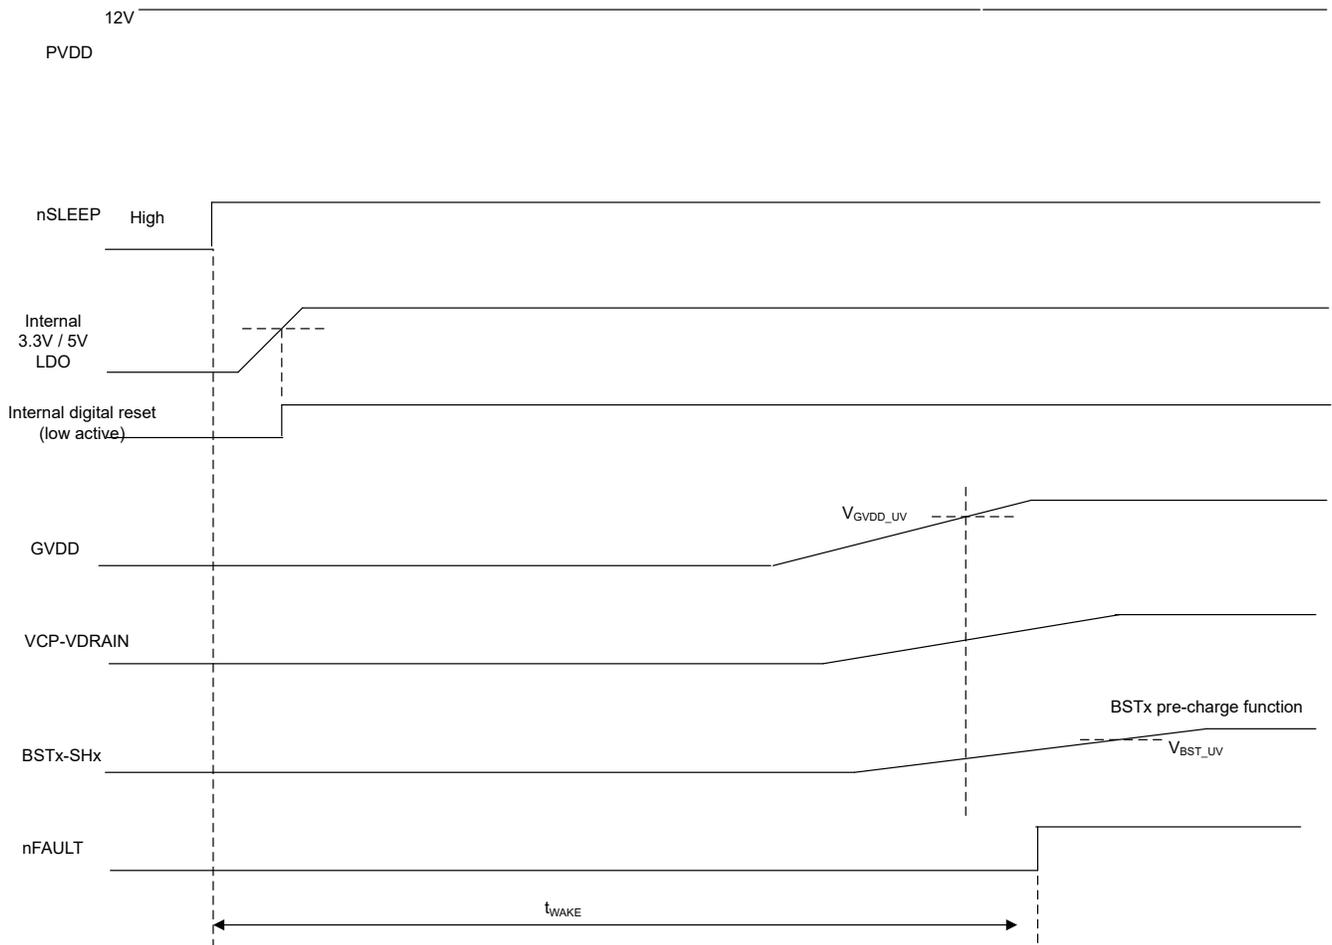

#### 6.4.1.1 Sleep Mode

The nSLEEP pin manages the state of the DRV8334. When the nSLEEP pin is low, the device goes to a low-power sleep mode. In sleep mode, all gate drivers are disabled, sense amplifiers are disabled, all external MOSFETs are disabled, and the GVDD regulator is disabled. The  $t_{SLEEP}$  time must elapse after a falling edge on the nSLEEP pin before the device goes to sleep mode. The device comes out of sleep mode automatically if the nSLEEP pin is pulled high. The  $t_{WAKE}$  time must elapse before the device is ready for inputs.

#### 6.4.1.2 Operating Mode

When the nSLEEP pin is high and the  $V_{PVDD}$  voltage is greater than the  $V_{UVLO}$  voltage, the device goes to operating mode. The  $t_{WAKE}$  time must elapse before the device is ready for inputs. In this mode the GVDD regulator and AVDD regulator are active.

### 6.4.2 Device Power Up Sequence

**Figure 6-23. Device Power Up Sequence and  $t_{WAKE}$**

Figure 6-23 explains the device power up sequence including the device internal information. As described in Section 6.4, if the nSLEEP pin is driven high, the device starts the power up sequence to enable the internal LDOs, GVDD and VCP charge pump. The nFAULT output is low when the device completes the power up sequence and enters the Operating Mode. The external MCU additionally waits for the pre-charge of bootstrap capacitors before toggling the high-side gate drivers, and the SPI status flag BST\_UVx can be used to check the status of pre-charge operation.

## 6.5 Programming

### 6.5.1 SPI

The device uses a serial peripheral interface (SPI) bus to set device configurations, operating parameters, and read out diagnostic information. The device SPI operates in peripheral mode and connects to a controller external controller. If SPI CRC (SPI\_CRC\_EN = 1b) is enabled, the SPI input data (SDI) word consists of a 32 bit word, with an 8 bit command, 16 bits of data, and 8 bit CRC (initial value 0xFF, polynomial 0x2F). The SPI output data (SDO) word consists of a 32 bit word, with an 8-bit status data, 16 bits of register data and 8bit CRC (initial value 0xFF, polynomial 0x2F). If SPI CRC is disabled (SPI\_CRC\_EN = 0b), the SPI data word consists of 24 bit word, where 8 bit CRC is excluded.

---

#### Note

CRC is enabled by default. To disable CRC, transmit "0x0009" to register 0x1C with CRC value "0x6E" (full SPI frame is "0x3800096E") after device power-up.

---

A valid frame must meet the following conditions:

- The SCLK pin is low when the nSCS pin transitions from high to low and from low to high.
- The nSCS pin is pulled high for at least 450ns between words.
- When the nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is set Hi-Z.
- Data is captured on the falling edge of SCLK and data is propagated on the rising edge of SCLK.
- The most significant bit (MSB) is shifted in and out first.
- A full 32 (or 24) SCLK cycles must occur for transaction to be valid.
- If the data word sent to the SDI pin is not 32 (or 24) bits, a frame error occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin following the 8 bit command data.
- The SDO pin is a push-pull type output.
- The SPI fault is confirmed at the rising edge of nSCS.

### 6.5.2 SPI Format

The SDI input data word is 32 (or 24) bits long and consists of the following format:

- 7 address bits, A6-A0
- 1 read or write bit, W0. W0 = 0b for write command and W0 = 1b for read command.
- 16 data bits, D15-D0
- 8-bit CRC if SPI\_CRC\_EN = 1b.

The SDO output data word is 32 (or 24) bits long and consists of the following format.

- 1 fault status bit, F. This bit is identical to IC\_STAT1 FAULT register bit.
- 7 read back bits, A6-A0. This is the read back of incoming 7 address bits of SDI in the same SPI frame. The device captures SDI at the rising edge of SCLK and pushes SDI out on falling edge of SCLK.
- 16 data bits, D15-D0. This is read data of the addressed register. For write command, it is the data previously stored in the addressed register.
- 8-bit CRC if SPI\_CRC\_EN = 1b.

### 6.5.3 SPI Format Diagrams

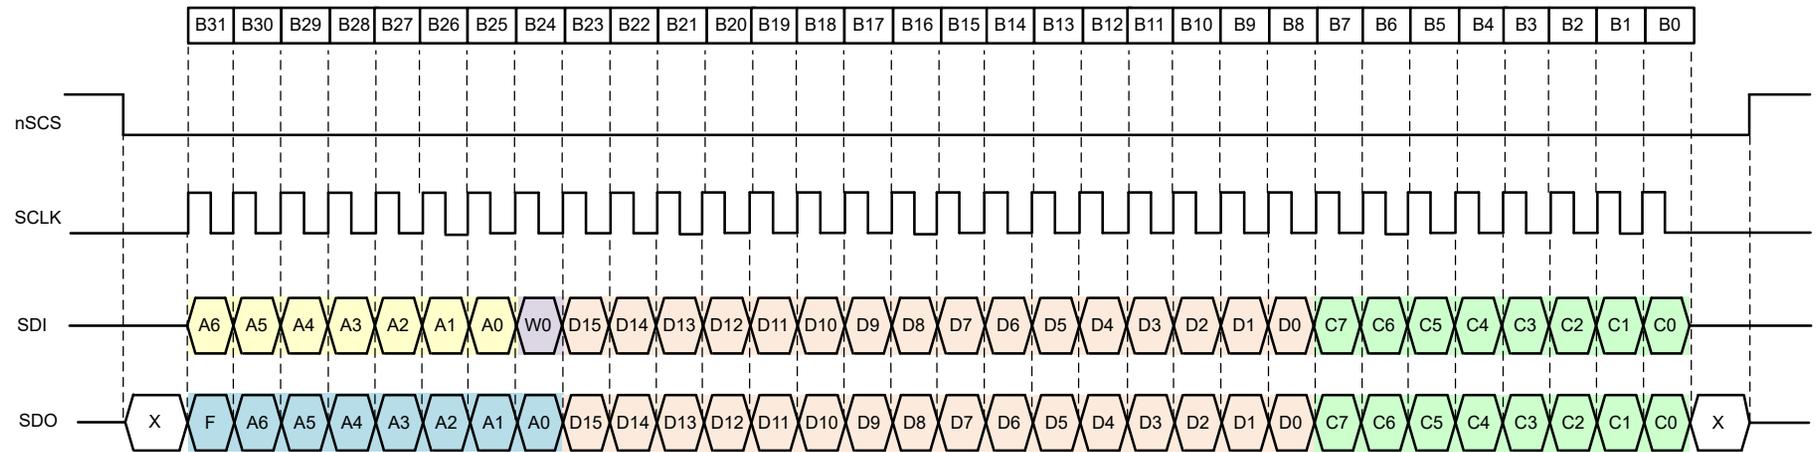

Figure 6-24. SPI Format - 32-bit frame (SPI\_CRC\_EN = 1b)

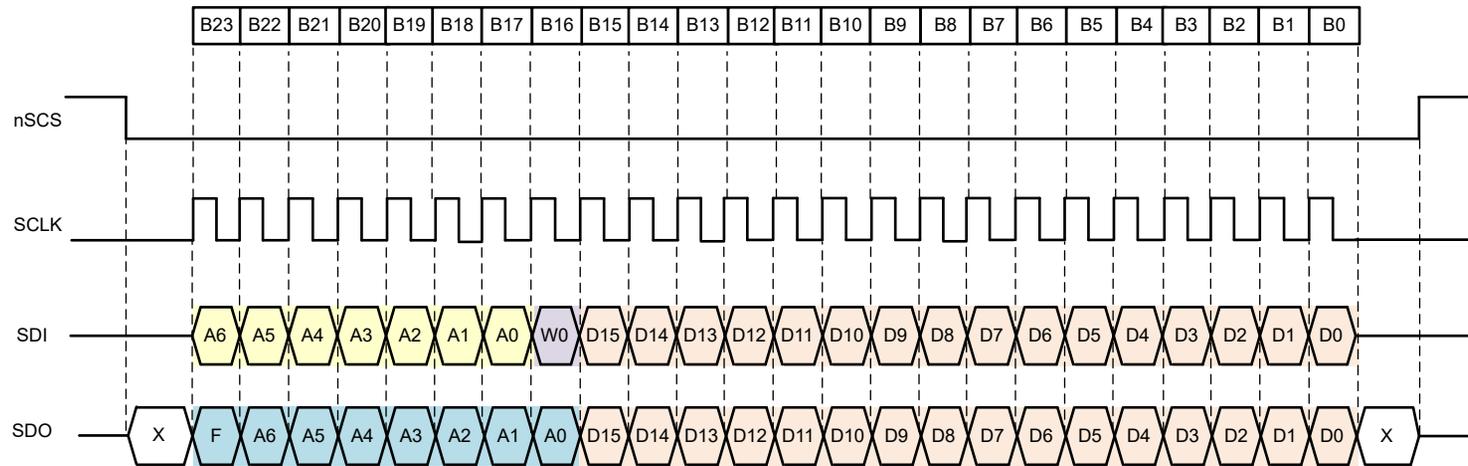

Figure 6-25. SPI Format - 24-bit frame (SPI\_CRC\_EN = 0b)

## 7 Register Maps

## 7.1 STATUS Registers

Table 7-1 lists the memory-mapped registers for the STATUS registers. All register offset addresses not listed in Table 7-1 is considered as reserved locations and the register contents are be modified.

**Table 7-1. STATUS Registers**

Address	Acronym	Register Name	Section
0h	IC_STAT1	IC Status Register 1	<a href="#">Section 7.1.1</a>
1h	IC_STAT2	IC Status Register 2	<a href="#">Section 7.1.2</a>
2h	IC_STAT3	IC Status Register 3	<a href="#">Section 7.1.3</a>
3h	IC_STAT4	IC Status Register 4	<a href="#">Section 7.1.4</a>
4h	IC_STAT5	IC Status Register 5	<a href="#">Section 7.1.5</a>
5h	IC_STAT6	IC Status Register 6	<a href="#">Section 7.1.6</a>

Complex bit access types are encoded to fit into small table cells. Table 7-2 shows the codes that are used for access types in this section.

**Table 7-2. STATUS Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value

### 7.1.1 IC\_STAT1 Register (Address = 0h) [Reset = 8000h]

IC\_STAT1 is shown in Table 7-3.

Return to the [Summary Table](#).

**Table 7-3. IC\_STAT1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	SPI_OK	R	1b	No SPI Fault is detected 0b = SPI Fault is detected 1b = No fault
14	FAULT	R	0b	Logic OR of FAULT status registers. Mirrors nFAULT pin. 0b = nFAULT status logic-low 1b = nFAULT status logic-high. One or multiple fault events detected.
13	WARN	R	0b	Logic OR of WARN status, except OTW 0b = No warning event detected 1b = One or multiple warning event detected
12	VDS	R	0b	Logic OR of VDS overcurrent detection 0b = No VDS events detected. 1b = One or multiple VDS events detected.
11	VGS	R	0b	Logic OR of VGS detection 0b = No VGS events detected. 1b = One or multiple VGS events detected.
10	SNS_OCP	R	0b	Logic OR of Sense overcurrent detection 0b = No sense overcurrent events detected. 1b = One or multiple sense overcurrent events detected.
9	OV	R	0b	Logic OR of supply voltage overvoltage detection 0b = No overvoltage events detected. 1b = One or more overvoltage events detected.

**Table 7-3. IC\_STAT1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
8	UV	R	0b	Logic OR of supply voltage undervoltage detection 0b = No undervoltage events detected. 1b = One or more undervoltage events detected.
7-2	RESERVED	R	0b	Reserved
1	OTW	R	0b	Overtemperature Warning Status Bit 0b = No event is detected 1b = Overtemperature warning event detected
0	DRV_STAT	R	0b	Indicates Driver Enable Status. Mirrors ENABLE_DRV register bit

### 7.1.2 IC\_STAT2 Register (Address = 1h) [Reset = 0000h]

IC\_STAT2 is shown in [Table 7-4](#).

Return to the [Summary Table](#).

**Table 7-4. IC\_STAT2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	CBC_ST	R	0b	VDS and SNS_OCP monitor Cycle By Cycle (CBC) counter activity status. If CBC is enabled (CBC is 1b), CBC counter is incremented when VDS or SNS_OCP condition is detected. CBC_ST is 1 if CBC counter is not 0 (CBC counter > 0) to indicate one or multiple VDS or SNS_OCP conditions have been detected. 0b = CBC counter is 0 1b = CBC counter is not 0 if CBC is enabled.
14-11	RESERVED	R	0b	Reserved
10	SNS_OCP_A	R	0b	Overcurrent on External Sense Resistor Status Bit on phase A
9	SNS_OCP_B	R	0b	Overcurrent on External Sense Resistor Status Bit on phase B
8	SNS_OCP_C	R	0b	Overcurrent on External Sense Resistor Status Bit on phase C
7-6	RESERVED	R	0b	Reserved
5	VDS_HA	R	0b	VDS Overcurrent Status on the A High-side MOSFET
4	VDS_LA	R	0b	VDS Overcurrent Status on the A Low-side MOSFET
3	VDS_HB	R	0b	VDS Overcurrent Status on the B High-side MOSFET
2	VDS_LB	R	0b	VDS Overcurrent Status on the B Low-side MOSFET
1	VDS_HC	R	0b	VDS Overcurrent Status on the C High-side MOSFET
0	VDS_LC	R	0b	VDS Overcurrent Status on the C Low-side MOSFET

### 7.1.3 IC\_STAT3 Register (Address = 2h) [Reset = 0000h]

IC\_STAT3 is shown in [Table 7-5](#).

Return to the [Summary Table](#).

**Table 7-5. IC\_STAT3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-6	RESERVED	R	0b	Reserved
5	VGS_HA	R	0b	Gate driver fault status on the A High-side MOSFET.
4	VGS_LA	R	0b	Gate driver fault status on the A Low-side MOSFET.
3	VGS_HB	R	0b	Gate driver fault status on the B High-side MOSFET.
2	VGS_LB	R	0b	Gate driver fault status on the B Low-side MOSFET.
1	VGS_HC	R	0b	Gate driver fault status on the C High-side MOSFET.
0	VGS_LC	R	0b	Gate driver fault status on the C Low-side MOSFET.

### 7.1.4 IC\_STAT4 Register (Address = 3h) [Reset = 0000h]

IC\_STAT4 is shown in [Table 7-6](#).

Return to the [Summary Table](#).

**Table 7-6. IC\_STAT4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PVDD_OV	R	0b	PVDD overvoltage status
14	PVDD_UV	R	0b	PVDD undervoltage status
13	VDRAIN_OV	R	0b	VDRAIN overvoltage status
12	VDRAIN_UV	R	0b	VDRAIN undervoltage status
11	VCP_OV	R	0b	VCP overvoltage status
10	VCP_UV	R	0b	VCP undervoltage status
9	GVDD_OV	R	0b	GVDD overvoltage status
8	GVDD_UV	R	0b	GVDD undervoltage status
7	RESERVED	R	0b	Reserved
6	RESERVED	R	0b	Reserved
5	BSTA_OV	R	0b	BST overvoltage on the A High-side MOSFET
4	BSTA_UV	R	0b	BST undervoltage on the A High-side MOSFET
3	BSTB_OV	R	0b	BST overvoltage on the B High-side MOSFET
2	BSTB_UV	R	0b	BST undervoltage on the B High-side MOSFET
1	BSTC_OV	R	0b	BST overvoltage on the C High-side MOSFET
0	BSTC_UV	R	0b	BST undervoltage on the C High-side MOSFET

### 7.1.5 IC\_STAT5 Register (Address = 4h) [Reset = 0000h]

IC\_STAT5 is shown in [Table 7-7](#).

Return to the [Summary Table](#).

**Table 7-7. IC\_STAT5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	RESERVED	R	0b	Reserved
14	PVDD_UVW	R	0b	PVDD undervoltage warning status
13-11	RESERVED	R	0b	Reserved
10	GVDD_CP_LDO	R	0b	GVDD operating mode status 0b = Charge pump 1b = LDO mode
9	OTSD	R	0b	
8	WDT_FLT	R	0b	Watch dog timer fault bit
7	SPI_CRC_FLT	R	0b	SPI CRC fault bit
6	SPI_ADDR_FLT	R	0b	SPI Address fault bit
5	SPI_CLK_FLT	R	0b	SPI Clock Framing fault bit. For 32-bit frame (SPI_CRC_EN is 1), the SPI_CLK_FLT is set to 1 if the number of SPI clock of one SPI frame is 1 to 31, 33 or higher. The SPI_CLK_FLT is 0 if the number of SPI clocks is 0 or 32. For 24-bit frame (SPI_CRC_EN is 0b), the SPI_CLK_FLT is 0 if the number of SPI clocks is 0 or 24. For 96-bit frame, the SPI_CLK_FLT is 0 if the number of SPI clocks is 0 or 96. Otherwise, SPI_CLK_FLT is set to 1.
4	OTP_CRC_FLT	R	0b	OTP CRC fault bit. A fault of OTP memory used for device production has been detected.

**Table 7-7. IC\_STAT5 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	OTP_USR_CRC_FLT	R	0b	USER OTP CRC fault. A fault of OTP memory used for user configuration has been detected. The OTP_USR_CRC_FLT is always be set to 1b if USER OTP is not used (programmed), and the flag must be cleared at power up. The OTP_USR_CRC_FLT doesn't affect nFAULT or Gate Drivers.
2	RESERVED	R	0b	Reserved
1	STP_FLT	R	0b	Shoot Through Protection violation
0	DEADT_FLT	R	0b	Dead time violation

### 7.1.6 IC\_STAT6 Register (Address = 5h) [Reset = 0000h]

IC\_STAT6 is shown in [Table 7-8](#).

Return to the [Summary Table](#).

**Table 7-8. IC\_STAT6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PHCA_FLT	R	0b	Indicates phase comparator fault of PHCA
14	PHCB_FLT	R	0b	Indicates phase comparator fault of PHCB
13	PHCC_FLT	R	0b	Indicates phase comparator fault of PHCC
12	RESERVED	R	0b	Reserved
11	VREF_OV	R	0b	VREF input overvoltage status
10	VREF_UV	R	0b	VREF input undervoltage status
9	VDDSDO_UV	R	0b	Device internal regulator VDDSDO regulator undervoltage status
8	RESERVED	R	0b	Reserved
7	DVDD_OV	R	0b	DVDD overvoltage status
6-5	RESERVED	R	0b	Reserved
4	ABIST_FLT	R	0b	Analog BIST fault status
3	DEV_MODE_FLT	R	0b	Device mode fault status
2-1	RESERVED	R	0b	Reserved
0	CLK_MON_FLT	R	0b	Clock monitor fault status

## 7.2 CONTROL Registers

Table 7-9 lists the memory-mapped registers for the CONTROL registers. All register offset addresses not listed in Table 7-9 are considered as reserved locations and the register contents are not to be modified.

**Table 7-9. CONTROL Registers**

Address	Acronym	Register Name	Section
1Ah	IC_CTRL1	IC Control Register 1	<a href="#">Section 7.2.1</a>
1Bh	IC_CTRL2	IC Control Register 2	<a href="#">Section 7.2.2</a>
1Ch	IC_CTRL3	IC Control Register 3	<a href="#">Section 7.2.3</a>
1Eh	GD_CTRL1	Gate Drive Control Register 1	<a href="#">Section 7.2.4</a>
1Fh	GD_CTRL2	Gate Drive Control Register 2	<a href="#">Section 7.2.5</a>
21h	GD_CTRL3	Gate Drive Control Register 3	<a href="#">Section 7.2.6</a>
22h	GD_CTRL3B	Gate Drive Control Register 3B	<a href="#">Section 7.2.7</a>
23h	GD_CTRL4	Gate Drive Control Register 4	<a href="#">Section 7.2.8</a>
24h	GD_CTRL5	Gate Drive Control Register 5	<a href="#">Section 7.2.9</a>
25h	GD_CTRL6	Gate Drive Control Register 6	<a href="#">Section 7.2.10</a>
26h	GD_CTRL7	Gate Drive Control Register 7	<a href="#">Section 7.2.11</a>
29h	CSA_CTRL	CSA Control Register	<a href="#">Section 7.2.12</a>
2Bh	MON_CTRL1	Monitor Control Register 1	<a href="#">Section 7.2.13</a>
2Ch	MON_CTRL2	Monitor Control Register 2	<a href="#">Section 7.2.14</a>
2Dh	MON_CTRL3	Monitor Control Register 3	<a href="#">Section 7.2.15</a>
2Eh	MON_CTRL4	Monitor Control Register 4	<a href="#">Section 7.2.16</a>
2Fh	MON_CTRL5	Monitor Control Register 5	<a href="#">Section 7.2.17</a>
30h	MON_CTRL6	Monitor Control Register 6	<a href="#">Section 7.2.18</a>
33h	DIAG_CTRL1	Diagnostic Control Register 1	<a href="#">Section 7.2.19</a>
36h	SPI_TEST	SPI Test Register	<a href="#">Section 7.2.20</a>
48h	OTP_USR	OTP User control	<a href="#">Section 7.2.21</a>

Complex bit access types are encoded to fit into small table cells. Table 7-10 shows the codes that are used for access types in this section.

**Table 7-10. CONTROL Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
R-0	R -0	Read Returns 0s
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

### 7.2.1 IC\_CTRL1 Register (Address = 1Ah) [Reset = 0000h]

IC\_CTRL1 is shown in Table 7-11.

Return to the [Summary Table](#).

**Table 7-11. IC\_CTRL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-1	RESERVED	R	0b	Reserved
0	VDDSDO_SEL	R/W	0b	VDDSDO regulator output selection bit. The bit determines VOH level of SDO and PHCx between 3.3V mode or 5V mode. The VIH/VIL of input buffers are not affected by VDDSDO_SEL bit. Before VDDSDO_SEL is set, VDDSDO_MON_LVL needs to be correctly configured. 0b = SDO/PHCx 3.3V mode 1b = SDO/PHCx 5V mode

**7.2.2 IC\_CTRL2 Register (Address = 1Bh) [Reset = 0006h]**IC\_CTRL2 is shown in [Table 7-12](#).Return to the [Summary Table](#).**Table 7-12. IC\_CTRL2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	ENABLE_DRV	R/W	0b	Enable predriver bit. The bit is cleared to 0b if one or multiple predriver shutdown conditions are detected and fault flags are set to 1b and if ALL_CH is 1b, or if DRVOFF is driven high. The ENABLE_DRV bit is forced to 0b by device while the fault condition exists or while DRVOFF is high. At power up, write access to ENABLE_DRV is ignored and the bit cannot be set to 1 until nFAULT goes high. After nFAULT goes high, wait 5us and set ENABLE_DRV to 1b. During initial setup, it's recommended to set the gate drive current IDRvX settings before ENABLE_DRV is set to 1b. 0b = INHx and INLx digital inputs are ignored and the gate driver outputs are pulled low (active pull down) by default. 1b = Gate driver outputs are controlled by INHx and INL digital inputs. If IDRVP or IDRVN register values is modified while ENABLE_DRV is 1b, the one PWM cycle delay is expected to get the gate driver current updated.
14	MODE_NSLEEP	R/W	0b	nSLEEP Mode. 0b = nSLEEP is active low and device enters sleep mode when nSLEEP is driven low. 1b = nSLEEP is active low and device enters DRVOFF shutdown mode when nSLEEP is driven low. Internal regulators including GVDD charge pump and TCP/VCP charge pumps are active. If WDT_FLT is detected, the device enters sleep mode when nSLEEP is low regardless of MODE_NSLEEP bit.
13	CFG_CRC_EN	R/W	0b	Enable configuration data CRC function 0b = Configuration DATA CRC function is disabled. 1b = Configuration Data CRC function is enabled.
12	CLKMON_EN	R/W	0b	Clock monitor enable 0b = Clock monitor is disabled. 1b = Clock monitor is enabled.
11	CSA_EN	R/W	0b	Current Sense Amplifier Enable. If GVDD_UV_MODE is 0b (Warning mode), MCU must maintain GVDD_UV flag is 0b before CSA_EN bit is set to 1b. If GVDD_UV_MODE is 1b (Fault mode), IC disables CSA amplifier when GVDD_UV is detected. 0b = CSA is disabled. SOx are HiZ state. 1b = CSA is enabled.
10	CSA_AZ_DIS	R/W	0b	Current Sense Amplifier Auto Zero function disable 0b = CSA Auto Zero function is enabled. This bit is 0b during normal PWM/CSA operation. 1b = CSA Auto Zero function is disabled. The purpose of this bit is to disable switching activity of current sense amplifier for auto zero function. Refer to timing requirements if this bit is used.

**Table 7-12. IC\_CTRL2 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
9	DIS_GVDD_SS	R/W	0b	<p style="text-align: center;"><b>Note</b></p> <p>TI recommends users to set DIS_GVDD_SS to 1b after power up for the prototype samples. The final production sample plans to remove this function</p> <hr/> <p>Disable GVDD Charge pump soft start 0b = GVDD output load capability does not meet the spec when PVDD input voltage is lower than 7.2V. 1b = For prototype samples, TI recommends users to set the bit to 1 after power up for prototype samples.</p>
8	GVDD_MODE	R/W	0b	GVDD Charge pump LDO mode control 0b = Normal GVDD operation. Charge pump mode and LDO mode are controlled by device. 1b = LDO mode. GVDD charge pump clock is disabled. (charge pump switching operation is disabled).
7-6	VCP_MODE	R/W	00b	VCP/TCP mode control 00b = Normal VCP/TCP operation. VCP/TCP is enabled at power up. TCP SW is enabled when SPI_ENABLE_DRV is 0. When DRVOFF is high and if system expects the device to keep BST cap stay charged, VCP_MODE must be 00b. 01b = VCP/CPH-SHx switch is disabled. VCP/TCP charge pump clock is active. This bit is valid regardless of SPI_ENABLE_DRV. 10b = VCP/TCP shutdown. Both VCP/CPH-SHx switch and VCP/TCP charge pump clock are disabled. This bit is valid regardless of SPI_ENABLE_DRV. 11b = Normal VCP/TCP operation. VCP/TCP is enabled at power up. TCP SW is disabled when SPI_ENABLE_DRV is 0.
5-4	RESERVED	R	0b	Reserved
3-1	LOCK	R/W	011b	Lock and unlock the register setting Bit settings not listed have no effect. 011b = Unlock all the registers 110b = Lock the settings by ignoring further register writes except to these bits.
0	CLR_FLT	R/W	0b	Clear fault. After fault event is detected and fault flag is set, TI recommends to issue CLR_FLT command first, then ENABLE_DRV command next in a separate SPI frame. If CLR_FLT and ENABLE_DRV commands are issued in the same SPI frame, CLR_FLT is higher priority and ENABLE_DRV is not set if fault flag is already latched and the device is waiting CLR_FLT. 0b = No action 1b = Clear faults. Self-clear to 0b.

### 7.2.3 IC\_CTRL3 Register (Address = 1Ch) [Reset = 8009h]

IC\_CTRL3 is shown in [Table 7-13](#).

Return to the [Summary Table](#).

**Table 7-13. IC\_CTRL3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	SPI_CRC_EN	R/W	1b	SPI CRC Enable 0b = SPI CRC is disabled. One SPI frame is 8-bit command, 16-bit data. 1b = SPI CRC is enabled. One SPI frame is 8-bit command, 16-bit data, and 8-bit CRC.

**Table 7-13. IC\_CTRL3 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
14	WARN_MODE	R/W	0b	Warning nFAULT mode; Control nFAULT response for warning events 0b = No nFAULT reporting for warning response. Status flags are set. 1b = nFAULT is driven low for warning response. Status flags are set.
13	RESERVED	R	0b	Reserved
12	DIS_SSC	R/W	0b	T1 Internal design parameter: No change is required unless notified by TI. The bit disables Spread Spectrum Clocking feature of the device internal oscillator 0b = Normal operation. Spread Spectrum Clocking feature is enabled. 1b = Spread Spectrum Clock feature is disabled for T1 debug purpose.
11	RESERVED	R	0b	Reserved
10	TCP_EN_DLY	R/W	0b	Delay time to activate trickle charge pump after the device detects PWM inactive (INHx=INLx=Low) 0b = 100us (typ) 1b = 250us (typ)
9	DRVOFF_PDSEL_HS	R/W	0b	DROVFF Pull-down select for high-side gate driver 0b = High-side gate driver outputs GHx are semi active pull-down (RPDSA_HS) if DRVOFF is high. 1b = High-side gate driver outputs GHx are passive pull-down (RPD_HS) if DRVOFF is high.
8	DRVOFF_PDSEL_LS	R/W	0b	DROVFF Pull-down select for low-side gate driver 0b = Low-side gate driver outputs GLx are semi active pull-down (RPDSA_LS) if DRVOFF is high. 1b = Low-side gate driver outputs GLx are passive pull-down (RPD_LS) if DRVOFF is high.
7-4	RESERVED	R	0b	Reserved
3	OT_LVL	R/W	1b	Overtemperature shutdown threshold selection 0b = Grade 1 mode 1b = Grade 0 mode
2	RESERVED	R	0b	Reserved
1-0	OTSD_MODE	R/W	01b	Overtemperature shutdown mode 00b = Warning mode 01b = Fault (shutdown) mode 10b = No report. No shutdown. 11b = No report. No shutdown

**7.2.4 GD\_CTRL1 Register (Address = 1Eh) [Reset = 0138h]**GD\_CTRL1 is shown in [Table 7-14](#).Return to the [Summary Table](#).**Table 7-14. GD\_CTRL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	RESERVED	R	0b	Reserved

7-6	RESERVED	R	0b	Reserved
5-0	IDRVN_D_L	R/W	000000b	Peak sink pull down pre-discharge current for low-side gate driver. Refer to IDRIVE description

### 7.2.8 GD\_CTRL4 Register (Address = 23h) [Reset = 0000h]

GD\_CTRL4 is shown in [Table 7-18](#).

Return to the [Summary Table](#).

**Table 7-18. GD\_CTRL4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	PWM1X_COM	R/W	0b	1x PWM Commutation Control 0b = 1x PWM mode uses synchronous rectification 1b = 1x PWM mode uses asynchronous rectification
14	PWM1X_DIR	R/W	0b	1x PWM Direction. In 1x PWM mode this bit is ORed with the INHC (DIR) input
13-12	PWM1X_BRAKE	R/W	00b	1x PWM output configuration 00b = Outputs follow commanded inputs 01b = Turn on all three low-side MOSFETs 10b = Turn on all three high-side MOSFETs 11b = Turn off all six MOSFETs (coast)
11-10	RESERVED	R	0b	Reserved
9	IDRVP_CFG	R/W	0b	IDRVP configuration mode 0b = IDRVP register is not valid and ignored. IDRVP_RATIO is used to determine IDRVP parameter if IDRVP is in the range of 000000b (0.7mA) - 100011b (247mA). If IDRVP is 100100b (600mA) - 101100b (2000mA), IDRVP uses the same setting as IDRVP. For example, if IDRVP is set to 100100b (600mA), IDRVP is 100100b (300mA) where pull-up current is typically half of pull-down current. 1b = IDRVP register is used to determine IDRVP parameter. IDRVP_RATIO is not valid and is ignored.
8	IHOLD_SEL	R/W	0b	Select IHOLD pull-up and pull-down current. IHOLD_SEL bit must be configured while PWM is inactive (ENABLE_DRV is 0b). 0b = IHOLD pull-up/down 500mA/1000mA (typ) 1b = IHOLD pull-up/down 260mA/260mA (typ)
7-6	RESERVED	R	0b	Reserved
5	DRV_GHA	R/W	0b	Drive GHA by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GHA is driven low 1b = GHA is driven high
4	DRV_GHB	R/W	0b	Drive GHB by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GHB is driven low 1b = GHB is driven high
3	DRV_GHC	R/W	0b	Drive GHC by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GHC is driven low 1b = GHC is driven high
2	DRV_GLA	R/W	0b	Drive GLA by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GLA is driven low 1b = GLA is driven high
1	DRV_GLB	R/W	0b	Drive GLB by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GLB is driven low 1b = GLB is driven high
0	DRV_GLC	R/W	0b	Drive GLC by SPI command. PWM_MODE = 101b (SPI gate drive mode) only. This bit is valid when ENABLE_DRV is 1b. 0b = GLC is driven low 1b = GLC is driven high

### 7.2.9 GD\_CTRL5 Register (Address = 24h) [Reset = 0007h]

GD\_CTRL5 is shown in [Table 7-19](#).

Return to the [Summary Table](#).

**Table 7-19. GD\_CTRL5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-3	RESERVED	R	0b	Reserved
2	DRVEN_A	R/W	1b	DRVEN_A = 0 enforces GHA and GLA low with active pull down without shutdown sequence. This bit is valid for any PWM_MODE settings. This bit is valid when ENABLE_DRV is 1b. 0b = GHA and GLA are actively pulled down (low). ENABLE_DRV is not affected by this bit. 1b = No affect. GHA and GLA are controlled normally depending following PWM_MODE setting.
1	DRVEN_B	R/W	1b	DRVEN_B = 0 enforces GHB and GLB low with active pull down without shutdown sequence. This bit is valid for any PWM_MODE settings. This bit is valid when ENABLE_DRV is 1b. 0b = GHB and GLB are actively pulled down (low). ENABLE_DRV is not affected by this bit. 1b = No affect. GHB and GLB are controlled normally depending following PWM_MODE setting.
0	DRVEN_C	R/W	1b	DRVEN_C = 0 enforces GHC and GLC low with active pull down without shutdown sequence. This bit is valid for any PWM_MODE settings. This bit is valid when ENABLE_DRV is 1b. 0b = GHC and GLC are actively pulled down (low). ENABLE_DRV is not affected by this bit. 1b = No affect. GHC and GLC are controlled normally depending following PWM_MODE setting.

### 7.2.10 GD\_CTRL6 Register (Address = 25h) [Reset = 0000h]

GD\_CTRL6 is shown in [Table 7-20](#).

Return to the [Summary Table](#).

**Table 7-20. GD\_CTRL6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-14	RESERVED	R	0b	Reserved
13-8	IDRVP_H	R/W	000000b	High-side peak source pull up current. IDRVP_H is valid if IDRVP_CFG = 1b. IDRVP_H is not valid and ignored if IDRVP_CFG = 0b.
7-6	RESERVED	R	0b	Reserved
5-0	IDRVP_L	R/W	000000b	Low-side peak source pull up current. IDRVP_L is valid if IDRVP_CFG = 1b. IDRVP_H is not valid and ignored if IDRVP_CFG = 0b.

### 7.2.11 GD\_CTRL7 Register (Address = 26h) [Reset = 0000h]

GD\_CTRL7 is shown in [Table 7-21](#).

Return to the [Summary Table](#).

**Table 7-21. GD\_CTRL7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-14	IDRV_RATIO_H	R/W	00b	High-side IDRVP and IDRVN ratio. IDRV_RATIO_H is valid if IDRVP_CFG = 0b and if the range of IDRVN_H is from 00000b (0.7mA) to 100011b (typ 247mA). IDRIVE_RATIO_H doesn't affect gate driver performance if IDRVN_H is 100100b(600mA) or higher setting. If IDRVP_CFG = 1b, IDRV_RATIO_H is not valid and ignored. 00b = IDRVP is IDRVN x 1 01b = IDRVP is IDRVN x 0.75 10b = IDRVP is IDRVN x 0.5 11b = IDRVP is IDRVN x 0.25

**Table 7-21. GD\_CTRL7 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
13-8	IDRVN_H	R/W	000000b	High-side peak sink pull down current. Refer to Electrical Characteristics table, IDRVN parameter.
7-6	IDRV_RATIO_L	R/W	00b	Low-side IDRVP and IDRVN ratio. IDRV_RATIO_L is valid if IDRVP_CFG = 0b and if the range of IDRVN_H is from 00000b (0.7mA) to 100011b (typ 247mA). IDRIVE_RATIO_L doesn't affect gate driver performance if IDRVN_H is 100100b(600mA) or higher setting. If IDRVP_CFG = 1b, IDRV_RATIO_L is not valid and ignored. 00b = IDRVP is IDRVN x 1 01b = IDRVP is IDRVN x 0.75 10b = IDRVP is IDRVN x 0.5 11b = IDRVP is IDRVN x 0.25
5-0	IDRVN_L	R/W	000000b	Low-side peak sink pull down current. Refer to Electrical Characteristics table, IDRVN parameter.

**7.2.12 CSA\_CTRL Register (Address = 29h) [Reset = 0000h]**

CSA\_CTRL is shown in [Table 7-22](#).

Return to the [Summary Table](#).

**Table 7-22. CSA\_CTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	AREF_DIV	R/W	0b	VREF dividing ratio 0b = 1/2 1b = 1/8
14-12	RESERVED	R	0b	Reserved

15-14	RESERVED	R	0b	Reserved
13	VDDSDO_MON_LVL	R/W	0b	VDDSDO (Power supply of SDO) undervoltage and overvoltage monitor level. The target nominal VDDSDO voltage is either 3.3V or 5V. 0b = 3.3V mode 1b = 5V mode

**Table 7-27. MON\_CTRL5 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
12	VREF_MON_LVL	R/W	0b	VREF (CSA reference voltage) undervoltage and overvoltage monitor threshold level. The target nominal VREF voltage is either 3.3V or 5V 0b = Target nominal voltage of VREF is 3.3V. The under voltage monitor threshold is 2.8V (typ) and the overvoltage monitor threshold is 3.8V (typ). 1b = Target nominal voltage of VREF is 5V. The under voltage monitor threshold is 4.2V (typ) and the overvoltage monitor threshold is 5.8V (typ).
11	VREF_MON_MODE	R/W	0b	VREF monitor mode for under and over voltage monitors. 0b = Warning mode 1b = Fault mode
10-5	RESERVED	R	0b	
4	PHC_OUTDG_SEL	R/W	0b	Phase Comparator output (PHCx device pin) deglitch time selection 0b = No deglitch time. The device comparator output is directly routed to device pin (PHCx). 1b = Deglitch 1us (typ) is enabled, and deglitch is added on the phase comparator output.
3	PHC_MON_MODE	R/W	0b	Phase Comparator fault monitor mode 0b = Report to status register bits. No nFAULT1 reporting. No gate driver shutdown 1b = Report to status register bits and nFAULT1 is driven low. No Gate driver shutdown
2	PHC_COMPEN	R/W	0b	Phase Comparator enable 0b = disabled. Phase comparator outputs (device pin or SPI status bit) are not valid. 1b = enabled. System needs to wait 5us after enabled.
1	PHC_OUTEN	R/W	0b	Phase Output buffer enable. This bit can be enabled regardless of PWM_MODE. 0b = disabled. The output is HiZ. 1b = enabled. INLx signals are tied to low in device.
0	PHC_TH	R/W	0b	Phase Comparator threshold 0b = 75% for rising and 25% for falling 1b = 50%

**7.2.18 MON\_CTRL6 Register (Address = 30h) [Reset = 20BBh]**MON\_CTRL6 is shown in [Table 7-28](#).Return to the [Summary Table](#).**Table 7-28. MON\_CTRL6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-14	RESERVED	R	0b	Reserved
13	ALL_CH	R/W	1b	All channel shutdown enable 0b = Associated faulty half-bridge is shutdown (active pull down) in response to VDS, VGS and OCP_SNS. nFAULT goes low after all three channels have the faults. ENABLE_DRV bit is NOT cleared by the device. For a recovery sequence to re-start PWM, MCU uses CLR_FLT and clears ENABLE_DRV (can be in one SPI command), then set ENABLE_DRV to 1b. 1b = All three half-bridges are shutdown (semi-active pull down) in response to VDS, VGS and OCP_SNS. nFAULT goes low if one or multiple channels have the faults. ENABLE_DRV bit is cleared to 0b by the device.

**Table 7-28. MON\_CTRL6 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
12	CBC	R/W	0b	Cycle By Cycle shutdown retry mode enable. This bit is applied to Fault mode of VDS and SNS_OCP detection. One counter is implemented internally for each phase. 0b = Cycle By Cycle retry mode is disabled 1b = Cycle By Cycle retry mode is enabled. When gate driver is shutdown when VDS or SNS_OCP fault is detected (fault mode), PWM outputs are automatically retried when a new PWM input (either rising or falling edge of INLx/INHx) is given. The status flag is latched. If nFAULT reporting is enabled, nFAULT is asserted (low) when CBC count reaches at CBC_CNT + 1b.
11	CBC_CNT	R/W	0b	Cycle By Cycle shutdown retry count selection. The CBC retry finishes after the retry count reaches at CBC_CNT (after CBC_CNT + 1 faults are detected). If ALL_CH = 1b, ENABLE_DRV is cleared after CBC retry finishes. After ENABLE_DRV is cleared, the CBC_CNT is reset to 0 when ENABLE_DRV is set to 1. If CBC_CNT is cleared when CLR_FLT is set 1. 0b = CBC retry is repeated 3 times. CBC retry finishes at 4th fault. 1b = CBC retry is repeated 10 times. CBC retry finishes at 11th fault.
10-8	RESERVED	R	0b	Reserved
7-4	VDS_LVL_HS	R/W	1011b	VDS overcurrent threshold for high-side MOSFETs
3-0	VDS_LVL_LS	R/W	1011b	VDS overcurrent threshold for low-side MOSFETs. The threshold setting is identical to VDS_LVL_HS

### 7.2.19 DIAG\_CTRL1 Register (Address = 33h) [Reset = 0000h]

DIAG\_CTRL1 is shown in [Table 7-29](#).

Return to the [Summary Table](#).

**Table 7-29. DIAG\_CTRL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-6	RESERVED	R	0b	Reserved
5	PHDEN_HA	R/W	0b	Phase Diagnostic switch enable on high-side channel A ( VDRAIN-SHA) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_Hx and VDS_Lx flags change from the fault detection to the real monitor status. If all PHDEN_x bits are cleared to all 0s, VDS_xx flags are cleared by device.
4	PHDEN_LA	R/W	0b	Phase Diagnostic switch enable on low-side channel A ( SHA-GND) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_LA bit is real monitor status of SHA-SLA voltage
3	PHDEN_HB	R/W	0b	Phase Diagnostic switch enable on high-side channel B ( VDRAIN-SHB) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_Hx and VDS_Lx flags change from the fault detection to the real monitor status.
2	PHDEN_LB	R/W	0b	Phase Diagnostic switch enable on low-side channel B ( SHB-GND) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_LB bit is real monitor status of SHB-SLB voltage
1	PHDEN_HC	R/W	0b	Phase Diagnostic switch enable on high-side channel C ( VDRAIN-SHC) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_Hx and VDS_Lx flags change from the fault detection to the real monitor status.

**Table 7-29. DIAG\_CTRL1 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
0	PHDEN_LC	R/W	0b	Phase Diagnostic switch enable on low-side channel C ( SHC-GND) 0b = No effect 1b = Phase Diagnostic switch is enabled. VDS_LC bit is real monitor status of SHC-SLC voltage

**7.2.20 SPI\_TEST Register (Address = 36h) [Reset = 0000h]**

SPI\_TEST is shown in [Table 7-30](#).

Return to the [Summary Table](#).

**Table 7-30. SPI\_TEST Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	SPI_TEST	R/W	0000000000 000000b	SPI Test register. Write access to this register has no effect on device operation.

**7.2.21 OTP\_USR Register (Address = 48h) [Reset = 0000h]**

OTP\_USR is shown in [Table 7-31](#).

Return to the [Summary Table](#).

**Table 7-31. OTP\_USR Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-5	RESERVED	R	0b	Reserved
4	OTP_USR_P_VER	R/W	0b	Enables memory verification of User OTP Program. The bit is used after user OTP is programmed by user. MCU waits until the bit is cleared to 0 by the device, and then MCU must check OTP_USR_CRC_FLT for the verification result. OTP_USR_PRG and OTP_USR_P_VER shall never be set to 1b at the same time. 0b = User OTP Verification is inactive 1b = User OTP Verification is enabled and is active. The device runs CRC automatically, and OTP_USR_CRC_FLT status bit is set to 1b if User OTP Verification is failing.
3-1	OTP_USR_P_ACC	R/W	000b	Access control of User OTP Program and User OTP Verification. The write access of OTP_USR_PRG bit is not available unless the following value is written in sequence; 0x2, 0x1, 0x4. Any other undefined values are ignored and the reset the internal sequence logic. The device returns read 0x7 if the sequence values are accepted. After the sequence is accepted by device (read =0x7), any write access (including 0x2, 0x1, 0x4) to this register resets the sequence logic (read = 0x0). 000b = Read returned data if sequence logic is reset. 001b = The 2nd data to be entered in the sequence 010b = The 1st data to be entered in the sequence 100b = The 3rd data to be entered in the sequence 111b = Read returned data if the sequence commands are accepted by device and write access to OTP_USR_PRG is allowed.
0	OTP_USR_PRG	W	0b	Program User OTP. MCU sets the bit to 1 to enable OTP program. MCU waits until the bit is cleared to 0 by the device. OTP_USR_PRG and OTP_USR_P_VER shall never be set to 1b at the same time. When OTP_USR_PRG is set to 1, the following SPI register bits shall be configured accordingly; ENABLE_DRV=0, ADC_EN=0, ADC_EN2=0, PWSPI_EN=0, WDT_EN=0, VCP_MODE=11, CLKMON_EN=0, DRVEN_A=0, DRVEN_B=0, DRVEN_C=0, CSA_EN=0, GVDD_MODE=1. 0b = User OTP Program is inactive. 1b = User OTP Program is enabled and is active.

## 8 Application and Implementation

---

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

### 8.1 Application Information

The DRV8334 is primarily used in applications for three-phase brushless DC motor control. The design procedures in the [Section 8.2](#) section highlight how to use and configure the DRV8334 device.

### 8.2 Typical Application

#### 8.2.1 Typical Application with 48-pin package

Figure shows a typical application diagram of DRV8334 48-pin package.

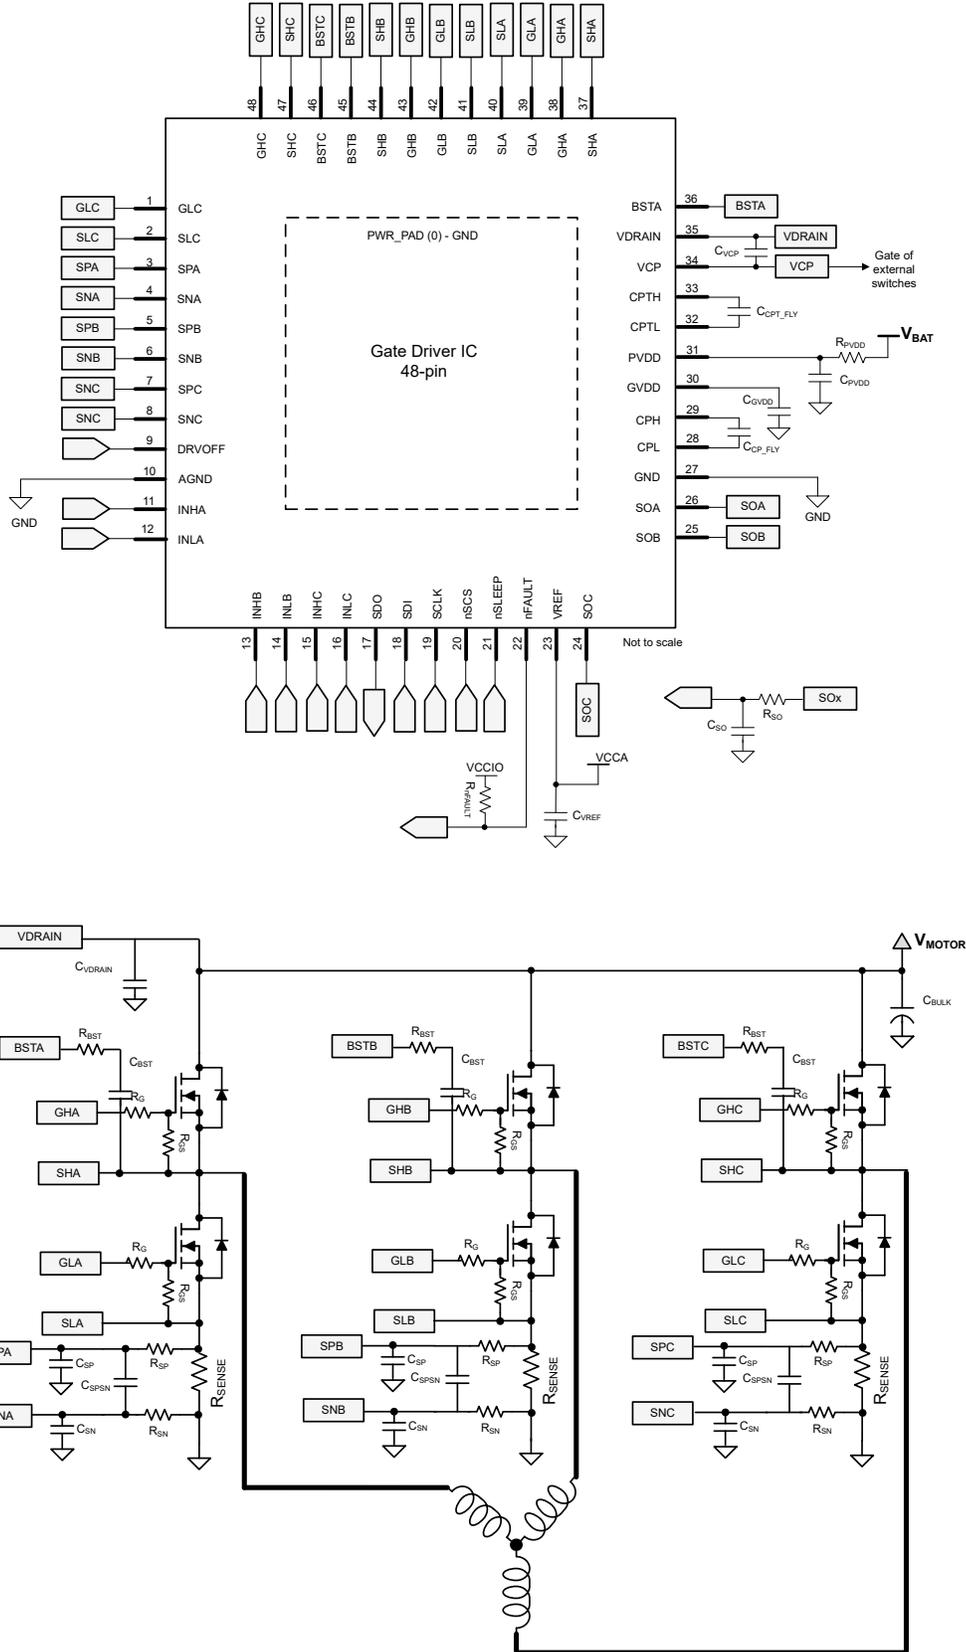

Figure 8-1. DRV8334 Typical Application Schematic

### 8.2.1.1 External Components

External components lists the recommended external components. Note that the capacitances below are considered effective capacitances under nominal conditions. Consider the impact of DC derating when selecting these components.

**Table 8-1. External Components (48-pin Package)**

COMPONENT	PIN1	PIN2	RECOMMENDED
R <sub>PVDD</sub>	V <sub>BAT</sub>	PVDD	OPTIONAL: 1Ω (or smaller) series resistor
C <sub>PVDD</sub>	PVDD	GND	10μF ceramic capacitor rated for PVDD.
C <sub>GVDD</sub>	GVDD	GND	10μF ceramic capacitor rated for GVDD.
C <sub>CP_FLY</sub>	CPH	CPL	1.0μF ceramic capacitor rated for GVDD voltage
C <sub>CPT_FLY</sub>	CPH	CPTL	1.0μF ceramic capacitor rated for GVDD voltage
C <sub>VCP</sub>	VCP	VDRAIN	1.0μF ceramic capacitor rated for VCP voltage
R <sub>nFAULT</sub>	VCCIO	nFAULT	10kΩ pulled up the MCU I/O power supply
C <sub>VREF</sub>	VREF	GND	0.1μF ceramic capacitor rated for VREF
C <sub>BULK</sub>	V <sub>MOTOR</sub>	GND	100μF - 1000μF rated for V <sub>MOTOR</sub> ; Depending on system configuration
C <sub>VDRAIN</sub>	VDRAIN	GND	1μF rated for VDRAIN
C <sub>BST</sub>	BSTx	SHx	1.0μF, 20V ceramic capacitor between BSTx and SHx depending on the total gate charge of external MOSFET Q <sub>g</sub> . C <sub>BST</sub> > 20 X Q <sub>g</sub> / (V <sub>GHx</sub> -V <sub>SHx</sub> )
R <sub>BST</sub>	BSTx	SHx	OPTIONAL: 2Ω series resistor between BSTx and SHx to help prevent C <sub>BST</sub> from being overcharged if big negative transient voltage is observed on SHx pin.
R <sub>G</sub>	GHx, GLx	Gate of external MOSFET	OPTIONAL: 3Ω series resistor between GHx/GLx and Gate of external MOSFET.
R <sub>GS</sub>	GHx, GLx	Source of external MOSFET	100kΩ pull down resistor between GHx/GLx and Source of external MOSFET.
R <sub>SENSE</sub>	SPx	SNx	0.5mΩ Shunt resistor for current sense amplifier. System design parameter.
R <sub>SO</sub>	MCU ADC	SOx	160Ω for current sense amplifier output filter
C <sub>SO</sub>	MCU ADC	GND	470pF ceramic capacitor rated for AREF for current sense amplifier output filter
R <sub>SP</sub> , R <sub>SN</sub>	SPx/SNx	R <sub>SENSE</sub>	OPTIONAL: 10Ω for current sense amplifier input filter.
C <sub>SPSN</sub>	SPx	SNx	OPTIONAL: 1nF ceramic capacitor for current sense amplifier input filter.
C <sub>SP</sub> , C <sub>SN</sub>	SPx/SNx	GND	OPTIONAL: 1nF ceramic capacitor for current sense amplifier input filter.

## 8.2.2 Application Curves

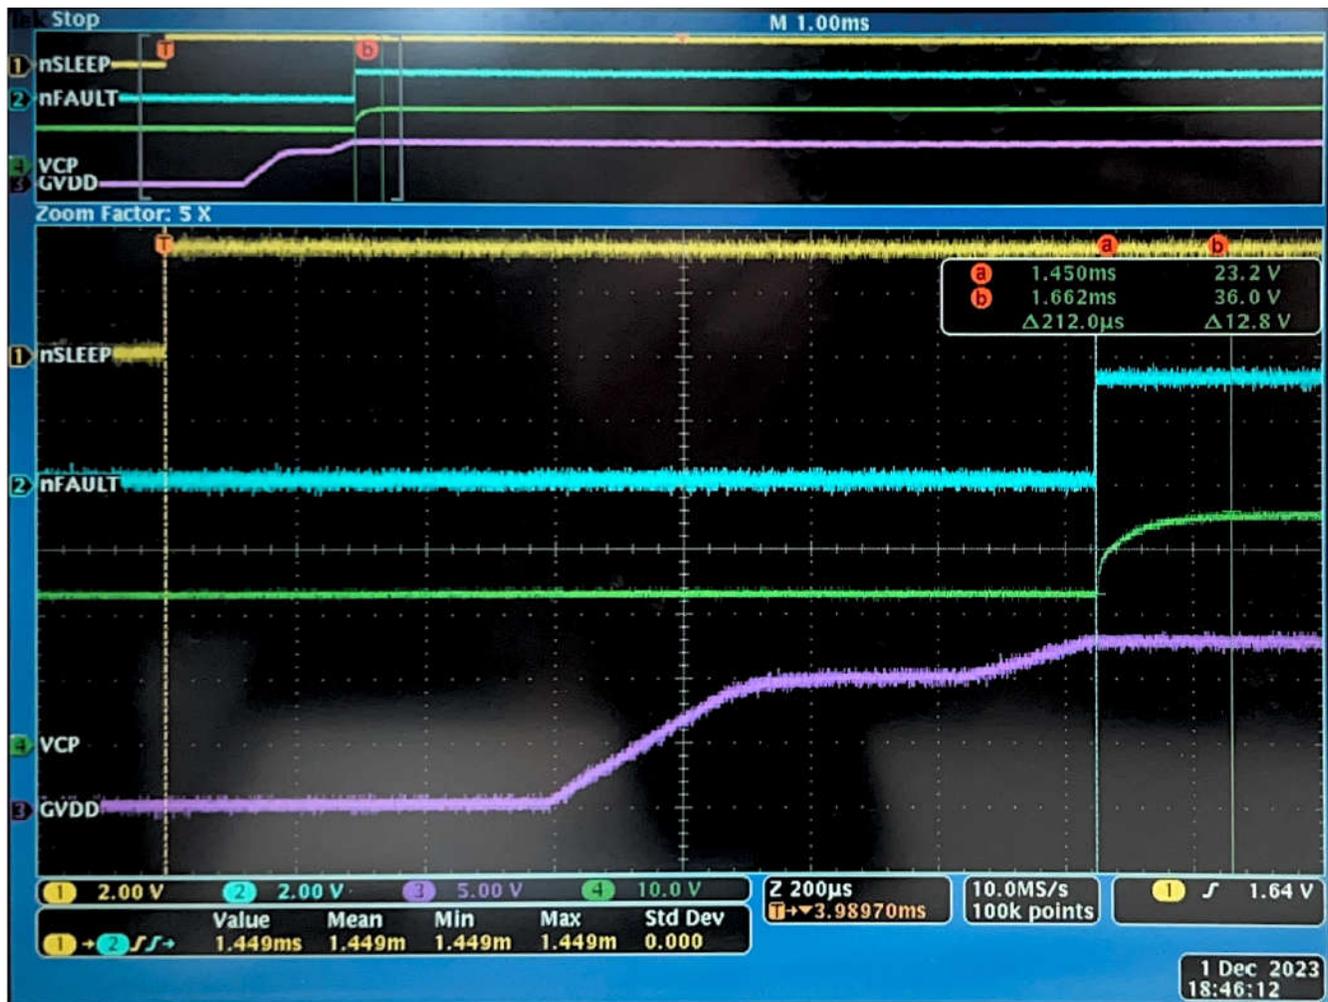

Figure 8-2. Device Powerup

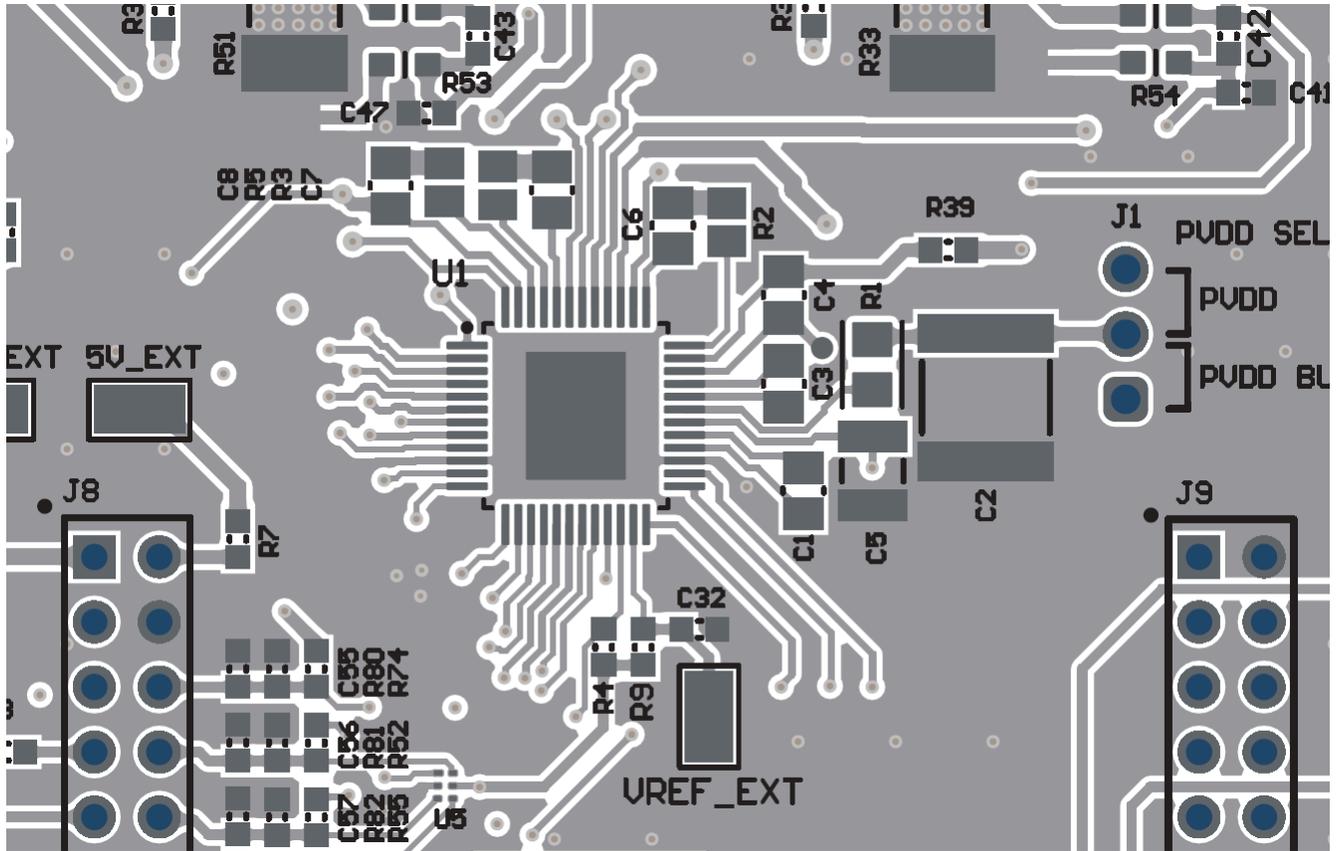

## 8.3 Layout

### 8.3.1 Layout Guidelines

- Minimize length and impedance of GHx, SHx, GLx, and SLx traces. Use as few vias as possible to minimize parasitic inductance. TI recommends to increase these trace widths shortly after routing away from the device pin to minimize parasitic resistance.
- Keep BSTx capacitors close to the respective pins
- Keep CPH/CPL flying capacitor as close to the device pins as possible
- Keep PVDD capacitors close to PVDD pin
- Keep VDRAIN capacitor close to VDRAIN pin to supply steady switching current for the charge pump.
- Additional bulk capacitance is required to bypass the high current path on the external MOSFETs. This bulk capacitance is placed to minimize the length of any high current paths through the external MOSFETs. The connecting metal traces are as wide as possible, with numerous vias connecting PCB layers. These practices minimize inductance and let the bulk capacitor deliver high current.
- Connect SLx pins to MOSFET source, not directly to GND, for accurate VDS detection.
- Route SNx/SPx pins in parallel from the sense resistor to the device. Place filtering components close to the device pins to minimize post-filter noise coupling. Maintain that SNx/SPx stays separated from GND plane to achieve best CSA accuracy. The bypass capacitor across VREF and GND is placed closer to the device pin.

- The exposed pad is used for thermal dissipation, not electrical grounding, and has a high-impedance connection to the GND/AGND pins. Therefore, TI recommends to connect the exposed pad to the best thermal GND, and to connect the GND/AGND pins to the MCU-reference GND.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision A (May 2025) to Revision B (August 2025)</b>	<b>Page</b>
---	-------------

- |   |    |
|---|----|
| • Updated the device status for DRV3233QPHP to production data..... | 73 |
|---|----|
- 

<b>Changes from Revision * (December 2023) to Revision A (May 2025)</b>	<b>Page</b>
---	-------------

- |   |    |
|---|----|
| • Added QFN package to data sheet.....  | 1  |
| • Updated the device status for DRV3233EPHP to production data. ....  | 1  |
| • Added descriptions for PVDD Supply Undervoltage Warning, PVDD Supply Overvoltage Fault, GVDD Undervoltage Lockout, GVDD Overvoltage Fault, Bootstrap Undervoltage Lockout, Bootstrap Overvoltage Fault, VCP Undervoltage Fault, VCP Overvoltage Fault, VDRAIN Undervoltage Fault, VDRAIN Overvoltage Fault, and MOSFET VGS Monitoring Protection. Added diagrams for MOSFET VDS Overcurrent Protection..... | 36 |

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 11.1 Package Option Addendum

### Packaging Information

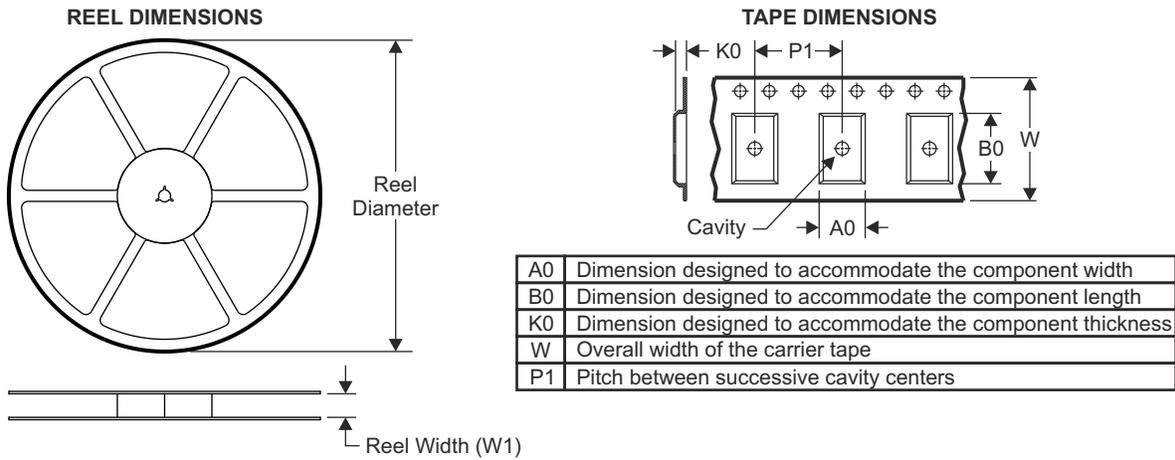

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan	Lead/Ball Finish <sup>(5)</sup>	MSL Peak Temp <sup>(2)</sup>	Op Temp (°C)	Device Marking <sup>(3) (4)</sup>
DRV8334RGZR	ACTIVE	VQFN	RGZ	48	1000	RoHS & Green	NiPdAu	Level-3-260C-1 68 HR	-40 to 125	DRV8334

- (1) The marketing status values are defined as follows:  
**ACTIVE:** Product device recommended for new designs.  
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.  
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.  
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.  
**OBSOLETE:** TI has discontinued the production of the device.
- (2) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (3) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (4) Multiple Device markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (5) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

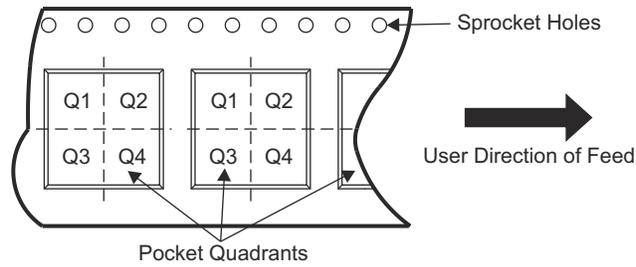

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## 11.2 Tape and Reel Information

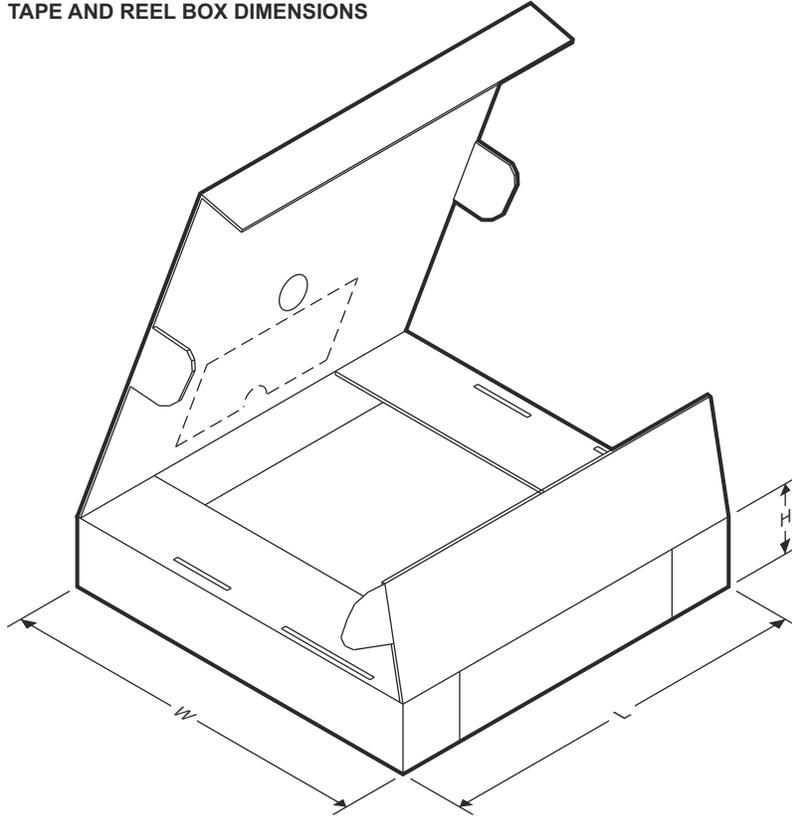

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

DRV8334RGZR	HTQFP	RGZ	48	1000	336.6	336.6	31.8

**RGZ0048N**

**PACKAGE OUTLINE**  
**VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

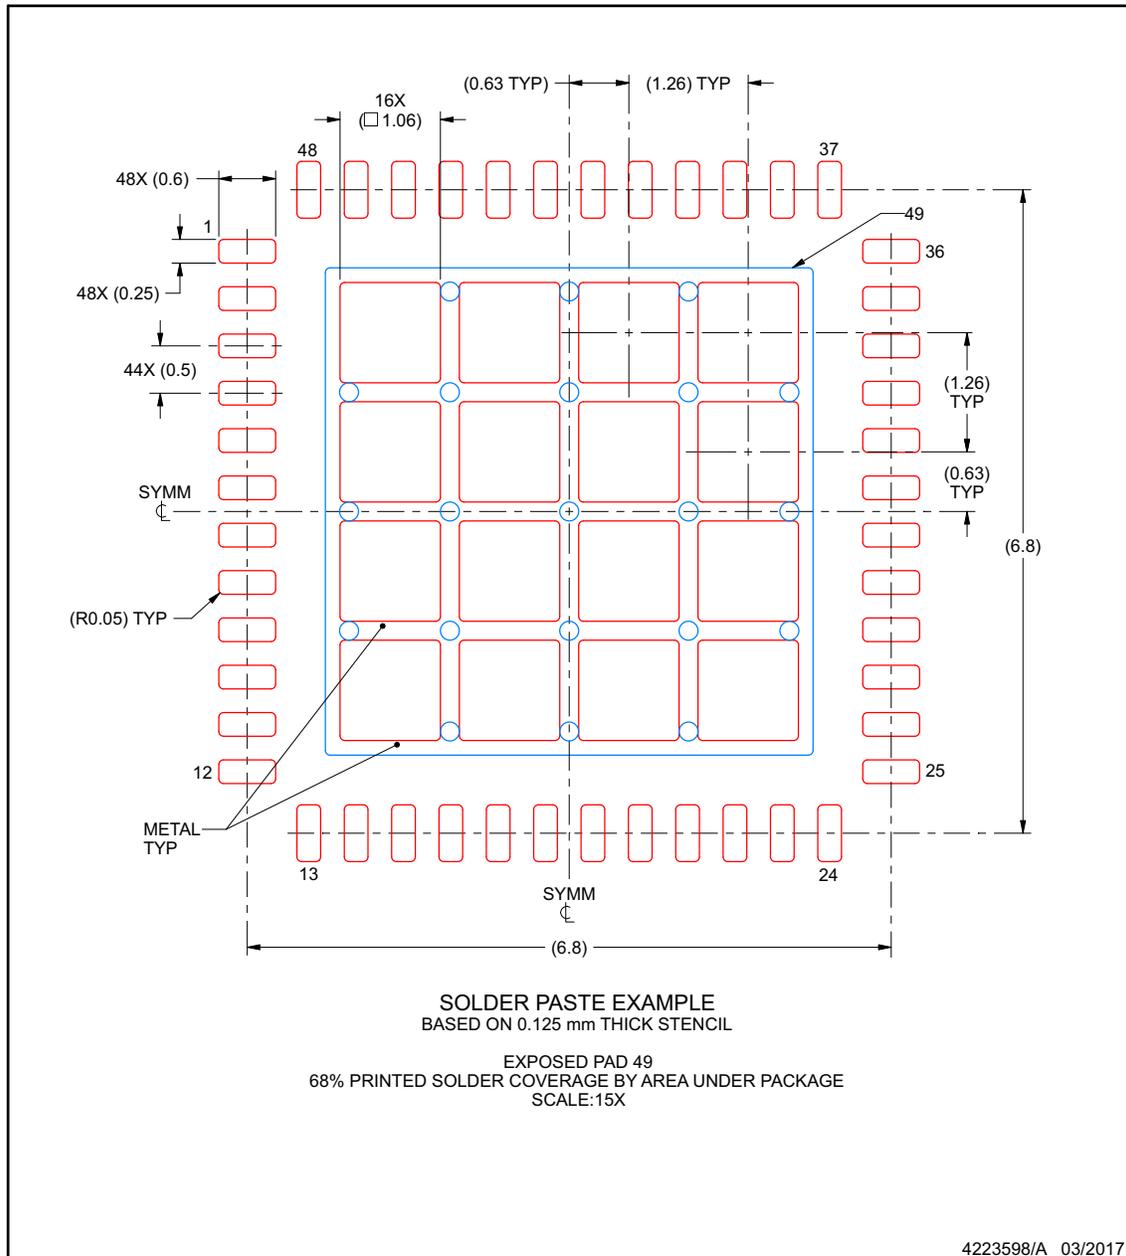

## EXAMPLE STENCIL DESIGN

**RGZ0048N**

**VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">DRV8334PHPR</a>	Active	Production	HTQFP (PHP)   48	1000   LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8334
DRV8334PHPR.A	Active	Production	HTQFP (PHP)   48	1000   LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8334
<a href="#">DRV8334RGZR</a>	Active	Production	VQFN (RGZ)   48	4000   LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8334 RGZ

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

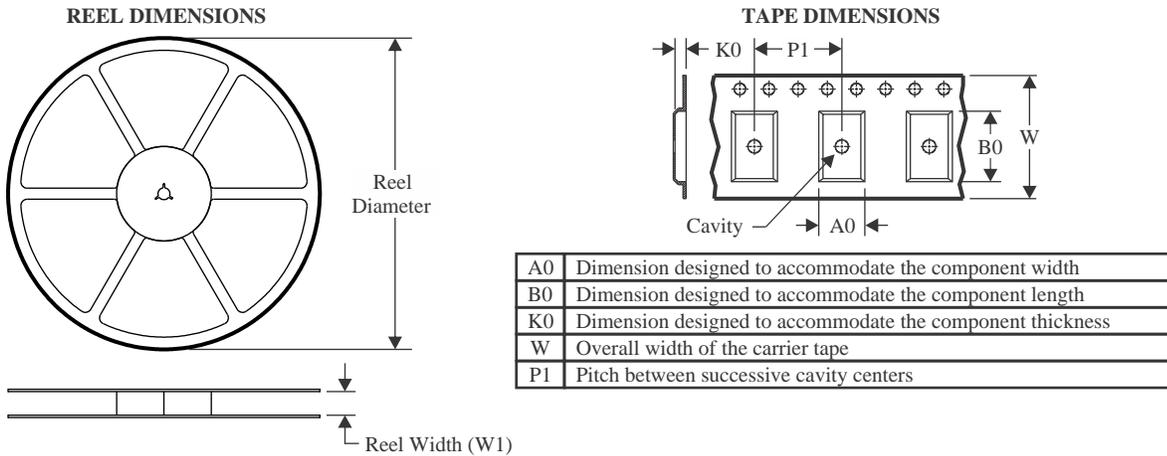

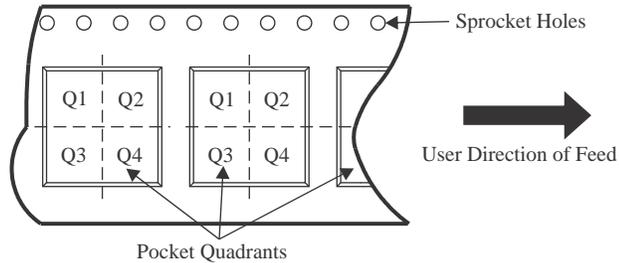

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
