TEXAS INSTRUMENTS

LMZ34202

SNVSAJ2C – MARCH 2016 – REVISED JUNE 2018

LMZ34202 4.5-V to 42-V Input, 2-A Power Module

1 Features

- Complete Integrated Power Solution Allows Small Footprint, Low-Profile Design
- 10 mm × 10 mm × 4.3 mm Package
- Wide-Output Voltage Adjust (2.5 V to 7.5 V)
- Adjustable Switching Frequency (200 kHz to 1 MHz)
- Synchronizes to an External Clock
- Automatic PFM Mode for Light Load Efficiency
- Adjustable Soft-Start Time
- Output Voltage Sequencing / Tracking
- Power Good Output
- Programmable Undervoltage Lockout (UVLO)
- Over-Temperature Thermal Shutdown Protection
- Over-Current Protection (Hiccup Mode)
- Pre-Bias Output Start-Up
- Operating Temperature Range: –40°C to 105°C
- Enhanced Thermal Performance: 14°C/W
- Meets EN55022 Class B Emissions
  – Integrated Shielded Inductor
- Create a Custom Design using the LMZ34202 with the WEBENCH® Power Designer

2 Applications

- Industrial and Motor Controls
- Automated Test Equipment
- Medical and Imaging Equipment
- High Density Power Systems

3 Description

The LMZ34202 power module is an easy-to-use integrated power supply that combines a 2-A DC-DC converter with a shielded inductor and passives into a low profile, QFN package. This total power solution allows as few as three external components while maintaining an ability to adjust key parameters to meet specific design requirements.

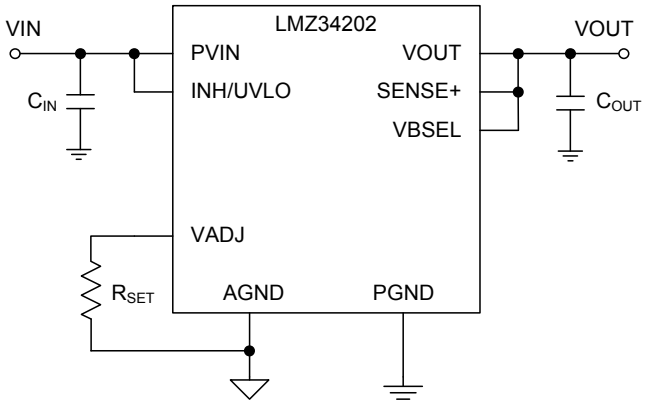
The QFN package is easy to solder to a printed circuit board, allows reflow profiles up to 245°C, and has excellent power dissipation capability. The LMZ34202 offers flexibilty with many features and is ideal for powering a wide range of devices and systems.

Device Information(1)

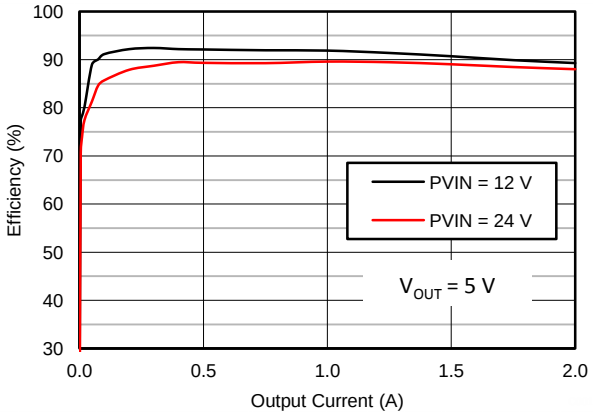
DEVICE NUMBER	PACKAGE	BODY SIZE
LMZ34202	QFN (43)	10.00 mm × 10.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Application



Efficiency vs Output Current



An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (April 2018) to Revision C — **Page**

- Changed allows reflows "up to 260°C" to "up to 245°C" to match *Abs Max* table ... 1
- Added top navigator for TI reference design ... 1

Changes from Revision A (June 2017) to Revision B — **Page**

- Added WEBENCH® design links for the LMZ34202 ... 1
- Increased the peak reflow temperature and maximum number of reflows to JEDEC specifications for improved manufacturability ... 5

Changes from Original (March 2016) to Revision A — **Page**

- Added peak reflow and maximum number of reflows information ... 5

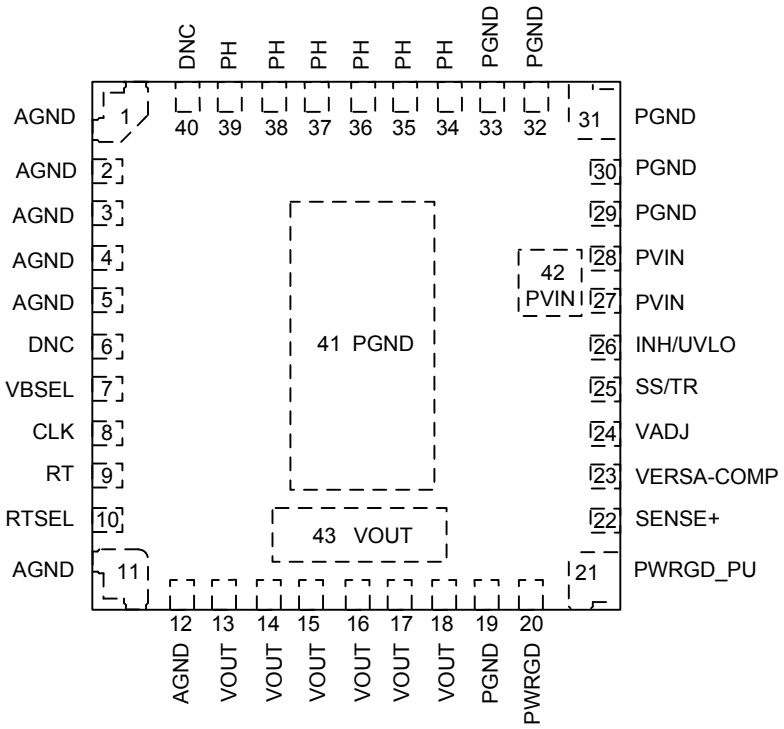
5 Pin Configuration and Functions

RVQ Package
43-Pin QFN
(Top View)



Pin Functions

PIN		TYPE (1)	DESCRIPTION
NAME	NO.		
AGND	1, 2, 3, 4, 5, 11, 12	G	Zero volt reference for the analog control circuitry. All of these pins are not connected together internal to the device and must be connected to one another externally using an analog ground plane on the PCB. Pins 11 and 12 are internally connected to the PGND of the device at a single point. The analog ground plane of the PCB should allow only analog ground currents to flow through these pins.
CLK	8	I	Synchronization input to synchronize the device to an external clock. Connect this pin to AGND if not used.
DNC	6, 40	-	Do Not Connect. Do not connect these pins to AGND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
INH/UVLO	26	I	Inhibit and UVLO adjust pin. Use an open drain or open collector device to control the inhibit function. A resistor divider between this pin, AGND, and PVIN adjusts the UVLO voltage. Connect this pin to PVIN if not used.
PGND	19, 29, 30, 31, 32, 33, 41	G	This is the return current path for the power stage of the device. Connect these pins to the input source, the load, and to the bypass capacitors associated with PVIN and VOUT using power ground planes on the PCB. Pad 41 should be connected to the ground planes using multiple vias for good thermal performance.
PH	34, 35, 36, 37, 38, 39	O	Phase switch node. Do not place any external components on these pins or tie them to a pin of another function.
PVIN	27, 28, 42	I	Power input voltage. These pins supply all of the power to the device. Connect these pins to the input source and connect external bypass capacitors between these pins and PGND close to the device.
PWRGD	20	O	Power Good flag pin. This open drain output asserts low if the output voltage is more than approximately ±10% out of regulation. This pin is internally connected to an uncommitted 100k pull-up resistor that can be pulled up to a user-defined voltage applied to the PWRGD_PU pin.

(1) G = Ground, I = Input, O = Output

Copyright © 2016–2018, Texas Instruments Incorporated

Pin Functions (continued)

PIN		TYPE (1)	DESCRIPTION
NAME	NO.		
PWRGD_PU	21	I	An internal 100 k pull-up resistor is connected between this pin and the PWRGD pin. If use of this internal pull-up resistor is desired, connect this pin to an appropriate voltage source that is less than or equal to 12 V. If unused, leave this pin floating.
RT	9	I	This pin is connected to internal frequency setting circuitry which sets the default switching frequency to 500 kHz. An external resistor can be connected from this pin to AGND to adjust the switching frequency. Refer to application section in datasheet.
RTSEL	10	I	This pin can be used to adjust the switching frequency to 1 MHz without the need for an external resistor. Connect this pin to AGND to adjust the frequency to 1 MHz. Otherwise, leave this pin floating.
SENSE+	22	I	Remote sense connection. This pin must be connected to VOUT at the load or at the device pins. Connect the pin to VOUT at the load for improved regulation.
SS/TR	25	I	soft-start and tracking pin. Connecting an external capacitor to this pin adjusts the output voltage soft-start ramp above its 4.1 ms default setting. A voltage applied to this pin allows for tracking and sequencing control.
VADJ	24	I	Connecting a resistor between this pin and AGND adjusts the output voltage.
VBSEL	7	I	Selectable internal bias supply. For output voltages ≥ 4.5 V, connect this pin to VOUT. For output voltages < 4.5 V, connect this pin to AGND.
VERSA-COMP	23	I	Connects to internal compensation network. This pin can be left floating or connected to the VADJ pin to select the proper compensation depending on the output voltage.
VOUT	13, 14, 15, 16, 17, 18, 43	O	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external bypass capacitors between these pins and PGND close to the device.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Input voltage	PVIN, INH/UVLO	–0.3	50	V
	VOUT, SENSE+, VBSEL	–0.3	30(2)	V
	VADJ, VERSA-COMP, RT, RTSEL, SS/TR	–0.3	3.6	V
	PWRGD, PWRGD_PU	–0.3	15	V
	CLK	–0.3	5.5	V
Output voltage	PH	–0.3	50	V
Operating junction temperature(3)		–40	125	°C
Storage temperature, T_{stg}		–65	150	°C
Peak Reflow Case Temperature(4)			245(5)	°C
Maximum Number of Reflows Allowed(4)			3(5)	
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		1500	G
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz		20	G

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The maximum voltage that can be applied to these pins is 30 V or PVIN, whichever is less.
(3) See temperature derating curves in the Typical Characteristics section for thermal information.
(4) For soldering specifications, refer to the Soldering Requirements for BQFN Packages application note.
(5) Devices with a date code prior to week 14 2018 (1814) have a peak reflow case temperature of 240°C with a maximum of one reflow.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
P_{VIN}	Input voltage	4.5		42	V
V_{OUT}	Output voltage	2.5		7.5	V
f_{SW}	Switching frequency	300		1000	kHz
T_A	Operating ambient temperature	–40		105	°C

6.4 Thermal Information

THERMAL METRIC(1)		LMZ34202 RVQ (QFN) 43 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	14	°C/W
ψ_{JT}	Junction-to-top characterization parameter	2.6	°C/W
ψ_{JB}	Junction-to-board characterization parameter	9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics

Over –40°C to +105°C free-air temperature, PV_{IN} = 24 V, V_{OUT} = 5 V, I_{OUT} = I_{OUT} max, f_{sw} = 500 kHz, $C_{IN}1$ = 1 × 10-µF, 100-V 1210 ceramic, $C_{IN}2$ = 1 × 100-µF 100-V electrolytic bulk, and C_{OUT} = 3 × 47-µF, 16-V 1210 ceramic (unless otherwise noted).

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
INPUT VOLTAGE (PV_{IN})							
PV_{IN}	Input voltage range	Over I_{OUT} range		4.5(1)		42	V
UVLO	PV_{IN} undervoltage lockout	PV_{IN} increasing			3.2	3.8	V
		PV_{IN} decreasing			2.8		V
OUTPUT VOLTAGE							
$V_{OUT\ (ADJ)}$	Output voltage adjust range	Over I_{OUT} range		2.5		7.5	V
V_{OUT}	Set-point voltage tolerance	T_A = 25°C, I_{OUT} = 200 mA			±0.7	±1.5(2)	%
	Temperature variation	-40°C ≤ T_A ≤ 105°C, I_{OUT} = 0 A			±0.9		%
	Line regulation	T_A = 25°C, Over PV_{IN} range, I_{OUT} = 300 mA			±0.1		%
	Load regulation	T_A = 25°C, I_{OUT} = 300 mA to I_{OUT} max			±0.3		%
	Total output voltage variation	Includes set-point, line, load, and temperature			±2		%
V_{OUT} ripple	Output voltage ripple	20-MHz Bandwidth			10		mV/pp
OUTPUT CURRENT							
I_{OUT}	Output current	T_A = 105°C, natural convection		0		1.5	A
I_{OUT}	Output current	T_A = 105°C, 200LFM		0		2	A
I_{OUT}	Output current	T_A = 95°C, natural convection		0		2	A
I_{LIM}	Overcurrent threshold				2.5		A
PERFORMANCE							
η	Efficiency	PV_{IN} = 12 V, I_{OUT} = 1 A	V_{OUT} = 7.5 V; f_{SW} = 400 kHz		95		%
			V_{OUT} = 5 V; f_{SW} = 200 kHz		93		%
			V_{OUT} = 5 V; f_{SW} = 500 kHz		92		%
			V_{OUT} = 3.3 V; f_{SW}= 200 kHz		90		%
			V_{OUT} = 2.5 V; f_{SW} = 200 kHz		87		%
		PV_{IN} = 24 V, I_{OUT} = 1 A	V_{OUT} = 7.5 V; f_{SW} = 400 kHz		92		%
			V_{OUT} = 5 V; f_{SW}= 250 kHz		90		%
			V_{OUT} = 5 V; f_{SW}= 500 kHz		88		%
			V_{OUT} = 3.3 V; f_{SW} = 250 kHz		86		%
			V_{OUT} = 2.5 V; f_{SW} = 250 kHz		81		%
	Transient response	I_{OUT} = 50% load step 1 A/µs slew rate	Recovery time		100		µs
			Over/Undershoot		2		%
SLOW START							
T_{SS}	Internal slow start time	SS/TR pin open			4.1		ms
INHIBIT							
V_{INH} (high)	Inhibit control	Precision inhibit level		2.00	2.1	2.42	V
V_{INH} (low)		Inhibit turn-off hysteresis			-0.294		V
I_I (shutdown)	Input shutdown supply current	INH/UVLO pin conected to AGND			2.4	6.2(3)	µA
POWER GOOD (PWRGD)							
V_{PWRGD}	PWRGD thresholds	V_{OUT} rising	Good		95		%
			Fault		110		%
		V_{OUT} falling	Fault		90		%
			Good		105		%

(1) The minimum PV_{IN} is 4.5 V or (V_{OUT} / 0.75), whichever is greater. For V_{OUT} = 3.3 V, the minimum PV_{IN} is 4.75 V when I_{OUT} > 1.5 A.
(2) The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external R_{SET} resistor.
(3) Guaranteed by design. Not production tested.

Electrical Characteristics (continued)

Over –40°C to +105°C free-air temperature, PV_{IN} = 24 V, V_{OUT} = 5 V, I_{OUT} = I_{OUT} max, f_{sw} = 500 kHz, $C_{IN}1$ = 1 × 10-µF, 100-V 1210 ceramic, $C_{IN}2$ = 1 × 100-µF 100-V electrolytic bulk, and C_{OUT} = 3 × 47-µF, 16-V 1210 ceramic (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
THERMAL SHUTDOWN						
$T_{SHUTDOWN}$	Thermal shutdown	Shutdown Temperature		160		°C
		Hysteresis		10		°C
INPUT/OUTPUT CAPACITANCE						
C_{IN}	External input capacitance	ceramic	10(4)			µF
		non-ceramic		100		µF
C_{OUT}	External output capacitance	Ceramic	64(5)		See(6)	µF
		Non-ceramic		100	See(6)	µF
		ceramic + non-ceramic			See(6)	µF
		Equivalent series resistance (ESR)			20	mΩ

(4) The specified minimum ceramic input capacitance represents the standard capacitance value. The actual effective capacitance after considering the effects of DC bias and temperature variation should be ≥ 4.7 µF.
(5) The amount of required output capacitance varies depending on the output voltage (see Output Capacitor Selection). The minimum required output capacitance must be comprised of ceramic capacitance. The amount of required ceramic capacitance represents the standard capacitance value. Locate the capacitance close to the device. Adding additional ceramic or non-ceramic capacitance close to the load improves the response of the regulator to load transients.
(6) The maximum allowable output capacitance varies depending on the output voltage (see Output Capacitor Selection).

6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{SW}	Switching frequency	RT and RTSEL pins open	410	500	590	kHz
f_{CLK}	CLK Control	Synchronization frequency	200		1000	kHz
V_{CLK-H}		CLK high level	2		5.5	V
V_{CLK-L}		CLK low level			0.4	V
D_{CLK}		CLK duty cycle	10%	50%	90%

7 Detailed Description

7.1 Overview

The LMZ34202 is a full featured 42-V input, 2-A, synchronous step down converter with PWM, MOSFETs, inductor, and control circuitry integrated into a low-profile, overmolded package. This device enables small designs by integrating all but the input and output capacitors, while still leaving the ability to adjust key parameters to meet specific design requirements. The LMZ34202 provides a 3× output voltage range of 2.5 V to 7.5 V. A single external resistor is used to adjust the output voltage to the desired output. The switching frequency is also adjustable by using an external resistor or a synchronization pulse to accommodate various input and output voltage conditions and to optimize efficiency. The device provides accurate voltage regulation for a variety of loads by using an internal voltage reference that is 2% accurate over temperature. Input under-voltage lockout is internally set at 3.2 V, but can be adjusted upward using a resistor divider on the INH/UVLO pin of the device. The INH/UVLO pin can also be pulled low to put the device in standby mode to reduce input quiescent current. The device provides a power good signal to indicate when the output is within ±5% of its nominal voltage. Thermal shutdown and current limit features protect the device during an overload condition. Automatic PFM mode improves light-load efficiency. A 43-pin, QFN, package that includes exposed bottom pads provides a thermally enhanced solution for space-constrained applications.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Adjusting the Output Voltage

The VADJ pin sets the output voltage of the LMZ34202. The output voltage adjustment range is from 2.5 V to 7.5 V. The switching frequency range for any output voltage must be determined from Table 4 or Table 5. The adjustment method requires the addition of R_{SET}, which sets the output voltage, and the connection of SENSE+ to VOUT. The R_{SET} resistor must be connected directly between the VADJ (pin 24) and AGND. The SENSE+ pin (pin 22) must be connected to VOUT either at the load for improved regulation or at VOUT of the device. Table 1 lists the standard external R_{SET} resistor for a number of common bus voltages.

Table 1. Standard R_{SET} Resistor Values for Common Output Voltages

	OUTPUT VOLTAGE V_{OUT} (V)				
	2.5	**3.3**	**5.0**	**6.0**	**7.5**
R_{SET} (kΩ)	13.7	8.87	5.11	4.02	3.09

For other output voltages, the value of the required resistor can either be calculated using the following formula, or simply selected from the range of values given in Table 2.

$$R_{SET} = \frac{20}{\left[\left(\frac{V_{OUT}}{1.011}\right) - 1\right]} \ (k\Omega) \quad (1)$$

Table 2. Standard R_{SET} Resistor Values

V_{OUT} (V)	R_{SET} (kΩ)	V_{OUT} (V)	R_{SET} (kΩ)
2.5	13.7	5.1	4.99
2.6	12.7	5.2	4.87
2.7	11.8	5.3	4.75
2.8	11.3	5.4	4.64
2.9	10.7	5.5	4.53
3.0	10.2	5.6	4.42
3.1	9.76	5.7	4.32
3.2	9.31	5.8	4.22
3.3	8.87	5.9	4.12

7.3.2 Switching Frequency (RT)

The switching frequency range of the LMZ34202 is 200 kHz to 1 MHz. Not all PV_{IN}, V_{OUT}, and I_{OUT} conditions can be set to all of the frequencies in this range. See Recommended Operating Range for the allowable operating ranges. The switching frequency can easily be set one of three ways. First, leaving the RT pin (pin 9) and RTSEL pin (pin 10) floating (OPEN) allows operation at the default switching frequency of 500 kHz. Also, connecting the RTSEL pin to AGND while floating the RT pin, sets the switching frequency to 1 MHz. The option is also available to set the switching frequency to any frequency in the range of 200 kHz to 1 MHz, by connecting a resistor (R_{RT}) between the RT pin and AGND, while floating the RTSEL pin. See Table 3 for standard resistor values for setting the switching frequency or use Equation 2 to calculate R_{RT} for other switching frequencies.

Table 3. Switching Frequency R_{RT} Values

Switching Frequency	R_{RT} (kΩ)
250 kHz	158
500 kHz	78.7 or (RT pin OPEN, RTSEL pin OPEN)
750 kHz	53.6
1 MHz	38.3 or (RT pin OPEN, RTSEL pin to AGND)

$$R_{RT} = \frac{40200}{Fsw(kHz)} - 0.6 \ \ (k\Omega) \tag{2}$$

7.3.3 Recommended Operating Range

Table 4 and Table 5 below show the allowable switching frequencies for a given range of output voltages. Reference Table 4 for applications where the maximum output current is 1.75 A or less. Reference Table 5 for applications that the output current is greater than 1.75 A. Notice that applications requiring less than 1.75 A can operate over a much wider range of switching frequencies. For the most efficient solution, always operate at the lowest allowable frequency.

Table 4. Switching Frequency vs Output Voltage
Output Current ≤ 1.75 A

V_{OUT} RANGE (V)	SWITCHING FREQUENCY RANGE (kHz)					
	PVIN = 12 V		PVIN = 24 V		PVIN = 36 V	
	MIN	MAX	MIN	MAX	MIN	MAX
2.5 - 3.5 V	200	1000	200	600	200	400
>3.5 - 4.5 V	200	1000	200	850	200	550
>4.5 - 5.5 V	200	1000	200	1000	200	750
>5.5 - 6.5 V	300	1000	200	1000	200	1000
>6.5 - 7.5 V	300	900	300	1000	300	950

Table 5. Switching Frequency vs Output Voltage
Output Current > 1.75 A

V_{OUT} RANGE (V)	SWITCHING FREQUENCY RANGE (kHz)					
	PVIN = 12 V		PVIN = 24 V		PVIN = 36 V	
	MIN	MAX	MIN	MAX	MIN	MAX
2.5 - 3.5 V	200	450	200	500	200	400
>3.5 - 4.5 V	200	500	200	600	200	550
>4.5 - 5.5 V	200	500	200	650	200	700
>5.5 - 6.5 V	300	500	250	700	250	800
>6.5 - 7.5 V	300	400	300	750	300	800

Copyright © 2016–2018, Texas Instruments Incorporated

7.3.4 Synchronization (CLK)

The LMZ34202 switching frequency can also be synchronized to an external clock from 200 kHz to 1 MHz. Not all PV_{IN}, V_{OUT}, and I_{OUT} conditions can be set to all of the frequencies in this range. See *Recommended Operating Range* for the allowable operating ranges.

To implement the synchronization feature, connect a clock signal to the CLK pin with a duty cycle between 10% and 90%. The clock signal amplitude must transition lower than 0.4 V and higher than 2.0 V. The start of the switching cycle is synchronized to the rising edge of CLK pin. Before the external clock is present the device operates in RT mode and the switching frequency is set by R_{RT} resistor. Select R_{RT} to set the frequency close to the external synchronization frequency. When the external clock is present, the CLK mode overrides the RT mode. If the external clock is removed or fails at logic high or low, the LMZ34202 will switch at the frequency programmed by the R_{RT} resistor after a time-out period. Connect the CLK pin (pin 8) to AGND if not used.

7.3.5 Output Capacitor Selection

The minimum required and maximum output capacitance of the LMZ34202 is a function of the output voltage as shown in Table 6. Additionally, the output voltage will determine the Versa-Comp configuration (see VERSA-COMP Pin Configurations), which is also included in Table 6. The capacitance values listed in Table 6 are the specified capacitance values. The effects of DC bias and temperature variation must be considered when using ceramic capacitance. For ceramic capacitors, package size, voltage rating, and dielectric material will contribute to differences between the specified value and the actual effective value of the capacitance. $C_{OUT(min)}$ must be comprised of ceramic type capacitors. Additional capacitance, not exceeding $C_{OUT(max)}$, may be ceramic type or low-ESR polymer type. See Table 7 for a preferred list of output capacitors by vendor.

Table 6. Required Output Capacitance

V_{OUT} (V)	MINIMUM REQUIRED C_{OUT} (µF) (1) (2)	MAXIMUM C_{OUT} (µF) (2)	Versa-Comp Connection
2.5	64	350	Leave OPEN
3.3	64	350	Connect to VADJ
5.0	64	350	Connect to VADJ
6.0	64	200	Connect to VADJ
7.5	100	200	Connect to VADJ

(1) Minimum required output capacitance must be comprised of ceramic capacitance.
(2) C_{OUT} values represent specified capacitance values.

7.3.6 VERSA-COMP Pin Configurations

The versa-comp feature of the LMZ34202 allows a simple method to adjust the internal compensation network to provide the optimized phase and gain margin based on the output voltage. This easy-to-use feature requires no external components and is implemented by the simple configuration of two adjacent pins on the module.

The versa-comp feature must be configured in one of two ways; VERSA-COMP pin left OPEN or VERSA-COMP pin tied to VADJ. The output voltage determines the appropriate Versa-Comp pin configuration. Table 8 lists the Versa-Comp configuration. Figure 19 shows the two possible Versa-Comp pin configurations.

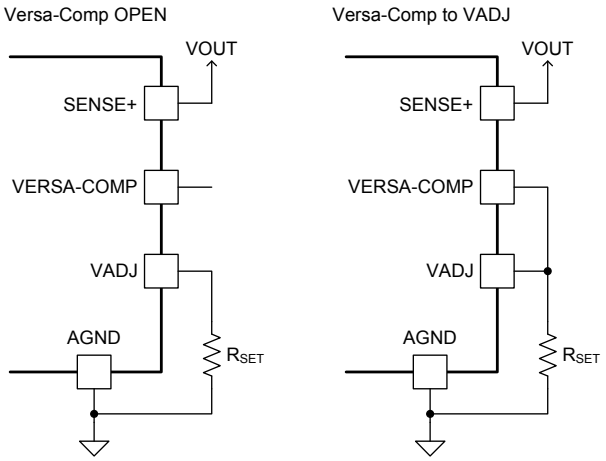

Figure 19. Versa-Comp Configurations

Table 8. VERSA-COMP Pin Configurations

V_{OUT} RANGE (V)		VERSA-COMP PIN CONFIGURATION
MIN	MAX	
2.5	< 3.0	OPEN
3.0	7.5	Connect to VADJ

7.3.7 Input Capacitor Selection

The LMZ34202 requires a ceramic capacitor with a minimum effective input capacitance of 4.7 µF. Use only high-quality ceramic type X5R or X7R capacitors with sufficient voltage rating. An additional 100 µF of non-ceramic capacitance is recommended for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage. To compensate the derating of ceramic capactors, a voltage rating of twice the maximum input voltage is recommended. At worst case, when operating at 50% duty cycle and maximum load, the combined ripple current rating of the input capacitors must be at least 1.0 Arms. Table 9 includes a preferred list of capacitors by vendor.

Table 9. Recommended Input Capacitors(1)

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS		
			WORKING VOLTAGE (V)	CAPACITANCE (2) (µF)	ESR (3) (mΩ)

7.3.8 Output On/Off Inhibit (INH/UVLO)

The INH/UVLO pin provides on and off control of the device. The INH input provides a precise 2.1 V rising threshold to allow direct logic drive or connection to a voltage divider from a higher voltage source such as PV_{IN}. Once the INH/UVLO pin voltage exceeds the threshold voltage, the device starts operation. The INH input also incorporates 300 mV (typ) of hysteresis resulting in a falling threshold of 1.8 V. If the INH/UVLO pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state. The INH/UVLO pin cannot be open circuit or floating. The simplest way to enable the operation of the LMZ34202 is to connect the INH/UVLO pin to PVIN pin directly as shown in Figure 20. This connection allows the LMZ34202 device to restart when PV_{IN} is again within the operation range.

If an application requires controlling the INH/UVLO pin, either drive it directly with a logic input or use an open drain and collector device to interface with the pin and place a 100-kΩ resistor between this pin and PVIN pin as shown in Figure 21. When turning Q1 on applies a low voltage to the inhibit control (INH/UVLO) pin and disables the output of the supply, shown in Figure 22. If Q1 is turned off, the supply executes a soft-start power-up sequence, as shown in Figure 23.

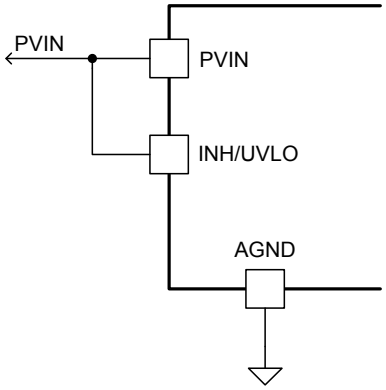

Figure 20. Enabling the Device

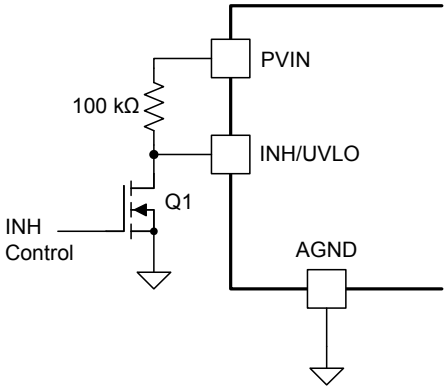

Figure 21. Typical Inhibit Control

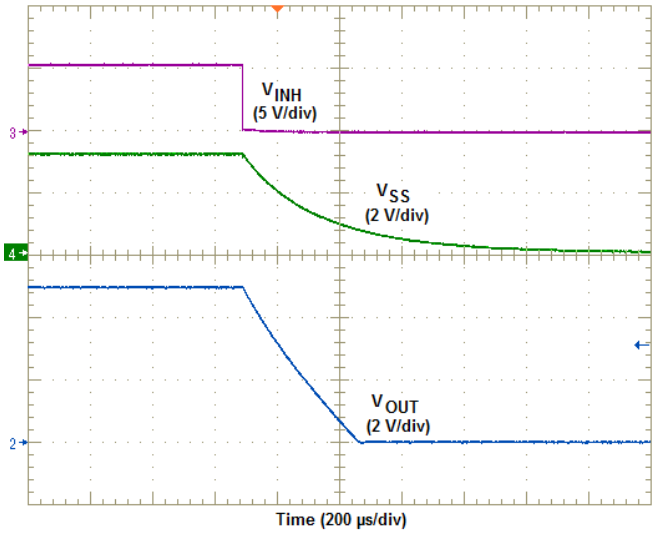

Figure 22. Inhibit Turn-Off

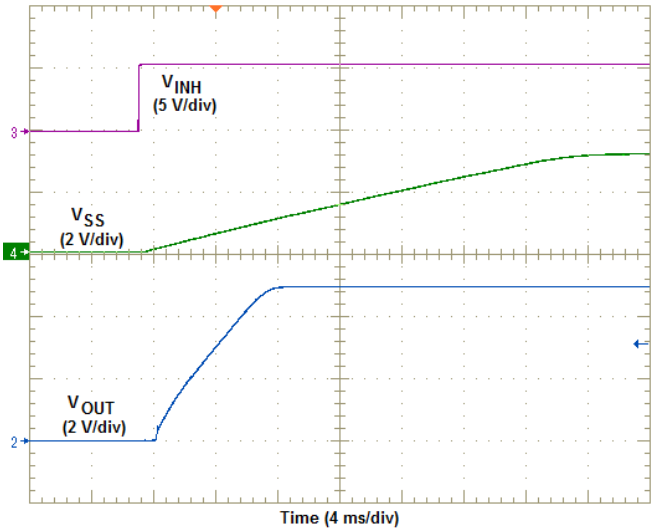

Figure 23. Inhibit Turn-On

7.3.9 Under Voltage Lockout (UVLO)

The LMZ34202 device has an internal UVLO circuit which prevents the device from operating until the PV_{IN} voltage exceeds the UVLO threshold, (3.2 V (typ)). The device will begin switching and the output voltage will begin to rise once PV_{IN} exceeds the threshold, however PV_{IN} must be greater than (V_{OUT}/0.75) in order to for V_{OUT} to regulate at the set-point voltage.

Applications may require a higher UVLO threshold to prevent early turn-on, for sequencing requirements, or to prevent input current draw at lower input voltages. An external resistor divider can be added to the INH/UVLO pin to adjust the UVLO threshold higher. The external resistor divider can be configured as shown in Figure 24. Table 10 lists standard values for R_{UVLO1} and R_{UVLO2} to adjust the UVLO voltage higher.

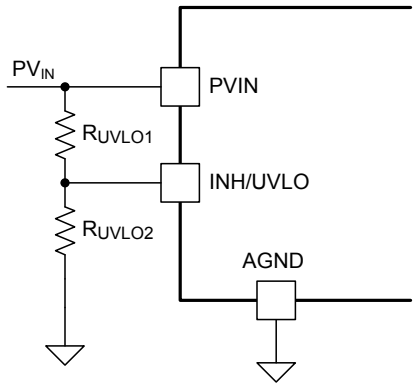

Figure 24. Adjustable PVIN UVLO

Table 10. Resistor Values for Adjusting PVIN UVLO

PVIN UVLO (V)	4.5	10	15	20	25	30
R_{UVLO1} (kΩ)	100	100	100	100	100	100
R_{UVLO2} (kΩ)	86.6	26.1	16.2	11.5	9.09	7.50

7.3.10 Remote Sense

The SENSE+ pin must be connected to V_{OUT} at the load, or at the device pins.

Connecting the SENSE+ pin to V_{OUT} at the load improves the load regulation performance of the device by allowing it to compensate for any I-R voltage drop between its output pins and the load. An I-R drop is caused by the high output current flowing through the small amount of pin and trace resistance. This should be limited to a maximum of 300 mV.

NOTE

The remote sense feature is not designed to compensate for the forward drop of nonlinear or frequency dependent components that may be placed in series with the converter output. Examples include OR-ing diodes, filter inductors, ferrite beads, and fuses. When these components are enclosed by the SENSE+ connection, they are effectively placed inside the regulation control loop, which can adversely affect the stability of the regulator.

7.3.11 VBSEL

The VBSEL pin allows the user to select the input source of the internal bias circuitry to improve efficiency. For output voltages ≥ 4.5 V, connect this pin to VOUT. For output voltages < 4.5 V, connect this pin to AGND.

Copyright © 2016–2018, Texas Instruments Incorporated

7.3.12 Soft-Start (SS/TR)

Leaving SS/TR pin open enables the internal slow start time interval of approximately 4.1 ms. Adding additional capacitance between the SS pin and AGND increases the slow start time. Increasing the slow start time will reduce inrush current seen by the input source and reduce the current seen by the device when charging the output capacitors. To avoid the activation of current limit and ensure proper start-up, the SS capacitor may need to be increased when operating near the maximum output capacitance limit.

See Table 11 below for SS capacitor values and timing interval.

Table 11. Soft-Start Capacitor Values and Soft-Start Time

C_{SS} (nF)	open	15	22	33	47
SS Time (ms)	4.1	7	10	15	20

7.3.13 Power Good (PWRGD) and Pull-up (PWRGD_PU)

The PWRGD pin is an open drain output. Once the voltage on the SENSE+ pin is between 95% and 105% of the set voltage, the PWRGD pin pull-down is released and the pin floats. The recommended pullup resistor value is between 10 kΩ and 100-kΩ to a voltage source that is 12 V or less. The LMZ34202 has an internal 100 kΩ between the PWRGD pin (pin 20) and the PWRGD_PU pin (pin 21). Connect the PWRGD_PU pin to an external voltage source to avoid using an external pullup resistor. The PWRGD pin is pulled low when the voltage on SENSE+ is lower than 90% or greater than 110% of the nominal set voltage.

7.3.14 Overcurrent Protection

For protection against load faults, the LMZ34202 incorporates output overcurrent protection. Applying a load that exceeds the regulator's overcurrent threshold causes the output to shut down when the output voltage falls below the PWRGD threshold. Following shutdown, the module periodically attempts to recover by initiating a soft-start power-up as shown in Figure 25. This is described as a hiccup mode of operation, whereby the module continues in a cycle of successive shutdown and power up until the load fault is removed. During this period, the average current flowing into the fault is significantly reduced which reduces power dissipation. Once the fault is removed, the module automatically recovers and returns to normal operation as shown in Figure 26.

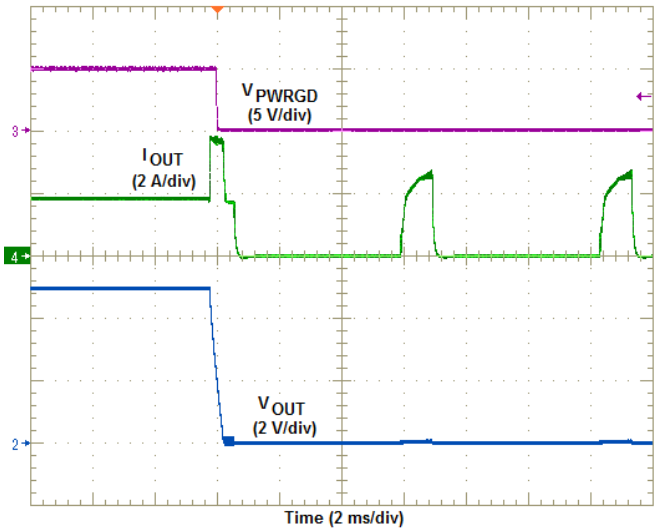

Figure 25. Overcurrent Limiting

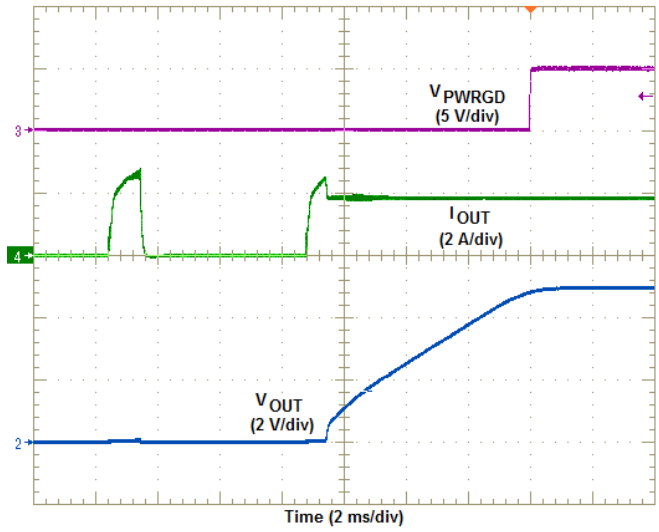

Figure 26. Removal of Overcurrent

7.3.15 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 160°C typically. The device reinitiates the power up sequence when the junction temperature drops below 150°C typically.

Copyright © 2016–2018, Texas Instruments Incorporated

7.4 Device Functional Modes

7.4.1 Active Mode

The LMZ34202 is in Active Mode when PVIN is above the UVLO threshold and the INH/UVLO pin voltage is above the INH high threshold. The simplest way to enable the LMZ34202 is to connect the INH/UVLO terminal to PVIN. This allows self start-up of the LMZ34202 when the input voltage is in the operation range: 4.5 V to 42 V.

7.4.2 Light Load Operation

At light load, the LMZ34202 operates in pulse skip mode to improve efficiency and decrease power dissipation by reducing switching losses and gate drive losses. In light load operation (PFM mode), the output voltage can rise slightly above the set-point specification. To avoid this behavior, a 300-mA load is required on the output.

7.4.3 Shutdown Mode

The INH/UVLO pin provides electrical ON and OFF control for the LMZ34202. When the INH/UVLO pin voltage is below the INH threshold, the device is in shutdown mode. In shutdown mode the stand-by current is 2.4 μA typically with PV_{IN} = 24 V. The LMZ34202 also employs under voltage lock out protection. If PV_{IN} is below the UVLO level, the output of the regulator turns off.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMZ34202 is a synchronous step down DC-DC power module. It is used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 2 A. The following design procedure can be used to select components for the LMZ34202. Alternately, the WEBENCH® software may be used to generate complete designs. When generating a design, the WEBENCH software utilizes an iterative design procedure and accesses comprehensive databases of components.

8.2 Typical Application

8.2.1 Minimum External Component Application

The LMZ34202 requires only a few external components to convert from a wide input voltage supply range to a wide range of output voltages. Figure 27 shows a basic LMZ34202 schematic with only the minimum required components.

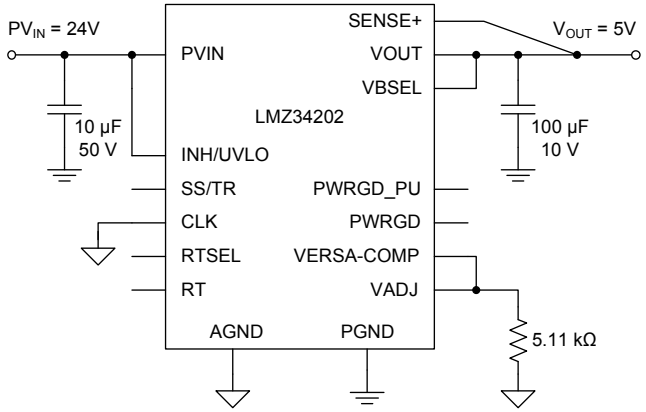

Figure 27. LMZ34202 Minimum External Component Application

8.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 12 and follow the design procedures below.

Table 12. Design Example Parameters

DESIGN PARAMETER	VALUE
Input Voltage PV_{IN}	24 V typical
Output Voltage V_{OUT}	5.0 V
Output Current Rating	2 A
Operating Frequency	500 kHz

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the LMZ34202 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.1.2.2 Output Voltage Set-Point

The output voltage of the LMZ34202 device is externally adjustable using a single resistor (R_{SET}). Select the value of R_{SET} from Table 2 or calculate using Equation 3:

$$R_{SET} = \frac{20}{\left[\left(\frac{V_{OUT}}{1.011}\right) - 1\right]} \ (k\Omega) \tag{3}$$

Knowing the desired output voltage is 5 V, the R_{SET} value can then be calculated using Equation 3 or selected from Table 2. The formula yields a value of 5.07 kΩ. Choose the closest available value of 5.11 kΩ for R_{SET}.

8.2.1.2.3 RT and RTSEL

The default switching frequency of the LMZ34202 is set to 500 kHz by leaving the RT pin open and the RTSEL pin open. The switching frequency of this application is 500-kHz, therefore no additional resistor is required to set the switching frequency. If another frequency is desired, use Table 3 to select the required resistor value.

8.2.1.2.4 VERSA-COMP

The Versa-Comp feature of the LMZ34202 configures the internal compensation based on the output voltage. From Table 8, the required Versa-Comp configuration for a 5-V output is to connect the VERSA-COMP pin to the VADJ pin.

8.2.1.2.5 VBSEL

The VBSEL pin allows the user to select the input source of the internal bias circuitry to improve efficiency. For output voltages ≥ 4.5 V, connect this pin to VOUT. For output voltages < 4.5 V, connect this pin to AGND.

8.2.1.2.6 Input Capacitors

For this design, a 10-µF, X7R dielectric ceramic capacitor rated for 50 V is used for the input decoupling capacitor. The effective capacitance at 24 V is 5.7 µF, the equivalent series resistance (ESR) is approximately 3 mΩ, and the current-rating is 5 A.

8.2.1.2.7 Output Capacitors

The minimum required output capacitance for a 5 V output is 64 µF of ceramic capacitance. For this design, a 100 µF, X5R dielectric ceramic capacitor rated for 10 V is used for the output capacitor.

8.2.1.3 Application Curves

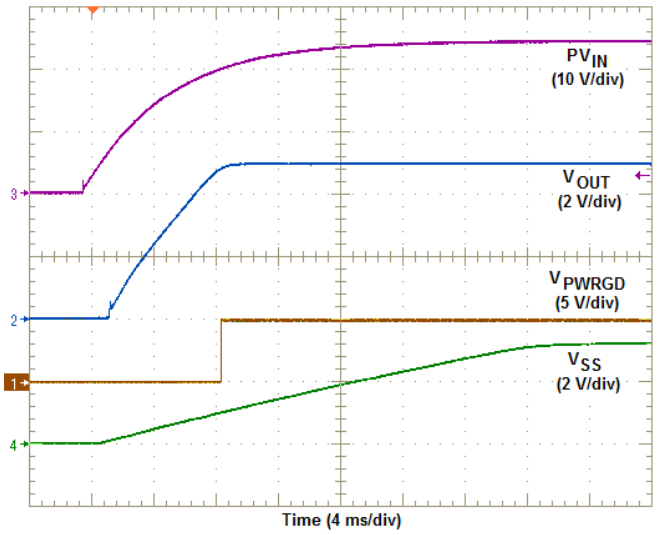

Figure 28. Start-up Waveforms

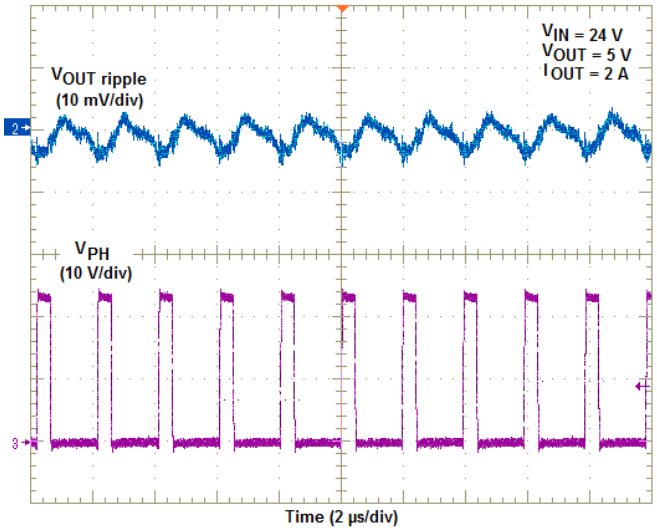

Figure 29. Output Ripple and PH Node Waveforms

8.2.2 INH Control Application

Figure 30 shows a more typical use schematic which makes use of the INH control, Versa-Comp, SS, PWRGD and PWRGD_PU features, along with adjusting the switching frequency with an external resistor. Setting these additional features is descibed below.

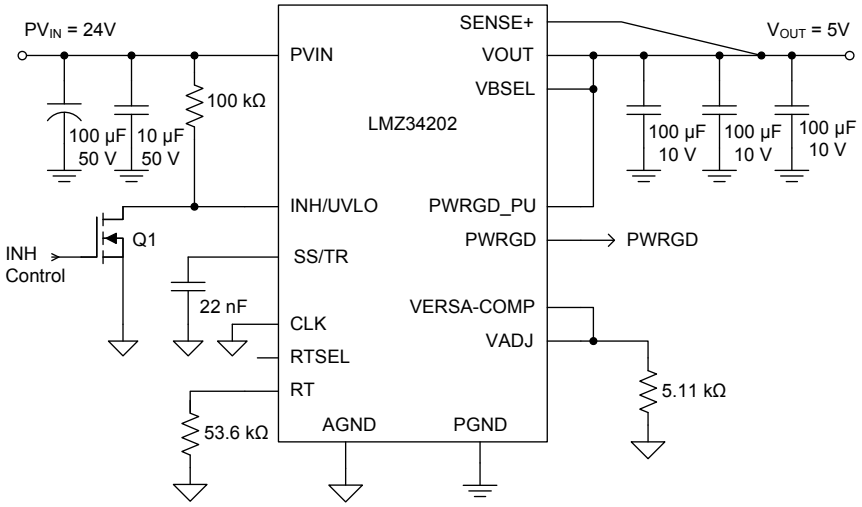

Figure 30. LMZ34202 Typical Schematic

8.2.2.1 Design Requirements

For this design example, use the parameters listed in Table 13 as the input parameters. For the complete design procedures start with the procedures for the basic application above as well as the procedures listed below.

Table 13. Design Example Parameters

DESIGN PARAMETER	VALUE
Input Voltage PV_{IN}	24 V typical
Output Voltage V_{OUT}	5.0 V
Output Current Rating	2 A

Copyright © 2016–2018, Texas Instruments Incorporated

Table 13. Design Example Parameters (continued)

DESIGN PARAMETER	VALUE
Operating Frequency	750 kHz
Inhibit Control	Yes
Power Good Signal	Yes
Slow Start Time	10 ms
Output Capacitance	300 µF

8.2.3 Detailed Design Procedure

8.2.3.1 Switching Frequency

To adjust the switching frequency place a resistor between the RT pin (pin 9) and AGND. Refer to Table 3 to select the required value for R_{RT} resistor. To set the switching frequency to 750 kHz, the value for R_{RT} is 53.6 kΩ, selected from Table 3.

8.2.3.2 Power Good

The PWRGD pin is an open drain output. The LMZ34202 includes an internal 100 kΩ pullup resistor between the PWRGD pin and the PWRGD_PU pin. Connecting the PWRGD_PU pin to a pullup voltage allows use of the PWRGD signal without adding an additional component. In this example, the 5-V output is used as the pullup voltage.

8.2.3.3 Inhibit Control

To control the turn ON and OFF of the LMZ34202, an open-drain and collector device is recommended. The open-drain and collector device must be rated for the maximum voltage applied to PVIN. A pull-up resistor is required between the INH/UVLO pin and PVIN. Place a 100-kΩ resistor between the INH/UVLO pin and the PVIN pin.

8.2.3.4 VERSA-COMP

The Versa-Comp feature of the LMZ34202 configures the internal compensation based on the output voltage. From Table 8, the required Versa-Comp configuration for a 5-V output is to connect the VERSA-COMP pin to the VADJ pin.

8.2.3.5 VBSEL

The VBSEL pin allows the user to select the input source to the internal power circuitry to improve efficiency. For output voltages ≥ 4.5 V, connect this pin to VOUT. For output voltages < 4.5 V, connect this pin to AGND.

8.2.3.6 Soft-Start Capacitors

When the SS/TRK pin remains floating the LMZ34202 implements a typical soft-start time of 4.1 ms. In order to increase the slow start time, an external slow start capacitor, C_{SS} must be placed between the SS/TRK pin and AGND. Select a value for C_{SS} from Table 11.

For the desired soft-start time of 10 ms, a soft-start capacitor value of 22 nF is selected from Table 11.

8.2.3.7 Input Capacitors

For this design, a 10-µF ceramic capacitor plus a 100-µF aluminum electrolytic capacitor, both rated for 50 V are used for the input decoupling capacitors.

8.2.3.8 Output Capacitors

The maximum allowable output capacitance for a 5-V output is 350 µF of capacitance. At least 64 µF of capacitance must be ceramic type. For this design, 3× 100-µF, X5R dielectric ceramic capacitors rated for 10 V are used for the output capacitors.

Copyright © 2016–2018, Texas Instruments Incorporated

9 Power Supply Recommendations

The LMZ34202 is designed to operate from an input voltage supply range between 4.5 V and 42 V. This input supply should be well regulated and able to withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail should be low enough that an input current transient does not cause a high enough drop at the LMZ34202 supply voltage that can cause a false UVLO fault triggering and system reset.

If the input supply is located more than a few inches from the LMZ34202 additional bulk capacitance may be required in addition to the ceramic bypass capacitors. The typical amount of bulk capacitance is 47 µF or the typical amount of electrolytic capacitance is 100 µF.

Copyright © 2016–2018, Texas Instruments Incorporated

10 Layout

The performance of any switching power supply depends as much upon the layout of the PCB as the component selection. The following guidelines will help users design a PCB with the best power conversion performance, thermal performance, and minimized generation of unwanted EMI.

10.1 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 31 thru Figure 34, shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (PVIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Keep AGND and PGND separate from one another. The connection is made internal to the device.
- Place R_{SET}, R_{RT}, and C_{SS} as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.

10.2 Layout Example

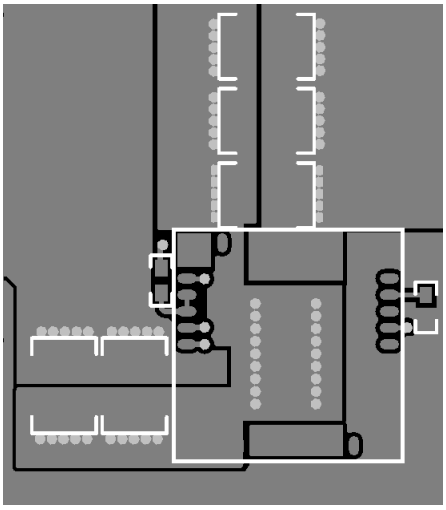

Figure 31. Typical Top-Layer Layout

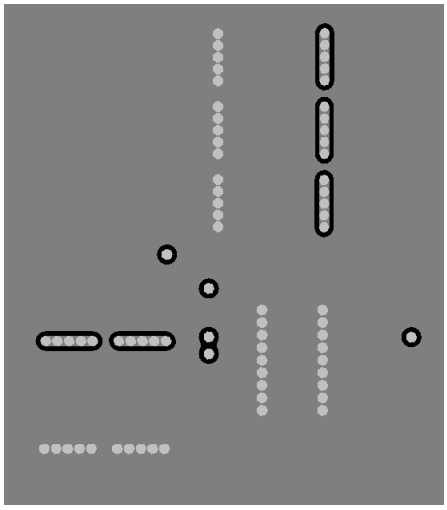

Figure 32. Typical Layer-2 Layout

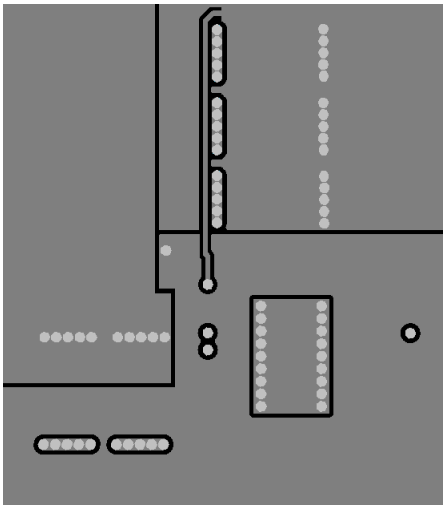

Figure 33. Typical Layer-3 Layout

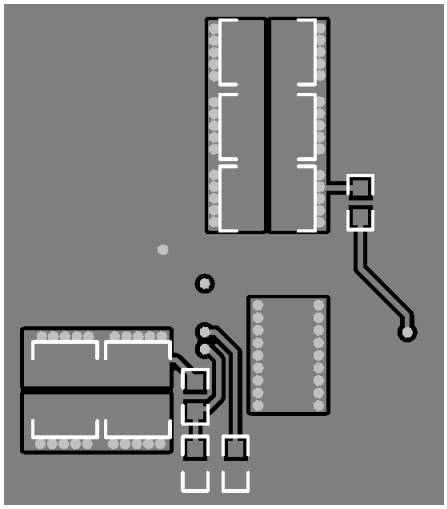

Figure 34. Typical Bottom-Layer Layout

LMZ34202RVQR.A	Active	Production	B3QFN (RVQ) | 43	500 | LARGE T&R	Exempt	NIPDAU	Level-3-245C-168 HR	-40 to 105	LMZ34202
LMZ34202RVQT	Active	Production	B3QFN (RVQ) | 43	250 | SMALL T&R	Yes	NIPDAU	Level-3-245C-168 HR	-40 to 105	LMZ34202
LMZ34202RVQT.A	Active	Production	B3QFN (RVQ) | 43	250 | SMALL T&R	Yes	NIPDAU	Level-3-245C-168 HR	-40 to 105	LMZ34202

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

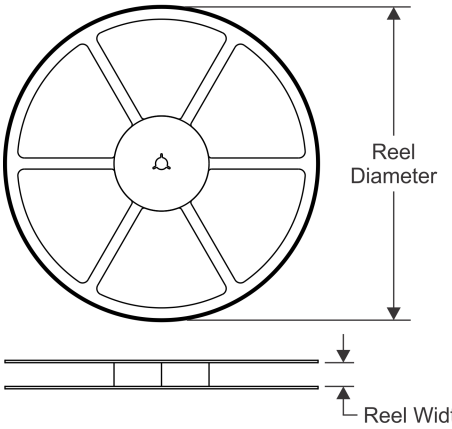
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

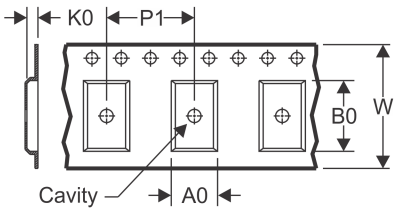
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

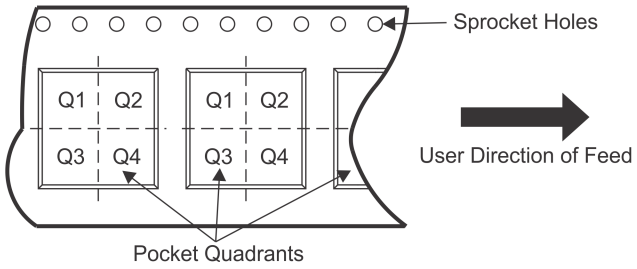


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMZ34202RVQR	B3QFN	RVQ	43	500	330.0	24.4	10.35	10.35	4.6	16.0	24.0	Q2

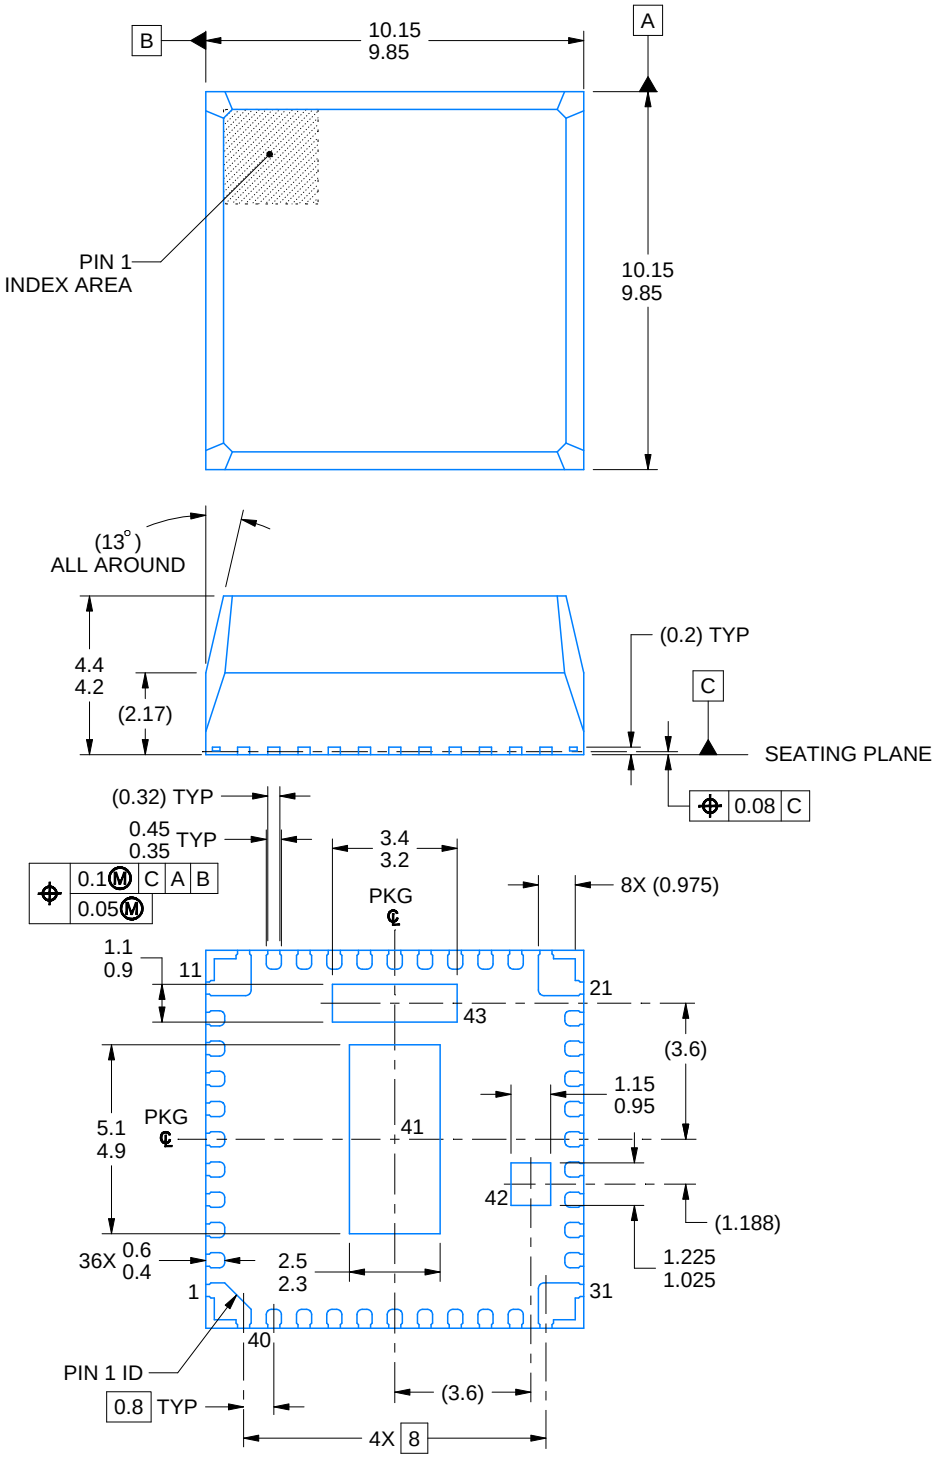
PACKAGE OUTLINE

RVQ0043A

B3QFN - 4.4mm max height

PLASTIC QUAD FLATPACK - NO LEAD



4226463/A 02/2021

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pads must be soldered to the printed circuit board for optimal thermal and mechanical performance.

NOTES: (continued)

4. This package designed to be soldered to a thermal pads on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
