

## LP5810 4-Channel RGBW LED Driver with Autonomous Control

### 1 Features

- Operating voltage range:
  - $V_{CC}$  range: 2.7V to 5.5V
  - Logic pins compatible with 1.8V, 3.3V, and 5V
- 4 constant current sinks with high precision:
  - 0.1mA to 51mA per current sink
  - Device-to-device error: max  $\pm 5\%$
  - Channel-to-channel error: max  $\pm 5\%$
  - Ultra-low headroom voltage: 110mV (typ.) at 25.5mA; 210mV (typ.) at 51mA
  - PWM phase shift configurable for each LED
- Ultra-low power consumption:
  - Standby:  $I_{STB} = 26\mu A$  (typical) when CHIP\_EN = 0 (data retained)
  - Active:  $I_{NOR} = 0.4mA$  (typical) when LED current = 25.5mA
- Analog dimming (current gain control)
  - Global 1-bit Maximum Current (MC): 25.5mA or 51mA
  - Individual 8-bit Dot Current (DC) setting
- PWM dimming up to audible-noise-free 24kHz
  - Individual 8-bit PWM dimming resolution
  - Linear or exponential dimming curves
- Autonomous animation engine control
- Individual LED dot open/short detection
- Integrated de-ghosting function
- 1MHz (max.) I<sup>2</sup>C interface
- 40°C to 85°C operating temperature range

### 2 Applications

LED animation and indication for:

- Portable and wearable electronics - earbud and charging case, E-cigarette, smart watch
- Gaming and home entertainment - smart speaker, RGB mouse, VR headset, and controller
- Internet-of-Things (IOT) - E-tag, video doorbell
- Networkings - router, access point
- Industrial HMI - EV charger, factory automation

### 3 Description

The LP5810 is a 4-channel RGBW LED driver with autonomous animation engine control. The device has ultra-low normal operation current with 0.4mA (typical) when illuminate LEDs.

Both analog dimming and PWM dimming methods are adopted to achieve powerful dimming performance. The output current of each LED can be adjusted with 256 steps from 0.1mA to 25.5mA or 0.2mA to 51mA. The 8-bit PWM generator enables smooth and audible-noise-free dimming control for LED brightness.

The autonomous animation engine can significantly reduce the real-time loading of controller. Each LED can be configured through the related registers to realize vivid and fancy lighting effects. The device can generate 6MHz clock signal and use it for synchronizing the lighting effects among multiple devices.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
LP5810	DSBGA (9)	1.43mm × 1.34mm
	WSON (8)	3mm × 3mm

## 5 Pin Configuration and Functions

Figure 5-1. LP5810 YBH Package 9-Pin DSBGA Top View

Figure 5-2. LP5810 DSD Package 8-Pin WSON Top View

**Table 5-1. Pin Functions**

PIN			TYPE <sup>(1)</sup>	DESCRIPTION
NAME	YBH	DSD		
OUT0	A1	8	O	Output 0 which contains current sink 0 and high-side scan FET 0. If not used, this pin must be floating.
GND	A2	Thermal Pad	G	Ground. Must be connected to the common ground plane
VCC	A3	1	P	Boost converter output. A 22 $\mu$ F capacitor is recommended to be connected between this pin with GND and be placed as close to the device as possible.
OUT1	B1	7	O	Output 1 which contains current sink 1 and high-side scan FET 1. If not used, this pin must be floating.
SYNC	B2	2	I/O	Synchronous between multiple devices. If not used, this pin can be connected to ground to save power.
SCL	B3	3	I	I <sup>2</sup> C serial interface clock input.
OUT2	C1	6	O	Output 2 which contains current sink 2 and high-side scan FET 2. If not used, this pin must be floating.
OUT3	C2	5	O	Output 3 which contains current sink 3 and high-side scan FET 3. If not used, this pin must be floating.
SDA	C3	4	I/O	I <sup>2</sup> C serial interface data input/output.

(1) P: Power Pin; I: Input Pin; I/O: Input/Output Pin; O: Output Pin.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage range at terminals	VCC	-0.3	6	V
	OUT0, OUT1, OUT2, OUT3	-0.3	6	V
	SCL, SDA, SYNC	-0.3	6	V
T <sub>J</sub>	Junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±4000
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins <sup>(2)</sup>	±1000

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VCC	Input voltage range	0.5	5.5	V	
C <sub>IN</sub>	Effective input capacitance range	1	4.7	μF	
OUT0, OUT1, OUT2, OUT3	Voltage on OUT0, OUT1, OUT2, OUT3 pins	0	5.5	V	
SCL, SDA, SYNC	Voltage on SCL, SDA, SYNC pins	0	5.5	V	
T <sub>A</sub>	Ambient temperature	-40	85	°C	
T <sub>J</sub>	Operating junction temperature	-40	125	°C

## 7 Detailed Description

### 7.1 Overview

The LP5810 is a 4-channel RGBW LED driver with autonomous animation engine control.

The LP5810 has ultra-low operation current at active mode, consuming about 0.4mA when LED maximum current setting is 25.5mA. If all LEDs are turned off, the device will enter standby state to reduce power consumption with data retained. When 'chip\_enable' bit setting is 0, initial state is entered with minimum power consumption to save power.

The LP5810 supports both analog dimming and PWM dimming. In analog dimming, the output current of each LED can be adjusted with 256 steps. In PWM dimming, the integrated 8-bit configurable PWM generator enables smooth brightness dimming control. Optional exponential PWM dimming can be activated for individual LED to achieve a human-eye-friendly visual performance.

The LP5810 integrates autonomous animation engine, with no need for brightness control commands from controller. Each LED has an individual animation engine which can be configured through the related registers. The device can generate a 6 MHz clock signal, which synchronizes the lighting effects among multiple devices.

The LP5810 has 4 different material versions with different I<sup>2</sup>C chip address. Up to 4 LP581x devices can be connected to the same I<sup>2</sup>C bus and controlled individually. The LP5810 materials and corresponding chip addresses are shown in [Section 4](#).

### 7.2 Functional Block Diagram

**Figure 7-1. Functional Block Diagram**

### 7.3 Feature Description

#### 7.3.1 Analog Dimming

The current gain of each LED can be controlled by 2 methods to achieve analog dimming in the LP5810.

- Global 1-bit Maximum Current (MC) control for all LEDs without external resistor
- Individual 8-bit Dot Current (DC) control for each LED

The maximum output current  $I_{OUT\_max}$  of each current sink can be programmed by the 1-bit `max_current`. The default value of `max_current` is 0h, which means the LED maximum current is set to 25.5mA in default.

**Table 7-1. Maximum Current (MC) Bit Setting**

1 bit Maximum Current (MC)		$I_{OUT\_MAX}$ (mA)
Binary	Decimal	
0 (default)	0 (default)	25.5 (default)
1	1	51

The LP5810 can individually adjust the peak current of each LED by using Dot Current (DC) function. The brightness deviation among the LED bins can be minimized, to achieve uniform display performance. The

current is adjusted with 256 steps from 0 to 100% of  $I_{OUT\_MAX}$ , which is programmed in an 8-bit register whose default value is 80h.

**Table 7-2. Dot Current (DC) Bits Setting**

8-bits Dot Current (DC) Register		Ratio of $I_{OUT\_MAX}$
Binary	Decimal	
0000 0000	0	0%
0000 0001	1	0.39%
0000 0010	2	0.78%
---	---	---
1000 0000 (default)	128 (default)	50.2% (default)
---	---	---
1111 1101	253	99.2%
1111 1110	254	99.6%
1111 1111	255	100%

By configuring the MC and DC, the peak current of each current sink can be calculated as [Equation 1](#):

$$I_{OUT} (mA) = I_{OUT\_max} \times \frac{DC}{255} \quad (1)$$

The average current of each LED in TCM drive mode and mix drive mode is shown as [Equation 2](#):

$$I_{AVE} (mA) = \frac{I_{OUT}}{N} \times \frac{DC}{255} \times D_{PWM} \quad (2)$$

- N is the total scan number setting.
- $D_{PWM}$  is the PWM duty.

### 7.3.2 PWM Dimming

The LP5810 supports 8-bit PWM dimming with 24kHz or 12kHz frequency, which is configured by 'PWM\_Fre' bit in Dev\_config\_1 register. An internal 6MHz oscillator is used to generate the PWM clock. SYNC pin can be configured as PWM clock input or output by configure 'vsync\_out\_en' bit in Dev\_Config\_11 register. If multiple LP5810 are used in the system with autonomous animation engine control, all devices can refer the same clock signal, which comes from one of LP5810 or external controller, to avoid animation mismatch in long time operation.

Each LED can be configured into 3 different PWM alignment phases: Forward, Middle, and Backward. The alignment phase of each LED is set by 'phase\_align' bits in Dev\_Config\_7 to Dev\_Config\_10 registers. By turning on the LEDs in different phase, the peak current load from the system power supply is greatly decreased. The input current ripple and ceramic-capacitor audible ringing can also be reduced. [Figure 7-2](#) shows the PWM alignment phases. In the forward alignment, the rising edge of PWM pulse is fixed at the beginning of PWM period. In the middle alignment, the middle point of PWM pulse is fixed at the middle of PWM period, while the pulse spreads to both directions. In the backward alignment, the falling edge of PWM pulse is fixed at the end of PWM period.

**Figure 7-2. PWM Alignment Scheme**

The LP5810 allow users to configure the dimming scale as exponential curve or linear curve, through the 'exp\_en' bits in Dev\_Config\_5 and Dev\_Config\_6 registers. A human-eye-friendly visual performance can be achieved by using the internal exponential scale. The linear scale has great linearity between PWM duty cycle and PWM setting value, which provides flexible approach for external controlled gamma correction algorithm. The 8-bit linear and exponential curves are shown as [Figure 7-3](#).

**Figure 7-3. Linear and Exponential PWM Dimming Curves**

### 7.3.3 Autonomous Animation Engine Control

The LP5810 supports both manual mode and autonomous mode to control the DC and PWM of each LED. In manual mode, the LEDs are directly controlled by the related configuration registers and reflect the value immediately. In autonomous mode, the autonomous animation engine is applied for each LED, which can realize vivid lighting effects without external processor control. The animation engine pattern is composed by 3 animation engine units (AEU) and 2 animation pause units (APU) for complex and flexible control. One AEU is formed by 4 slopers, which is used for fading effect.

After setting up all animation engine pattern configurations, sending `start_cmd` to the device can let the animation running autonomously, to free external controller real-time loading. The PWM value and unit status of each LED can be read from `PWM_value` registers and `pattern_status` registers. To make sure the precision of reading results, sending `pause_cmd` to pause the animation firstly is recommended.

#### 7.3.3.1 Animation Engine Pattern

Each LED of the LP5810 has own animation engine, to achieve premium visual lighting effects. One whole animation engine pattern is defined as [Figure 7-4](#). 3 animation engine units (AEU) and 2 animation pause units (APU) compose the animation engine pattern. AEU2 and AEU3 can be skipped by setting the playback times to 0. The LED current of each LEDs in the autonomous mode is set through the `Autonomous_DC` registers.

**Figure 7-4. Animation engine pattern**

The whole animation pattern includes two APUs and three AEUs with several playback times:

- APU $x$  ( $x = 1, 2$ ): Animation pause unit, each unit includes one timing value T.
- AEU $x$  ( $x = 1, 2, 3$ ): Animation engine unit, including 5 PWM values PWM1 to PWM5 and 4 time values T1 to T4.
- PT: Playback times of AEU1+AEU2+AEU3, which has 2-bit value to set 0/1/2/Infinite times.
- PT $x$ : Playback times of AEU $x$  ( $x=1/2/3$ ), which has 2-bit value to set 0/1/2/Infinite times.

### 7.3.3.2 Sloper

Sloper is the basic element to achieve autonomous fade-in and fade-out animations. It can achieve 256 steps fade-in or fade-out effects from 'PWM\_Start' to 'PWM\_End' within a target time period T as [Figure 7-5](#). The 8-bit PWM steps, which is configurable in animation pattern PWM setting registers, help to achieve extremely smooth effects. Exponential dimming curve can also be supported in the sloper.

**Figure 7-5. Sloper curve demonstration**

The programmable time T is selectable from 0 to around 8s with 16 levels shown in [Table 7-3](#).

**Table 7-3. Programmable time options**

Register value	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
Time (Typ.)	0 s	0.09 s	0.18 s	0.36 s	0.54 s	0.80 s	1.07 s	1.52 s	2.06 s	2.50 s	3.04 s	4.02 s	5.01 s	5.99 s	7.06 s	8.05 s

### 7.3.3.3 Animation Engine Unit (AEU)

The AEU is the most important unit to achieve autonomous animation effects. One AEU is formed by 4 slopers. There are 5 PWM values and 4 time values can be configured in the AEU. Each PWM $x$  ( $x = 1, 2, \dots, 5$ ) can be arbitrarily programmed from 0 to 255, The Tx ( $x = 1, 2, 3, 4$ ) is selectable from 0 to 8 s with 16 levels referring to [Table 7-3](#). If two adjacent PWM values are equal, the brightness keeps unchange within the time setting. When a Tx is set to 0, this sloper is skipped. To avoid flicker happens due to PWM value suddenly changes, the begin and end PWM of this sloper need to be the same.

Typical breathing effect example is illustrated as [Figure 7-6](#).

**Figure 7-6. Animation engine unit - Example 1**

Advanced breathing effect example is shown in [Figure 7-7](#). 2 different fading speeds are set in the PWM rising and falling phases, to achieve a complex animation.

**Figure 7-7. Animation engine unit - Example 2**

#### 7.3.3.4 Animation Pause Unit (APU)

The APU is defined as the pausing time at the beginning and the end of the animation pattern. The APU contains 1 time value which is selectable from 0 to 8s with 16 levels referring to [Table 7-3](#). If the value is set as 0, the APU is skipped. The brightness of APU1 uses the PWM1 value of the AEU following the APU1, while the brightness of APU2 uses the PWM5 value of the AEU in front of APU2. One animation pattern example is shown in [Figure 7-8](#). Only AEU2 is enabled in the pattern, so that the brightness of APU1 uses the PWM1 value of AEU2, and the brightness of APU2 uses PWM5 value of AEU2.

**Figure 7-8. APU example**

### 7.3.4 Protections and Diagnostics

#### 7.3.4.1 LED Open Detections

The LP5810 integrates LED open detection (LOD) for the fault caused by any open LED. The threshold for LOD is 90 mV when max current is set as 25.5 mA, and 180 mV when max current is set as 51 mA. To have enough detection time, LOD can only be performed when the PWM setting of this LED is above 25. If the voltage on the cathode of this LED is lower than the LOD threshold in continuously 3 cycles, LED open of this LED is reported to the corresponding LOD\_status register.

The LOD flags can be cleared by writing 1h to 'lod\_clear' bit in Fault\_Clear register. If the LED open status is removed, the related 'lod\_status' bit is set to 0 automatically.

The 'lod\_action' bit in Dev\_config\_12 register can determine the action once open fault is detected. When the 'lod\_action' bit is set to 1h, the dot where LED open happens is turned off to avoid any unpredictable issue. When the 'lod\_action' bit is 0, no additional action is taken after LOD is detected. LED open fault detection and action is only executed in NORMAL state.

### 7.3.4.2 LED Short Detections

The LP5810 integrates LED short detection (LSD) for the fault caused by any short LED. The threshold of LSD is able to configure from  $(0.35 \times VCC)$  V to  $(0.65 \times VCC)$  V by configuring `lsd_threshold` in `Dev_config_12` register. To have enough detection time, LSD can only be performed when the PWM setting of this LED is above 25. If the voltage on the cathode of this LED is higher than the LSD threshold in continuously 3 cycles, LED short of this LED is reported to the corresponding `LSD_status` register.

The LSD flags can be cleared by writing 1h to `lsd_clear` in `Fault_CLR` register. If the LED short status is removed, the related `lsd_status` bit is set to 0 automatically.

The '`lsd_action`' bit in `Dev_config_12` register can determine the reaction once open fault is detected. When the '`lsd_action`' bit is set to 1h, all LEDs are turned off which is called one fails all fail (OFAF) action, to prevent potential damage caused by the short issue. The device enters to STANDBY state after sending '`lsd_clear`' command. When the '`lsd_action`' bit is 0, no additional action is taken after LSD is detected. LSD detection is only executed in NORMAL state.

### 7.3.4.3 Thermal Shutdown

The LED driver of LP5810 goes into thermal shutdown state once the junction temperature exceeds 150°C. All LEDs turn off to avoid damaging the device. When the junction temperature drops below the thermal shutdown recovery temperature 130°C, the LED driver starts operating again.

## 7.4 Device Functional Modes

The [Figure 7-9](#) shows the main state machine of the LED driver.

**Figure 7-9. LP5810 functional modes**

- INITIAL: The device enters into INITIAL after VCC power up.
- STANDBY: The device enters into STANDBY state from INITIAL when `Chip_EN` is set to 1. The device can also enter into STANDBY from NORMAL when no LED is effective, or `Stop_cmd` is received, or from OFAF when `LSD_Clear` = 1.
- NORMAL: The device enters NORMAL state from STANDBY when one or more LEDs are effective: for manual mode, at least one LED is enable (PWM and DC setting is not 0); for autonomous mode, at least one LED is enable and `Start_cmd` is received.

- OFAF: The device enters OFAF (one fail all fail) state when LED short is detected and LSD\_Action =1. In OFAF mode, all LEDs are turned off. Once LSD\_Clear is written to 1, the device enters back to STANDBY state.

## 7.5 Programming

The LP5810 is compatible with I<sup>2</sup>C standard specification. The device supports standard mode (100-kHz maximum), fast mode (400-kHz maximum), and fast plus mode (1-MHz maximum). The device has 4 different chip address versions, which allows connecting up to four parallel devices in one I<sup>2</sup>C bus.

### I<sup>2</sup>C Data Transactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9<sup>th</sup> clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, the receiver must indicate to the transmitter an end of data by not acknowledging (*negative acknowledge*) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

### I<sup>2</sup>C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 5 bits of the chip address, 2 higher bits of the register address, and 1 read/write bit. The other 8 lower bits of register address are put in Address Byte 2. The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started. The Bit 4 and Bit 3 are determined by the device, which can refer to [Section 4](#).

**Table 7-4. I<sup>2</sup>C Data Format**

Address Byte1	Chip Address					Register Address		R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>Independent</b>	1	0	1	Bit 4	Bit 3	9 <sup>th</sup> bit	8 <sup>th</sup> bit	R: 1 W: 0
<b>Broadcast</b>	1	1	0	1	1			
<b>Register Address</b>								
<b>Address Byte2</b>	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	7 <sup>th</sup> bit	6 <sup>th</sup> bit	5 <sup>th</sup> bit	4 <sup>th</sup> bit	3 <sup>rd</sup> bit	2 <sup>nd</sup> bit	1 <sup>st</sup> bit	0 bit

**Figure 7-10. I<sup>2</sup>C Write Timing**

**Figure 7-11. I<sup>2</sup>C Read Timing**

### 7.5.1 I<sup>2</sup>C Data Transactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9<sup>th</sup> clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, the receiver must indicate to the transmitter an end of data by not acknowledging (*negative acknowledge*) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

### 7.5.2 I<sup>2</sup>C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 5 bits of the chip address, 2 higher bits of the register address, and 1 read/write bit. The other 8 lower bits of register address are put in Address Byte 2. The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started. The Bit 4 and Bit 3 are determined by the device, which can refer to [Section 4](#).

**Table 7-5. I<sup>2</sup>C Data Format**

Address Byte1	Chip Address					Register Address		R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>Independent</b>	1	0	1	Bit 4	Bit 3	9 <sup>th</sup> bit	8 <sup>th</sup> bit	R: 1 W: 0
<b>Broadcast</b>	1	1	0	1	1			
<b>Address Byte2</b>	Register Address					Bit 2	Bit 1	Bit 0
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3

## 8 Register Maps

This section provides a summary of the LP5810 register maps.

**Table 8-1. Register Section/Block Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
RC	R	Read
	C	to Clear
R-0	R	Read
	-0	Returns 0s
<b>Write Type</b>		
W	W	Write
W0CP	W	W
	0C	0 to clear
	P	Requires privileged access
<b>Reset or Default Value</b>		
-n		Value after reset or the default value

**Table 8-2. LP5810 Registers Map**

Register Group	Register Acronym	Address(Hex.)	Function	Type
ChipEN	Chip_en	000	Chip enable	R/W
CONFIG	Dev_config0 ~ Dev_config12	001 ~ 00D	Device configuration registers	R/W
Update CMD	Update_cmd	010	Configuration update command: CONFIG registers will ONLY be effective by sending this command	R/W
Start CMD	Start_cmd	011	Autonomous control start command or restart with the latest setting	R/W
Stop CMD	Stop_cmd	012	LED driver stop command, LED driver goes to INITIAL state with this command from all the other states	R/W
Pause CMD	Pause_cmd	013	Autonomous control pause command	R/W
Continue CMD	Continue_cmd	014	Autonomous control continue command	R/W
LED EN	LED_EN1	020	LED enable registers	R/W
Fault CLR	Fault_Clear	022	Fault clear registers to clear TSD/LOD/LSD faults	R/W
RESET	Reset	023	Software reset	W
DC_Manual	DC0 ~ DC3	030 ~ 033	LED current setting at manual mode	R/W
PWM_Manual	PWM0 ~ PWM3	040 ~ 043	LED PWM setting at manual mode	R/W
DC_Auto	DC_Auto0 ~ DC_Auto3	050 ~ 053	LED current setting at autonomous mode	R/W
LED0 AEP	Tp, PT, PWM1 ~ PWM5, T1 ~ T4	080 ~ 099	LED0 Animation Engine Pattern parameters	R/W
LED1 AEP	Tp, PT, PWM1 ~ PWM5, T1 ~ T4	09A ~ 0B3	LED1 Animation Engine Pattern parameters	R/W
LED2 AEP	Tp, PT, PWM1 ~ PWM5, T1 ~ T4	0B4 ~ 0CD	LED2 Animation Engine Pattern parameters	R/W
LED3 AEP	Tp, PT, PWM1 ~ PWM5, T1 ~ T4	0CE ~ 0E7	LED3 Animation Engine Pattern parameters	R/W

**Table 8-2. LP5810 Registers Map (continued)**

STATUS	TSD_Config_Status	300	TSD status and Configuration error indication register	R
	LOD_Status1 ~ LOD_Status2	301 ~ 302	LOD status registers	R
	LSD_Status1 ~ LSD_Status2	303 ~ 304	LSD status registers	R
	PWM_Internal0 ~ PWM_Internal_D2	305 ~ 314	Internal PWM values for LED0 ~ LED_D2	R
	PATTERN_Status1 ~ PATTERN_Status8	315 ~ 31C	AEP status registers to indicate pattern progress for LED0 ~ LED_D2	R

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The LP5810 is a 4-ch RGB LED driver with autonomous animation engine control. The LP5810 has ultra-low operation current at active mode, and it only consumes 0.4mA when LED current is set at 25mA. In battery powered applications like e-tag, earbud, e-cigarettes, VR headset, RGB mouse, smart speaker, and other handheld devices, LP5810 is ideal to provide premium LED lighting effects with low power consumption and small package.

### 9.2 Typical Application

#### 9.2.1 Application

Figure 9-1 shows an example of typical application, which uses one LP5810 to drive RGBW LEDs through I<sup>2</sup>C communication.

**Figure 9-1. Typical Application - LP5810 Driving RGBW LEDs**

### 9.2.2 Design Parameters

Design Parameters shows the typical design parameters of [Figure 9-1](#).

**Table 9-1. Design Parameters**

PARAMETER	VALUE
Input voltage	3.6V to 4.2V by one Li-on battery cell
LED count	4
LED maximum average current (red, green, blue, white)	51mA, 40.8mA, 40.8mA, 40.8mA
LED PWM frequency	24kHz

### 9.2.3 Detailed Design Procedure

This section will showcase the detailed design procedures for LP5810 including components selection, LED driver manual and autonomous modes application examples.

#### 9.2.3.1 Input Capacitor Selection

Input capacitors must be located as close as possible to the device. While a 10 $\mu$ F input capacitor is sufficient for most applications, large capacitance is used to reduce input current ripple. When the input power is supplied through long wire and only ceramic capacitor is put, the load step at the output induces ringing at the VCC pin. This ringing couples back to the output and influence loop stability or even damage the device. In this circumstance, placing additional bulk capacitance (tantalum or aluminum electrolytic capacitor) between ceramic input capacitor and the power supply can reduce the ringing

### 9.2.3.2 Program Procedure

After VCC powering up, the device can be initialized by configuring chip\_en = 1 after executing I<sup>2</sup>C slave addressing. Then the CONFIG registers can be set to the expected configuration. After updating the CONFIG registers, one update command must be sent to make the configuration effective. Either manual mode or autonomous mode can be selected for each LED. A new configuration is only effective once update command is received.

The detailed program procedure is illustrated as:

**Figure 9-2. Program Procedure**

### 9.2.3.3 Programming Example

To get the design parameters in [Section 9.2.2](#), the following program steps can be referred.

After VCC powering up and waiting around 1 ms,

1. Execute I<sup>2</sup>C slave addressing, for details refer to the [sample code](#)
2. Set chip\_en = 1 to enable the device (**Write 01h to register 000h**)

3. Set max\_current = 1h to set 51 mA maximum output LED current (**Write 01h to register 001h**)
4. Set lsd\_threshold = 3h is recommended to avoid incorrect LSD detection (**Write 0Bh to register 00Dh**).  
Leave the PWM frequency, manual or autonomous mode, linear or exponential dimming curve, phase align method, vsync mode settings as default (In other application requirements, these functions can be set)
5. Send update command to complete configuration settings (**Write 55h to register 010h**)
6. Read back config\_err\_status to check if the configuration is proper (**Read register 300h**)
7. Enable all 4 LEDs (**Write 0Fh to register 020h**)
8. Set 51 mA peak current for red LEDs, 40 mA peak current for green, blue and white LEDs (**write FFh to register 30h, write CCh to registers 031h - 033h**)
9. Set 100% duty cycle to illuminate the LEDs (**Write FFh to registers 040h - 043h**)

### 9.2.4 Application Performance Plots

The following figures show the application performance plots.

phase\_align\_a0 = 0h, phase\_align\_a1 = 0h, phase\_align\_a2 = 0h, PWM = 127

**Figure 9-3. PWM Alignment Disabled**

phase\_align\_a0 = 1h, phase\_align\_a1 = 2h, phase\_align\_a2 = 3h, PWM = 127

**Figure 9-4. PWM Alignment Enabled**

### 9.3 Power Supply Recommendations

The LP5810 can also work normally by powering from VCC with 2.7V to 5.5V voltage range and an external LED supply with 2.7V to 5.5V voltage range is supported to power up the LEDs in direct drive configurations.

## 9.4 Layout

### 9.4.1 Layout Guidelines

The input capacitor needs not only to be close to the VCC pin, but also to the GND pin in order to reduce input supply ripple. For OUTx (x = 0, 1, 2, 3), low inductive and resistive path of switch load loop can help to provide a high slew rate. Therefore, path of adjacent outputs must be short and wide and avoid parallel wiring and narrow trace. For better thermal performance, TI suggest to make copper polygon connected with each pin bigger.

## 10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 10.1 Documentation Support

### 10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.6 Glossary

#### [TI Glossary](#)

This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (December 2024) to Revision D (February 2025)	Page
• Added URL to Sample Code.....	25

---

Changes from Revision B (September 2024) to Revision C (December 2024)	Page
• Added Pin Configuration Section.....	4
• Removed EN on parameter from Recommended Operating Conditions Table .....	6
• Removed $V_{EN\_H}$ and $V_{EN\_L}$ on parameter from Electrical Characteristics Table .....	6
• Updated Functional Modes image .....	16
• Updated parameters in Design Parameters table.....	24
• Changed Program Procedure.....	25
• Changed Program Example.....	25
• Removed Scan Lines and Current Sinks Waveforms of OUT0, OUT1, OUT2, OUT3, removed Scan Lines Switching Waveforms of OUT0, OUT1, OUT2, OUT3.....	27

---

Changes from Revision A (November 2023) to Revision B (September 2024)	Page
• Updated Body size from 1.43mm to 1.43mm to 1.43mm to 1.34mm.....	1
• Updated Absolute Maximum Ratings Table .....	6
• Updated Recommended Operating Conditions Table .....	6
• Updated Thermal Information Table .....	6
• Updated Electrical Specifications Table .....	6

---

Changes from Revision * (November 2023) to Revision A (November 2023)	Page
• Changed document status from "Advance Information" to "Production Data".....	1
• Added Programming Example.....	25

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**DSD0008B****PACKAGE OUTLINE****WSON - 0.8 mm max height**

PLASTIC SMALL OUTLINE - NO LEAD

4226923/A 06/2021

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

## EXAMPLE BOARD LAYOUT

**DSBGA - 0.4 mm max height**

DIE SIZE BALL GRID ARRAY

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

## EXAMPLE BOARD LAYOUT

**YBH0009-C01**

**DSBGA - 0.4 mm max height**

DIE SIZE BALL GRID ARRAY

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 40X

SOLDER MASK DETAILS  
NOT TO SCALE

4228370/C 01/2023

NOTES: (continued)

3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints.  
See Texas Instruments Literature No. SNVA009 ([www.ti.com/lit/snva009](http://www.ti.com/lit/snva009)).

## EXAMPLE STENCIL DESIGN

**YBH0009-C01**

**DSBGA - 0.4 mm max height**

DIE SIZE BALL GRID ARRAY

SOLDER PASTE EXAMPLE  
BASED ON 0.075 mm THICK STENCIL  
SCALE: 40X

4228370/C 01/2023

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

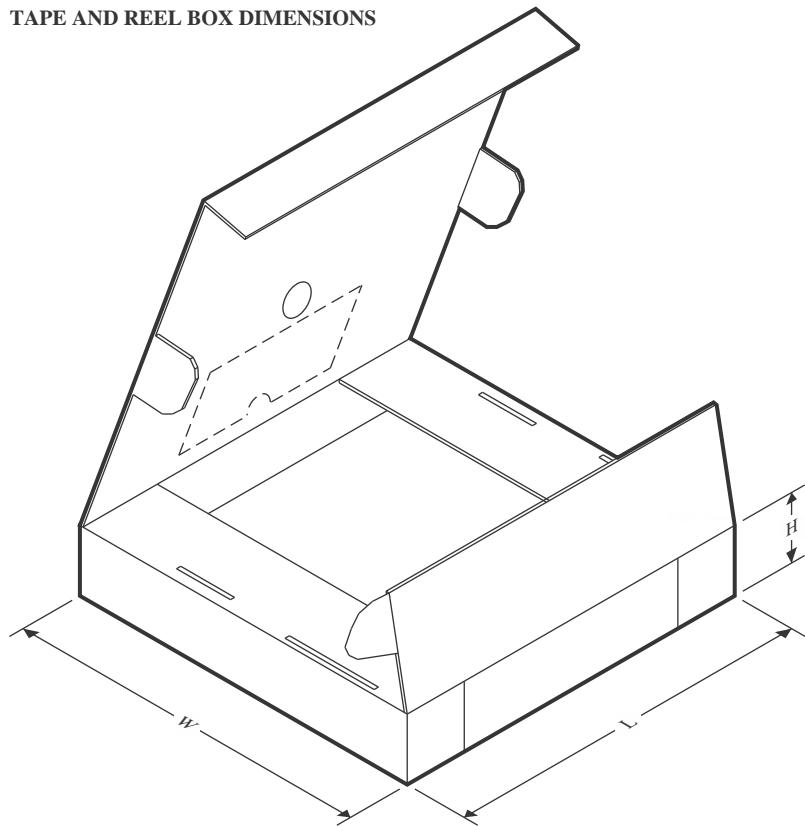

**TAPE AND REEL INFORMATION**

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

## GENERIC PACKAGE VIEW

**DSD 8**

**WSON - 0.8 mm max height**

**3 X 3, 0.8 mm pitch**

**PLASTIC QUAD FLATPACK - NO LEAD**

This image is a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4227007/A

# PACKAGE OUTLINE

**DSD0008B**

**WSON - 0.8 mm max height**

PLASTIC SMALL OUTLINE - NO LEAD

4226923/A 06/2021

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC SMALL OUTLINE - NO LEAD

4226923/A 06/2021

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
