

LMC604x CMOS, Dual, Micropower Operational Amplifiers

1 Features

- Typical values unless otherwise noted
- Low supply current: 10µA/amp
- Supply range: 4.5V to 15V, single supply
- Ultra-low input current: 2fA
- Rail-to-rail output swing
- Input common-mode includes ground

2 Applications

- Battery monitoring and power conditioning
- Photodiode and infrared-detector preamplifier
- Silicon-based transducer systems
- Portable analytic instruments
- pH-probe buffer amplifier
- Fire- and smoke-detection systems
- Charge amplifier for piezoelectric transducers

3 Description

Ultra-low power consumption and low input-leakage current are the hallmarks of the LMC6041, LMC6042, and LMC6044 (LMC604x). Providing input currents of only 2fA (typical), the LMC604x operate from a single supply, with an output swing extending to each supply rail and an input voltage range that includes ground.

The LMC604x are designed for use in systems requiring ultra-low power consumption. In addition, the insensitivity to latch-up, the high output drive, and an output swing to ground without requiring external pulldown resistors make these op amps an excellent choice for single-supply, battery-powered systems.

Other applications for the LMC604x include barcode-reader amplifiers, magnetic- and electric-field detectors, and portable electrometers.

This device is built with TI's advanced double-poly silicon-gate CMOS process.

Device Information

PART NUMBER	CHANNEL COUNT	PACKAGE ⁽¹⁾
LMC6041	Single	D (SOIC, 8)
		P (PDIP, 8)
LMC6042	Dual	D (SOIC, 8)
		P (PDIP, 8)
LMC6044	Quad	D (SOIC, 14)
		N (PDIP, 14)

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
	Differential input voltage	±Supply voltage		
V _S	Supply voltage, V _S = (V+) – (V–)		16	V
I _{SC}	Output short circuit ⁽⁵⁾	To V+	See ⁽³⁾	
		To V–	See ⁽⁴⁾	
	Voltage at input/output pin	(V–) – 0.3	(V+) + 0.3	V
	Current at input pin		±5	mA
	Current at output pin		±18	
	Current at power supply pin		35	
P _D	Power dissipation		See ⁽⁵⁾	
	Lead temperature (soldering, 10s)		260	°C
T _J	Junction temperature ⁽⁵⁾		110	°C
T _{stg}	Storage temperature	–65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) Do not connect output to V+ when V+ is greater than 13V or reliability can be adversely affected.
- (4) Applies to both single-supply operation. Continuous short-circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 110°C. Output currents in excess of ±30mA over the long term can adversely affect reliability.
- (5) The maximum power dissipation is a function of T_{J(Max)}, θ_{JA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(Max)} – T_A) / θ_{JA}.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±500	V

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _S	Supply voltage, V _S = (V+) – (V–)	Single supply	4.5	15.5	V
		Dual supply	±2.25	±7.75	
P _D	Power dissipation			See ⁽¹⁾	
	Specified temperature	–40		+85	°C

- (1) To operate the device at elevated temperatures, derate the device based on thermal resistance θ_{JA} with P_D = (T_J – T_A) / θ_{JA}.

6 Application and Implementation

6.1 Application Information

6.1.1 Amplifier Topology

The LMC604x incorporate a novel op-amp design topology that enables a rail-to-rail output swing even when driving a large load. Special compensation design techniques are incorporated to maintain stability over a wider range of operating conditions than traditional micropower op amps. These features make the LMC604x both easier to design in, and provide higher speed than products typically found in this ultra-low power class.

6.1.2 Compensating For Input Capacitance

Large values of feedback resistance are quite common for amplifiers with ultra-low input current, such as the LMC604x.

Although the LMC604x are highly stable over a wide range of operating conditions, certain precautions must be taken to achieve the desired pulse response when a large feedback resistor is used. Large feedback resistors and even small values of input capacitance, due to transducers, photodiodes, and circuit board parasitics, reduce phase margins.

When a high input impedance is demanded, guard the inputs of the LMC604x. Guarding input lines can not only reduce leakage, but lower stray input capacitance as well (see [Section 6.3.1.1](#)).

Figure 6-1. Canceling the Effect of Input Capacitance

Compensate for the effect of input capacitance by adding a capacitor. Place a capacitor, C_F , around the feedback resistor (as in [Figure 6-1](#)) so that:

$$\frac{1}{2\pi R_1 C_{IN}} \geq \frac{1}{2\pi R_2 C_F} \quad (1)$$

where

$$R_1 C_{IN} \leq R_2 C_F \quad (2)$$

The exact value of C_{IN} is often difficult to know, but C_F can be experimentally adjusted so that the desired pulse response is achieved. See the [LMC660](#) and [LMC662](#) for a more detailed discussion on compensating for input capacitance.

6.1.3 Capacitive-Load Tolerance

Direct capacitive loading reduces the phase margin of many op amps. A pole in the feedback loop is created by the combination of the op-amp output impedance and the capacitive load. This pole induces phase lag at the unity-gain crossover frequency of the amplifier resulting in either an oscillatory or underdamped pulse response. With a few external components, op amps can easily indirectly drive capacitive loads. Figure 6-2 shows an example.

Figure 6-2. LMC604x Noninverting Gain-of-10 Amplifier, Compensated to Handle Capacitive Loads

In the circuit of Figure 6-2, R1 and C1 serve to counteract the loss of phase margin by feeding the high-frequency component of the output signal back into the inverting input of the amplifier, thereby preserving phase margin in the overall feedback loop.

Capacitive load driving capability is enhanced by using a pullup resistor to V^+ (Figure 6-3). Typically, a pullup resistor conducting $10\mu\text{A}$ or more significantly improves capacitive load responses. The value of the pullup resistor must be determined based on the current sinking capability of the amplifier with respect to the desired output swing. The open-loop gain of the amplifier can also be affected by the pullup resistor (see Section 5.7).

Figure 6-3. Compensating for Large Capacitive Loads With a Pullup Resistor

6.2 Typical Applications

6.2.1 Instrumentation Amplifiers

The extremely high input impedance and low power consumption of the LMC604x make these op amps an excellent choice for applications that require battery-powered instrumentation amplifiers. Examples of these types of applications are portable pH probes, analytic medical instruments, magnetic field detectors, gas detectors, and silicon-based pressure transducers.

The circuit in Figure 6-4 is recommended for applications where the common-mode input range is relatively low and the differential gain is in the range of 10 to 1000. This two op-amp instrumentation amplifier features an independent adjustment of the gain and common-mode rejection trim, and a total quiescent supply current of less than $20\mu\text{A}$. To maintain ultra-high input impedance, use ground rings and consider printed circuit board (PCB) layout an important part of the overall system design (see [Printed Circuit Board Layout for High Impedance Work](#)). Figure 6-4 shows that the input voltages are represented as a common-mode input V_{CM} plus a differential input V_{D} .

Rejection of the common-mode component of the input is accomplished by making the ratio of R1/R2 equal to R3/R4. So that:

$$\frac{R3}{R4} = \frac{R2}{R1} \tag{3}$$

The gain equation of the instrumentation amplifier is given by:

$$V_{OUT} = \frac{R4}{R3} \left(1 + \frac{R3}{R4} + \frac{R2 + R3}{R0} \right) \tag{4}$$

A suggested design guideline is to minimize the difference of the value between R1 through R4. Minimizing often results in improved resistor temperature coefficient, amplifier gain, and CMRR over temperature. If $R_N = R1 = R2 = R3 = R4$ then the gain equation is simplified as:

$$V_{OUT} = 2V_D \left(1 + \frac{R_N}{R_0} \right) \tag{5}$$

As a result of the *zero-in, zero-out* performance of the LMC604x, and output swing rail-to-rail, the dynamic range is only limited to the input common-mode range of 0V to $V_S - 2.3V$, the worst case at room temperature. This feature of the LMC604x makes these op amps an excellent choice for low-power instrumentation systems.

Figure 6-5 shows a complete instrumentation amplifier designed for a gain of 100. Provisions are made for the low-sensitivity trimming of CMRR and gain.

6.3 Layout

6.3.1 Layout Guidelines

6.3.1.1 Printed-Circuit-Board Layout for High-Impedance Work

As a general rule, any circuit that must operate with less than 1000pA of leakage current requires special layout of the printed circuit board (PCB). To take advantage of the ultra-low input current of the LMC604x, typically 150fA, an excellent layout is essential. Fortunately, the techniques used to obtain low leakages are quite simple. First, do not ignore the surface leakage of the PCB, even though the leakage current can sometimes appear acceptably low, because under conditions of high humidity, dust, or contamination, the surface leakage can be appreciable.

To minimize the effect of any surface leakage, lay out a ring of foil completely surrounding the LMC604x inputs and the terminals of capacitors, diodes, conductors, resistors, relay terminals, and anything else connected to the inputs of the op amp (see also [Figure 6-14](#)). To have a significant effect, place guard rings on both the top and bottom of the PCB. Then, connect the foil to a voltage that is at the same voltage as the amplifier inputs, because no leakage current can flow between two points at the same potential. For example, a PCB trace-to-pad resistance of 10^{12} , which is normally considered a very large resistance, can leak 5pA if the trace is a 5V bus adjacent to the pad of the input. This leakage can cause a 250 times degradation from the actual performance of the LMC604x. However, if a guard ring is held within 5mV of the inputs, then even a resistance of $10^{11}\Omega$ causes only 0.05pA of leakage current. See [Figure 6-10](#) to [Figure 6-12](#) for typical connections of guard rings for standard op-amp configurations

Figure 6-10. Typical Connections of Guard Rings: Inverting Amplifier

Figure 6-11. Typical Connections of Guard Rings: Noninverting Amplifier

Figure 6-12. Typical Connections of Guard Rings: Follower

If laying out a PCB for the sake of just a few circuits is not practical, the following technique is even better than a guard ring. Do not insert the input pin of the amplifier into the PCB at all. Instead, bend the pin up in the air, and use only air as an insulator because air is an excellent insulator. In this case, you forgo some of the advantages of PCB construction, but the advantages are sometimes well worth the effort of using point-to-point up-in-the-air wiring. [Figure 6-13](#) shows an example of air wiring.

Note: The input pins are lifted out of the PCB and soldered directly to components. All other pins connected to the PCB.

Figure 6-13. Air Wiring

6.3.2 Layout Examples

Figure 6-14. Example of Guard Ring in PCB Layout

7 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

7.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

7.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

7.3 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.4 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

8 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (March 2013) to Revision F (March 2025)	Page
• Added LMC6041 and LMC6044 to this data sheet; previously in SNOS610E and SNOS612D, respectively...	1
• Added <i>Pin Configuration and Functions</i>	3
• Added ESD Ratings.....	5
• Added <i>Thermal Information</i>	6
• Updated parameter names and symbols.....	7
• Deleted footnotes 1 and 2 from DC <i>Electrical Characteristics</i>	7
• Changed input current noise from 0.2fA/√Hz to 12.5fA/√Hz	7
• Changed total harmonic distortion from 0.01% to 1%.....	7
• Moved footnote 3 from DC <i>Electrical Characteristics</i> to open-loop voltage gain test conditions.....	7
• Changed open-loop gain MIN for R _L = 100kΩ (sourcing) from 400V/mV to 300V/mV for LMC604xAI.....	7
• Changed open-loop gain MIN for R _L = 100kΩ (sourcing, T _A = –40°C to +85°C) from 300V/mV to 200V/mV for LMC604xAI.....	7
• Deleted footnotes 1 and 2 from AC <i>Electrical Characteristics</i>	7
• Moved footnote 3 test conditions from AC <i>Electrical Characteristics</i> to slew rate test conditions.....	7
• Delete phase margin.....	7
• Moved footnote 4 from AC <i>Electrical Characteristics</i> to crosstalk test conditions.....	7
• Updated <i>Amplifier Topology</i>	17

Changes from Revision D (March 2013) to Revision E (March 2013)	Page
• Changed layout of National Data Sheet to TI format.....	20

9 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

P (R-PDIP-T8)

PLASTIC DUAL-IN-LINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. Falls within JEDEC MS-001 variation BA.

N (R-PDIP-T**)

PLASTIC DUAL-IN-LINE PACKAGE

16 PINS SHOWN

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).
 - The 20 pin end lead shoulder width is a vendor option, either half or full width.

D0014A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4220718/A 09/2016

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm, per side.
5. Reference JEDEC registration MS-012, variation AB.
