

## TPIC6C595 Power Logic 8-Bit Shift Register

### 1 Features

- Low  $r_{DS(on)}$ , 7  $\Omega$  Typical
- Avalanche Energy, 30 mJ
- Eight Power DMOS Transistor Outputs of 100-mA Continuous Current
- 250-mA Current Limit Capability
- ESD Protection, 2500 V
- Output Clamp Voltage, 33 V
- Devices are Cascadable
- Low-Power Consumption

### 2 Applications

- Instrumentation Clusters
- Tell-Tale Lamps
- LED Illumination and Controls
- Automotive Relay or Solenoids
- Drivers

### 3 Description

The TPIC6C595 is a monolithic, medium-voltage, low-current power 8-bit shift register designed for use in systems that require relatively moderate load power such as LEDs. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other low-current or medium-voltage loads.

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through both the shift and storage registers on the rising edge of the shift register clock (SRCK) and the register clock (RCK), respectively. The device transfers data out the serial output (SER OUT) port on the rising edge of SRCK. The storage register transfers data to the output buffer when shift register clear ( $\overline{CLR}$ ) is high. When  $\overline{CLR}$  is low, the input shift register is cleared. When output enable ( $\overline{G}$ ) is held high, all data in the output buffers is held low and all drain outputs are off. When  $\overline{G}$  is held low, data from the storage register is transparent to the output buffers. When data in the output buffers is low, the DMOS transistor outputs are off. When data is high, the DMOS transistor outputs have sink-current capability. The SER OUT allows for cascading of the data from the shift register to additional devices.

Outputs are low-side, open-drain DMOS transistors with output ratings of 33-V to 100-mA continuous sink-current capability. Each output provides a 250-mA maximum current limit at  $T_C = 25^\circ\text{C}$ . The current limit decreases as the junction temperature increases for additional device protection. The device also provides up to 2500 V of ESD protection when tested using the human-body model and the 200-V machine model.

The TPIC6C595 is characterized for operation over the operating case temperature range of  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPIC6C595	SOIC (16)	9.90 mm x 3.91 mm
	TSSOP (16)	5.00 mm x 4.40 mm
	PDIP (16)	19.30 mm x 6.35 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Logic supply voltage <sup>(2)</sup>	-0.3	7	V
V <sub>I</sub>	Logic input voltage	-0.3	7	V
V <sub>DS</sub>	Power DMOS drain-to-source voltage <sup>(3)</sup>	-0.3	33	V
	Continuous source-to-drain diode anode current	0	250	mA
	Pulsed source-to-drain diode anode current <sup>(4)</sup>	0	500	mA
I <sub>D</sub>	Pulsed drain current, each output, all outputs on, T <sub>C</sub> = 25°C <sup>(4)</sup>	0	250	mA
I <sub>D</sub>	Continuous drain current, each output, all outputs on, T <sub>C</sub> = 25°C <sup>(4)</sup>	0	100	mA
I <sub>DM</sub>	Peak drain current single output, T <sub>C</sub> = 25°C <sup>(4)</sup>	0	250	mA
E <sub>AS</sub>	Single-pulse avalanche energy (see <a href="#">Figure 11</a> )	0	30	mJ
I <sub>AS</sub>	Avalanche current <sup>(5)</sup>	0	200	mA
	Continuous total dissipation	See <a href="#">Thermal Information</a>		
T <sub>J</sub>	Operating virtual junction temperature	-40	150	°C
T <sub>C</sub>	Operating case temperature	-40	125	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to GND.
- (3) Each power DMOS source is internally connected to GND.
- (4) Pulse duration ≤ 100 μs and duty cycle ≤ 2%.
- (5) DRAIN supply voltage = 15 V, starting junction temperature (T<sub>JS</sub>) = 25°C, L = 1.5 H, I<sub>AS</sub> = 200 mA (see [Figure 11](#)).

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2500
		Charged-device model (CDM), per AEC Q100-011	±200
			V

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>CC</sub>	Logic supply voltage	4.5	5.5	V
V <sub>IH</sub>	High-level input voltage	0.85 V <sub>CC</sub>		V
V <sub>IL</sub>	Low-level input voltage		0.15 V <sub>CC</sub>	V
	Pulsed drain output current, T <sub>C</sub> = 25°C, V <sub>CC</sub> = 5 V, all outputs on <sup>(1)</sup> <sup>(2)</sup> (see <a href="#">Figure 7</a> )		250	mA
t <sub>su</sub>	Setup time, SER IN high before SRCKM ↑ (see <a href="#">Figure 9</a> )	20		ns
t <sub>h</sub>	Hold time, SER IN high after SRCKM ↑, (see <a href="#">Figure 9</a> )	20		ns
t <sub>w</sub>	Pulse duration (see <a href="#">Figure 9</a> )	40		ns
T <sub>C</sub>	Operating case temperature	-40	125	°C

- (1) Pulse duration ≤ 100 μs and duty cycle ≤ 2%.
- (2) Technique should limit T<sub>J</sub> - T<sub>C</sub> to 10°C maximum.

## 6.4 Thermal Information

		I <sub>OH</sub> = -4 mA,	V <sub>CC</sub> = 4.5 V	4	4.2		
V <sub>OL</sub>	Low-level output voltage, SER OUT	I <sub>OL</sub> = 20 μA,	V <sub>CC</sub> = 4.5 V		0.005	0.1	V
		I <sub>OL</sub> = 4 mA,	V <sub>CC</sub> = 4.5 V		0.3	0.5	
I <sub>IH</sub>	High-level input current	V <sub>CC</sub> = 5.5 V,	V <sub>I</sub> = V <sub>CC</sub>			1	μA
I <sub>IL</sub>	Low-level input current	V <sub>CC</sub> = 5.5 V,	V <sub>I</sub> = 0			-1	μA
I <sub>CC</sub>	Logic supply current	V <sub>CC</sub> = 5.5 V	All outputs off		20	200	μA
			All outputs on		150	500	
I <sub>CC(FRQ)</sub>	Logic supply current at frequency	f <sub>SRCK</sub> = 5 MHz, All outputs off,	C <sub>L</sub> = 30 pF, See <a href="#">Figure 9</a> and <a href="#">Figure 2</a>		1.2	5	mA
I <sub>N</sub>	Nominal current	V <sub>DS(on)</sub> = 0.5 V, T <sub>C</sub> = 85°C	I <sub>N</sub> = I <sub>D</sub> , See <sup>(1)</sup> ( <sup>2</sup> )( <sup>3</sup> )		90		mA
I <sub>DSX</sub>	Off-state drain current	V <sub>DS</sub> = 30 V,	V <sub>CC</sub> = 5.5 V		0.1	0.2	μA
		V <sub>DS</sub> = 30 V T <sub>C</sub> = 125°C	V <sub>CC</sub> = 5.5 V		0.15	0.3	
r <sub>DS(on)</sub>	Static drain-source on-state resistance	I <sub>D</sub> = 50 mA, V <sub>CC</sub> = 4.5 V	See <sup>(1)</sup> and <sup>(2)</sup> and <a href="#">Figure 3</a> and <a href="#">Figure 4</a>		6.5	9	Ω
		I <sub>D</sub> = 50 mA, T <sub>C</sub> = 125°C, V <sub>CC</sub> = 4.5 V			9.9	12	
		I <sub>D</sub> = 100 mA, V <sub>CC</sub> = 4.5 V			6.8	10	

(1) Technique should limit T<sub>J</sub> - T<sub>C</sub> to 10°C maximum.

(2) These parameters are measured with voltage-sensing contacts separate from the current-carrying contacts.

(3) Nominal current is defined for a consistent comparison between devices from different sources. It is the current that produces a voltage drop of 0.5 V at T<sub>C</sub> = 85°C.

## 8 Detailed Description

### 8.1 Overview

The TPIC6C595 is a monolithic, medium-voltage, low-current power 8-bit shift register designed to drive relatively moderate load power such as LEDs. The device contains a built-in voltage clamp on the outputs for inductive transient protection, so it can also drive relays, solenoids, and other low-current or medium-voltage loads.

### 8.2 Functional Block Diagram

Figure 12. Logic Diagram (Positive Logic)

### 8.3 Feature Description

#### 8.3.1 Serial-In Interface

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through both the shift and storage registers on the rising edge of the shift register clock (SRCK) and the register clock (RCK), respectively. The storage register transfers data to the output buffer when shift register clear (CLR) is high.

#### 8.3.2 Clear Register

A logical low on (CLR) clears all registers in the device. TI suggests clearing the device during power up or initialization.

#### 8.3.3 Output Control

Holding the output enable (G) high holds all data in the output buffers low, and all drain outputs are off. Holding (G) low makes data from the storage register transparent to the output buffers. When data in the output buffers is low, the DMOS transistor outputs are off. When data is high, the DMOS transistor outputs have sink-current capability. This pin can also be used for global PWM dimming.

#### 8.3.4 Cascaded Application

The serial output (SER OUT) allows for cascading of the data from the shift register to additional devices. Connect the device (SEROUT) pin to the next device (SERIN) for daisy Chain.

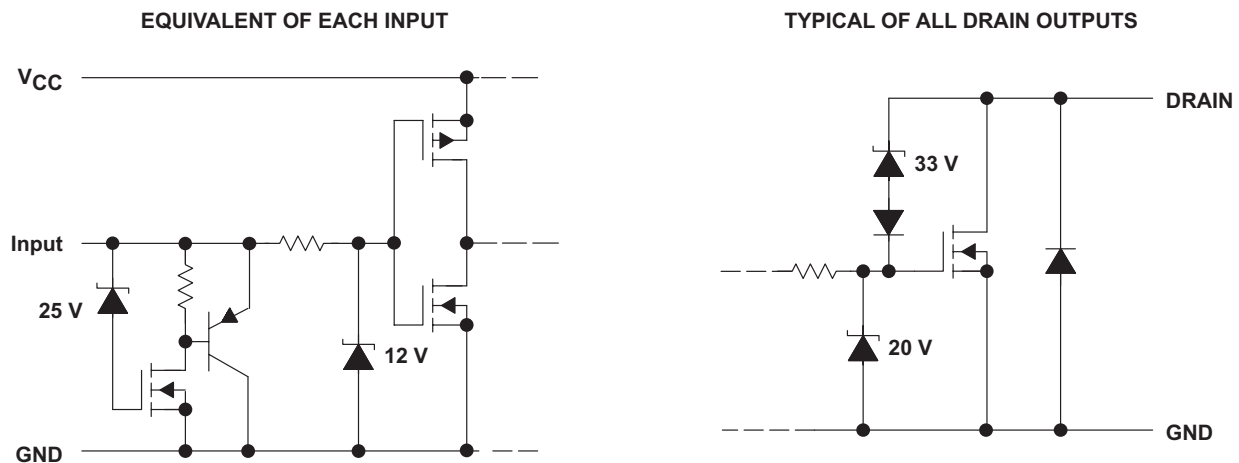

Figure 13. Schematic of Inputs and Outputs

#### 8.3.5 Current Limit Function

Outputs are low-side, open-drain DMOS transistors with output ratings of 33 V and 100-mA continuous sink current capability. Each output provides a 250-mA typical current limit at TC = 25°C. The current limit decreases as the junction temperature increases for additional device protection.

### 8.4 Device Functional Modes

#### 8.4.1 Operation With $V_{(VIN)} < 4.5\text{ V}$ (Minimum $V_{(VIN)}$ )

This device works normally during  $4.5\text{ V} \leq V_{(VIN)} \leq 5.5\text{ V}$ , when operation voltage is lower than 4.5 V. TI can't ensure the behavior of device, including communication interface and current capability.

#### 8.4.2 Operating With $5.5\text{ V} < V_{(VIN)} < 6\text{ V}$

This device works normally during this voltage range, but reliability issues may occur while the device works for a long time in this voltage range.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TPIC6C595 is a serial-in parallel-out, Power+LogicE 8-bit shift register with low-side switch DMOS outputs rating of 100 mA per channel. The device is designed for use in systems that require relatively moderate load power such as LEDs. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other low current or medium-voltage loads. The following focuses on automotive cluster applications for the TPIC6C595.

### 9.2 Typical Application

The typical application of TPIC6C595 is automotive cluster driver. In this example, two TPIC6C595 power shift registers are cascaded and used to turn on LEDs in the cluster panel. In this case, the LED must be updated after all 16 bits of data have been loaded into the serial shift registers. MCU outputs the data to the serial input (SER IN) while clocking the shift register clock (SRCK). After the 16th clock, a pulse to the register clock (RCK) transfers the data to the storage registers. If output enable (G) is low, then the LEDs are turned on corresponding to the status word with ones being on and zeros off. With this simple scheme, MCU can use the SPI interface to turn on 16 LEDs using only two ICs as illustrated in Figure 14.

**Figure 14. Typical Application Schematic**

## Typical Application (continued)

### 9.2.1 Design Requirements

Table 1 shows the design parameters for this typical application.

**Table 1. Design Parameters**

DESIGN PARAMETERS	EXAMPLE VALUE
V <sub>supply</sub>	9 V to 16 V
V(D1), V(D2), V(D3), V(D4), V(D5), V(D6), V(D7), V(D8)	2 V
V(D9), V(D10), V(D11), V(D12), V(D13), V(D14), V(D15), V(D16)	3.3 V
I(D1), I(D2), I(D3), I(D4), I(D5), I(D6), I(D7), I(D8)	20 mA when V <sub>battery</sub> is 12 V
I(D9), I(D10), I(D11), I(D12), I(D13), I(D14), I(D15), I(D16)	30 mA when V <sub>battery</sub> is 12 V

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Step-by-Step Design Procedure

To begin the design process, one must decide on a few parameters. The designer must know the following:

- V<sub>supply</sub> – LED supply is connected directly to the car battery, which has a voltage range from 9 V to 16 V, or fixed voltage. This application connects to the battery directly.
- V(D<sub>x</sub>) – LED forward voltage
- I(D<sub>x</sub>) – LED setting current when battery is 12 V.

##### 9.2.2.1.1 R1, R2, R3, R4, R5, R6, R7, R8

$$R1 = R2 = R3 = R4 = R5 = R6 = R7 = R8 = (V_{\text{supply}} - V(D_x)) / I(D_x) = (12 \text{ V} - 2 \text{ V}) / 0.02 \text{ A} = 500 \Omega \quad (1)$$

When V<sub>supply</sub> is 9 V, I(D1) = I(D2) = I(D3) = I(D4) = I(D5) = I(D6) = I(D7) = I(D8) = (V<sub>supply</sub> – V(D<sub>x</sub>)) / R<sub>x</sub> = 14 mA.

When V<sub>supply</sub> is 16 V, I(D1) = I(D2) = I(D3) = I(D4) = I(D5) = I(D6) = I(D7) = I(D8) = (V<sub>supply</sub> – V(D<sub>x</sub>)) / R<sub>x</sub> = 28 mA.

##### 9.2.2.1.2 R9, R10, R11, R12, R13, R14, R15, R16

$$R9 = R10 = R11 = R12 = R13 = R14 = R15 = R16 = (V_{\text{supply}} - V(D_x)) / I(D_x) = (12 \text{ V} - 3.3 \text{ V}) / 0.03 \text{ A} = 290 \Omega \quad (2)$$

When V<sub>supply</sub> is 9 V, I(D9) = I(D10) = I(D11) = I(D12) = I(D13) = I(D14) = I(D15) = I(D16) = (V<sub>supply</sub> – V(D<sub>x</sub>)) / R<sub>x</sub> = 19.7 mA.

When V<sub>supply</sub> is 16 V, I(D9) = I(D10) = I(D11) = I(D12) = I(D13) = I(D14) = I(D15) = I(D16) = (V<sub>supply</sub> – V(D<sub>x</sub>)) / R<sub>x</sub> = 43.8 mA.

#### NOTE

If customer can accept the current variation when battery voltage is changing, they can connect to battery directly. If customer needs the less variation of current, they must use the voltage regulator as supply voltage of LED, or change to constant current LED driver directly.

### 9.2.3 Application Curve

Figure 15. CH1 is SRCK, CH2 is RCK, CH3 is SERIN, CH4 is D1 current

## 10 Power Supply Recommendations

The TPIC6C595 device is designed to operate from an input voltage supply range from 4.5 V to 5.5 V. This input supply must be well regulated. TI recommends placing the ceramic bypass capacitors near the  $V_{CC}$  pin.

## 11 Layout

### 11.1 Layout Guidelines

There is no special layout requirement for the digital signal pin; the only requirement is placing the ceramic bypass capacitors near the corresponding pin. Because the TPIC6C595 device does not have a thermal shutdown protection function, to prevent thermal damage,  $T_J$  must be less than 150°C. If the total sink current is high, the power dissipation might be large. The devices are currently not available in the thermal pad package, so good PCB design can optimize heat transfer, which is absolutely essential for the long-term reliability of the device.

Maximize the copper coverage on the PCB to increase the thermal conductivity of the board, because the major heat-flow path from the package to the ambient is through the copper on the PCB. Maximum copper is extremely important when the design does not include heat sinks attached to the PCB on the other side of the package.

- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- All thermal vias should be either plated shut or plugged and capped on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage should be at least 85%.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

D (R-PDSO-G16)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
  - E. Reference JEDEC MS-012 variation AC.

4220204/B 12/2023

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

# EXAMPLE BOARD LAYOUT

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 10X

SOLDER MASK DETAILS

4220204/B 12/2023

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

PW0016A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE: 10X

4220204/B 12/2023

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

N (R-PDIP-T\*\*)

PLASTIC DUAL-IN-LINE PACKAGE

16 PINS SHOWN

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - $\triangle C$  Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).
  - $\triangle D$  The 20 pin end lead shoulder width is a vendor option, either half or full width.
