

# TPS7A74 1.5-A, Low-Dropout Linear Regulator With Programmable Soft-Start

## 1 Features

- $V_{OUT}$  range: 0.65 V to 3.6 V
- Ultra-low  $V_{IN}$  range: 0.65 V to 6 V
- $V_{BIAS}$  range: 1.7 V to 6 V
- Low dropout: 150 mV typical at 1.5 A,  $V_{BIAS} = 5$  V
- Noise: 7.1  $\mu V_{RMS}$
- PSRR:
  - 70 dB at 1 kHz
  - 60 dB at 10 kHz
  - 55 dB at 100 kHz
  - 50 dB at 1 MHz
- 1.5% accuracy over line, load, and temperature
- Programmable soft-start provides linear voltage start-up
- $V_{BIAS}$  permits low  $V_{IN}$  operation with good transient response
- UVLO on both IN and BIAS
- Stable with any output capacitor  $\geq 10 \mu F$
- Package: Small, 3-mm  $\times$  3-mm  $\times$  0.8-mm WSON-8

## 2 Applications

- [High-performance computing](#)
- [Microservers](#)
- [Desktop and PC motherboards](#)
- [Data concentrators](#)
- [Rugged PC laptops](#)

## 3 Description

The TPS7A74 low-dropout (LDO) linear regulator provides an easy-to-use robust power management solution for a wide variety of applications. User-programmable soft-start minimizes stress on the input power source by reducing capacitive inrush current on start up. The soft-start is monotonic and well-suited for powering many different types of processors and application-specific integrated circuits (ASICs). The enable input allows for easy sequencing with external regulators. This complete flexibility allows a solution to be configured that meets the sequencing requirements of field-programmable gate arrays (FPGAs), digital signal processors (DSPs), and other applications with special start-up requirements.

A precision reference and error amplifier deliver 1.5% accuracy over load, line, temperature, and process. The device is stable with any type of capacitor greater than or equal to 10  $\mu F$ , and is fully specified for  $T_J = -40^\circ C$  to  $+125^\circ C$ . The TPS7A74 is offered in a small, 3-mm  $\times$  3-mm, WSON-8 package, yielding a highly compact, total solution size.

### Package Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS7A74	WSON (8)	3.00 mm $\times$ 3.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

Not to scale

**Figure 5-1. DSD Package, 8-Pin WSON With Thermal Pad (Top View)**

### Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	BIAS	I	Bias input voltage for error amplifier, reference, and internal control circuits. Use a 0.1 $\mu$ F or larger input capacitor for optimal performance. If IN is connected to BIAS, a 4.7 $\mu$ F or larger capacitor must be used.
2	EN	I	Enable pin.
3	SS	I	Soft-start pin. This pin must be connected to a capacitor to GND.
4	IN	I	Input to the device. Use a 1 $\mu$ F or larger input capacitor for optimal performance.
5, 6	OUT	O	Regulated output voltage. A small capacitor (total typical capacitance of $\geq 10$ $\mu$ F, ceramic) is required from this pin to ground to assure stability.
7	FB	I	Feedback pin. The feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating.
8	GND	—	Ground.
—	Thermal Pad	—	Ground.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage	IN	−0.3	6.5	V
Bias voltage	BIAS	−0.3	6.5	V
Enable voltage	EN	−0.3	6.5	V
Soft-start voltage	SS	−0.3	6.5	V
Feedback voltage	FB	−0.3	2	V
Output voltage	OUT	−0.3	$V_{IN} + 0.3$	V
Maximum output current	$I_{LIMIT}$	Internally limited		
Output short-circuit duration	$I_{SC}$	Indefinite		
Continuous total power dissipation	$P_{DISS}$	See Thermal Information		
Junction Temperature	$T_J$	−40	150	°C
Storage Temperature	$T_{stg}$	−55	150	

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input supply voltage	0.65	V <sub>BIAS</sub> – 0.1		V
V <sub>BIAS</sub> <sup>(1)</sup>	BIAS supply voltage	1.7		6	V
V <sub>EN</sub>	Enable voltage			6	V
V <sub>OUT</sub>	Output voltage	0.65		3.6	V
I <sub>OUT</sub>	Output current	0		1.5	A
C <sub>OUT</sub>	Output capacitor	10			μF
C <sub>IN</sub>	Input capacitor <sup>(2)</sup>	1			μF
C <sub>BIAS</sub>	Bias capacitor	0.1	1		μF
T <sub>J</sub>	Operating junction temperature	–40		125	°C

(1) BIAS supply is required when V<sub>IN</sub> is below V<sub>OUT</sub> + 1.62 V.

(2) If V<sub>IN</sub> and V<sub>BIAS</sub> are connected to the same supply, the recommended minimum capacitor for the supply is 4.7 μF.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS7A74		UNIT
		DSD (WSON) <sup>(2)</sup>	DSD (WSON) <sup>(3)</sup>	
		10 PINS	10 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	49.3	34.9	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	55.3	–	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	21.3	–	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.9	1.6	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	21.3	18.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	5.8	–	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

(2) JEDEC standard. (2s2p, no vias to internal planes and bottom layer).

(3) TPS7A74 thermal characteristics on EVM.

## 6.5 Electrical Characteristics

at V<sub>EN</sub> = 1.1 V, V<sub>IN</sub> = V<sub>OUT</sub> + 0.3 V, C<sub>BIAS</sub> = 0.1 μF, C<sub>IN</sub> = C<sub>OUT</sub> = 10 μF, C<sub>NR</sub> = 10 nF, I<sub>OUT</sub> = 10 mA, V<sub>BIAS</sub> = 5.0 V <sup>(3)</sup>, and T<sub>J</sub> = –40°C to 125°C (unless otherwise noted); typical values are at T<sub>J</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>REF</sub>	Internal reference (adj.)		0.641	0.65	0.659	V
	Output accuracy <sup>(1)</sup> <sup>(4)</sup> <sup>(5)</sup>	2.97 V ≤ V <sub>BIAS</sub> ≤ 6 V, 0 mA ≤ I <sub>OUT</sub> ≤ 1.5 A	−1.5	±0.5	1.5	%
	Line regulation (V <sub>BIAS</sub> )	Max(2.7 V, V <sub>OUT</sub> + 1.6 V) ≤ V <sub>BIAS</sub> ≤ 6 V		0.2	0.32	%/V
	Line regulation (V <sub>IN</sub> )	V <sub>OUT(nom)</sub> + 0.15 V ≤ V <sub>IN</sub> ≤ 6 V		0.01	0.05	%/V
	Load regulation	0 mA ≤ I <sub>OUT</sub> ≤ 1.5 A		0.33		%/A
V <sub>DO(IN)</sub>	V <sub>IN</sub> dropout voltage <sup>(2)</sup>	I <sub>OUT</sub> = 1.5 A, V <sub>BIAS</sub> − V <sub>OUT(nom)</sub> ≥ 2.8 V		150	180	mV
V <sub>DO(BIAS)</sub>	V <sub>BIAS</sub> dropout voltage <sup>(2)</sup>	I <sub>OUT</sub> = 1.5 A, V <sub>IN</sub> = V <sub>BIAS</sub>		1.1	1.3	V
I <sub>CL</sub>	Output current limit	V <sub>OUT</sub> = 80% × V <sub>OUT(nom)</sub>	2	2.7	3.3	A
I <sub>BIAS</sub>	BIAS pin current	I <sub>OUT</sub> = 10 mA		0.25	0.33	mA
I <sub>SHDN</sub>	Shutdown supply current (I <sub>GND</sub> )	V <sub>EN</sub> ≤ 0.4 V, V <sub>IN</sub> = 6 V, V <sub>BIAS</sub> = 6 V		1	55	μA
I <sub>FB</sub>	Feedback pin current		−1	0.15	1	μA
V <sub>BIAS(UVLO)</sub>	Bias rail UVLO rising threshold		1.04	1.4	1.65	V
V <sub>BIAS(UVLO)</sub> , HYST	Bias rail UVLO hysteresis		0.02	0.06	0.07	V

## 6.5 Electrical Characteristics (continued)

at  $V_{EN} = 1.1\text{ V}$ ,  $V_{IN} = V_{OUT} + 0.3\text{ V}$ ,  $C_{BIAS} = 0.1\text{ }\mu\text{F}$ ,  $C_{IN} = C_{OUT} = 10\text{ }\mu\text{F}$ ,  $C_{NR} = 10\text{ nF}$ ,  $I_{OUT} = 10\text{ mA}$ ,  $V_{BIAS} = 5.0\text{ V}$  <sup>(3)</sup>, and  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$  (unless otherwise noted); typical values are at  $T_J = 25^\circ\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{IN(UVLO)}$ , rising	In rail UVLO rising threshold		0.39	0.455	0.5	V
$V_{IN(UVLO)}$ , falling	In rail UVLO falling threshold		0.21	0.26	0.3	V
$t_{STR}$	Minimum start-up time	$R_{LOAD}$ for $I_{OUT} = 1.0\text{ A}$ , $C_{SS} = \text{open}$	35		335	$\mu\text{s}$
$I_{SS}$	Soft-start charging current	$V_{SS} = 0\text{ V}$	8	17	31	$\mu\text{A}$
$V_{SS}$	Soft-start pin disable voltage	$V_{EN} = 0\text{ V}$		0	50	mV
PSRR	Power-supply rejection ( $V_{BIAS}$ to $V_{OUT}$ )	1 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		57		dB
		300 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		27		
PSRR	Power-supply rejection ( $V_{IN}$ to $V_{OUT}$ )	$BW = 10\text{ Hz to }1\text{ MHz}$ , $I_{OUT} = 1\text{ A}$ , $V_{IN} = 2.05\text{ V}$ , $V_{OUT} = 1.8\text{ V}$		27		dB
$V_n$	Output voltage noise	$BW = 10\text{ Hz to }100\text{ kHz}$ , $I_{OUT} = 1\text{ A}$ , $V_{IN} = 0.95\text{ V}$ , $V_{OUT} = 0.65\text{ V}$		7.1		$\mu\text{V}_{RMS}$
$V_{EN(hi)}$	Enable input high level		1.1		5.5	V
$V_{EN(lo)}$	Enable input low level		0		0.4	V
$V_{EN(hys)}$	Enable pin hysteresis			55		mV
$V_{EN(dg)}$	Enable pin deglitch time			20		$\mu\text{s}$
$I_{EN}$	Enable pin current	$V_{EN} = 5\text{ V}$		0.1	0.2	$\mu\text{A}$
$R_{PULLDOWN(OUT)}$	$V_{BIAS} = 5\text{ V}$ , $V_{EN} = 0\text{ V}$			0.6	1	k $\Omega$
$R_{PULLDOWN(FB)}$	$V_{BIAS} = 5\text{ V}$ , $V_{EN} = 0\text{ V}$			120		$\Omega$
$T_{SD}$	Thermal shutdown temperature	Shutdown, temperature increasing		165		$^\circ\text{C}$
		Reset, temperature decreasing		140		

- (1) Adjustable devices tested at 0.65 V; resistor tolerance is not taken into account.
- (2) Dropout is defined as the voltage from  $V_{IN}$  to  $V_{OUT}$  when  $V_{OUT}$  is 3% below nominal.
- (3)  $V_{BIAS} = V_{DO\_MAX(BIAS)} + V_{OUT}$  for  $V_{OUT} \geq 3.4\text{ V}$
- (4) The device is not tested under conditions where  $V_{IN} > V_{OUT} + 1.65\text{ V}$  and  $I_{OUT} = 1.5\text{ A}$ , because the power dissipation is higher than the maximum rating of the package. Also, this accuracy specification does not apply on any application condition that exceeds the power dissipation limit of the package under test.
- (5) The device is not tested under conditions where  $V_{IN} > V_{OUT} + 1.65\text{ V}$  and  $I_{OUT} = 1.5\text{ A}$ , because the power dissipation is higher than the maximum rating of the package. Also, this accuracy specification does not apply on any application condition that exceeds the power dissipation limit of the package under test.

## 6.6 Typical Characteristics

at  $T_J = 25^\circ\text{C}$ ,  $V_{IN} = V_{OUT(nom)} + 0.3\text{ V}$ ,  $V_{BIAS} = 5\text{ V}$ ,  $V_{EN} = V_{IN}$ ,  $C_{IN} = 10\text{ }\mu\text{F}$ ,  $C_{BIAS} = 1\text{ }\mu\text{F}$ , and  $C_{OUT} = 10\text{ }\mu\text{F}$  (unless otherwise noted)

## 7 Detailed Description

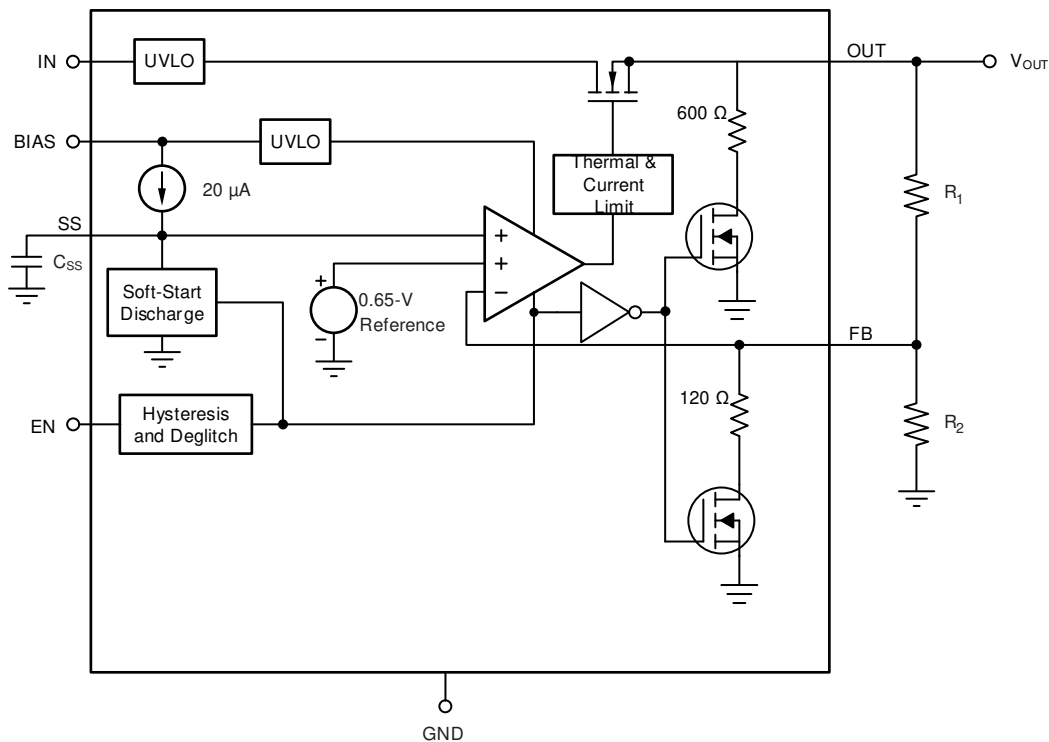

### 7.1 Overview

The TPS7A74 is a low-input, low-output, low-quiescent-current linear regulator optimized to support excellent transient performance. This regulator uses a low-current bias rail to power all internal control circuitry, allowing the n-type field effect transistor (NMOS) pass transistor to regulate very-low input and output voltages.

Using an NMOS-pass transistor offers several critical advantages for many applications. Unlike a p-channel metal-oxide-semiconductor field effect transistor (PMOS) topology device, the output capacitor has little effect on loop stability. This architecture allows the TPS7A74 to be stable with any ceramic capacitor 10  $\mu\text{F}$  or greater. Transient response is also superior to PMOS topologies, particularly for low  $V_{\text{IN}}$  applications.

The TPS7A74 features a programmable voltage-controlled, soft-start circuit that provides a smooth, monotonic start-up and limits start-up inrush currents that can be caused by large capacitive loads. An enable (EN) pin with hysteresis and deglitch allows slow-ramping signals to be used for sequencing the device. The low  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often required by processor-intensive systems.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Enable and Shutdown

The enable (EN) pin is active high and compatible with standard digital-signaling levels. Setting  $V_{EN}$  below 0.4 V turns the regulator off, and setting  $V_{EN}$  above 1.1 V turns the regulator on. Unlike many regulators, the enable circuitry has hysteresis and deglitching for use with relatively slowly ramping analog signals. This configuration allows the device to be enabled by connecting the output of another supply to the EN pin. The enable circuitry typically has 50 mV of hysteresis and a deglitch circuit to help avoid on-off cycling as a result of small glitches in the  $V_{EN}$  signal.

The enable threshold is typically 0.75 V and varies with temperature and process variations, see [Figure 6-42](#). Temperature variation is approximately  $-1.2 \text{ mV}/^{\circ}\text{C}$ ; process variation accounts for most of the rest of the variation to the 0.4-V and 1.1-V limits. If precise turn-on timing is required, a fast rise-time signal must be used.

If not used, EN can be connected to BIAS. Place the connection as close as possible to the bias capacitor.

### 7.3.2 Active Discharge

The TPS7A74 has two internal active pulldown circuits: one on the FB pin and one on the OUT pin.

Each active discharge function uses an internal metal-oxide-semiconductor field-effect transistor (MOSFET) that connects a resistor ( $R_{PULLDOWN}$ ) to ground when the low-dropout resistor (LDO) is disabled in order to actively discharge the output voltage. The active discharge circuit is activated when the device is disabled by driving EN to logic low, when the voltage at IN or BIAS is below the UVLO threshold, or when the regulator is in thermal shutdown.

The discharge time after disabling the device depends on the output capacitance ( $C_{OUT}$ ) and the load resistance ( $R_L$ ) in parallel with the pulldown resistor.

The first active pulldown circuit connects the output to GND through a 600- $\Omega$  resistor when the device is disabled.

The second circuit connects FB to GND through a 120- $\Omega$  resistor when the device is disabled. This resistor discharges the FB pin. [Equation 1](#) calculates the output capacitor discharge time constant when OUT is shorted to FB, or when the output voltage is set to 0.65 V.

$$T_{OUT} = (600 \parallel 120 \times R_L / (600 \parallel 120 + R_L)) \times C_{OUT} \quad (1)$$

If the LDO is set to an output voltage greater than 0.65 V, a resistor divider network is in place and minimizes the FB pin pulldown. [Equation 2](#) and [Equation 3](#) calculate the time constants set by these discharge resistors.

$$R_{DISCHARGE} = (120 \parallel R_2) + R_1 \quad (2)$$

$$T_{OUT} = R_{DISCHARGE} \times R_L / (R_{DISCHARGE} + R_L) \times C_{OUT} \quad (3)$$

Do not rely on the active discharge circuit for discharging a large amount of output capacitance after the input supply has collapsed because reverse current can flow from the output to the input and can cause damage to the device. Limit reverse current to no more than 5% of the device-rated current.

See [Figure 6-48](#) for additional information.

### 7.3.3 Global Undervoltage Lockout (UVLO) Circuit

Two undervoltage lockout (UVLO) circuits are present to prevent the TPS7A74 from turning on with an insufficient rail. One circuit is present on the BIAS pin and the other circuit is on the IN pin. The two UVLO signals are connected internally through an AND gate, as shown in Figure 7-1, that turns off the device when the voltage on either input is below their respective UVLO thresholds.

In other words, the output is disabled until the IN pin voltage reaches a value greater than  $UVLO_{IN}$  and the BIAS pin voltage reaches a voltage greater than  $UVLO_{BIAS}$ .

**Figure 7-1. Global UVLO Circuit**

### 7.3.4 Internal Current Limit

The device has an internal current-limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a hybrid brick-wall foldback scheme. The current limit transitions from a brick-wall scheme to a foldback scheme at the foldback voltage ( $V_{FOLDBACK}$ ). In a high-load current fault with the output voltage above  $V_{FOLDBACK}$ , the brick-wall scheme limits the output current to the current limit ( $I_{CL}$ ). When the voltage drops below  $V_{FOLDBACK}$ , a foldback current limit activates that scales back the current when the output voltage approaches GND. When the output is shorted, the device supplies a typical current called the *short-circuit current limit* ( $I_{SC}$ ).  $I_{CL}$  and  $I_{SC}$  are listed in the [Electrical Characteristics](#) table.

For this device,  $V_{FOLDBACK}$  is approximately  $60\% \times V_{OUT(nom)}$ .

The output voltage is not regulated when the device is in current limit. When a current-limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in a brick-wall current limit, the pass transistor dissipates power  $[(V_{IN} - V_{OUT}) \times I_{CL}]$ . When the device output is shorted and the output is below  $V_{FOLDBACK}$ , the pass transistor dissipates power  $[(V_{IN} - V_{OUT}) \times I_{SC}]$ . If thermal shutdown is triggered, the device turns off. When the device sufficiently cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits](#) application note. Figure 7-2 illustrates a diagram of the foldback current limit.

**Figure 7-2. Foldback Current Limit**

### 7.3.5 Thermal Shutdown Protection ( $T_{SD}$ )

The internal thermal shutdown protection circuit disables the output when the thermal junction temperature ( $T_J$ ) of the pass transistor rises to the thermal shutdown temperature threshold,  $T_{SD(shutdown)}$  (typical). The thermal shutdown circuit hysteresis ensures that the LDO resets (turns on) when the temperature falls to  $T_{SD(reset)}$  (typical).

The thermal time constant of the semiconductor die is fairly short; thus, the device may cycle on and off when thermal shutdown is reached until the power dissipation is reduced. Power dissipation during start up can be high from large  $V_{IN} - V_{OUT}$  voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start up completes.

For reliable operation, limit the junction temperature to the maximum listed in the [Recommended Operating Conditions](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry is designed to protect against thermal overload conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the regulator into thermal shutdown, or above the maximum recommended junction temperature, reduces long-term reliability.

## 7.4 Device Functional Modes

Table 7-1 shows the conditions that lead to the different modes of operation. See the [Electrical Characteristics](#) table for parameter values.

**Table 7-1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER				
	V <sub>IN</sub>	V <sub>BIAS</sub>	V <sub>EN</sub>	I <sub>OUT</sub>	T <sub>J</sub>
Normal mode	V <sub>IN</sub> ≥ V <sub>OUT(nom)</sub> + V <sub>DO</sub> and V <sub>IN</sub> ≥ V <sub>IN(min)</sub>	V <sub>BIAS</sub> ≥ V <sub>OUT</sub> + V <sub>DO(BIAS)</sub>	V <sub>EN</sub> ≥ V <sub>HI(EN)</sub>	I <sub>OUT</sub> < I <sub>CL</sub>	T <sub>J</sub> < T <sub>SD</sub> for shutdown
Dropout mode	V <sub>IN(min)</sub> < V <sub>IN</sub> < V <sub>OUT(nom)</sub> + V <sub>DO(IN)</sub>	V <sub>BIAS</sub> < V <sub>OUT</sub> + V <sub>DO(BIAS)</sub>	V <sub>EN</sub> > V <sub>HI(EN)</sub>	I <sub>OUT</sub> < I <sub>CL</sub>	T <sub>J</sub> < T <sub>SD</sub> for shutdown
Disabled mode (any true condition disables the device)	V <sub>IN</sub> < V <sub>UVLO(IN)</sub>	V <sub>BIAS</sub> < V <sub>BIAS(UVLO)</sub>	V <sub>EN</sub> < V <sub>LO(EN)</sub>	—	T <sub>J</sub> ≥ T <sub>SD</sub> for shutdown

### 7.4.1 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is greater than the nominal output voltage plus the dropout voltage (V<sub>OUT(nom)</sub> + V<sub>DO</sub>)
- The bias voltage is greater than the nominal output voltage plus the dropout voltage (V<sub>OUT(nom)</sub> + V<sub>DO</sub>)
- The output current is less than the current limit (I<sub>OUT</sub> < I<sub>CL</sub>)
- The device junction temperature is less than the thermal shutdown temperature (T<sub>J</sub> < T<sub>SD(shutdown)</sub>)
- The enable voltage has previously exceeded the enable rising threshold voltage and has not yet decreased to less than the enable falling threshold

### 7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. Similarly, if the bias voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode as well. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and functions as a switch. Line or load transients in dropout can result in large output voltage deviations.

When operating in dropout, the ground current may increase. For dropout operation and the effect on the IN and BIAS current, see [Figure 6-51](#) to [Figure 6-56](#).

When the device is in a steady dropout state, defined as when the device is in dropout, (V<sub>IN</sub> < V<sub>OUT</sub> + V<sub>DO</sub> or V<sub>BIAS</sub> < V<sub>OUT</sub> + V<sub>DO</sub> directly after being in normal regulation state, but not during start up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage (V<sub>OUT(NOM)</sub> + V<sub>DO</sub>), the output voltage can overshoot for a short time when the device pulls the pass transistor back into the linear region.

### 7.4.3 Disabled

The output of the device can be shutdown by forcing the voltage of the enable pin to less than V<sub>IL(EN)</sub> (see the [Electrical Characteristics](#) table). When disabled, the pass transistor is turned off, internal circuits are shutdown, and the output voltage is actively discharged to ground by an internal discharge circuit from the output to ground.

The device is disabled under the following conditions:

- The input or bias voltages are below the respective minimum specifications
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold
- The device junction temperature is greater than the thermal shutdown temperature

## 7.5 Programming

### 7.5.1 Programmable Soft-Start

The TPS7A74 features a programmable, monotonic, voltage-controlled soft-start that is set with an external capacitor ( $C_{SS}$ ). This feature is important for many applications because the soft-start eliminates power-up initialization problems when powering FPGAs, DSPs, or other processors. The controlled voltage ramp of the output also reduces peak inrush current during start-up, minimizing start-up transient events to the input power bus.

To achieve a linear and monotonic soft-start, the error amplifier tracks the voltage ramp of the external soft-start capacitor until the voltage exceeds the internal reference. The soft-start ramp time depends on the soft-start charging current ( $I_{SS}$ ), soft-start capacitance ( $C_{SS}$ ), and the internal reference voltage ( $V_{REF}$ ). Equation 4 calculates the soft-start ramp time.

$$t_{SS} = \frac{(V_{REF} \times C_{SS})}{I_{SS}} \quad (4)$$

If large output capacitors are used, the device current limit ( $I_{CL}$ ) and the output capacitor may set the start-up time. The start-up time is given by Equation 5 in this case.

$$t_{SSCL} = \frac{(V_{OUT(NOM)} \times C_{OUT})}{I_{CL(MIN)}} \quad (5)$$

where:

- $V_{OUT(nom)}$  is the nominal output voltage
- $C_{OUT}$  is the output capacitance
- $I_{CL(min)}$  is the minimum current limit for the device

In applications where monotonic start up is required, the soft-start time given by Equation 4 must be set greater than Equation 5.

The maximum recommended soft-start capacitor is 15 nF. Larger soft-start capacitors can be used and do not damage the device; however, the soft-start capacitor discharge circuit may not be able to fully discharge the soft-start capacitor when enabled. Soft-start capacitors larger than 15 nF can be a problem in applications where the enable pin must be rapidly pulsed and the device must soft-start from ground.  $C_{SS}$  must be low-leakage; X7R, X5R, or C0G dielectric materials are preferred. Table 7-2 lists suggested soft-start capacitor values.

**Table 7-2. Standard Capacitor Values for Programming the Soft-Start Time<sup>(1)</sup>**

$C_{SS}$	SOFT-START TIME
Open	0.1 ms
1 nF	0.032 ms
5.6 nF	0.182 ms
10 nF	0.325 ms

$$(1) \quad t_{SS(s)} = \frac{V_{REF} \cdot C_{SS}}{I_{SS}} = \frac{0.65V \cdot C_{SS}(F)}{20\mu A}, \text{ where } t_{SS(s)} = \text{soft-start time in seconds.}$$

Another option to set the start-up rate is to use a feedforward capacitor; see the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator](#) application note for more information.

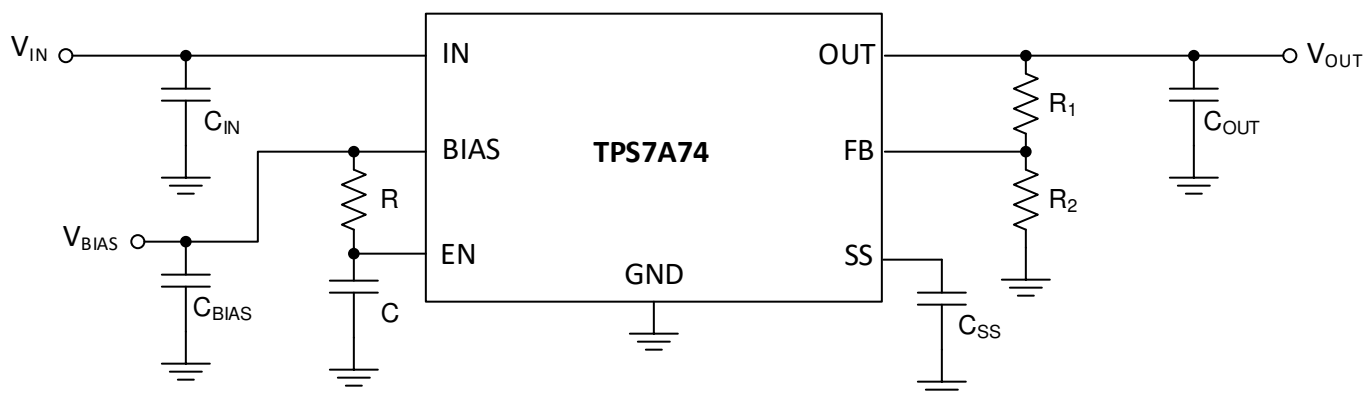

## 7.5.2 Sequencing Requirements

$V_{IN}$ ,  $V_{BIAS}$ , and  $V_{EN}$  can be sequenced in any order without causing damage to the device. However, for the soft-start function to work as intended, certain sequencing rules must be applied. Connecting EN to IN is acceptable for most applications, as long as  $V_{IN}$  is greater than 1.1 V and the ramp rate of  $V_{IN}$  and  $V_{BIAS}$  is faster than the set soft-start ramp rate.

There are several different start-up responses that are possible, but not typical:

- If the ramp rate of the input sources is slower than the set soft-start time, the output tracks the slower supply minus the dropout voltage until reaching the set output voltage
- If EN is connected to BIAS, the device soft-starts as programmed, provided that  $V_{IN}$  is present before  $V_{BIAS}$
- If  $V_{BIAS}$  and  $V_{EN}$  are present before  $V_{IN}$  is applied and the set soft-start time has expired, then  $V_{OUT}$  tracks  $V_{IN}$
- If the soft-start time has not expired, the output tracks  $V_{IN}$  until  $V_{OUT}$  reaches the value set by the charging soft-start capacitor

Figure 7-3 shows the use of an RC-delay circuit to hold off  $V_{EN}$  until  $V_{BIAS}$  has ramped. This technique can also be used to drive EN from  $V_{IN}$ . An external control signal can also be used to enable the device after  $V_{IN}$  and  $V_{BIAS}$  are present.

**Figure 7-3. Soft-Start Delay Using an RC Circuit to Enable the Device**

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

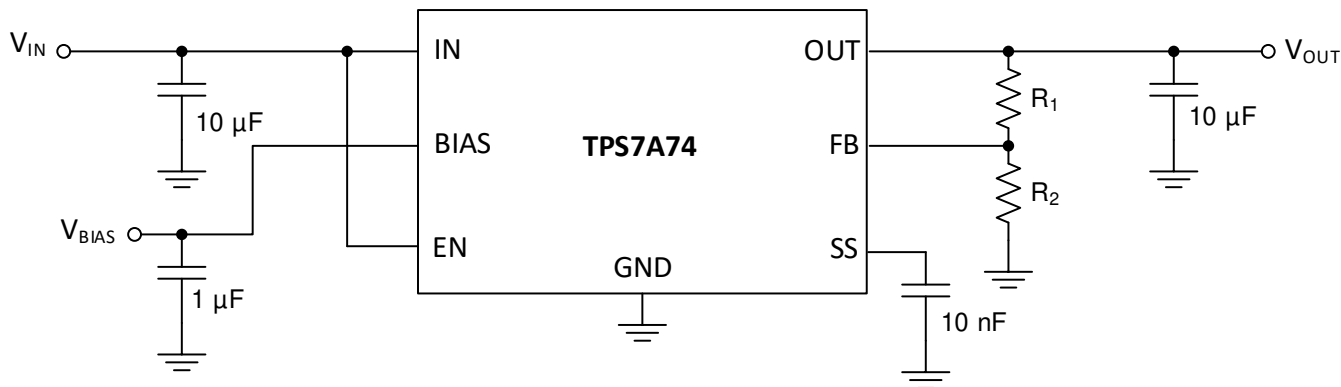

The TPS7A74 is a low-input, low-output (LILO) low-dropout regulator (LDO) that feature soft-start capability. This regulator uses a low-current bias input to power all internal control circuitry, allowing the NMOS pass transistor to regulate very low input and output voltages.

The use of an NMOS pass transistor offers several critical advantages for many applications. Unlike a PMOS topology device, the output capacitor has little effect on loop stability. This architecture allows stability with ceramic capacitors of 10  $\mu\text{F}$  or greater. Transient response is also superior to PMOS topologies, particularly for low  $V_{\text{IN}}$  applications.

A programmable voltage-controlled, soft-start circuit provides a smooth, monotonic start-up and limits start-up inrush currents that can be caused by large capacitive loads. An enable (EN) pin with hysteresis and deglitch allows slow-ramping signals to be used for sequencing the device. The low  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often required by processor-intensive systems.

#### 8.1.1 Adjusting the Output Voltage

Figure 8-1 shows the typical application circuit for the adjustable output device.

**Figure 8-1. Typical Application Circuit for the TPS7A74 (Adjustable)**

$R_1$  and  $R_2$  can be calculated for any output voltage using the formula shown in Figure 8-1. Table 8-1 lists sample resistor values of common output voltages. In order to achieve the maximum accuracy specifications,  $R_2$  must be  $\leq 4.99 \text{ k}\Omega$ .

**Table 8-1. Standard 1% Resistor Values for Programming the Output Voltage<sup>(1)</sup>**

R <sub>1</sub> (kΩ)	R <sub>2</sub> (kΩ)	Targeted V <sub>OUT</sub> (V)
Short	Open	0.65
0.768	4.99	0.75
2.43	4.53	1.00
2.72	4.42	1.05
3.48	4.99	1.10
4.22	4.99	1.20
4.99	3.83	1.50
4.99	2.80	1.80
4.99	1.74	2.51
4.99	1.21	3.33

(1)  $V_{OUT} = 0.65 \times (1 + R_1 / R_2)$ .

### Note

When V<sub>BIAS</sub> and V<sub>EN</sub> are present and V<sub>IN</sub> is not supplied, this device outputs approximately 50 μA of current from OUT. Although this condition does not cause any damage to the device, the output current can charge the OUT node if total resistance between OUT and GND (including external feedback resistors) is greater than 10 kΩ.

Because this LDO has a relatively low quiescent current of 50 μA, some applications may benefit from using larger R<sub>1</sub> and R<sub>2</sub> resistor values. In such cases where resistor values greater than 5 kΩ are considered, adding a C<sub>ff</sub> capacitor across R<sub>1</sub> may help improve stability.

### 8.1.2 Input, Output, and Bias Capacitor Requirements

The device is designed to be stable for ceramic capacitor of values ≥ 10 μF. The device is also stable with multiple capacitors in parallel, which can be of any type or value.

The capacitance required on the IN and BIAS pins strongly depends on the input supply source impedance. To counteract any inductance in the input, the minimum recommended capacitor for V<sub>IN</sub> is 1 μF and the minimum recommended capacitor for V<sub>BIAS</sub> is 0.1 μF. If V<sub>IN</sub> and V<sub>BIAS</sub> are connected to the same supply, the recommended minimum capacitor for V<sub>BIAS</sub> is 4.7 μF. Use good quality, low equivalent series resistance (ESR) and equivalent series inductance (ESL) capacitors on the input; ceramic X5R and X7R capacitors are preferred. Place these capacitors as close the pins as possible for optimum performance.

Low ESR and ESL capacitors improve high-frequency PSRR.

### 8.1.3 Transient Response

The TPS7A74 is designed to have excellent transient response for most applications with a small amount of output capacitance. In some cases, the transient response can be limited by the transient response of the input supply. This limitation is especially true in applications where the difference between the input and output is less than 300 mV. In this case, adding additional input capacitance improves the transient response more than just adding additional output capacitance. With a solid input supply, adding additional output capacitance reduces undershoot and overshoot during a transient event; see [Figure 6-10](#) in the [Typical Characteristics](#) section. Because the TPS7A74 is stable with output capacitors as low as 10 μF, many applications may then need very little capacitance at the LDO output. For these applications, local bypass capacitance for the powered device may be sufficient to meet the transient requirements of the application. This design reduces the total solution cost by avoiding the need to use expensive, high-value capacitors at the LDO output.

### 8.1.4 Dropout Voltage

The TPS7A74 offers very low dropout performance, making the device well-suited for high-current, low  $V_{IN}$  and low  $V_{OUT}$  applications. The low dropout allows the device to be used in place of a dc/dc converter and still achieve good efficiency. Equation 6 provides a quick estimate of the efficiency.

$$\text{Efficiency} \approx \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times (I_{IN} + I_Q)} \approx \frac{V_{OUT}}{V_{IN}} \text{ at } I_{OUT} \gg I_Q \quad (6)$$

This efficiency provides designers with the power architecture for their applications to achieve the smallest, simplest, and lowest cost solutions.

For this architecture, there are two different specifications for dropout voltage. The first specification (see Figure 8-2) is referred to as  $V_{IN}$  dropout and is used when an external bias voltage is applied to achieve low dropout. This specification assumes that  $V_{BIAS}$  is at least 2.8 V above  $V_{OUT}$ , which is the case for  $V_{BIAS}$  when powered by a 5.0-V rail with 5% tolerance and with  $V_{OUT} = 1.5$  V. If  $V_{BIAS}$  is higher than  $V_{OUT} + 2.8$  V, the  $V_{IN}$  dropout is less than specified.

#### Note

2.8 V is a test condition of this device and can be adjusted by referring to the [Electrical Characteristics](#) table.

The second specification (illustrated in Figure 8-2) is referred to as  $V_{BIAS}$  dropout and applies to applications where IN and BIAS are tied together. This option allows the device to be used in applications where an auxiliary bias voltage is not available or low dropout is not required. Dropout is limited by BIAS in these applications because  $V_{BIAS}$  provides the gate drive to the pass transistor; therefore,  $V_{BIAS}$  must be 1.3 V above  $V_{OUT}$ . Because of this usage, having IN and BIAS tied together become a highly inefficient solution that can consume large amounts of power. Pay attention not to exceed the power rating of the device package.

### 8.1.5 Output Noise

The TPS7A74 provides low output noise when a soft-start capacitor is used. When the device reaches the end of the soft-start cycle, the soft-start capacitor serves as a filter for the internal reference. By using a 1-nF, soft-start capacitor, the output noise is reduced by half and is typically 7.1  $\mu\text{V}_{\text{RMS}}$  for a 0.65-V output (10 Hz to 100 kHz). Further increasing  $C_{SS}$  has little effect on noise. Because most of the output noise is generated by the internal reference, the noise is a function of the set output voltage. Equation 7 gives the RMS noise with a 1-nF, soft-start capacitor:

$$V_N(\mu\text{V}_{\text{RMS}}) = 7.1 \cdot \left( \frac{\mu\text{V}_{\text{RMS}}}{V} \right) \cdot V_{OUT}(V) \quad (7)$$

The low output noise makes this LDO a good choice for powering transceivers, phase-locked loops (PLLs), or other noise-sensitive circuitry.

### 8.1.6 Estimating Junction Temperature

By using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , as shown in the [Thermal Information](#) table, the junction temperature can be estimated with corresponding formulas (given in [Equation 8](#)). For backwards compatibility, an older  $\theta_{JC(top)}$  parameter is listed as well.

$$\begin{aligned}\Psi_{JT}: T_J &= T_T + \Psi_{JT} \cdot P_D \\ \Psi_{JB}: T_J &= T_B + \Psi_{JB} \cdot P_D\end{aligned}\tag{8}$$

Where  $P_D$  is the power dissipation shown by [Equation 9](#),  $T_T$  is the temperature at the center-top of the package, and  $T_B$  is the PCB temperature measured 1 mm away from the package *on the PCB surface*.

---

#### Note

Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

---

For more information about measuring  $T_T$  and  $T_B$ , see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com).

For a more detailed discussion of why TI does not recommend using  $\theta_{JC(top)}$  to determine thermal characteristics, see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com). For further information, see the [Semiconductor and IC Package Thermal Metrics application note](#), also available on the TI website.

## 8.2 Typical Application

### 8.2.1 FPGA I/O Supply at 1.8 V With a Bias Rail

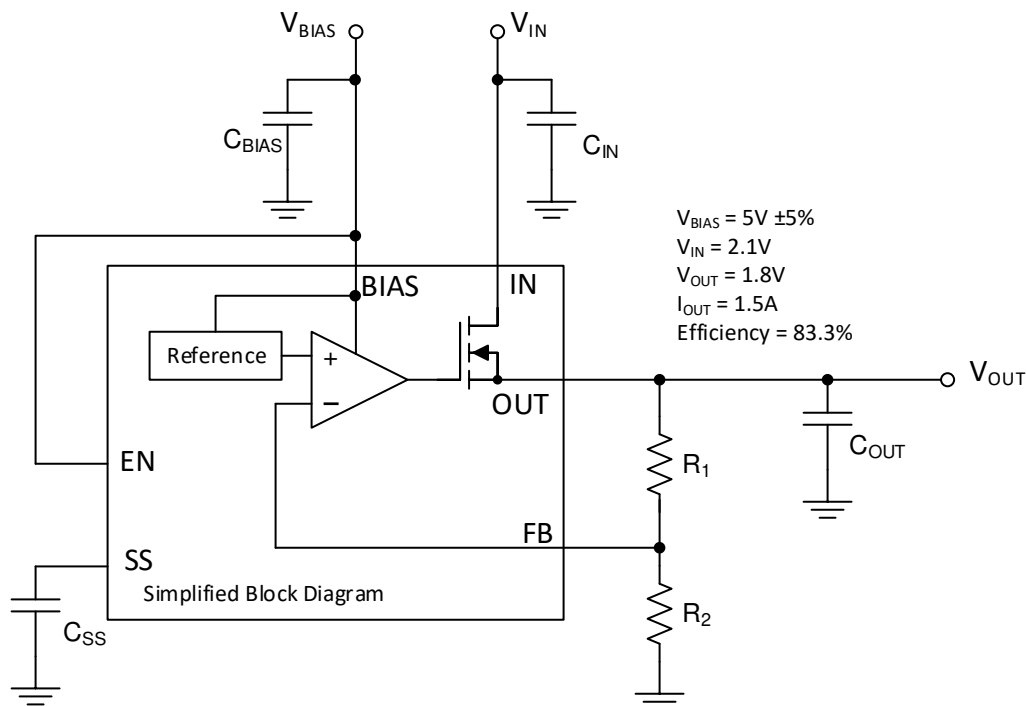

Figure 8-2. Typical Application Using an Auxiliary Bias Rail

#### 8.2.1.1 Design Requirements

This application powers the I/O rails of an FPGA, at  $V_{OUT(nom)} = 1.8V$  and  $I_{OUT(dc)} = 1.5A$ . The available external supply voltages are 2.1V, 3.3V, and 5V.

Table 8-2 lists the parameters for this design example.

Table 8-2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
$V_{IN}$	2.1 V
$V_{BIAS}$	2.4 V to 5.5 V
$V_{OUT}$	1.8 V
$I_{OUT}$	600 mA (typical), 900 mA (peak)

#### 8.2.1.2 Detailed Design Procedure

First, determine what supplies to use for the input and bias rails. A 2.1-V input can be stepped down to 1.5 V at 1.5 A if an external bias is provided, because the maximum dropout voltage is 180 mV if  $V_{BIAS}$  is at least 2.8 V higher than  $V_{OUT}$ . To achieve this voltage step, the bias rail is supplied by the 5-V supply. The approximation in Equation 6 estimates the efficiency at 83.3%.

The output voltage then must be set to 1.5 V. As Table 8-1 describes, set  $R_1 = 4.99 k\Omega$  and  $R_2 = 3.82 k\Omega$  to obtain the required output voltage. The minimum capacitor sizing requires the total solution size footprint to be reduced; see the [Input, Output, and Bias Capacitor Requirements](#) section for  $C_{IN} = 1 \mu F$ ,  $C_{BIAS} = 1 \mu F$ , and  $C_{OUT} = 2.2 \mu F$ . Use  $C_{SS} = 1 nF$  for a typical 0.032-ms start-up time.

Figure 8-2 shows a simplified version of the final circuit.

### 8.2.1.3 Application Curves

$C_{IN} = C_{OUT} = 10 \mu F$ ,  $C_{BIAS} = 1 \mu F$ ,  $V_{IN} = 2.1 V$ ,  $V_{BIAS} = 6 V$  to  $3.5 V$  to  $6 V$ ,  $I_{OUT} = 1.5 A$

**Figure 8-3.  $V_{BIAS}$  Line Transient**

$C_{IN} = C_{OUT} = 10 \mu F$ ,  $C_{BIAS} = 1 \mu F$ ,  $V_{BIAS} = 5 V$ ,  $V_{IN} = 2.1 V$  to  $4.1 V$  to  $2.1 V$ ,  $I_{OUT} = 1.5 A$

**Figure 8-4.  $V_{IN}$  Line Transient**

$C_{IN} = C_{OUT} = 10 \mu F$ ,  $C_{BIAS} = 1 \mu F$ ,  $V_{BIAS} = 5 V$ ,  $V_{IN} = 2.1 V$ ,  $I_{OUT} = 10 mA$  to  $1.5 A$  to  $10 mA$

**Figure 8-5. Output Load Transient Response**

$C_{IN} = C_{OUT} = 10 \mu F$ ,  $C_{BIAS} = 1 \mu F$ ,  $V_{BIAS} = 5 V$ ,  $V_{IN} = 2.1 V$ ,  $I_{OUT} = 0 mA$

**Figure 8-6. Turn-On Response**

## 8.3 Power Supply Recommendations

The TPS7A74 is designed to operate from an input voltage up to 6.0 V, provided the bias rail is at least 1.3 V higher than the input supply and dropout requirements are met. The bias rail and the input supply must both provide adequate headroom and current for the device to operate normally. Connect a low output impedance power supply directly to the IN pin. This supply must have at least 1  $\mu F$  of capacitance near the IN pin for optimal performance. A supply with similar requirements must also be connected directly to the bias rail with a separate 1  $\mu F$  or larger capacitor. If the IN pin is tied to the bias pin, a minimum 4.7- $\mu F$  capacitor is required for performance. To increase the overall PSRR of the solution at higher frequencies, use a pi-filter or ferrite bead before the input capacitor.

## 8.4 Layout

### 8.4.1 Layout Guidelines

An optimal layout can greatly improve transient performance, PSRR, and noise. To minimize the voltage drop on the input of the device during load transients, the capacitance on IN and BIAS must be connected as close as possible to the device. This capacitance also minimizes the effects of parasitic inductance and resistance of the input source and can, therefore, improve stability. To achieve optimal transient performance and accuracy, the top side of R<sub>1</sub> in [Figure 8-1](#) must be connected as close as possible to the load. If BIAS is connected to IN, connect BIAS as close to the sense point of the input supply as possible. This connection minimizes the voltage drop on BIAS during transient conditions and can improve the turn-on response.

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the thermal pad is critical to avoiding thermal shutdown and ensuring reliable operation. Power dissipation (P<sub>D</sub>) of the device depends on input voltage and load conditions. [Equation 9](#) calculates P<sub>D</sub>.

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (9)$$

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On the WSON (DSD) package, the primary conduction path for heat is through the exposed pad to the printed circuit board (PCB). The pad can be connected to ground or left floating; however, this pad must be attached to an appropriate amount of copper PCB area to ensure the device does not overheat. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device. [Equation 10](#) calculates the maximum junction-to-ambient thermal resistance.

$$R_{\theta JA} = \frac{(+125^{\circ}\text{C} - T_A)}{P_D} \quad (10)$$

---

#### Note

When the device is mounted on an application PCB, TI strongly recommends using  $\Psi_{JT}$  and  $\Psi_{JB}$ , as explained in the [Estimating Junction Temperature](#) section.

---

#### 8.4.1.1 Estimating Junction Temperature

By using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , as shown in the [Thermal Information](#) table, the junction temperature can be estimated with corresponding formulas (given in [Equation 11](#)). For backwards compatibility, an older  $\theta_{JC(top)}$  parameter is listed as well.

$$\begin{aligned}\Psi_{JT}: T_J &= T_T + \Psi_{JT} \cdot P_D \\ \Psi_{JB}: T_J &= T_B + \Psi_{JB} \cdot P_D\end{aligned}\tag{11}$$

Where  $P_D$  is the power dissipation shown by [Equation 9](#),  $T_T$  is the temperature at the center-top of the package, and  $T_B$  is the PCB temperature measured 1 mm away from the package *on the PCB surface*.

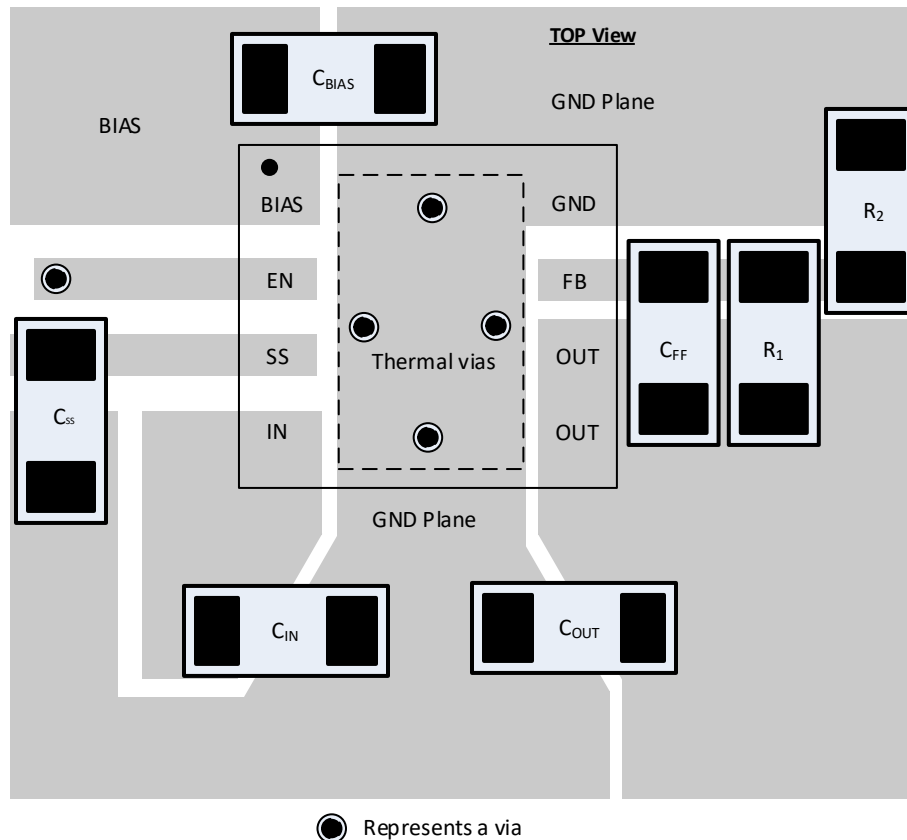

#### Note

Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring  $T_T$  and  $T_B$ , see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com).

For a more detailed discussion of why TI does not recommend using  $\theta_{JC(top)}$  to determine thermal characteristics, see the [Using New Thermal Metrics application note](#), available for download at [www.ti.com](http://www.ti.com). For further information, see the [Semiconductor and IC Package Thermal Metrics application note](#), also available on the TI website.

Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">TPS7A7401DSDR</a>	Active	Production	SON (DSD)   8	5000   LARGE T&R	Yes	FULL NIPDAU	Level-2-260C-1 YEAR	-40 to 125	7A7401
TPS7A7401DSDR.A	Active	Production	SON (DSD)   8	5000   LARGE T&R	Yes	FULL NIPDAU	Level-2-260C-1 YEAR	-40 to 125	7A7401

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
