

ISOS141-SEP Radiation Tolerant High-Speed Quad-Channel Digital Isolator

1 Features

- Radiation Tolerant
 - Total Ionizing Dose (TID) Characterized (ELDRS-Free) = 30 krad(Si)
 - TID RLAT/RHA = 30 krad(Si)
 - Single-Event Latch-up (SEL) Immune to LET = 43 MeV·cm²/mg at 125°C
 - Single-Event Dielectric Rupture (SEDR) Immune (43 MeV·cm²/mg) at 500 V_{DC}
- Space Enhanced Plastic (Space EP)
 - Meets NASA's ASTM E595 Outgassing Spec
 - Vendor Item Drawing (VID) [V62/21610](#)
 - Military Temp Range (-55°C to 125°C)
 - One Wafer Fabrication Site
 - One Assembly and Test Site
 - Gold Bond Wire, NiPdAu Lead Finish
 - Wafer Lot Traceability
 - Extended Product Life Cycle
 - Extended Product Change Notification
- 600 V_{RMS} continuous working voltage
- [Section 6.7](#):
 - DIN VDE V 0884-11:2017-01
 - UL 1577 component recognition program
- 100 Mbps data rate
- Wide supply range: 2.25 V to 5.5 V
- 2.25-V to 5.5-V level translation
- Default output *low*
- Low power consumption, 1.5 mA per channel typical at 1 Mbps
- Low propagation delay: 10.7 ns typical (5-V Supplies)
- Low channel-to-channel skew: 4 ns max (5-V Supplies)
- ±100 kV/μs typical CMTI
- System-level ESD, EFT, Surge, and Magnetic Immunity
- Small QSOP (DBQ-16) package

2 Applications

- Low Earth Orbit (LEO) Space Applications
- Signal Isolation (RS-422, RS-485, CAN, SPI)
- Gate Driver Isolation or Isolated Feedback for GaN DC-DC converters
- Space-Grade Isolated DC/DC Module
- Spacecraft Battery Management System (BMS)
- Satellite Propulsion Power Processing Unit (PPU)
- Launcher & Lander Systems
- Communications Payload
- Radar Imaging Payload

3 Description

The ISOS141-SEP radiation-tolerant device is a high-performance, quad-channel digital isolator in a small form factor 16-pin QSOP package. Each isolation channel has a logic input and output buffer separated by a double capacitive silicon dioxide (SiO₂) insulation barrier. This device supports low Earth orbit (LEO) space applications with its high data rate of 100 Mbps, low propagation delay of 10.7 ns, and tight channel-to-channel skew of 4 ns. The ISOS141-SEP device has three forward and one reverse-direction channels and if the input power or signal is lost, the default output is low. The enable pins can be used to put the respective outputs in high impedance for multi-master driving applications and to reduce power consumption.

The ISOS141-SEP provides high electromagnetic immunity and low emissions with low power consumption, while isolating CMOS or LVCMOS digital I/Os. The device has a high common-mode transient immunity of 100 kV/μs and can ease system-level ESD, EFT, surge, and simplify emissions compliance through its innovative chip design.

Device Information

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISOS141FDBQSEP 30 krad(Si) RLAT/RHA	16-lead QSOP (DBQ)	4.90 mm × 3.90 mm
ISOS141FDBQTSEP 30 krad(Si) RLAT/RHA		

V_{CC1}=Input supply, V_{CC2}=Output supply
 GND1=Input ground, GND2=Output ground

5 Pin Configuration and Functions

Figure 5-1. ISOS141-SEP DBQ Package 16-pin QSOP Top View

Table 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	Number		
EN1	7	I	Output enable 1. Output pins on side 1 are enabled when EN1 is high or open and in high-impedance state when EN1 is low.
EN2	10	I	Output enable 2. Output pins on side 2 are enabled when EN2 is high or open and in high-impedance state when EN2 is low.
GND1	2	—	Ground connection for V_{CC1}
	8		
GND2	9	—	Ground connection for V_{CC2}
	15		
INA	3	I	Input, channel A
INB	4	I	Input, channel B
INC	5	I	Input, channel C
IND	11	I	Input, channel D
OUTA	14	O	Output, channel A
OUTB	13	O	Output, channel B
OUTC	12	O	Output, channel C
OUTD	6	O	Output, channel D
V_{CC1}	1	—	Power supply, side 1
V_{CC2}	16	—	Power supply, side 2

6 Specifications

6.1 Absolute Maximum Ratings

See⁽¹⁾

		MIN	MAX	UNIT
Supply voltage ⁽²⁾	V_{CC1}, V_{CC2}	-0.5	6	V
Voltage at INx, OUTx, ENx	V	-0.5	$V_{CCX} + 0.5$ ⁽³⁾	V
Output current	I_o	-15	15	mA
Temperature	Operating junction temperature, T_J		150	°C
	Storage temperature, T_{stg}	-65	150	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values
- (3) Maximum voltage must not exceed 6 V.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±6000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1500	
		Contact discharge per IEC 61000-4-2; Isolation barrier withstand test ^{(3) (4)}	±8000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) IEC ESD strike is applied across the barrier with all pins on each side tied together creating a two-terminal device.
- (4) Testing is carried out in air or oil to determine the intrinsic contact discharge capability of the device.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC1}, V_{CC2} (1)	Supply Voltage	2.25		5.5	V
V_{CC} (UVLO+)	UVLO threshold when supply voltage is rising		2	2.25	V
V_{CC} (UVLO-)	UVLO threshold when supply voltage is falling	1.7	1.8		V
V_{hys} (UVLO)	Supply voltage UVLO hysteresis	100	200		mV
V_{IH}	High level Input voltage	$0.7 \times V_{CCI}$ (2)		V_{CCI}	V
V_{IL}	Low level Input voltage	0	$0.3 \times V_{CCI}$		V
I_{OH}	High level output current	$V_{CCO} = 5\text{ V}$ (2)		-4	mA
		$V_{CCO} = 3.3\text{ V}$		-2	mA
		$V_{CCO} = 2.5\text{ V}$		-1	mA
I_{OL}	Low level output current	$V_{CCO} = 5\text{ V}$		4	mA
		$V_{CCO} = 3.3\text{ V}$		2	mA
		$V_{CCO} = 2.5\text{ V}$		1	mA
DR	Data Rate	0		100	Mbps
T_A	Ambient temperature	-55	25	125	°C

(1) V_{CC1} and V_{CC2} can be set independent of one another

(2) $V_{CCI} = \text{Input-side } V_{CC}$; $V_{CCO} = \text{Output-side } V_{CC}$

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ISOS141	UNIT
		DBQ (SOIC)	
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	109	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	54.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	51.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	14.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	51.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

6.5 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ISOS141						
P_D	Maximum power dissipation (both sides)	$V_{CC1} = V_{CC2} = 5.5\text{ V}$, $T_J = 150^\circ\text{C}$, $C_L = 15\text{ pF}$, Input a 50-MHz 50% duty cycle square wave			200	mW
P_{D1}	Maximum power dissipation (side-1)				75	mW
P_{D2}	Maximum power dissipation (side-2)				125	mW

6.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	VALUE	UNIT
			DBQ-16	
CLR	External clearance ⁽¹⁾	Shortest terminal-to-terminal distance through air	>3.7	mm
CPG	External creepage ⁽¹⁾	Shortest terminal-to-terminal distance across the package surface	>3.7	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	>21	um
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	>600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage $\leq 300 V_{RMS}$	I-III	
DIN VDE V 0884-11:2017-01 ⁽²⁾				
V_{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	848	V_{PK}
V_{IOWM}	Maximum working isolation voltage	AC voltage; Time dependent dielectric breakdown (TDDB) Test See Figure 10-7	600	V_{RMS}
		DC voltage	848	V_{DC}
V_{IOTM}	Maximum transient isolation voltage	$V_{TEST} = V_{IOTM}$, $t = 60$ s (qualification); $V_{TEST} = 1.2 \times V_{IOTM}$, $t = 1$ s (100% production)	4242	V_{PK}
V_{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 62368-1, 1.2/50 μ s waveform, $V_{TEST} = 1.3 \times V_{IOSM}$ (qualification)	4000	V_{PK}
q_{pd}	Apparent charge ⁽⁴⁾	Method a, After Input-output safety test subgroup 2/3, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s; $V_{pd(m)} = 1.2 \times V_{IORM}$, $t_m = 10$ s	≤ 5	pC
		Method a, After environmental tests subgroup 1, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s; $V_{pd(m)} = 1.2 \times V_{IORM}$, $t_m = 10$ s	≤ 5	
		Method b; At routine test (100% production) and preconditioning (type test) $V_{ini} = V_{IOTM}$, $t_{ini} = 1$ s; $V_{pd(m)} = 1.5 \times V_{IORM}$, $t_m = 1$ s	≤ 5	
C_{IO}	Barrier capacitance, input to output ⁽⁵⁾	$V_{IO} = 0.4 \times \sin(2\pi ft)$, $f = 1$ MHz	~ 1	pF
R_{IO}	Isolation resistance ⁽⁵⁾	$V_{IO} = 500$ V, $T_A = 25^\circ$ C	$>10^{12}$	Ω
		$V_{IO} = 500$ V, 100° C $\leq T_A \leq 125^\circ$ C	$>10^{11}$	
		$V_{IO} = 500$ V at $T_S = 150^\circ$ C	$>10^9$	
	Pollution degree		2	
	Climatic category		55/125/21	
UL 1577				
V_{ISO}	Maximum withstanding isolation voltage	$V_{TEST} = V_{ISO}$, $t = 60$ s (qualification), $V_{TEST} = 1.2 \times V_{ISO}$, $t = 1$ s (100% production)	3000	V_{RMS}

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed-circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-terminal device.

6.7 Safety-Related Certifications

VDE	UL
Certifying according to DIN VDE V 0884-11:2017-01	Certifying according to UL 1577 Component Recognition Program
Maximum transient isolation voltage, 4242 V _{PK} (DBQ-16); Maximum repetitive peak isolation voltage, 848 V _{PK} (DBQ-16); Maximum surge isolation voltage, 4000 V _{PK} (DBQ-16)	Single protection, 3000 V _{RMS}
Basic certificate: planned	File number: planned

6.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DBQ-16 PACKAGE					
I _S	Safety input, output, or supply current	R _{θJA} = 109°C/W, V _I = 5.5 V, T _J = 150°C, T _A = 25°C See Figure 6-1		209	mA
		R _{θJA} = 109°C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C See Figure 6-1		319	
		R _{θJA} = 109°C/W, V _I = 2.75 V, T _J = 150°C, T _A = 25°C See Figure 6-1		417	
P _S	Safety input, output, or total power	R _{θJA} = 109°C/W, T _J = 150°C, T _A = 25°C See Figure 6-2		1147	mW
T _S	Maximum safety temperature			150	°C

- (1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power respectively. The maximum limits of I_S and P_S should not be exceeded. These limits vary with the ambient temperature, T_A.
The junction-to-air thermal resistance, R_{θJA}, in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:
T_J = T_A + R_{θJA} × P, where P is the power dissipated in the device.
T_{J(max)} = T_S = T_A + R_{θJA} × P_S, where T_{J(max)} is the maximum allowed junction temperature.
P_S = I_S × V_I, where V_I is the maximum input voltage.

6.9 Electrical Characteristics—5-V Supply

$V_{CC1} = V_{CC2} = 5\text{ V} \pm 10\%$ (over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	$I_{OH} = -4\text{ mA}$; See Figure 8-1	$V_{CCO} - 0.4$ ⁽¹⁾			V
V_{OL}	Low-level output voltage	$I_{OL} = 4\text{ mA}$; See Figure 8-1			0.4	V
$V_{IT+(IN)}$	Rising input switching threshold			$0.7 \times V_{CCI}$ ⁽¹⁾		V
$V_{IT-(IN)}$	Falling input switching threshold		$0.3 \times V_{CCI}$			V
$V_{I(HYS)}$	Input threshold voltage hysteresis		$0.1 \times V_{CCI}$			V
I_{IH}	High-level input current	$V_{IH} = V_{CCI}$ ⁽¹⁾ at INx or ENx			10	μA
I_{IL}	Low-level input current	$V_{IL} = 0\text{ V}$ at INx or ENx	-10			μA
CMTI	Common mode transient immunity	$V_I = V_{CC}$ or 0 V , $V_{CM} = 1200\text{ V}$; See Figure 8-4	85	100		kV/us
C_i	Input Capacitance ⁽²⁾	$V_I = V_{CC}/2 + 0.4 \times \sin(2\pi ft)$, $f = 2\text{ MHz}$, $V_{CC} = 5\text{ V}$		2		pF

(1) V_{CCI} = Input-side V_{CC} ; V_{CCO} = Output-side V_{CC}

(2) Measured from input pin to same side ground.

6.10 Supply Current Characteristics—5-V Supply

$V_{CC1} = V_{CC2} = 5\text{ V} \pm 10\%$ (over recommended operating conditions unless otherwise noted)

PARAMETER	TEST CONDITIONS	SUPPLY CURRENT	MIN	TYP	MAX	UNIT
ISOS141						
Supply current - Disable	$EN1 = EN2 = 0\text{ V}$; $V_I = 0\text{ V}$ (ISOS141)	I_{CC1}		1	1.5	mA
		I_{CC2}		0.8	1.1	
	$EN1 = EN2 = 0\text{ V}$; $V_I = V_{CCI}$ ⁽¹⁾ (ISOS141)	I_{CC1}		4.3	6.3	
		I_{CC2}		1.8	2.7	
Supply current - DC signal ⁽²⁾	$EN1 = EN2 = V_{CCI}$; $V_I = 0\text{ V}$ (ISOS141)	I_{CC1}		1.5	2.3	
		I_{CC2}		2	3	
	$EN1 = EN2 = V_{CCI}$; $V_I = V_{CCI}$ (ISOS141)	I_{CC1}		4.8	6.8	
		I_{CC2}		3.2	4.9	
Supply current - AC signal ⁽³⁾	All channels switching with square wave clock input; $C_L = 15\text{ pF}$	1 Mbps	I_{CC1}		3.2	4.6
			I_{CC2}		2.8	4.1
		10 Mbps	I_{CC1}		3.7	5.2
			I_{CC2}		4.2	5.7
		100 Mbps	I_{CC1}		8.6	11.3
			I_{CC2}		18	22

(1) V_{CCI} = Input-side V_{CC}

(2) Supply current valid for $ENx = V_{CCx}$ and $ENx = \text{open}$

(3) Supply current valid for $ENx = V_{CCx}$

6.11 Electrical Characteristics—3.3-V Supply

$V_{CC1} = V_{CC2} = 3.3\text{ V} \pm 10\%$ (over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	$I_{OH} = -2\text{mA}$; See Figure 8-1	$V_{CCO} - 0.3$ ⁽¹⁾			V
V_{OL}	Low-level output voltage	$I_{OL} = 2\text{mA}$; See Figure 8-1			0.3	V
$V_{IT+(IN)}$	Rising input switching threshold			$0.7 \times V_{CCI}$ ⁽¹⁾		V
$V_{IT-(IN)}$	Falling input switching threshold		$0.3 \times V_{CCI}$			V
$V_{I(HYS)}$	Input threshold voltage hysteresis		$0.1 \times V_{CCI}$			V
I_{IH}	High-level input current	$V_{IH} = V_{CCI}$ ⁽¹⁾ at INx or ENx			10	μA
I_{IL}	Low-level input current	$V_{IL} = 0\text{ V}$ at INx or ENx	-10			μA
CMTI	Common mode transient immunity	$V_I = V_{CC}$ or 0 V , $V_{CM} = 1200\text{ V}$; See Figure 8-4	85	100		kV/us
C_i	Input Capacitance ⁽²⁾	$V_I = V_{CC}/2 + 0.4 \times \sin(2\pi ft)$, $f = 1\text{ MHz}$, $V_{CC} = 5\text{ V}$		2		pF

- (1) V_{CCI} = Input-side V_{CC} ; V_{CCO} = Output-side V_{CC}
 (2) Measured from input pin to same side ground.

6.12 Supply Current Characteristics—3.3-V Supply

$V_{CC1} = V_{CC2} = 3.3\text{ V} \pm 10\%$ (over recommended operating conditions unless otherwise noted)

PARAMETER	TEST CONDITIONS	SUPPLY CURRENT	MIN	TYP	MAX	UNIT
ISOS141						
Supply current - Disable	$EN1 = EN2 = 0\text{ V}$; $V_I = 0\text{ V}$ (ISOS141)	I_{CC1}		1	1.5	mA
		I_{CC2}		0.8	1.1	
	$EN1 = EN2 = 0\text{ V}$; $V_I = V_{CC1}$ ⁽¹⁾ (ISOS141)	I_{CC1}		4.3	6.3	
		I_{CC2}		1.9	2.7	
Supply current - DC signal ⁽²⁾	$EN1 = EN2 = V_{CCI}$; $V_I = 0\text{ V}$ (ISOS141)	I_{CC1}		1.5	2.3

7 Operating Life Deration

The information in this section is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

1. Silicon operating life design goal is 100000 power-on hours (POH) at 105 °C junction temperature (does not include package interconnect life).
2. The predicted operating lifetime versus junction temperature is based on reliability modeling using wirebond lifetime as the dominant failure mechanism affecting device wear out for the specific device process and design characteristics.

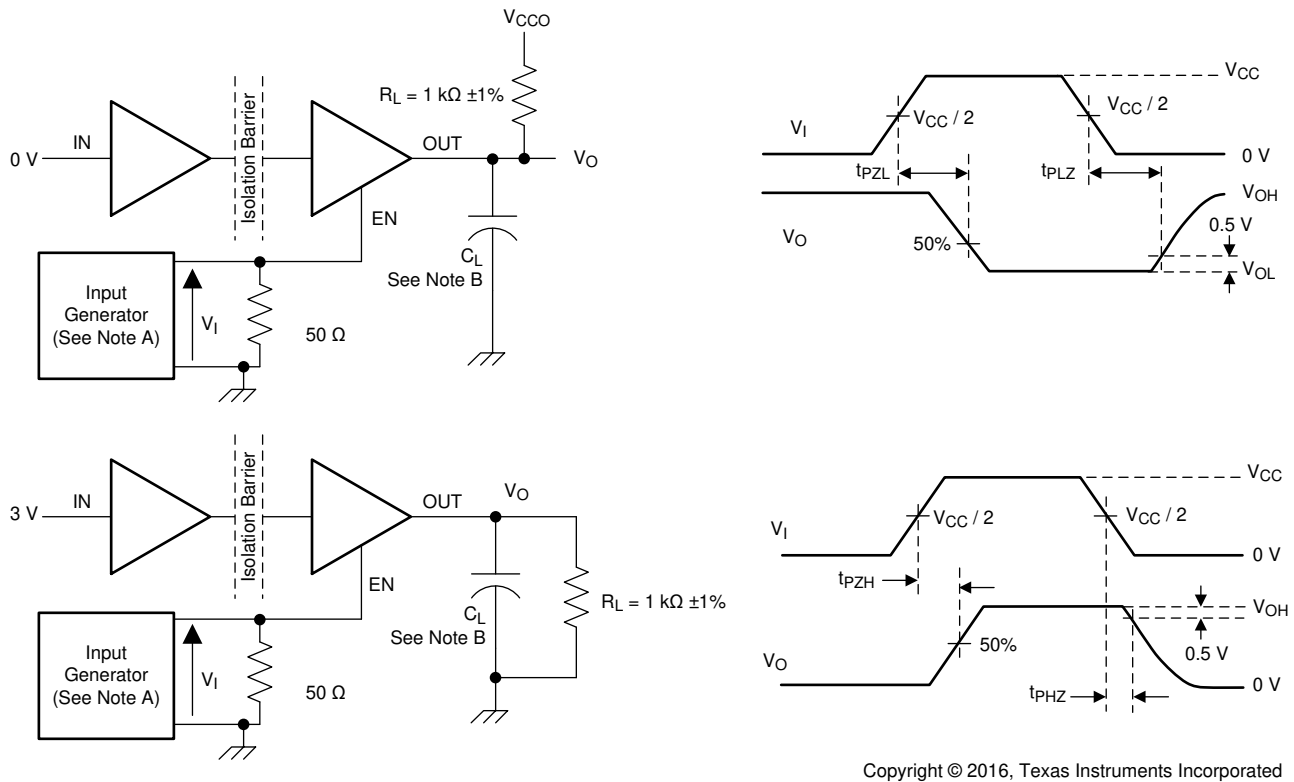

Wirebond Life Derating Curve

8 Parameter Measurement Information

- A. The input pulse is supplied by a generator having the following characteristics: PRR \leq 50 kHz, 50% duty cycle, $t_r \leq$ 3 ns, $t_f \leq$ 3 ns, $Z_O = 50 \Omega$. At the input, 50Ω resistor is required to terminate Input Generator signal. It is not needed in actual application.
- B. $C_L = 15$ pF and includes instrumentation and fixture capacitance within $\pm 20\%$.

Figure 8-1. Switching Characteristics Test Circuit and Voltage Waveforms

- A. The input pulse is supplied by a generator having the following characteristics: PRR \leq 10 kHz, 50% duty cycle, $t_r \leq$ 3 ns, $t_f \leq$ 3 ns, $Z_O = 50 \Omega$.
- B. $C_L = 15$ pF and includes instrumentation and fixture capacitance within $\pm 20\%$.

9 Detailed Description

9.1 Overview

The ISOS141-SEP has an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon dioxide based isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. If the ENx pin is low then the output goes to high impedance. The ISOS141-SEP device also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions due to the high frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, [Figure 9-1](#), shows a functional block diagram of a typical channel.

9.2 Functional Block Diagram

Figure 9-1. Conceptual Block Diagram of a Digital Capacitive Isolator

[Figure 9-2](#) shows a conceptual detail of how the ON-OFF keying scheme works.

Figure 9-2. On-Off Keying (OOK) Based Modulation Scheme

9.3 Feature Description

Table 9-1 provides an overview of the device features.

Table 9-1. Device Features

PART NUMBER	CHANNEL DIRECTION	MAXIMUM DATA RATE	DEFAULT OUTPUT	PACKAGE	RATED ISOLATION ⁽¹⁾
ISOS141-SEP With F suffix	3 Forward, 1 Reverse	100 Mbps	Low	DBQ-16	3000 V _{RMS} / 4242 V _{PK}

(1) See Section 6.7 for detailed isolation ratings.

9.3.1 Radiation Tolerance

Total Ionizing Dose (TID)— ISOS141-SEP is a radiation tolerant, TI Space Enhanced Plastic (Space EP) device, and as such it has a Total Ionizing Dose (TID) level specified in the “Device Information” table on the front page. Testing and qualification of these products is done on a wafer level according to MIL-STD-883, Test Method 1019. Radiation Lot Acceptance Testing (RLAT) is performed at the 30-krad TID levels. A TID characterization report is available. Group E TID RLAT data are available with lot shipments as part of the QCI summary reports.

Single-Event Effects (SEE)— one-time SEE characterization was performed according to EIA/JEDEC standard, EIA/JEDEC57 to linear energy transfer (LET) = 43 MeV·cm²/mg. During testing, no Single-Event Latch-Up (SEL) or Single-Event Dielectric Rupture (SEDR) were observed.

Neutron Displacement Damage (NDD)— ISOS141-SEP was irradiated up to 1×10^{12} n/cm². A sample size of 15 units was exposed to radiation testing per MILSTD-883, Method 1017 for Neutron Irradiation.

Radiation Testing and Characterization Reports— are available for all radiation effects described in this section, to find the latest reports go to the [ISOS141-SEP Technical Documentation](#) section on TI.com.

9.3.2 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISOS141-SEP device incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

9.4 Device Functional Modes

Table 9-2 lists the functional modes for the ISOS141-SEP.

Table 9-2. Function Table

V _{CCI}	V _{CCO}	INPUT (IN _x) ⁽²⁾	OUTPUT ENABLE (EN _x)	OUTPUT (OUT _x)	COMMENTS
PU	PU	H	H or open	H	Normal Operation: A channel output assumes the logic state of its input.
		L	H or open	L	
		Open	H or open	Default	Default mode: When IN _x is open, the corresponding channel output goes to its default logic state. Default is <i>Low</i> for ISOS141-SEP with F suffix.
X	PU	X	L	Z	A low value of output enable causes the outputs to be high-impedance.
PD	PU	X	H or open	Default	Default mode: When V _{CCI} is unpowered, a channel output assumes the logic state based on the selected default option. Default is <i>Low</i> for ISOS141-SEP with F suffix. When V _{CCI} transitions from unpowered to powered-up, a channel output assumes the logic state of the input. When V _{CCI} transitions from powered-up to unpowered, channel output assumes the selected default state.
X	PD	X	X	Undetermined	When V _{CCO} is unpowered, a channel output is undetermined ⁽¹⁾ . When V _{CCO} transitions from unpowered to powered-up, a channel output assumes the logic state of the input.

(1) The outputs are in undetermined state when $1.7\text{ V} < V_{CCI}, V_{CCO} < 2.25\text{ V}$.

(2) A strongly driven input signal can weakly power the floating V_{CC} through an internal protection diode and cause undetermined output.

Figure 9-3. Device I/O Schematics

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The ISOS141-SEP four channel digital isolator provides flexibility for multiple use cases in LEO applications. Used in conjunction with isolated power supplies, these devices help prevent noise currents on data buses, such as UART, SPI, RS-485, RS-232, and CAN from damaging sensitive circuitry. It can also be used to isolate multiple static signals in a system to provide additional redundancy and robustness. When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is, MCU or FPGA), and a data converter or a line transceiver, regardless of the interface type or standard.

Additionally, this digital isolator can be used as a logic-level translator in addition to providing isolation. Since an isolation barrier separates the two sides, each side can be sourced independently with any voltage within recommended operating conditions. The supply voltage range is from 2.25 V to 5.5 V for both supplies, V_{CC1} and V_{CC2} . As an example, it is possible to supply ISOS141-SEP V_{CC1} with 3.3 V (which is within 2.25 V to 5.5 V) and V_{CC2} with 5V (which is also within 2.25 V to 5.5 V).

10.2 Typical Application

Figure 10-1 shows ISOS141-SEP in the GaN half bridge circuit being used to isolate PWM signals from the half-bridge controller on the primary side to the half-bridge gate driver on the secondary side to achieve higher efficiency through synchronous rectification.

Figure 10-1. Isolated 75V to 5V 50W GaN-Based Half-Bridge Topology

10.2.1 Design Requirements

To design with these devices, use the parameters listed in [Table 10-1](#).

Table 10-1. Design Parameters

PARAMETER	VALUE
Supply voltage, V_{CC1} and V_{CC2}	2.25 to 5.5 V
Decoupling capacitor between V_{CC1} and GND1	0.1 μ F
Decoupling capacitor from V_{CC2} and GND2	0.1 μ F

10.2.2 Detailed Design Procedure

The ISOS141-SEP device only require two external bypass capacitors to operate.

Figure 10-2. Typical ISOS141-SEP Circuit Hook-up

10.2.3 Application Curve

The following typical eye diagrams of the ISOS141-SEP device indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

10.2.3.1 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See Figure 10-6 for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 87.5% for lifetime which translates into minimum required insulation lifetime of 37.5 years at a working voltage that's 20% higher than the specified value.

Figure 10-7 shows the intrinsic capability of the isolation barrier to withstand high voltage stress over its lifetime. Based on the TDDB data, the insulation withstand capability of DBQ-16 package is 600 V_{RMS} with a lifetime of >1000 years as illustrated in Figure 10-7. Factors, such as package size, pollution degree, and material group can limit the working voltage of a component.

Figure 10-6. Test Setup for Insulation Lifetime Measurement

Figure 10-7. Insulation Lifetime Projection Data

11 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- μ F bypass capacitor is recommended at the input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible.

12 Layout

12.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 12-1](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

12.1.1 PCB Material

For digital circuit boards operating below 150 Mbps, (or rise and fall times higher than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit boards. This PCB is preferred over cheaper alternatives due to its lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

12.2 Layout Example

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
