

TPIC2810

8-BIT LED DRIVER WITH I²C INTERFACE

SLIS109A – DECEMBER 2001 – REVISED SEPTEMBER 2002

- Low $r_{DS(on)}$. . . 5 Ω Typical
- Eight Power DMOS Transistor Outputs of 100-mA Continuous Current
- 210-mA Current Limit Capability
- Drain Output ESD Protection . . . 3000 V
- Output Clamp Voltage . . . 40 V

description

The TPIC2810 device is a monolithic, medium-voltage, low-current, 8-bit shift register design to drive low-side switched resistive loads such as LEDs. The device is not recommended for switching inductive loads.

This device contains an 8-bit, serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through the shift register via an I²C bus interface. Data is transferred into the data shift register only after the group ID and device address have been verified. The subaddress directs the I²C bus interface to read or write data to the device or transfer data to the output. When output enable (\overline{G}) is held high, all drain outputs are off. When \overline{G} is held low, data from the output storage register is transparent to the output buffers. When data in the output buffers is low, the DMOS transistor outputs are off. When data is high, the DMOS transistor outputs have sink-current capability.

The TPIC2810 device has an internal power-up clear to initialize all registers to an off state when power is applied to the device. It also has a thermal sensor to monitor the die temperature and shut the drain outputs off, if an over current condition occurs.

Outputs are low-side, open-drain DMOS transistors with output ratings of 40 V and 100 mA continuous sink-current capability. Each output provides a 210-mA maximum current limit at $T_C = 25^\circ\text{C}$. The current limit decreases as the junction temperature increases for additional device protection. The device also provides up to 3000 V of ESD protection on output terminals and 2000 V of ESD protection on input terminals when tested using the human-body model.

The TPIC2810 device is characterized for operation over the operating case temperature range of -40°C to 125°C .

functional block diagram

See the *TPIC2810 subaddress and I²C protocol definition* section of this data sheet for definition of the 11H, 22H, and 44H control signals.

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
A0	9	I	Address input 0
A1	10	I	Address input 1
A2	7	I	Address input 2
DRAIN0	3	O	FET drain outputs. The DRAIN terminals are low-side switches for resistive loads.
DRAIN1	4		
DRAIN2	5		
DRAIN3	6		
DRAIN4	11		
DRAIN5	12		
DRAIN6	13		
DRAIN7	14		
\overline{G}	8	I	Output enable. Active low input enables output FETs when low and disables output FETs when high.
GND	16	O	Ground
SCL	15	I	Serial clock
SDA	2	I/O	Open drain, bidirectional serial data terminal
V _{CC}	1	I	Supply voltage input

SLIS109A – DECEMBER 2001 – REVISED SEPTEMBER 2002

absolute maximum ratings over the recommended operating case temperature range (unless otherwise noted)†

Logic supply voltage range, V_{CC} (see Note 1)	7 V
Logic input voltage range, V_I	–0.3 V to 7 V
Power DMOS drain-to-source voltage, V_{DS} (see Note 2)	40 V
Continuous source-to-drain diode anode current	210 mA
Pulsed source-to-drain diode anode current (see Note 3)	420 mA
Pulsed drain current, each output, all outputs on, I_D , $T_C = 25^\circ\text{C}$ (see Note 3)	210 mA
Peak drain current, single output, I_{DM} , $T_C = 25^\circ\text{C}$ (see Note 3)	210 mA
Continuous total dissipation	See Dissipation Rating Table
Operating virtual junction temperature range, T_J	–40°C to 150°C
Operating case temperature range, T_C	–40°C to 125°C
Storage temperature range, T_{stg}	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. All voltage values are with respect to GND.
 2. Each power DMOS source is internally connected to GND.
 3. Pulse duration $\leq 100 \mu\text{s}$ and duty cycle $\leq 2\%$.

DISSIPATION RATING TABLE

PACKAGE	$T_C = 25^\circ\text{C}$ POWER RATING	DERATING FACTOR ABOVE $T_C = 25^\circ\text{C}$	$T_C = 125^\circ\text{C}$ POWER RATING

PRINCIPLES OF OPERATION

TPIC2810 subaddress and I²C protocol definition

subaddress definition:

Summary:

HEX Value	R/W Bit	Function
11H	1	Read data from the input register
11H	0	Write data to the data shift register, do not transfer to output register
22H	0	Command to transfer data from the data shift register to the output storage register
44H	0	Write data to the data shift register and transfer it to the output storage register immediately (extra load 22H command not needed)
Other	x	No action on undefined subaddresses

All other undefined subaddress values are not acknowledged.

register definition:

- The data shift register receives serial data from the I²C interface.
- The data shift register receives data from the input interface and holds it until it is transferred to the output storage register.
- The output storage register controls whether the FET is on or off.

TPIC2810 I²C input interface protocol definition

S	Start Condition
G	Group ID: Defined as 1100
A(0:2)	Device Address Selectable Via Input Terminals
RW	Read/Write Select Bit
A	Acknowledge
Subaddress	Defined Per Subaddress Table
Data	Data to Be Loaded Into the Shift and Output Registers
P	Stop Condition

TPIC2810

8-BIT LED DRIVER WITH I²C INTERFACE

SLIS109A – DECEMBER 2001 – REVISED SEPTEMBER 2002

PRINCIPLES OF OPERATION

Case 1: Read/Write serial data, but do not load output register

This case loads the data shift register with data via the I²C interface. Data is not transferred to the output storage register.

write operation:

G[3:0]: Fixed at 1100

A[2:0]: Selectable Via Input Terminals

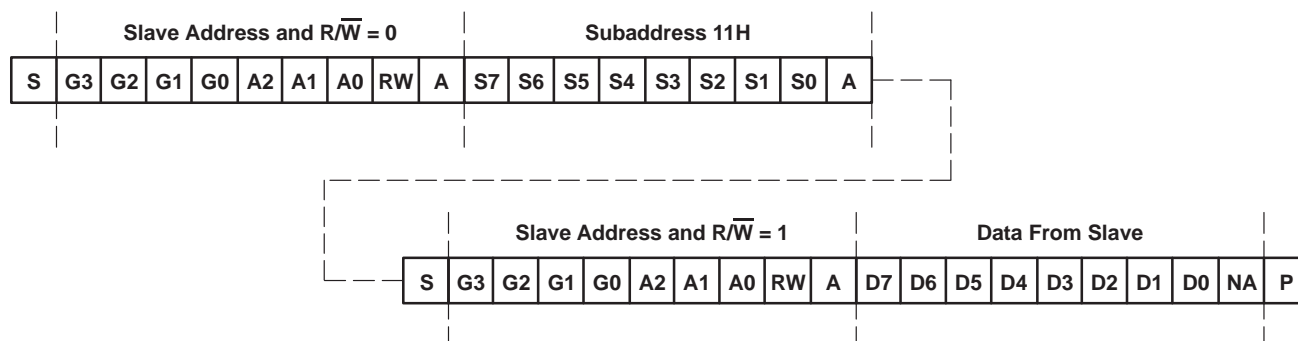

RW: 0 = Write Shift Register

Subaddress: 11H (0001 0001)

Data: Output Data to the TPIC2810 Device

Acknowledge: Occurs After Valid Address Byte, After the Subaddress Byte, and After the Data Byte

read operation:

G[3:0]: Fixed at 1100

A[2:0]: Selectable Via Input Terminals

RW: 1 = Read Shift Register (Note the Slave Address RW Bit = 0)

Subaddress: 11H (0001 0001)

Data: Input Data From the TPIC2810 Device

Acknowledge: Occurs After Valid Address Byte and After the Subaddress Byte

PRINCIPLES OF OPERATION

Case 2: Transfer serial data to output storage register

This case transfers data from the data shift register to the output storage register. The transfer must occur during the subaddress acknowledge bit and the data byte is ignored.

G[3:0]: Fixed at 1100
A[2:0]: Selectable Via Input Terminals
RW: 0 = Write Shift Register
Subaddress: 22H (0010 0010)
Data: Output Data to the TPIC2810 Device
Acknowledge: Occurs After Valid Address Byte and After the Subaddress Byte

Case 3: Read serial data and load output storage register

This case loads the data shift register with data via the I²C interface and transfers the data to output storage register, if $R/\overline{W} = 0$. The transfer occurs during the acknowledge bit following the data byte. Data byte and transfer to the output register is ignored if $R/\overline{W} = 1$.

G[3:0]: Fixed at 1100
A[2:0]: Selectable Via Input Terminals
RW: 0 = Write Shift Register
Subaddress: 44H (0100 0100)
Data: Output Data to the TPIC2810 Device
Acknowledge: Occurs After Valid Address Byte, After the Subaddress Byte and After the Data Byte

Case 4: Undefined subaddress values

G[3:0]: Fixed at 1100
A[2:0]: Selectable Via Input Terminals
RW: Don't Care
Subaddress: All Bit Combinations Except 11H, 22H, and 44H
Data: Don't Care; Data Is Ignored
Acknowledge: Occurs After Valid Address Byte, But Is Not Issued After an Undefined Subaddress Byte or After the Data Byte Following an Undefined Subaddress Byte

TPIC2810

8-BIT LED DRIVER WITH I²C INTERFACE

SLIS109A – DECEMBER 2001 – REVISED SEPTEMBER 2002

PRINCIPLES OF OPERATION

I²C bus operation

The I²C bus is a communications link between a controller and a series of slave terminals. The link is established using a two-wire bus consisting of a serial clock signal (SCL) and a serial data signal (SDA). The serial clock is sourced from the controller in all cases where the serial data signal is bidirectional for data communication between the controller and the slave terminals. Each device has an open drain output to transmit data on the serial data line. An external pullup resistor must be placed on the serial data signal to provide the high level portion of the data transmission.

Data transmission is initiated with a start bit from the controller as shown in Figure 10. Both the SCL and SDA signals must remain in a logic high state when the controller is not communicating with the slave devices. A start condition is recognized by the slave devices when the SDA line transitions from high to low during the high portion of the SCL signal. Upon reception of a start bit, the TPIC2810 device receives serial data on the SDA input and check for valid address and control information. If the appropriate group and address bits are set for the device, then the device issues an acknowledge pulse and prepares the receive subaddress data. The group ID for the TPIC2810 device is hard coded to be 1100. The slave address bits are set to correspond to the A(0:2) inputs for the device. Up to eight TPIC2810 devices can be placed on the bus. Subaddress data is decoded and responded to as per the *TPIC2810 subaddress and I²C protocol definition* section of this data sheet. Data transmission is complete by either the reception of a stop condition or the reception of the data word sent to the device. A stop condition is recognized as a low-to-high transition of the SDA input during the high portion of the SCL signal. All other transitions of the SDA line must occur during the low portion of the SCL signal.

An acknowledge is issued by the TPIC2810 device after the reception of valid address, subaddress and data words as per the *TPIC2810B subaddress and I²C protocol definition* section of this document. Reference Figure 10. The device acknowledges each byte of data that it receives from the controller.

Figure 10. Start/Stop/Acknowledge Protocol

TPIC2810DRG4.A	Active	Production	SOIC (D) 16	2500 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	IC2810

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
